THE ELECTRICIAN

Established 1861. *The Oldest Weekly Illustrated Journal of*

Electrical Engineering, Industry, Science and Finance

VOLUME CII.

From January 4, 1929, to June 28, 1929

[ALL RIGHTS RESERVED]

LONDON:

Printed by W. H. SMITH & SON LTD., The Arden Press, Stamford Street, S.E.1, and Published by BENN BROTHERS, LTD. at Bouverie House, 154, Fleet Street, London, E.C.4.

1929.

INDEX TO "THE ELECTRICIAN."—VOL. CII.

SUB-HEADINGS IN GENERAL INDEX.

	PAGE
Exhibitions	ii
Institution of Electrical Engineers	iii
Legal Intelligence	iii
Obituary	iii
Parliamentary	iii
Reviews of Books	iv
Telegraphy	iv
Telephony	iv
Wireless Telegraphy and Telephony	iv
Works, Descriptions of	iv

Names of Authors of Articles and Papers are indexed alphabetically in the GENERAL INDEX, *and not under the sub-headings.*

General Alphabetical Index.

***Heavy figures* denote that the subject matter is in the "Editorial Notes." When the letter (C) is placed after a title, it signifies that the article in question appeared in the Correspondence columns.**

A

Accounts, Monthly, **340**
Advertising Abuses, **492**, 558 [" Advertising Manager "] (C), 586; [Angus] (C), **615**; [Goody] (C), 615
Advertising for Contractors, **472**, **756**
Advertising, Utility, **605**
Aircraft, Cooking in, 480
Alarm Watches, 625
Alternator Frequency, Checking, 300
Amateur, Menace of the [" Experto Credo "] (C), 758
American Letter [Wells], 347, 726
Ammeters and Voltmeters, Permanent Magnet Moving Coil, 158, 287
ANGUS, A. H.: (C) Advertising Abuses, 615
Apparatus, Domestic, Design of, 60
Appliances, Electrical, for Spring Trade, 388
Appliances, Domestic Electrical, 68, 323, 476, 764
Apprenticeship in the Electrical Industry, **606**
Association of Ex-Siemens Men, Formation of [Huddleston] (C), 348; (C), 531
Association of Supervising Electrical Engineers, Annual Dinner of the, 274
Australian Letter [Davey], 445, **613**
Auxiliaries, Station [Marshall], 529

B

Baking, Electrical, 362
Ball, Electrical Engineers', 205
Ballot, John Benn Hostel, 250
Ballroom, Diffused Lighting in the, **62**
Banquet, John Benn Hostel, 704
BARCLAY, W. A.: Alignment Costs Chart, 262, **524**
Batteries, Christmas Toys and, **2**
Battery Charging, 300
Battery Eliminator, New, 763
Battersea Power Station Problem [Brownlie] (C), 503; **519**; (C), 556, **605**, **636**; [Siemens-Schuckert (Gt. Britain), Ltd.], (C), 531; **548**, **575**; [Fladgate], 577; [" Chemical Engineer "] (C), 556; [Taylor] (C), 614
Batti-Wallah's Society (Luncheon), 272, 530, 704 (Annual General Meeting), 387
Benn Bros.' Annual Outing, 797
BICKELL, S. F.: The Boiling Plate of To-day, 692
Bird Guarding on Overhead Lines [Scott], 345
Birkenhead, Lord, and Electricity Supply, **216**, 250
BLAIKIE, J. R.: (C) Fallacies of Load Factor, 112, 586; Electricity Supply and the Consumer, 261, 320, 521
Boats, River, Electric Propulsion for [Durtnall] (C), 445
Boiling Plate of To-day [Bickell], 692; [Haussauer] (C), 732
BOLTON, D. J.: (C) Thawing Out: Electricity to the Rescue, 242
Breakdowns, Transformer, 7
BRETTELLE, C. O.: (C) Some Fallacies of Load Factor, 137
BRIGHT, SIR C.: John Lee: An Appreciation, 70
BRISTOW, W. A.: (C) A Fuel Policy, 531;
British Electrical and Allied Industries Research Association, Annual General Meeting, **184**, 197
British Electrical Development Association, Annual Dinner and Meeting, 349
British Electrical Trade Protection Association, Formation of, 73
British Industries Fair, Electrical Firms and the [Martin] (C), 196; **258**, 267; ["H.C.M."] (C), 446; **520**; [" Hopeful "] (C), 387; [" Doubtful "] (C), 419
BROWN, P. J.: (C) North-East Coast Exhibition, 556
BROWN, S. G., and SPORING, P. A.: Prevention of Ionisation in Impregnated Paper Dielectrics, 443
BROWNLIE, D: (C) Battersea: A Suggestion, 503; "The Battersea Problem," 556; (C), 614
BUCHLER, W.: Telephones in China and Japan, 235
Budget, The, **464**
Bushings, High Voltage [Thompson], 465, 493

C

Cables, 132 000 V [Taylor] (C), **614**; (C), 700
Cables, Dancing, **156**
Cabling to Singapore, **130**
Capital for Telephone Development, **369**
Carbonisation, Low-Temperature, Power Stations and, 3
Carnival, Electrical, at Newcastle, **112**
Catalogue Economy, **184**
CATCHPOLE, J. W.: (C) Telephones in China and Japan, 321
Cement Manufacturing Machinery, Electrical Driving of, 29
Central Electricity Board's First Annual Report, **547**, 554
Charger, Wanted a Fool-Proof, **370**; [Turner] (C), 474
Charges, Reduction of, 45, 537, 705
Charges, Trade, in the Electrical Installation Industry, **576**, 579; [" Analysis "] (C), 732
Charing Cross Underground Station, New Booking Hall at, 277
Chart, Alignment Costs [Barclay], 262, 524
CHILDS, E. C.: (C) " Light's Golden Jubilee," 788
Church Lighting, 17
Cinema, Davis, Lighting of, **2**, 17
Circuit Breaker, New, 428
Circuit Theory, Electrical, Based on the Method of Complex Numbers [Windred], 409, 437
CLARK, E. V.: Some Fallacies of Load-Factor, **1**, 5; (C), 556
Clocks, Electric, 423
Club, Electrical Luncheon, **606**
Code, Canadian Electrical, 199
Colour and Its Application, **130**
Committees, Two New, **340**, 355
Competition, Electrical Trades Benevolent Institution, **748**, 792
Competition, Window Display, **548**, 564
Competition, W. E. Highfield Shield, **658**
Condenser, A Big, 442
Conductor Spacings, Proposed Formulæ for [Taylor], 86
Conductors, Line, Metals for E.H.T. [Taylor], 290
Conductors, Steel, for Power Lines [Taylor], 157, 194 (C), 321; [Turnbull] (C), 197; [Marchant] (C), 197
Conduit, " Bermico " Multiple, 562
Conferences—
  Electrical Development Association, 10, 139, 239
  Electrical Contractors' Association, 450, **776**
  International High Tension, **491**; [Rich], 728, 749, **747**, 779
Connector, New Jumper, 505
Consumers in Rural Areas, Obtaining [Vignoles], 646
Contracting, Eliminating the Unfit in, [Moss], 473
Contracting Trade, Safeguarding the [Moss], 59; [" Wireman "] (C), 586; [" Contractor "] (C), 615; [" Another Contractor "] (C), 648
Contractors, Advertising for, 472, 756
Contractors and Compulsory Registration, **54**; [" Northern Contractor "] (C), 166; [" Sales Manager "], 166
Contractors, Registered Electrical, List of, 76, 169, 304, 446, 567
Convention, Incorporated Municipal Electrical Association's Annual, 578, **635** (New President's Career) 637, 638, **665**, 667 **719** (Annual Dinner and Meeting), 730
COOKE, W. H.: (C) Wiring Regulations, 615
Cooking and Heating Developments, 139
Cooking in Aircraft, 480
COOPER, W. F.: Factor of Safety of Overhead Lines, 341, 503
Copper and Fittings Prices, **492**
Crakewell House, Equipment of, **184**
Credit Policy Defended, **155**
Current, Carrier, on Power Systems, **407**

D

DAVEY, W.: Australian Letter, 445, **613**
Daylight, Artificial, 705
Dazzle Problem, **129**
Designs, Industrial, **156**
Distribution Boards, Standard, **615**
Distribution, Importance of, **665**
DODSWELL, C. H.: (C) A Fountain of Light, 387
Drill, Buda-Hubron Earth, 362
Driving, Electrical, of Cement Manufacturing Machinery, 29
DUNTON, A. R. and MUIR, A. W.: Laminated Synthetic Resin Products, 27; Untreated Fabrics for Electrical Purposes, **439**; Electrical Press boards, 549, 721
DURTNALL, W. P.: (C) Electric Propulsion for River Boats, 445

E

ECKERSLEY, T. L.: An Investigation of Short Waves, 468
Educating the Public [" Regtract "] (C), 474; [" Regicon "] (C), 503.
Education in Installation Work, **547**
Einstein Electro-Chemical Process, 178
EKSTRÖEM, A.: Rural Electrification and Its Practical Politics, **99**; Anticipation of Electrical Load in Residential Areas, 131
Electric Fittings Committee, Report of, **54**
Election, General, and Trade, **257**, **591**, **666**, 702
Electrical Association for Women, Meetings and Visits of the, 17, 71, 143, 178, 301, 355, 507, 564
Electrical Contractors' Association Annual Dinner of the Cardiff Branch, 30
Electrical Contractors' Association, Annual Dinner of the, 116
Electrical Contractors' Association, Conference of the, 450
Electrical Contractors' Association of Scotland, Annual Meeting 794
Electrical Contractors' Association, Annual Dinner of the Sussex Branch, 583
Electrical Development Association, Developing the [Murdon] (C), 387
Electrical Power Engineers' Association, Annual Dinner of the, 238
Electrical Wholesalers' Federation, Annual Dinner of the, **216**, 241
Electricity Companies' Obligations, 141
Electricity, Economic Application of, to Low Temperature and Heating Purposes, 122
Electricity in Bulgaria, **2**
Electricity in Rural Areas, 610
Electricity Prices, London, 161
Electricity Scheme, Mid-East, England, **83**, 111, **407**, 423, 454
Electricity Scheme, North-East England, **775**, 787
Electricity Schemes, Indian, 122
Electrification, Practical Rural, **156**, **492**
Electrification, Rural, and Its Practical Politics [Ekström], 99
Electrification, Rural, in Western Lorraine, 98
Electro-Chemical Process, Einstein, 178
Electro-Harmonics, Liverpool, 619
ELLIS, A. G.: (C) Rating of Electrical Machinery, 66
Engine Tests, Electrical, 767
Engine, Heavy-Oil, and its Application in Electricity Supply Undertakings [Porter], 679
Engineer, British, Honoured, **286**
Engineering Economics, **53**, **129**
Equipment, Manufacturer's, 448, 558
Ex-British Westinghouse Annual Dinner, 331

EXHIBITIONS—
  Domestic Appliances, Proposed, 561
  Ideal Home, 258, 270
  Incorporated, Municipal Electrical Association's, **665**, 688, 735
  Industrial Heating (Manchester), 38
  National Radio Exhibition, **548**, **776**, **798**
  North-East Coast, 175, 250, **548**, [Brown] (C), 556, 620, 656 [" Cullercoats "] (C), 700; [" Another Northerner "] (C), 759

Exhibitions—*continued*,
  Physical and Optical Societies', **26**, 33, 64, 164
  Television, 331
Experimental Methods for Determining the Distribution of Electric and Magnetic Fields [Hague], 185
Export Openings, 234
Exports and the B.I.F., **215**
Ex-Siemens Men, Meeting-Place for, [Huddleston and Barfield] (C), 348

F

Fabrics, Untreated, for Electrical Purposes [Dunton and Muir], 439
Fair, British Industries, **2**, **38**, **129**, **156**, 170, **183**, 190, **215**, 219, **666**; [" Exhibitor "] (C), 296; [" W.C.T."] (C), 296
Fans, Electric, for 1929, 587
Fans and Refrigerators, **636**
Faraday Centenary Celebrations, **155**
Farm, Electric Poultry, 512
Feed Control for Pulverised Fuel, 412
Feed Water Testing, 247
FIELD, A. B.: (C) Plate Type Turbo Rotors, 348
FIELD, C. E.: (C) Showroom Radio Demonstrations, 112
Fields, Electric and Magnetic, Determining the Distribution of, 185, 315
Films, Talking, **370**
Film, Talking and British Apparatus, **776**
Finance, Municipal, 152
Fire Designers Wanted, **84**
Fires, Country House, **258**
Fires, Electrical, and Hand Extinguishers [Hodson] (C), 66
Fittings, Appliances and, Domestic, 68
Five-Day Week, American General Electric Co. and the, **436**
FLADGATE, W. F.: Battersea Power Station, 577
Floodlighting, Window, **655**, **666** [" Wanderer "] (C), 700
Foremanship, Training in, **286**
Fountain of Light, A [Dodswell] (C), 387
FRANCIS, G. S.: (C) Trade Credit, 35
FRIEND, J. NEWTON: Solution of Plain and Amalgamated Lines in Electric Batteries, 444
Fuel Policy, A [Bristow] (C), 531
Fuel, Pulverised, Developments, **130**
Fuel, Pulverised, Feed Control for, 412

G

GALLIERS, H. J.: (C) A Window with a Voice, 759
GANNETT, D. K.: (C) American Broadcasting, **661**
GARLAND, C. S.: Suspension Insulators for H.T. Transmission Lines, 109, 147
GARRARD, C. C.: Switchgear Developments, 694
Gas Alarm Apparatus, 238
Gas Scandal, A, **216**
GAUVAIN, W. P.: Rural Lines in New Zealand, 89; (C) Safety Factor of Concrete Poles, 242
Gear, Control, Industrial Motor, 725
Generators, Structural Steel for, 293
Generators, Additional, for Gatineau River, 446
Glass, Floodlighting Stained, **666** [" Wanderer "] (C), 700
GOODLET, B. L. and MITFORD, J. B.: Influence of Atmospheric Pollution on Performance of Line Insulators, 91
GOODLET, B. L.: (C) Glass Insulators, 138, 419
GOODY, H. M.: (C) Advertising Abuses, 615
Gramophone Device, 705
Gramophone Records, Frequency, 428
Guards, Bird, for Overhead Lines, 107, 237

H

HAGUE, B.: Experimental Methods for Determining the Distribution of Electric and Magnetic Fields, 185, 315

Digitized by Google

HAMMOND, A. E.: Spring-Time Window Displays, 378
HARDY, A. C.: Marine Electricity, 9, 136, 265, 417, 528; The All-Electric "Viceroy of India," 231
Harrison-Wood Patent, 326
HAUSSAUER, L. P.: (C) "The Boiling Plate of To-day," 732
Heating and Cooking Developments, 139
Heating Developments, Water, 385
Heating, Occasional, 408
Hire and Hire-Purchase, 10
Hire-Purchase, An Economist on, 606
HODGES, C. C.: (C) Wiring Regulations, 648
HODSON, B., HARTLEY, L. S., and PRATT, O. S.: Manufacture of Barium Oxide Filaments, 160
HODSON, W. H.: (C) Electrical Fires and Hand Extinguishers, 66
HOLMES, WARWICK: More Electrical Penetrations, 371
"Homes, Ideal" ["J.H.C."] (C), 295
Honours List, Birthday, 702
Honours List, New Year, 299
Hostel, John Benn, Christmas Celebrations, 12
HUDDLESTON, J. SNOW, and BARFIELD, E. P.: (C) Formation of Association of Ex-Siemens Men, 348, (C) 531
Hydro-electric Development in France, 720

I

Illumination Design Course, Nineteenth, 534, 548, 748
Imperial Chemical House, Electrical Equipment of, 301
Imports and Exports, 53, 71, 183, 201, 318, 325, 464, 479, 576, 591, 747, 761
Incorporated Municipal Electrical Association, Annual Convention of, 578, 635, (President's Career) 637, 638, 665, 667, 719; (Annual dinner and meeting), 730
Individualist Bookshop Luncheon, 359, 505
Industry, British Electrical, American Views on, 370
Industry, British, Reparations and, 314
Installation Practice, Electrical [Rogers], 189
Installation Work, Education in, 547
Institute of Metals, 21st Anniversary of, 339, (Congress), 650

INSTITUTION OF ELECTRICAL ENGINEERS—
Alternating Current, Direct Generation of, at High Voltages [Parsons], 409, 415
Annual Meeting, 584
Associate Membership Examination, Result of, 71
Competition, Golf, 559, 699
Dinner, Annual, 188
Filaments, Manufacture of Barium Oxide [Hodson], 160
Honorary Membership for the Prince of Wales, 184
Insulating Papers, Electrical, for the Manufacture of Power Cables [Riley and Scott], 441, 468
Ionisation The Prevention of, in Impregnated Paper Dielectrics [Brown and Sporing], 443
London Students' Section, (Annual Dinner) 299, (Annual Report) 510
Mains Testing, 161
Meters, Electricity, Rotor Bearings of [Lawson], 292
Motors, Variable Speed, 317
North Western Centre, Annual Dinner of the, 134
Scottish Centre's Annual Visit to Dundee, 591
Summer Meeting, 340, 359, 478, 754, 775, 782
Transmitting Aerials [Eckersley and Kirke], 757
Turbo-Generators, Recent Developments in [Kuyser], 409, 415
Waves, Short, An Investigation of [Eckersley], 468
Wireless Section Committee, 534
Instruments and Meters, Electrical, for Bulk Supply and General Measurements [Lipman], 381
Insulators, Glass, Development of, for Transmission Schemes [North], 101 [Goodlet] (C), 138, (C), 419; [Marchant and Robertson] (C), 166; [Taylor, Tunnicliff and Co.] (C), 196, 271; ["P.M.W."] (C) 242; [North] (C), 242, 347
Insulators, Line, Influence of Atmospheric Pollution on Performance of [Goodlet and Mitford], 91
Insulators, Suspension, for H.T. Transmission Lines [Garland], 109, 147
Integrators, Photometric, 530
Ironmongers' Policy, 636

Current Topics.

London's Future Travelling Facilities.

On several occasions during the last few years Lord Ashfield has mentioned that the Underground Railways Group could not entertain the idea of constructing any further tube railways unless there were instituted a general scheme for co-ordination of London passenger carrying services, and an equitable system of allocating the profits to the several companies or bodies providing such services. Apparently, the Underground administration is now satisfied that the Bills which it and London County Council are promoting to authorise such co-ordination will be duly passed, and will go at least part of the way towards ensuring for the Underground the security as to receipts and profits which it has long regarded as the desideratum which would enable it to plan and carry out a bold policy of expansion. It has long been urged that new tube railways should be constructed in South London, and that an extension of the Piccadilly Line, either independently or in conjunction with the Great Northern and City Railway, beyond Finsbury Park is badly needed, and the construction of the last-mentioned extension has been contemplated, subject to the desired improvement in working conditions being obtained. The Underground has published a list of developments which will be undertaken during the present year, and, although this does not include any extensions of lines, it comprises works which will involve large expenditure, and is an indication of the intention of the Underground administration to spare no effort to give a satisfactory service in return for the security of tenure and relief from undue competition which will be secured by means of the Acts now in the making. The present year's improvements will include the construction of many escalators, modifications of stations, the provision of 372 more cars on the tubes, and 91 new motor cars on the District Railway, the installation of a sixth 15 000 kW generator and new boilers and switchgear at the Lots Road power station, the remodelling of tramcars on the systems under Underground control, and such other details as the provision of roof covers on the present uncovered tramcars.

The B.E.A.M.A. and Trade Credit.

Just before Christmas there was held the winding-up meeting of the Sound Currency Association, at which a brief reference was made to the British Electrical and Allied Manufacturers' Association's recent memorandum concerning trade credit. The Sound Currency Association was formed in 1919 with the object of pressing upon the Government the need for the restoration of the gold standard in this country, and, that object having been achieved, there was no further need for the existence of the Association, and it has accordingly been wound up. The whole of the work was of a voluntary nature, but it was supported by the leading bankers, economists, and others in this country. Mr. D. M. Mason, who has acted as chairman of the Association since its formation, in his final speech referred to the B.E.A.M.A.'s manifesto, and said there seemed to be a feeling prevailing in certain circles that there is a lack of credit to-day. He contended, however, that there is no lack of credit, and that anybody who has good security has no difficulty in obtaining any credit they desire. At the same time, it was impossible to force credit into the country, because the only results were inflation and the very evils which the Association had endeavoured to prevent. The British Electrical and Allied Manufacturers' Association had suggested that the depression during recent years had been due to the monetary policy of the Bank of England, but the system of the Bank of England was, in a sense, governed by the trade of the country. It did not provide the trade, but existed for the purpose of circulating trade, and the function of the gold standard was for the purpose of enabling exports and imports to develop to the greatest extent. That system enabled this country to build up before the war a foreign trade second to none in the history of the world, which had stood the test of time, and it was a satisfaction to know that we had now got a currency which was convertible into gold, was elastic, and free from political influence.

Load-Factor Problems.

The article dealing with "Some Fallacies of Load-Factor" which we publish on a later page of this issue will doubtless give rise to no small amount of criticism. We are aware that some of Mr. E. V. Clark's contentions run counter to the expressed opinions of many electrical engineers, but as the author, who is Lecturer on Electrical Engineering in the University of Adelaide, Australia, is able to view the problem with a detachment which is hardly possible among engineers more intimately connected with the business of electricity supply, his views at least deserve consideration. Mr. Clark's case is that load-factor is so unduly stressed in some quarters that the

Digitized by Google

greater importance of diversity factor is far too little considered, if not overlooked, and that the more general adoption of bulk supplies is likely to enforce a truer view of the matter. We shall be glad to provide facilities for a full discussion of the subject in those of our columns devoted to correspondence.

Christmas Toys and Batteries.

IT will be remembered that last year we drew attention to the number of toy motor-cars to be seen in the Christmas bazaars, which incorporated flash lamp headlights operated by batteries. The bazaars just concluded again displayed motor cars similarly fitted, but though we visited many stores and shops no further application of the same principle was seen. As a suggestion to manufacturers of flash lamps and batteries we see no reason why such toys as trains and signals should not also be illuminated by the same means. The sales of these during the Christmas season must be considerable, and if it were possible to include in each sale one or more flash lamp bulbs and a battery, then the already big business in these goods would be still further improved.

British Industries Fair.

THERE has been issued this week a special advance overseas edition of the catalogue of the London Section of the British Industries Fair, which is now being sent to 10 000 business men in Europe, North America, South Africa and the eastern coast of South America, including all those buyers who have notified the Department of Overseas Trade of their intention to attend the Fair. By this publishing feat, which has only been made possible owing to the keenness of British manufacturers to participate in the Fair, trade buyers in cities as far apart as Constantinople, Capetown and Vancouver, will be able to receive a copy of the Fair catalogue before commencing their voyage to England. The London Section of the Fair includes, as in past years, the exhibits of the majority of the large manufacturers of radio apparatus, and from the advance details available it is indicated that there will be shown many new designs of sets, loud speakers and components of outstanding merit. The Electrical Section of the Fair at Birmingham will be one of the largest yet held, and the exhibits promise to reveal many advances and improvements. The exhibition will soon be upon us and the electrical industry generally, and the organisers of the Electrical Section in particular, are to be congratulated on the progress that has been and is still being made. The comprehensive display of exhibits which the industry is showing should do much to impress the numerous foreign buyers who have indicated their intention of attending, with the efficiency of the British electrical manufacturing trade in all its many branches, and since, as last year, many of the exhibits will have some relation to the various electrification schemes of the Central Electricity Board, these, we anticipate, will be of more than considerable interest to the foreign visitor in that no contract for such schemes has yet been placed with a foreign manufacturer, a fact which will at any rate excite curiosity, if nothing else. A list of the electrical exhibitors at both the Birmingham and London Sections of the Fair will be given in our next issue.

Domestic and Colour Lighting.

THE Sales and Publicity Calendar of the Electrical Development Association for January deals with domestic lighting and colour lighting. The supplementary programme which has been issued shows that an extensive national and local advertising campaign has been arranged, while special window displays, posters and publications are also available. The window displays include an artistic arrangement for use with coloured spotlights and coloured lamps, which demonstrates the importance of the principle of specialisation as a selling factor. The fitting strikes us as being a highly successful design which will without doubt command the attention of the public wherever it is shown. Another window trim aims at selling by the art of suggestion and is extremely simple to arrange, irrespective of size of window. Its appeal is direct, and the sale of domestic lighting fittings should be increased as a result of it. The window dressing schemes of the E.D.A. last month were associated with Christmas, and in those cases where these were adopted we have no doubt that extra sales were the reward. For January, specialisation and simplicity are the keynotes of the campaign, and though some of the electrical windows in this country may be regarded as a trifle complex, the E.D.A. designs for January are, on the other hand, pleasingly simple. The idea of devoting electrical windows to special subjects each month is one which is not likely to escape the attention of the public, and so long as the windows are changed at the beginning of the month, the public will become accustomed to look for the change at that time. The scheme may, in fact, be regarded as a means of educating the public into thinking electrically as well as buying electrically; a condition which the whole industry would do much to bring about.

Cinema Lighting.

AMONG the most appreciative of the value of electrical effects should be included the various cinema theatres, the lighting schemes of which are often as entertaining as their projections upon the screen. The theatres in and around London, as well as in the provincial centres, have all adopted a form of illumination which adds to the beauty of the internal decoration, and incidentally augments not only the sales of electrical fittings but also increases the power station load in the district where the hall is situated. The latest addition to the London cinemas is that at Croydon, and as will be understood from the brief description given elsewhere in this issue, the building is of considerable electrical interest. Mr. BASIL DAVIS, whose designs indicate that he has no small understanding of what can be done with electric lighting, is also, we believe, one of that exclusive band of radio transmitters whose early experiments were the forerunners of the present broadcasting system.

Electricity in Bulgaria.

CONSIDERABLE opportunities for export business may be found by British manufacturers of electrical machinery and appliances in the gradual advancement of electrical development in Bulgaria. As evidence of this, there was in 1900 only one electricity supply undertaking, while even in 1914 the number had only increased to four. Between 1923 and 1927, however, there were ten transmission systems brought into being, which number had increased to 74 by the end of 1927. At the present time there are thirty hydro-electric stations actually in operation, of which eleven have a capacity of 100 H.P., a similar number from 100 to 500 H.P., four from 500 to 1 000 H.P., two from 1 000 to 2 000 and two above 2 000 H.P. The Electric Society of Sofia and Bulgaria is the owner of one of these latter, the capacity of the station being 3 720 H.P. The other station, of 7 800 H.P., is operated by an organisation of the name of Granitoid, and these two stations produced during 1927 25 634 994 kWh. In addition to hydro-electric stations there are in Bulgaria 109 power stations of other types which during 1927 produced 11 097 540 kWh. These figures go to show that Bulgaria is not without market value, and though many of the domestic electrical appliances and much of the machinery used are of continental manufacture, the fact that American-made apparatus can find a ready sale there indicates that the market is competitive. Though we are naturally inclined to look to the larger countries for our export sales, the smaller countries of Europe should not be forgotten. The same markets should also prove attractive to the manufacturer of radio equipment, for though German- and Austrian-made components and sets are to be seen in number, the superior quality and overall efficiency of the British-made equipment are already well known and in many cases preferred in that part of the world.

POWER STATIONS AND LOW-TEMPERATURE CARBONISATION.

Advantages of Semi-Coke Fuel—A Continental Experience—Coal and Modern Stokers—Delivery Through Pipes—The Dunston Station—Question of Bulk Density.

THE problem of the low-temperature carbonisation of coal and its industrial applications, particularly its applications in the power house, were discussed in a paper by Dr. A. T. Demouilpied at a recent meeting of the London Local Technical Group of the Electrical Power Engineers' Association. As pointed out by Mr. W. J. Oswald, who presided, the subject has been prominently in the minds of power station engineers since Mr. R. P. Sloan presented a paper to the World Fuel Conference (held in London in September and October) on the economic utilisation of fuel in the production of electricity.

After a review of low-temperature carbonisation and of some of the processes invented, Dr. Demouilpied went on to discuss the application of the various products produced, the most important of which, he said, was the semi-coke, which was smokeless, burned well, ignited readily, had a higher rating efficiency than coal, and would go further than coal. In view of its activity, it was suitable for making producer gas, and among its other applications he referred to its use as a boiler fuel.

At the Dunston power station of the Newcastle-on-Tyne Electric Supply Co., coal is carbonised and the semi-coke fed on to chain grate stokers. Mr. Sloan had stated that a balance sheet could be worked out there showing a credit balance of nearly 3s. per ton of coal, but Dr. Demouilpied suggested that Mr. Sloan had been too modest in regard to the value of the semi-coke and gas, which he had fixed at 76% of the value of the original coal. Dr. Demouilpied's results with various coals, based on the net calorific values of the coke and gas, and allowing for the heating of the retort, showed values of the order of 82 and 83%.

With regard to the use of the semi-coke in the pulverised form, he said that the cost of drying before or during pulverisation was eliminated if semi-coke were used instead of coal. Owing to the physical structure of the semi-coke it offered a greater combustion surface and burned more readily, and with a short flame, so that it required a smaller combustion furnace. It had also been stated that about 20% less power was required for pulverising semi-coke than for pulverising most coals. Again, semi-coke could be burned satisfactorily with a higher ash content than in the case of coal: the specific gravity of pulverised semi-coke was low, so that the ash had a greater chance of dropping out. Storage was simplified, for the material did not cake, was not liable to spontaneous combustion, and occupied no more room than pulverised coal. Recent tests had shown that the average rate of steam production was about 21½% greater than when the parent coal was used, a fact which had an important bearing on the number of boilers required at a station. Tests had also shown that the efficiency of semi-coke was nearly 12% greater than that of the parent coal from which it was made.

The Discussion.

In the discussion which followed, MR. L. L. ROBINSON said that the results of his investigations of low-temperature carbonisation processes, primarily from the power station engineer's point of view, had damped his ardour rather severely. Recently he had visited Germany and had investigated a process which had been in practical operation at Duisburg for some twelve months. So far as the production of by-products and of a very excellent semi-coke was concerned, the process appeared to be admirable, but the calorific value of the gas produced represented only about 10 per cent. of the calorific value of the original coal, and it was obvious that if one were to use the gas only for boiler firing one would need a good many square miles of plant around the works in order to produce sufficient of the gas. Further, when he had found that the coal used, which he could have burned perfectly well on a modern stoker, was sold at about 5 marks per ton, but that the semi-coke produced from it by the low-temperature carbonisation process was selling at over 25 marks per ton, he had felt that it would be a sin to burn the latter under a boiler.

With modern stokers it was possible to get a boiler efficiency of at least 86% when using coal, and it was difficult to believe that by using coke one could add another 12% to that efficiency.

DR. DEMOUILPIED said he had not claimed a 12% increase in boiler efficiency by the use of semi-coke as compared with the parent coal, but a 12% increase in the efficiency of the fuel. A boiler efficiency of 86%, though admirable, was obtained at a price. His point was that it was a matter of great interest to a boiler engineer, or anyone else, to be able to show a reduction of 1s. per ton in the cost of his fuel. If a coal worth 5 marks per ton could be converted to a fuel worth 25 marks per ton, he would not let Mr. Robinson have a scrap of it for use under boilers. Dr. Demouilpied asked how much it would cost to dry a ton of fuel for pulverising.

MR. E. N. TAYLOR said that depended upon the system of pulverisation. If the fuel were prepared in a central plant, an expensive dryer would be required. If, however, one adopted the system of preparing the fuel in a mill at the point of user and firing direct, the fuel was dried in the mill by means of waste hot gas and passed straight to the boiler: the only loss incurred was that due to the moisture which passed through the boiler and out through the chimney with the waste gas. The cost in that case was merely the loss in boiler efficiency, which probably amounted to about 3%.

Efficiency of Semi-Coke.

DR. DEMOUILPIED was unable to give figures within his own knowledge with regard to the efficiency of semi-coke when burned on mechanical stokers, though he hoped to be able to do so in the near future, but M. Herry, of the Centrale Electrique de Flanders, who was using semi-coke under boilers at the power station near Ghent, was satisfied that the semi-coke from one ton of coal would give, when fed hot and properly controlled and burned, the same kind of efficiency as the ton of coal itself under the boilers.

MR. R. P. WALLIS asked whether the author would recommend that coal should be carbonised at individual power stations, or that the low-temperature carbonisation product should be manufactured at central depots and distributed to the power stations. If the coal were carbonised at the power stations, one had the advantage of being able to add the sensible heat from the retort to the boiler furnace, but that system had the disadvantage that both the gas and the coke produced had to be dealt with, and he understood that a totally different type of furnace would be required to burn each of these products. He had heard that where engineers had had to burn the gaseous and the solid fuel in the same boiler it was found extremely difficult to control the steam output of the boiler, because it would generate steam at varying rates, due to the variation in the quantity and quality of the gas made. It would appear necessary, therefore, to provide means of balancing the variations in gas generation in accordance with the load; otherwise, the station would be one having an electrical load to suit the boilers instead of one in which steam was generated to suit the electrical load.

DR. DEMOUILPIED said he was optimistic enough to believe that in time pulverised fuel, particularly if it be semi-coke (which did not clog and bridge in bunkers) would be delivered through pipes. In America, pulverised fuel was delivered in tanks, and recently he had seen a tank designed in this country for that purpose, so that there would be no difficulty in transport.

MR. E. SMYTHE, referring to the plant at the Dunston power station, said it was installed during the war to produce oils from the Northumberland coals by treating them with a distilling medium, the medium at that time being steam. The process was gradually developed to its present stage, in which the products of combustion, mixed with steam, are used, it being found that steam alone was too costly. The operation of the plant had solved a good many problems. A most excellent semi-coke was produced from Northumberland coal and burned direct on the grates of the boilers. Methods of pulverising the coke had been evolved recently, and semi-coke would be burned direct on the grates of the boilers on one side of the boiler house, and the pulverised coke would be burned under pulverised fuel-fired boilers on the other side. The use of the pulverised fuel seemed to him to solve to a great degree the difficulties in connection with peak load. The calorific

Digitized by Google

value of the semi-coke produced was almost identical with that of the original coal. The fuel was fed hot on to the boiler grates, but there was a certain amount of quenching in order to obtain the steam for admixture with the products of combustion, which mixture was used as the distilling medium. Finally, Mr. Smythe urged that there should be a national endeavour to pre-treat all coal burned.

In reply to the Chairman, Mr. Smythe said that the results obtained by burning the semi-coke on the grates of the Babcock boilers at Dunston were better than those obtained by burning the coal itself.

MR. MOUNT pointed out that the bulk density of pulverised coke was very much lower than that of raw coal, and a tank of a given size could transport nearly twice the weight of raw coal as of powdered coke; the importance of this from the point of view of transport costs was obvious. He had heard that two tanks were being manufactured for the transport of powdered coal, so that it appeared that a start was being made in the development of central pulverising plants in this country. The efficiency of coke burning on stokers depended upon air distribution. With regard to the transport of pulverised fuel through pipe lines, he pointed out that the abrasive effect of coals of very low ash content was different from that of coals of high ash content, and one of the biggest problems to be faced in connection with this form of transport was the cost of maintenance of pipe lines. In the burning of powdered coke there would probably be trouble due to the fact that the ash would fall more readily than that of powdered coal and cause slagging, whereas with pulverised coal the ash would go up the chimney. If the plant were not looked after carefully, part of the ash pit would become blocked and one could not get the ash away without damaging the brickwork; the boiler would have to be shut down in order that the brickwork could be repaired. The usual experience was that 20% more power was needed to pulverise coke than to pulverise coal.

DR. DEMOUILPIED, referring to bulk density, said it was stated by Dr. Lander and Dr. Sinnatt (of the Fuel Research Board) in a paper read before the recent World Fuel Conference, that, broadly speaking, it might be assumed that the lump low-temperature coke occupied twice the volume of coal, but that the bulk density of the coke and of coal of a similar degree of fineness would probably be of the same order. With regard to ash he said the scattering of ash from chimneys over large areas was a serious problem, and he was glad to hear that the ash from the low-temperature product showed a tendency to slag. He believed it would be possible to modify the plant in order to overcome the difficulty Mr. Mount had mentioned. The figures showing that 20% less power was required to pulverise semi-coke than to pulverise coal were obtained from an authoritative source. He asked what was the smallest size of any fuel that could be burned successfully on a modern chain grate stoker.

MR. P. PILKINGTON said that the maximum degree of fineness of semi-coke for burning on a chain grate stoker would probably be such that about 40% would pass through a $\frac{1}{8}$ in. sieve.

MR. MOUNT pointed out that the maximum fineness of fuel depended upon the air spaces on the stoker and the quantity of fines or riddlings. With regard to pulverising, he said coke was usually ground more finely than coal, because more time was needed to complete the combustion of coke than of coal, and it was usual in the design of combustion chambers to allow a greater flame travel for coke than for coal.

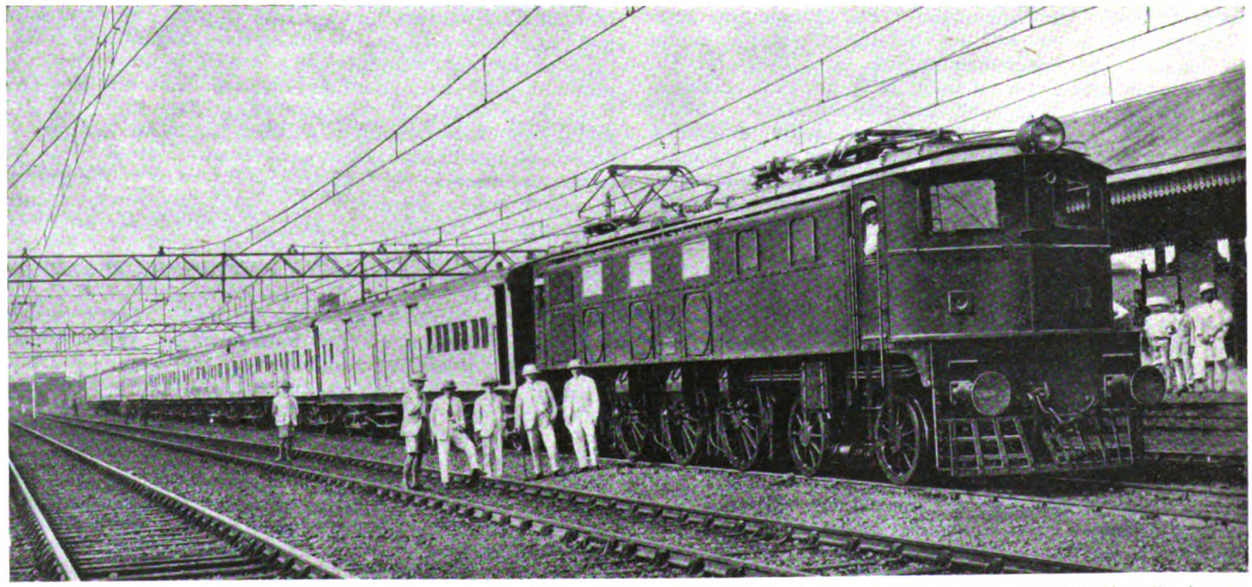
DR. DEMOUILPIED said that Audibert, the eminent French authority, was definitely of opinion that for equal efficiency of combustion, semi-coke need not be pulverised to the same degree of fineness as coal.

MR. E. N. TAYLOR asked for information as to the cost of maintenance of low-temperature carbonising plant per ton of coal treated.

DR. DEMOUILPIED replied that Mr. R. P. Sloan had stated that operation and maintenance charges amounted to about 4s. 8d. per ton of coal distilled; that was a reasonable figure for a successful plant.

MR. R. CHAPMAN pointed out that the figure of 4s. 8d. related to a small experimental plant, and said that Mr. Sloan had given a figure of 3s. 4d. per ton in the case of a larger plant. He asked if the pulverised semi-coke produced by the McEwan-Runge process was capable of being burned direct as pulverised coke.

MR. S. MCEWAN replied that the semi-coke as it left the retort, in the McEwan-Runge system, was pumped directly to the boilers and burned. As much as 40% of the material would remain on a 60-mesh screen. The particles were exploded, puffed-up particles of coal, which could be crushed between the finger and thumb, and the surface area was so large that combustion was instantaneous.



AN important contract for twenty-one 2 160 H.P. electric locomotives for express passenger service on the Great Indian Peninsula Railway has been placed with the Metropolitan-Vickers Electrical Co. The Metrovick sample locomotive submitted, is shown in the accompanying photograph in service. The construction is of the 4-6-2 type, consisting of three driving axles, one four-wheel bogie truck and one two-wheel pony axle working in conjunction with the nearest driving axle. The motors and their gearing are mounted on the frame of the locomotive, and transmit the power to the driving axles through a universal motion flexible link drive, which accommodates the route of movement between the axles and frame of the locomotive. The normal maximum service speed will not exceed 75 miles per hour, but all parts are designed for a speed of 85 miles. The electrical equipment includes six 360 H.P. motors and electro-pneumatic control gear. The pneumatically-operated switches are arrayed in a high tension chamber, those for the line and main resistances being of the single unit type arrayed in groups, and those for the motor combinations and reversing being of the cam group type.

SOME FALLACIES OF LOAD-FACTOR.

Load-Factor as Affecting Company and Municipal Owned Undertakings—Economic Considerations of Water Heating—Peak Load and Lighting—Domestic Appliances—Advantages of Bulk Supply.

By EDWARD V. CLARK, B.Sc., M.Inst.C.E., A.M.I.E.E.

MUCH has been written concerning the cost of electricity, and the importance of load-factor has been greatly stressed. It is well to remember, however, that load-factor is merely a means to an end, and that if the requirements of cheap electricity for those purposes for which it is most needed can best be attained by working on other lines, the matter of load-factor may be left to look after itself.

In England, electricity supply is largely in the hands of municipalities; and, as pointed out in a previous article*, the points of view of municipalities and companies are widely different. To the company, the profit and loss account and balance sheet are all important. The municipal undertaking considers more the statistical figures, and loves to see low running costs, low figures for the average revenue per unit, and a good position upon the comparative tables generally.

It is probably this that has given such undue prominence to load-factor, so that Dr. S. Parker Smith in the discussion upon Mr. Townend's recent paper before the I.E.E. begins: "To my mind the interesting point in connection with this paper is that improvement in modes of generation does not really seem to be the best solution to make cheap electricity a possibility. Probably improvement of load-factor by better utilisation has much more significance from that point of view." That better load-factors will permit of lower average costs of electricity is unquestionable; but that they will necessarily permit of lower selling rates for electricity for those purposes for which it is now chiefly used is open to considerable question.

An Example.

A supply station has an annual load-factor, let us say, of 25%. It sells so many units for domestic lighting at 6d. per unit, so many for heating and cooking at 1d., so many for industrial power at 1½d., and so on. Its plant is capable of supplying additional units up to 300% of its present sales with the same peak load at an additional cost of, say, 0·35d. per unit, this figure covering not only the extra cost of generation, but also cost of collecting the revenue from such sales, and all other charges directly due to the supply of the extra units.

If any such additional units can be sold at a price of 0·375d. per unit, without adding to the station or feeder peak loads, there is a small profit made upon them. But even should the load-factor be raised to 100%, the average reduction in price of electricity for other purposes could not exceed 0·075d. per unit, to give the same nett return on capital. If these additional units can only be sold at 0·35d., a load-factor of 100% will not allow of any reduction whatever in prices for other purposes; while any lower price must result either in an increase in tariff for some other purpose, or else a poorer financial return.

Nevertheless, a municipal undertaking that could dispose of these additional units at 0·325d. might well consider the business desirable, since it would at once be placed at the head of all public supply stations in the kingdom for load-factor and average price per unit, and probably very well up in average cost per unit and in coal consumption; while any small increase in other rates not exceeding an average of 0·075d. per unit might readily be attributed to rise in cost of coal, or in wages, or as being necessary to maintain ample reserves against obsolescence in view of the rapid growth of the load.

This is, of course, quite elementary. Its application lies in two facts. Firstly, that though it is readily seen that any additional units which improve the load-factor without increasing the plant capacity may be sold at a low figure, it is not easy to arrive at the actual cost; and, secondly, that unless definitely controlled it is exceedingly difficult to ensure that any large amount of new load shall not increase, directly or indirectly, the capital charges of the undertaking.

From these considerations, it naturally follows that in general, companies are much less interested in load-factor as such, than are municipal undertakings. The former must regard any new business upon its merits. If supplied at a rate that will clearly return appreciable profit, it is desirable. But if the rate that can be obtained is too close to the estimated cost, the business had better be turned down as involving risk of loss, and holding little hope of substantial profit.

Load-Factor of 100%.

Figures, however rough, may help to make this clear. Consider an undertaking with load-factor of 25 %, generating costs 0·6d. per unit, overhead charges, etc., other than capital, 0·3d., and average revenue 2d. per unit, all figures based on units generated. Units per kW of peak load are 2 190, realising £18·25 per annum. Costs at 0·9d. amount to £8·2, leaving a margin of £10·05 to meet capital charges on each kW of peak load.

Suppose, now, that the undertaking can bring the load-factor up to the neighbourhood of 100%, without increasing the peak load or the capital expenditure, by the sale of all surplus units at 0·375d. per unit, the extra cost entailed by their generation and sale being 0·35d. per unit. Extra units sold per kW are about 6 000, bringing in an extra £9·4, at a cost of £8·75, thus giving an extra profit per kW of peak load of £0·65. Comparative figures with the same capital are:—

WITH LOAD-FACTOR 25%.—Revenue, £18·25; costs, £8·2; surplus to meet capital charges, £10·05.

WITH LOAD-FACTOR 100%.—Revenue, £27·65; costs, £16·95; surplus to meet capital charges, £10·7.

Thus there is an increase in revenue of 50%, in expenditure of 100%, and in surplus of only 6½%.

Were these figures absolutely reliable, and conditions unchanging, the extra load would be desirable; but with the unsteady conditions normally prevailing, a business man may well say that the extra profit is not commensurate with the risk entailed. A 10% increase in costs due to rise in price of fuel, would make the new conditions poorer than the old, as would an increase of 7% in capital expenditure, entailed perhaps by the need for increase of standby plant with the high load-factor.

These figures are based upon the load-factor being brought close up to 100%. Any smaller sale of off-peak electricity at this price will have correspondingly smaller effect upon gross revenue, costs, and surplus; but the same fact still holds, that the increase of surplus is very small compared with the increase in expenditure.

Load Factor of 40%.

But suppose it is decided that, load-factor being of minor importance and sale of electricity whether by-product or otherwise at rates to show adequate profit being the object of the undertaking, electricity for night water heating shall be offered at 0·5d. instead of at 0·375d. per unit; and suppose also that with this higher tariff only one-fifth of the possible business is secured. There will now be sold 1 200 extra units per kW, which at 0·5d. bring in £2·5. Their cost, at 0·35d., is £1·75, and we have total revenue, £20·75; costs, £9·95; surplus, £10·8.

Thus, the surplus is greater for this load factor of about 40%, than for the former load-factor of almost 100%, while the comparative figures with the station before securing the heating load are: Revenue, increased by 14%, costs by 21%, and surplus by 7½%. The margin against increase in fuel costs is much greater; while the moderate load-factor means that the extra units sold for water heating may be kept well away from the peak loading, so that risk, either of increase in peak load or of station plant to carry it, will be very small.

Electricity for water heating conforms with all other commodities, in that *caeteris paribus* the demand depends upon the price. The assumption that at 0·5d. per unit one could obtain at least one-fifth of the business procurable at 0·375d. seems reasonable. The general conclusion to be drawn is that one has more prospect of being able to reduce the tariff for other supplies of electricity if one sells energy for water heating at a price to show reasonable profit, and is content with a moderate load-factor, than if one cuts the price of such energy to a figure which gives hopes of bringing the load-factor to the neighbourhood of 100%.

* THE ELECTRICIAN, Vol. XCIX., page 745.

Digitized by Google

It may be said that it is better for the community that electricity for water heating shall be sold at 0·375d. than at 0·5d. This, however, is open to question. Some hot water is a necessity in every household. A large supply is a luxury. Where hot water costs trouble as well as money to procure, it will be used sparingly. Where it is on tap, it will be used more freely. Whether it is best that a section of the community shall pay £9·4, and invariably indulge in hot baths; or £2·5, and have four cold baths to one hot one; or pay nothing and always have cold baths, it is outside the province of the engineer to decide. This matter is only referred to, because of the frequent assumption that reduced prices of commodities are necessarily beneficial to the community, irrespective of whether they are necessities or luxuries.

Importance of Diversity Factor.

There is a fundamental fallacy in the idea that electricity for water heating can be supplied at the lowest price to a consumer who brings his load-factor nearly to 100%, as by providing automatic switches which cut in heater elements as lamps, etc., are cut out; and this lies in ignoring the importance of diversity factor. Actual figures are hard to arrive at; but the diversity factor between domestic lighting consumers must be quite appreciable, apart entirely from any other apparatus they may use. The magnitude of the diversity factor, considering domestic lighting only, will depend upon the variability of the consumers' ways of living; and by considering the different hours and magnitudes of the daily peaks in a single house, it seems safe to say that the diversity factor of a number of houses of the same class will be at least 1·5; and probably from 2 to 2·5 where houses of very different kinds are supplied, these figures being based not on very occasional peaks, caused by abnormal domestic festivities, but upon the normal peak such as would be adopted as appropriate in any attempt to bring the load-factor of lighting plus water heating up to nearly 100% in a particular house. One is probably erring on the side of conservatism, then, if one assumes that those houses which would adopt water heating have a diversity factor *inter se* in their lighting loads of 1·5.

The effect of diversity factor is best considered by regarding it as producing a virtual reduction of individual peak loads. A thousand consumers, each averaging a peak load of 600 W, with a diversity factor as regards station and distribution of 1·5, will combine to put a peak load of 400 kW upon the system; and the capital charges of the undertaking are adequately met if each consumer is assessed as contributing 400 W to the peak load, due to his lighting.

If, however, his load-factor is brought up to something near 100%, evidently this consumer can contribute nothing to diversity factor; and hence must be assessed with the capital charges on 600 W, 400 W being attributable to lighting, and the rest to water heating. The latter is, therefore, by no means an entire by-product, and hence cannot be supplied at the lowest by-product rates.

This is the most favourable case, where the station peak occurs during the evening, being mainly due to domestic lighting. In many systems nowadays, the maximum peak occurs at about 4.30 p.m., during winter afternoons, and is due to the growing lighting load—especially shop, office, factory, and street—upon the waning industrial power load.

The diversity factor of domestic lighting being still 1·5 *inter se*, it is, nevertheless, much greater with respect to the peak upon the station, and is probably of the order of 3 at least. That is to say, 1 000 houses each with a peak load averaging 600 W, will combine to produce a joint load of 400 kW at about 7.30 p.m., when the station load is well past its peak, but will only give a joint load of 200 kW at 4.30 p.m., when the station peak is at its height.

The hour of station peak will not in general affect the tariff for lighting; for this being intrinsically the most valuable use of electricity, it will naturally carry the whole of the capital charges upon its combined peak, industrial power being still regarded as a partial by-product. But, despite this, the water heating load on a typical house means that an extra 400 W is added to the station peak, and something between 400 and 200 W to the peak on its section of the distribution system; and current for water heating will be supplied at a loss if these capital charges are ignored.

On the other hand, if, ignoring load-factor and concentrating on diversity factor, one arranges to supply electricity for water heating by means of a time switch, one may readily ensure that the peak load is not increased, and hence supply these extra units at a price which includes nothing for capital charges, other than on the time switch itself.

A house with a peak lighting load of 600 W, if bringing its load-factor to nearly 100%, by means of water heating, would use about 4 800 units per annum, with elements rated at 600 W. If operating upon a time switch, and relying upon night heating, its heater elements will be rated at about 1 700 W, to give the same supply of hot water, and the load-factor of the house will be about 30% only; and this arrangement will give appreciably more profit at the same rates for lighting and water heating.

There is a theoretical blemish on this method of supplying cheap current for water heating, in that if enough consumers adopt it one might find that the peak load upon the station or on sections of the distribution system occurred at about midnight, being attributable directly to the water heating. This possibility is, however, very remote in any ordinary undertaking; and should these conditions be imminent, the fact will be quite evident to the engineers, who will naturally relax their canvassing for this type of load.

In this discussion, no consideration has been paid so far to other domestic appliances—toasters, irons, and radiators—but these affect the problem only to a minor extent. Where water heating is carried out by means of automatic change-over switches, the elements are naturally arranged to be cut out whenever domestic power is used in quantity. The load-factor of the consumer will be appreciably below 100%, since the peak load will occur when one or two radiators are used at times of lighting load, and a water heater to keep the load constant at this level will be far too costly for the ordinary household.

The appropriate charge for water heating, however, will be slightly less than where other power is not used, since the lighting load plus water heating load will not necessarily be 600 W in the typical house at time of station peak. It would appear, nevertheless, that the reduction will be trivial; though one cannot arrive at any estimate without sundry assumptions concerning the use of these auxiliary appliances. Where water heating is limited to the night hours, the use by the consumer of other apparatus makes no difference to the appropriate charge.

"Change-Circuit" System.

The "change-circuit" system of water heating aims at raising the load-factor of each distributing transformer to the neighbourhood of 100%; and the extent to which it will suffer from the defects of attempts to bring the load-factors of individual consumers up to 100% will depend very largely upon the nature of the area being supplied, since this system takes duly into account the diversity factor of all premises connected to the one transformer, but disregards that between different transformers. It will be at its best where each transformer supplies a composite area which is typical in miniature of the whole area of supply, giving current to shops, houses of various types, and industrial loads as well. It will be at its worst in the case of a model city built in accordance with one of the many town planning fads, with one area set apart for shops, another for factories, another for small houses, and another for large. But, in any case, and particularly if the industrial load in the district is large, one may predict that before the "change-circuit" system has developed very much, it will be found desirable to incorporate some form of clock mechanism controlling the voltage of the "change-circuit," in conjunction with the current control, to ensure that transformers supplying what are essentially domestic loads shall not maintain their full output during the hours when the industrial loading is at its height.

Hitherto, most supply undertakings have been self-contained, comprising both generation and distribution. The difficulty in assessing the cost of a particular supply of electricity, no matter for what purpose, has been great, since the division of total costs into standing charges and running costs is at best but an approximation, and capital charges increase in jumps as each extension of plant takes place, without any direct connection with the peak load. But, in future, when bulk supplies become general, and the tariff for such supplies is known in advance, the position will become much clearer.

With a definite two-part tariff of £x per kW or kVA, plus y*d.* per unit, no matter whether x and y are constant or upon a sliding scale, the engineer in charge of a distribution system will be in a better position to realise what each supply he gives is costing him; and hence one may surmise that diversity factor will receive much more direct consideration than hitherto.

TRANSFORMER BREAKDOWNS.

Shorts Between Turns—D.C.C. Conductors—Effects of External Faults—Core Type Transformers—Excessive Overloads and Internal Cooling Facilities—Eddy Currents.

AT a meeting of the London Local Technical Group of the Electrical Power Engineers' Association on December 11th, Mr. S. Austen Stigant read a paper on "Transformer Breakdowns." Mr. W. J. Oswald presided.

The faults that most frequently occur in practice were classified by Mr. Stigant as follows, although he pointed out that they often react one upon another:—(1) breakdowns in the electrical conducting circuit, i.e., in the coils and minor insulation; (2) breakdowns in the magnetic circuit, i.e., in the cores, yokes and adjacent clamping structure; (3) breakdowns in the dielectric circuit, i.e., in the oil and major insulation.

Breakdowns in the electrical conducting circuit are due mainly to (*a*) local short circuits between turns of the windings; (*b*) short circuits external to the transformer; (*c*) transient voltage waves due to switching, lightning or external faults; and (*d*) overloads.

Reasons for Breakdown.

A study of the records of modern transformer breakdowns over a period of years, he said, shows conclusively that between 70 and 80% of them are due finally to a short circuit between turns. Short circuits between turns may result from abrasion of the insulation caused by the dislodging of, or shock to, one or more turns consequent upon an external short circuit or upon repeated unfavourable switching-in operations. In each of these cases large currents momentarily circulate in the windings, and as they produce large forces between the conductors, there is always the risk of considerable mechanical stress to the insulation. In certain cases this may not become apparent immediately, but should the transformer vibrate while on load, due to looseness of the core plates, core bolts, or core clamping structure, the insulation will ultimately break down.

Short circuits between turns may also occur if the copper conductors have sharp edges which chafe the insulation should the transformer vibrate on load, so bringing the copper conductors into contact. It is usual, of course, for the conductors to have rounded edges, but occasionally sharp or abraded edges pass unnoticed.

Another possible source of danger is in the use of square conductors on which the double cotton covering has not been wrapped tightly. If the covering is loosely applied, the wire appears almost round, and during winding of the coils may become twisted, so that at one or more points adjacent turns may be lying edge to edge or face to edge instead of face to face. Should the transformer vibrate on load, or receive (as it often does) severe mechanical shocks during transit, then the insulation becomes chafed at the edge to edge point, and ultimately wears through. The danger is accentuated if there is a considerable weight of coils above the location of the winding fault. Imperfect impregnation of the coils and the introduction of moisture into the insulating fabric are also responsible for short circuits between turns.

The effect of short circuits external to the transformer is to produce enormous mechanical forces in the transformer windings. These large mechanical forces are produced as a result of the heavy currents that flow under short circuit conditions, and which are inversely proportional to the impedance of the transformer plus that of the rest of the circuit up to the fault.

In core type transformers, in which the centres of the h.t. and l.t. coils coincide, the mechanical stress acts in a radial direction, and usually, if the transformer is in good condition, the conductors themselves are sufficiently strong to resist the bursting tendency set up under short circuit conditions. If, however, the centres of the h.t. and l.t. coils do not coincide, an axial component of the stress is introduced which has the effect of forcing the conductors upwards and downwards in an axial direction. This tendency must be combated by providing rigid supports for the windings in an axial direction.

In transformers with sandwiched windings the mechanical forces are normally set in a radial direction, and horizontally between high and low tension coils, while if the centres of the h.t. and l.t. coils do not coincide, distorting forces are introduced. The older designs of transformers were built with a very low impedance, of the order of 1½ to 2%, so that with a dead short circuit on the secondary side of such transformers the short circuit current would be from 67 to 50 times the normal full load current, while the mechanical forces would be 4 500 to 2 500 times those existing under normal service conditions. Nowadays the impedance averages from 3½ to 6%, according to the size of transformer and the system; in large transformers of thousands of kVA's it is not less than from 8 to 12%.

Breakdowns due to transient voltage waves were then discussed, and diagrams were also exhibited to illustrate how the reflected and transmitted wave phenomena is modified by the insertion of a protective condenser or a protective choke coil placed before the transformer. They showed steps in the progress of the transmission and reflection of finite rectangular electric waves travelling from an overhead line to a transformer past a protective condenser shunted at the transition point, and past a protective choke coil in series with the overhead line and transformer. The fronts and backs of the transmitted waves were much more sloping than if no protective device were inserted, and consequently the stress on the transformer insulation was very much reduced.

So far as the transmitted waves were concerned, there was no difference whatever between the characteristics of the choke coil and the condenser as protective devices, the only difference being in the signs of the reflected waves. As a result of the appreciation of the concentration of pressure, the end turns of transformer windings are usually reinforced from an insulation standpoint. Generally speaking, the end turns mainly are subject to these high transient pressures, and then only for extremely short periods of time, but cases have been known where transient pressure waves have penetrated the windings, being reflected at open ended tappings, so causing a breakdown of the insulation at those tappings.

With regard to overloads, the author said that continuous excessive overloads always result in complete breakdown sooner or later. The general characteristic of such breakdowns is the charring and carbonisation of the insulating fabric and the formation of hydrocarbon sludge deposits from the oil. The question of overload is intimately connected with the proper design of the internal cooling facilities (the oil ducts, etc.), and a case is on record of a transformer which, being badly designed from this point of view, burned itself out, even though subjected to quite a small overload for only a short period of time. In the case of a complete burn-out due to continuous heavy overloads there is the added danger that the magnetic circuit may be so badly damaged as to need replacing or at least entirely dismantling, re-insulating and re-building. Photographs were shown of a 3-phase, 125 kVA, core type transformer, the low tension winding of which was burned out, due to the employment of unskilled labour when drying out the transformer on site. The man employed had switched on an excessive drying-out current and had left the transformer for several hours.

Insulation of Bolts.

Discussing breakdowns in the magnetic circuit, Mr. Stigant referred to the breakdown of the insulation of the bolts inserted through the core of core-type transformers for the purpose of clamping the laminations together. This type of fault has the effect of short circuiting the laminations themselves, producing in them local eddy currents; if, in addition, two or more of the core bolts break down, heavy currents circulate in the bolts themselves, as they form a short circuited turn through which magnetic flux passes. The path formed by the bolts and the thick outer clamping plates is one of low impedance, and the amount of heat generated in breakdowns of this type is sometimes sufficient to distort the whole core to a very considerable extent. Occasionally it may happen that the thin layer of insulation on each separate plate for the purpose of reducing eddy currents deteriorates, with the result that the whole core structure becomes semi-solid. This also produces very heavy eddy currents and a large amount of heat, with the same distorting effects as in the case of a breakdown of the core bolt insulation. Again, if the core bolts are not tightened and locked efficiently, they will in time become slack and vibrate when the transformer is on load. This tends to weaken the insulation round the bolts, and will in time lead to breakdown.

Dealing with breakdowns due to magnetic circuit character-

Digitized by Google

istics, Mr. Stigant discussed the switching-in current rush, which is dependent mainly on the point of the pressure wave at which the transformer is switched in. If the transformer is switched in at the instant when the voltage is passing through zero, the maximum current rush is obtained. Under certain conditions it is theoretically possible to switch a transformer in at the instant of zero voltage without any current rush occurring; i.e., if the core possesses residual magnetism equal to and of the same polarity as the normal induction, the initial flux waves will follow their normal course and there will be no current rush. If, however, the residual magnetism in the core is less than the normal maximum, a transient component of the flux is introduced and the initial flux waves are unsymmetrical about the zero axis, and a corresponding current rush occurs. If the transformer is switched in when the voltage is at its maximum value, the flux would normally be zero, and therefore, with no initial flux in the core, there would be no current rush whatever; the current taken would be the usual small magnetising current, which is of the order of from 5 to 10% of the normal full load current. If there is any remanent magnetism in the core, the current rush is diminished or augmented, according to the relative polarity of the remanent magnetism and that resulting from the applied voltage.

The current rush may, under unfavourable conditions, produce relative movement of adjacent turns in the windings, which again may chafe or flake off the insulation round the conductors and cause a short circuit between turns. Transient switching-in current rushes may be minimised by switching the transformer in through buffer resistances which are connected to auxiliary contacts on the main switch. There is no real need to equip switches with these resistances indiscriminately, but where trouble is experienced with switching-in their use may be justified.

BOOK REVIEWS.

Alkaline Accumulators. By J. T. CRENNEL and F. M. LEA. (London: Longmans Green and Co.) Pp. x+132. Price 10s. 6d. net.

The authors are to be congratulated on having compiled the first comprehensive treatise on the chemistry of the iron nickel and iron cadmium cell (not alkali cells in general), a treatise of a historical and technical chemical nature with copious references to previous investigations on the subject.

Chemically (Chapters 3 and 6) the reactions expressed may be taken as satisfying to the chemist and scientist, also to the manufacturing chemist, as to the preparation of flake nickel, etc. The references to maintenance, however, hardly go beyond "makers' instructions," and there are unfortunately cases of importance which the authors have left in the "air." For instance, under "renewal of electrolyte," page 69, it is stated that "less lithium is used because during the working of the cell this becomes bound *in some way* with the active material of the positive plate, and the concentration of the lithium in the electrolyte is thus normally lower than in the new electrolyte." This, it would seem, indicates that the plates are not fully formed until they have been in service for some time, and absorbed some of the excess of lithium from the electrolyte; this is not very convincing, although Foerster's explanation as quoted may be accepted, even if not fully confirmed by analysis. Further on—the same subject, page 103—it would seem that the electrolyte is changed because the excess of lithium is exhausted, as it undoubtedly is *together with the potassium* as carbonate.

Again, on page 104, "qualitatively, its (carbonate) presence is stated to cause a loss of capacity and a decline in voltage; the evidence, however, is not very definite." Carbonate, to the battery man, is the "bête noire" of the alkali cell, involving, as it does, the complete change of electrolyte yearly, a costly item, and one frequently involving difficulties if the battery has to be put out of commission for the purpose; and, of course, the percentages of lithium and potassium carbonate in an exhausted electrolyte have been well established.

An investigation as to permissible impurities in the electrolyte would have been of great value, not only as to capacity and life, but also commercially, as there is an enormous difference in price between commercial and the various more or less purified forms of the article; there is also the presence of the hydrated oxides of iron (ferrous and ferric) found in suspension, and it is interesting also to see that distilled water is convicted as a guilty party in the contamination by carbonate.

An evidently studied and successful effort has been made by the authors to hold the scales evenly between lead acid and iron nickel, etc., alkali cells (lead hydrate are not referred to), but in the iron nickel cell the generation of heat involving even incandescence of the plate if not completely covered with electrolyte and the renewal of electrolyte annually in both the iron nickel and iron cadmium might have been placed in the correct pan of the scale; also, although costs have not been specifically dealt with, it must be remembered that the balance sheet is the *cost per annum*, and this involves not only the cost price divided by the number of years' life, but also interest on outlay.

The appendices are useful and interesting, but would not show such great differences in weight had it been pointed out therein that in making the comparison it is the weight per cell multiplied by the number of cells, for the required voltage, which gives the weight of the battery.

Whilst realising the scientific, technical, and comprehensive nature of the work, it is a matter of regret that the investigations made do not lead to any new conclusions as to maintenance. It is to be hoped that the authors may feel justified in continuing the subject with this point more especially in view.

L. W. DE GRAVE.

Grundlagen der Wechselstromtheorie. By Dr. P. B. ARTHUR LINKER, Hanover. (Berlin: Georg Stilke). Pp. 245. Price 16 Reichmarks.

This is yet one more German publication on the theory and application of alternating currents. The work is divided into four sections, the first of which commences with the Faraday–Maxwell formula for the generation of a volt. This is illustrated in the conventional way by means of a closed loop rotating in a two-pole field. This is followed by an illustration of a sinusoidal sine wave, and the projection of the latter on to a circle which, by means of vectors, shows the derivation of the formula $. - y = \sin . \phi$; where y is any ordinate and ϕ the angle which the coil makes with the horizontal line. This is mentioned to show how thorough is the commencement of this work. Other parts of the first section deals with polyphase currents, lead, lag and phase angle, etc. An interesting portion of this section is that dealing with the mutual effect of inductance and capacity, and the effect of resonance on current. The second section deals with star and delta connections and their relative values; current values in unbalanced systems with star-star and star-delta connections are clearly shown by means of vectors. The third section deals entirely with vectors, their addition, subtraction, multiplication, division, differentiation, integration and inversion. Various phases of the circle diagram are also given. The last section is devoted almost entirely to considerations of circuits containing inductance, capacity and resistance. Many examples are worked and the derivation of formula is given. The mathematics in this section are extremely intricate and difficult to follow. It would be very difficult to say for what purpose this book would be used. It commences, as I have shown, with matter taught to second year electrical engineer students in our technical schools, and it ends with matter of a standard rarely attained outside a University. The work would, perhaps, be more valuable if it were supplemented with the application of its contents to the essentials of the design of electrical machinery. At the end of the work is an excellent reference to the equivalents used in formula, and an excellent index completes the work.

MARINE ELECTRICITY—FURTHER PROGRESS.

The Increasing Attention of the Shipping World towards Electricity for Propulsive and for Auxiliary Purposes is Reflected in Recent Developments and Contracts—The Lesson of the "Celtic."

By A. C. HARDY, B.Sc., A.M.I.Mar.E. (Author of "Merchant Ships Types," etc.)

IT is gratifying for those interested in marine electricity to note that whereas even two years ago, an electrically-propelled ship was regarded as a somewhat rare specimen, orders are being placed fairly frequently to-day for such ships. It is customary always to suggest that America is the home of marine electricity. This is a platitude which close examination shows to be justified on only two counts. The first is that electricity is being applied in America to some spectacular ships (i.e., to ships of the large liner type which necessarily attract notice). The second is that the large number of harbour and shallow water craft so necessary to American domestic navigation are, in many cases, essentially adaptable to electric propulsion.

Conditions in Europe.

In Europe, and particularly in Great Britain, we have fewer harbour craft of the ferryboat type and even our tugs have less broad duties to perform, when contrasted with the myriad duties that a New York harbour tug carries out. And, in order further to kill our platitude, we may mention that the proportion of electrically-propelled tugs in the big American harbours, in proportion to the total number of all propulsive types, is not high. There are some large well-equipped railway-owned vessels, and these have naturally attracted a great deal of attention.

America is a fruitful, or rather a potentially fruitful, source for the man who is marketing electric propulsion by reason of the fact that the marine world in America is definitely receptive to the electrical idea. The marine electrical firms, too, are in that country very closely in touch with the shipping interests.

Signs are not wanting, however, that a similar state of affairs is rapidly coming into being in Europe. The trials of the big P. and O. ship "Viceroy of India," will unquestionably rivet the attention of the shipping world upon electrical propulsion. In many ways the "Viceroy of India" will attract more attention in this country than the recently completed electric tanker "Brunswick," because the latter being an American ship, will not have such a personal contact with British ports. She has, it may be mentioned, proved remarkably successful in operation.

It is, perhaps, significant of the more general acceptance which is being given to electrically-propelled ships in this country that in very few cases was the "Brunswick" hailed as anything out of the ordinary.

Also we may recall that there is at present building in a European shipyard an electrically-propelled ship which is of epoch making importance. This ship is being constructed at Trieste for the Italian State Railways for their service across the Straits of Messina between Messina and Reggio. She is important because she is the first large electrically propelled railroad (as contrasted with vehicular) ferryboat, and because, dimensionally, she will be comparable with a series of direct Diesel driven ferries in various parts of the world—on the Parana River and on the Danish main line route between Esbjerg and Copenhagen.

This electrically-propelled ferry is a large ship—of more than 4 000 tons load displacement. She has a length of 362 ft., a beam of 55·5 ft., and a draught of 12·4 ft. A loaded service speed of 15½ knots is to be given by twin screw electric propulsion, each propeller being driven by a 2 250 H.P. electric motor. The motors take current from three generator sets, each driven by a 2 000 H.P. four-cycle single Burmeister and Wain Diesel engine. Each of these engines, of course, drives a generator and an exciter, which arrangement enables power to be obtained for auxiliary purposes—lighting, steering, etc. For port use there is a standby generating set driven by a 250 H.P. engine.

What are the advantages of such an electric ship? In the first place, standby losses, when the ship is tied up in her slip at either end, are almost eliminated. In the second place, maximum manœuvrability is secured and a fine range of propeller revolutions made possible by the electrical controls. This is always possible with electrical ships. I have seen the pilots of New York electrical ferryboats handling their ships just as a tram driver handles his vehicle in a traffic jam. The *sine qua non* for such a service is, of course, an engine of maximum reliability to drive your generator. The majority of Diesel engines give this service.

To American shipping we can turn again for the moment for an example, the only example in existence, as it happens, although it will soon be followed by two sister ships—of an electrically-propelled cargo vessel of 10 000 tons deadweight and of the shelter deck type. This is the "Courageous" of the U.S. Shipping Board. She has recently been converted from steam power to all-electric power. This fact, coupled with the fact that the bow portion of the vessel has been lengthened and remodelled and the stern redesigned and rebuilt, has caused a great deal of interest to be displayed in the conversion work.

Now, it is beginning to become an accepted fact that while electricity is to-day a necessity on all ships, except tankers, for auxiliary purposes, there are certain ships to which it does not specially lend itself for main propulsion. The ordinary freight-carrying ship is one of such ships. Her auxiliary load is not high, and there are perfectly suitable prime movers—both steam and Diesel—which make direct propulsion a more economical proposition. Where high auxiliary loads are the rule and where it is desired to apply the economies of the Diesel engine to total powers of above about 27 000 H.P., then electrical powering is a necessity.

There has, therefore, been levelled against this latest Shipping Board conversion a good deal of criticism—on grounds of first cost, and on grounds of impracticability. Because, at face value, both criticisms are justified, it is not without interest to mention two contributory causes to the scheme adopted. Marine electrical engineers will regard it as a good testimonial to the type of prime mover they are marketing, that Mr. Wm. Francis Gibbs (naval architect in charge of the work) considered the electric motor as the most suitable form of prime mover to turn at the necessarily slow r.p.m. the single propeller used in conjunction with the redesigned stem.

The required r.p.m. were between 70 and 80 and the propeller shaft is driven by a double armature motor of about 4 000 H.P. The speed of the ship, as converted, it should be mentioned, is in the neighbourhood of 13½ knots loaded. This increase from 11 knots has been made possible by the structural (hull) alterations, and on that count the money spent is justified. The motor, it may be noted, is located in the main engine room, and not aft in the hold with the consequent elimination of the shaft tunnel.

Cargo Space.

It is found that the elimination of the shaft tunnel in electrically propelled ships does not, as was at first anticipated, contribute greatly to the cargo carrying space. Also the inconvenience of having the motor room isolated from the generator room and only accessible the one to the other by means of a walk along deck is, in times of bad weather, considerable. This, I have always understood, was especially found to be the case on the United Fruit Co.'s "La Playa," the first large Diesel-electric ship built in Great Britain.

It was considered also that the adoption of electric drive in the "Courageous," would enable the manufacturers of the main engines to mass-produce twelve units (four per ship for three ships) instead of unit-producing three units of big long stroke type. The cost of doing this in America is almost prohibitive.

So that, first and last, it should be realised that these Shipping Board electric conversions are special cases, although classical cases in their way. In line with modern practice, of course, their auxiliary deck machinery has been electrified also. This latter point is one with many advantages. Quickness and deftness of cargo handling left aside, another great advantage accruing from electricity for deck auxiliary purposes was sharply outlined by the recent fatal stranding of the White Star liner "Celtic." The engine room was flooded, which naturally left the ship without power. Before power could again be applied to the ship's winches to discharge cargo

Digitized by Google

over the side of the stranded hull into coasters, big boilers had to be transported from Liverpool in salvage ships, laboriously hauled on board and fired. Emergency oil engine generator sets on deck high above the water line would have enabled power to be transferred to the winch circuits, and cargo discharge to begin as soon as the coasters were ready.

This is a ready illustration of the ubiquity of marine electricity, as well as of its flexibility. It seems unquestionable that within the next few years, all but the cheapest and most conservative of ships will have electric deck auxiliaries, and many of them probably electrical steering too. Apropos of which it was gratifying to note that Sir Alan Anderson, chairman of the Orient line, trading between London and Australia via Suez, was warm in his praises of electricity for auxiliary purposes at the recent annual meeting of the company. He stated that his company had always sensed its possibilities, and, incidentally, they were among the first to use electricity for actually steering ships.

Since I contributed my last review of marine electrical progress, definite confirmation has been made of the fact that the new White Star mammoth will be electrically propelled, the ordering by Grace Lines of a ship for the South American service, the building of a big electric train ferry for Italy, and the approaching completion of the " Viceroy of India," . . . all these facts tend to show that marine electricity has passed beyond the embryo stage. These further notes show, in general terms, something of the far reaching effects of this development. Marine electricity is a new industry with great potentialities.

HIRE AND HIRE-PURCHASE.

Interesting Discussion at E.D.A. Conference—Better to Sell Than Hire Domestic Appliances—Extensive Business Done in Beckenham—Importance of Maintenance.

THE discussion at the London E.D.A. Conference on December 21st, related to hire and hire-purchase in electrical development schemes, a paper on the subject being presented by Mr. J. E. Tapper. Mr. A. C. Cramb presided.

Mr. Tapper said that with the exception of such apparatus as water heaters and cookers, it was better to sell, by cash or hire-purchase, than to hire domestic electrical appliances. In Beckenham 3 200 irons had been put out among 6 200 consumers without the necessity for hire, and when it was realised that on an average of three hours' use per week, these consumed 250 000 kWh a year, it was obvious that the business should be secured by any means.

Hire-purchase had become such a recognised method of purchasing that we were more or less driven to it. A man who had bought a new house and new furniture on the deferred payment system generally found that after he had paid his deposits and lawyers' fees he could hardly afford electrical fittings even of the plainest possible type. The electricity supply authority could not permit a brand new house, with brand new furniture, to be ruined by the fixing of hideous plain pendants and opal shades, nor would the authority's canvasser fail to draw attention to the advantages of electricity for heating, the use of a vacuum cleaner, a floor polisher and a refrigerator. It was quite beyond the capacity of the consumer to purchase outright, and the only way to secure the business was for the supply authority to assist. Whatever one's views as to the ethics of this method of conducting business, there was not the least doubt that it assisted in selling electrical goods and units. If no deposit, or only a very small one, was asked for in respect of goods sold on hire-purchase there was danger of the goods being returned considerably the worse for wear, having been kept probably only three or four months, with only an insignificant amount paid thereon. In the case of such goods as vacuum cleaners, he did not enter into a hire-purchase agreement, but dealt with the transaction as a definite sale, allowing the consumer to pay by instalments over an agreed period. This was best described as a " deferred payment " system. Whilst the authority could exercise discretion as to the acceptance of the return of goods, this method enabled them to refuse the return of badly used apparatus and to sue the purchaser for payment in full.

The Discussion.

The CHAIRMAN said his experience was that when consumers hired apparatus they did not take care of it.

Mr. BRYANT submitted that the present method of charging for the hire of cookers and for energy consumed was wrong. Hire rates were cut to a low figure and the supply authority hoped to recoup itself by the surplus on the sale of energy. In a fairly representative case a standard size cooker would rent at 10s. per quarter and energy would be sold at 1d. After making due allowance for overhead charges and maintenance, that boiled down to about 0·6d. per unit for energy. It would be more satisfactory to charge 0·6d. for energy and to increase the hire charge, perhaps to £1 per quarter. That might hold up the cooker business to an extent, but he believed the present position of the industry to be strong enough to enable such an arrangement to be adopted ; when the consumers appreciated the benefits of the lower price of energy, the cooker business would progress more quickly than ever before. The present system introduced a gambling element, for if the consumer did not use the amount of energy anticipated, the supply authority lost, but if more energy were used, the consumer paid through the nose.

Mr. J. LEADBEATER pointed out that if a cooker had been hired for a year and was thrown back on to the hands of the supply authority, difficulties arose, because no one wanted a second-hand cooker. He had found it advantageous to introduce a free maintenance scheme, even for cookers on hire-purchase, for a period of, say, three years. In fixing a price for hire, many engineers debited the revenue from the consumer first with the cost of maintenance and interest charges, and took what was left for energy, but he considered it was more correct to debit the consumer with the cost of the units first, and see what was left over for maintenance and interest.

Attractive Tariffs.

Mr. F. SELLEY said that in regard to hire and hire-purchase, the electrical industry could not do better than follow the lead of its competitors, who installed apparatus either on hire or hire-purchase and had built up a big business thereby The first essential to a successful hire and hire-purchase scheme was an attractive tariff.

Mr. L. E. BUCKELL urged the importance of maintenance of apparatus, whether hired, bought by hire-purchase, or bought for cash.

Mr. MORTON said that the trader was well advised to push hire-purchase sales, because that was often the only means of getting cash. Hire-purchase, coupled with good selling methods, produced business.

Mr. W. RITCHIE saw no reason why a supply authority should take the responsibility of third party risk in respect of hired apparatus ; surely it could safeguard itself in its agreements. The initial payment on hire-purchase apparatus should on no account be less than the amount of the salesman's commission ; the period of repayment should be within a year, if possible, because that was the guarantee period, and the supply authority was relieved of maintenance.

Lieut.-Col. W. A. VIGNOLES, drawing attention to the immense business that could be done by means of hire and hire-purchase schemes, said that between 1925 and 1928 the rate of increase of consumers connected and of units sold in Beckenham was greater than in the previous years, and that increase in the latter years had coincided exactly with the adoption of hire-purchase.

The CHAIRMAN deprecated the smug satisfaction of some electrical people who held that electricity would sell itself ; that view, he said, was perfectly ridiculous. If supply authorities had not an outside staff, it was time they handed over the electricity supply to someone else. He emphasised the value of proper service, particularly in regard to cookers. At his works a man was on duty until 1 o'clock on Sundays, ready to go out at once on receipt of a telephone message that a breakdown of a cooker had occurred. In the afternoon the mains department took over that work.

Mr. TAPPER, in his reply, said he did not consider it advisable to sell cookers by hire-purchase, because they must be maintained properly, and the only way to carry on the cooking business satisfactorily was to maintain throughout. He saw no reason for hiring irons or even radiators, for they could be bought at quite low prices. Hired apparatus could be bought subsequently at Beckenham either by hire-purchase or for cash, and quite a number of installations originally hired had been sold.

THE MAINTENANCE OF MECHANICAL OSCILLATIONS BY MAGNETOSTRICTION.

Further Investigations of the Longitudinal Vibration of Ferro-magnetic Bars—Directions for Performing the Isolated Peak Experiments.

By J. H. VINCENT, M.A., D.Sc., M.I.E.E., F.Inst.P.

(*Concluded from Vol. CI, page* 731.)

EXPERIMENTS IN WHICH BAR IS IN THE FIELD OF A COIL WHICH IS IN SERIES WITH THE MAIN INDUCTION COIL.—A very flexible and useful method of experimentation is to insert the coil surrounding the bar in the circuit of the main oscillator in series with the induction coil, that is between points *B* and *C* in Fig. 2 (see THE ELECTRICIAN, Vol. CI, page 729). It should be arranged that the coupling of the grid coil with the induction coil is variable over a wide range. The polarising field may as before be due to a separate polarising current, the permanent magnetism of the specimen, or to an electromagnet. The last arrangement is probably the most convenient.

A bar of iron or steel or nickel long enough to produce an audible note when vibrating longitudinally will give an intense sound if the alternating current of a carefully tuned valve set be sent round a couple of turns of insulated wire wrapped round the middle of the bar.

The variations of the grid current as the set is tuned through resonance depend very greatly on the grid coupling, and the ratio of the inductances of the main coil and the coil surrounding the bar. If the coupling is not very small and the above ratio large, the grid current curve dips as the set is tuned through resonance. With very loose grid coil coupling and few turns round the bar a curve giving the deflections of the grid galvanometer as a function of the main condenser shows a high peak at resonance flanked on the high capacity side by a very sudden fall to a minimum which is followed by a slight and gradual rise until the set ceases to swing when the capacity has been increased sufficiently. Over the steeply falling part of the curve only the bar vibrates with its own frequency.

But with the same main induction coil when the grid coupling is reduced and the number of turns round the bar is increased, the passage through resonance is shown by a peak which may, by cautious reduction of the grid coupling, be quite isolated, being flanked in either capacity direction by a region in which the set does not oscillate. In the immediate neighbourhood of this peak on the grid current curve, if the bar is long enough to make the experiment practicable, a slight blow on the end of the bar will cause oscillation which is indicated by the grid galvanometer and by a slowing fading sound if the observer can perceive the frequency of the sound evoked.

With the arrangement described above, if the fundamental of the bar is in the limits of audition, momentarily switching on the high tension battery or joining the connection of the induction coil produces a surprisingly loud note as if the end of the bar had been struck a hard blow.

Frequency of Oscillations.

Starting with the grid galvanometer at its maximum deflection if the capacity be slowly increased the intensity of the sound decreases until the oscillations cease. For higher capacities the assemblage will not oscillate. If starting again at the top of the peak one decreases the capacity the oscillations also die out provided the grid coupling is small enough. If, however, the capacity be further reduced the set will finally oscillate again and the bar will either oscillate under forced vibration or will, at the appropriate settings of the condenser, resonate to those higher modes in which the mid-point of the bar coil is a node. Three points about this method of maintenance are of particular interest

(*a*) The frequency of oscillation throughout the peak region is that dictated by the bar. It is independent of the setting of the condenser.

(*b*) Clamping the bar renders the set incapable of oscillation.

(*c*) Cutting off the polarising field has the same effect.

If the number of turns surrounding the bar be slightly less than the number required to exhibit (*a*) then the peak is flanked by two ranges in which the set and bar will oscillate with slightly different frequencies from that of the top of the peak. In this case on switching on the high tension battery beats are heard.

Similar effects are produced if the polarising field is sufficiently intense.

It may not be out of place to give a few directions to anyone wishing to perform these isolated peak experiments for the first time. Use a round bar of nickel of from a half to three cms. diameter and from a half to a metre long. It is a great help at first to work at audio frequency. The coil which surrounds the middle of the bar should be wound on a former a few cms. long having an aperture through which the bar can slide easily. This former supports the bar which is not clamped and is wound with the highest number of turns of wire which will allow the valve set to oscillate when the coil is placed in series with the induction coil of the set with the bar in position and the polarising field on. This field is conveniently provided by an electromagnet with bored pole pieces. The former of the bar coil rests on a stand between the arms of the magnet and the bar passes through the holes in the poles, ample room being provided in order that the bar shall not approach anywhere too closely to the pole pieces.

Approximate Tuning.

A rough calculation of the fundamental frequency of the bar enables the set to be approximately tuned by means of a wave meter. It is necessary to have the coupling between the grid coil and the main induction coil finely adjustable. The coupling is reduced until the grid current is measured in micro-amperes when using a 20 W bright emitter valve and no grid bias. If all is well the set will cease to oscillate before the capacity has been increased enough to tune in to the frequency of the bar. On further increasing the capacity the set will oscillate and the bar sing with its own frequency. When near the right conditions tapping the end of the bar will produce a temporary deflection of the grid galvanometer which increases as the tuning is changed in the right direction.

With the nickel bars used for Table 2, the following results for frequency were obtained :—

TABLE 3.

Length.	Frequency.
100 cm.	2 520
50 „	5 010
25 „	10 050
12·5 „	19 800

A pair of conical pole pieces were bored to take an ebonite tube in which nickel bars 1·26 cm. in diameter fitted loosely. The central part of this ebonite tube carried the former of the bar coil. With this arrangement the following results were obtained for the frequency of nickel bars 1·27 cm. in diameter :—

TABLE 4.

Length.	Frequency.
100 cm.	2 570
50 „	5 140
25 „	10 250
12·5 „	20 400

It will be noticed that the frequencies are higher than those corresponding in Table 3. This is due to some difference in the constitution of the material. It was found on testing that the nickel bar of smaller diameter was distinctly sharp on the thicker bar.

Using nickel bars of 1·27 cm. diameter with a smaller main induction coil and a bar coil of more turns the readings shown below were obtained.

TABLE 5.

Length.	Frequency.
25·5 cm...	10 250
12·5 „	20 350
6·25 „	40 700
3·125 „	80 200

The bars were in the condition as bought and not turned up true. It was found that the frequency was to a close approximation independent of the number of turns in the bar coil and of the polarising field provided that the ends of the bar were well within the tubes in the pole pieces. Keeping all else the same, the frequency as found by the wave-meter

Digitized by Google

was inversely as the length, as shown below. The bars used were cut from the same rod of nickel.

TABLE 6.

Length.	Frequency.	Product.
3·135 cm. ..	80 000 ..	250 800
3·000 ,, ..	83 600 ..	250 800

In order to continue these experiments towards higher frequencies a pair of conical bored pole pieces were made of mild steel with the holes through them large enough to admit freely a certain piece of glass tubing. This tubing was chosen so as to be an ample fit for nickel rod of diameter 0·635 cm. Each pole piece had a flat worked on it which was in contact with the core of the electromagnet and a longitudinal slot was cut through the wall of each pole piece with its plane at right angles to the flat. These slots enabled the little nickel bars to be seen in position in the glass tube and also served to lessen loss from eddy currents. Coils wound on separate formers were tried and worked well, but these were soon abandoned in favour of a coil of 140 turns of No. 38 D.W.S., wound on the middle of the glass tube by hand, which worked better. Short bars of nickel were readily maintained in oscillation in the glass tube. The specimen is simply put into the tube and due to the residual magnetism in the electromagnet or to the effect of the field when the current is switched on, it slips into a symmetrical position. The pole pieces are adjusted at such a distance from each other that the ends of the vibrating bar are well within their axial tubes. Two points may be mentioned as likely to save a little trouble to anybody repeating these experiments. The shorter the bars are the less must be the polarising field. Calculations of the expected frequency will be found very unreliable unless care is taken to prepare specimens of uniform cross section. For example, a frequency much greater than that calculated from the length will be given by a bar which during preparation has been inadvertently given a diameter slightly less at the ends than at the middle.

Using this method and employing parts of a rod of nickel 0·635 cm. in diameter not specially turned up true as vibrators, higher frequencies were obtained. It was found that the frequency for a bar 3 cm. long was the same as given by employing the 140 turn coil as when using a coil of 450 turns on an ebonite former. The frequency in this case was also sensibly independent of the polarising field, which, in order to get the characteristic isolated peak, had to be small.

Other results are shown in the following table :—

TABLE 7.

Length.	Frequency.
3 cms.	86 500
2·5 ,, ...	104 000
2·0 ,, ...	126 000
1·5 ,, ...	167 000

It will be noticed that the products of the numbers in the two columns are not constant. This is probably due to the specimens not being truly cylindrical.

Working with Shorter Bars.

In order to work with shorter bars it was found necessary to decrease the inductance of the main induction coil. When this was done a bar of the same section 1 cm. long gave the isolated peak effect quite well, the corresponding measured frequency being 257 000, which was higher than that to be expected for a cylinder of this length. It was found to be thicker at the middle than at the ends.

The effect of clamping these short rods, while showing the isolated peak effect, is, as with those of audio-frequency, to stop the electrical as well as the mechanical vibrations. These short nickel rods will vibrate at their old frequencies after being annealed by boiling in oil.

If the distance between the narrow ends of pole pieces is equal to, or is only a little less than, the length of the bar so that the pole pieces either do not overlap the ends of the bar or the overlap is very small, then the frequency is not even approximately independent of the field, the frequency being higher for greater field intensity.

An accurately cylindrical bar of "silver steel" 2·99 cm. long and 0·635 cm. in diameter was used in similar experiments. With much stronger polarising fields than those used with nickel a distinct peak was shown on the grid current curve. The velocity of propagation of longitudinal waves in this bar was approximately 5 160 m. a sec. and was sensibly independent of the polarising field. The effect was not so distinct as with nickel and the complete isolation of the resonant peak was not effected.

A nickel bar of about the same length, accurately cylindrical and of the same diameter, gave a velocity of 5 000 m. a sec. in a field in which the isolated peak was obtained.

Short bars of nickel and of "silver steel" will vibrate in higher modes. Accurately round bars of both these material 0·635 cm. in diameter and about 3 cm. long were found to give peaks on the grid current curve at frequencies three times as high as the fundamental. The resulting factor was accurately three within the limits with which the frequencies could be determined by the wave-meter. The tuning was in each case to the top of a peak the complete isolation of which was not possible. The bar coil was kept in the centre of the bar so that the bar vibrated first in its fundamental mode and then in its mode with three nodes. The experiment was not difficult with the nickel bar but the effects with the steel bar were very much less marked. With the same apparatus a nickel cylinder 0·9 cm. long and 0·638 cm. in diameter resonated well at a frequency of about 270 000. Probably much higher frequencies could be obtained from thinner and shorter bars by modifying the apparatus.

I have great pleasure in thanking my students Messrs. Lloyd, Hoban and Morris and also Messrs. Clements, Alexander and Sutton of the L.C.C. Paddington Technical Institute, London, for assistance. In particular I am indebted to Mr. Sutton, who has helped me in making all the observations.

[NOTE BY AUTHOR.—The above paper was written before seeing Prof. Pierce's memoir entitled: "Magnetostriction Oscillators: An Application of Magnetostriction to the Control of Frequency of Audio- and Radio-Electric Oscillations, to the Production of Sound, and to the Measurement of the Elastic Constants of Metals," published in the Proceedings of the American Academy of Arts and Sciences for April, 1928. This is a magnificent paper of fifty pages giving accurate data obtained by the detailed study of the behaviour of many metals and alloys when used as magnetostriction oscillators, the application of these methods to the frequency measurements of the highest refinement and a mathematical treatment of the propagation of longitudinal vibrations in a viscous magnetostrictive medium.—J. H. V.]

THE JOHN BENN HOSTEL.

Christmas Celebrations in the East End.

THE real Christmas spirit of gay festivity and active service prevailed at the John Benn Hostel for East End lads, a number of whom had never before enjoyed a real Christmas. Some 60 boys were in the Hostel over the holiday and, together with residents, they went through a programme that left little time for anything but eager activity. The first corporate act was attendance at early service, and later followed inspection of the "dorms," with attractive prizes for the winners. Christmas dinner was served with full ceremony and not a little fun. It was particularly pleasing that the expenses of the day were materially contributed to by the lads themselves, entirely on their own initiative. There were useful gifts for all, countless competitions, and the full fun of the typical family party. The staff were responsible for the complete production of the play staged in the Milner Hall, and later, at the sing-song, individual talent among the lads was encouraged. The close of a long day was a short voluntary service which secured a most gratifying attendance.

Boxing Day gave opportunities for further games, sports, and festive meals in which staff and lads gave equally willing service.

POINTS OF VIEW.

"We are in the midst to-day of an industrial revolution as important as that which occurred a century ago."—*Mr. Baldwin.*

* * *

"Our task must be to see to it that human conditions do not suffer because of invention, or development remain uncontrolled."—*Mr. C. T. Cramp.*

* * *

"From an economic point of view electricity has either to be very much cheapened or yield to the less vaunted but cheaper gas power."—*Mr. Alexander Leith.*

* * *

"Every favourable comment on the enterprise and up-to-dateness of a gas undertaking is a nail in the coffin of the idea that gas is a declining and doomed industry."—*Mr. H. E. Bloor.*

NEWS IN BRIEF.

Barton Power Station—Commemoration Dinner of Whitworth Society—Paisley Engineers—The P.M.G. and Telephone Poles—Assisted Wiring Schemes—Tramway Salesmanship

IT is proposed to floodlight Edinburgh policemen on point duty.

Stretford Electricity Committee is seeking a site for an electricity showroom in the Old Trafford district.

The magistrates of Glasgow have decided to carry out an experiment in automatic traffic control in the streets.

The Ericsson telephone factory at Vysocan, near Prague, has been damaged by fire to the extent of 6 000 000 kroner.

Axminster Board of Guardians has accepted a tender amounting to £112 for the electric wiring of the institution.

On December 17th a Christmas entertainment to 550 poor children took place at the Carisbrooke Road depot of the Liverpool tramways department.

It is proposed to instal several automatic telephone exchanges in Bucarest. One is already in use.

South Shields Electricity Committee has decided to borrow £5 000 for its assisted wiring scheme.

An extension of the electric lighting facilities in the King's estate at Balmoral is at present being carried out.

Stone (Staffs) Board of Guardians has decided to have the institution equipped for electric light, at an estimated cost of £200.

Glasgow Corporation Health Committee has asked a sub-committee to consider and report on a proposal for an electric lighting installation at Shieldhall Hospital.

Four charge engineers, four boiler-house engineers, four switchgear control room operators and four assistant switchgear control room operators are required by the London Power Co., Ltd.

Salford Corporation has been recommended to place a contract amounting to £2 275 for foundations and flooring and erection of structural steelwork for No. 4 turbo-alternator at Agecroft power station.

Contracts have been placed for alterations and extensions to Burnley electricity offices and the construction of electricity workshops and stores. An expenditure of £7 860 is authorised for these works.

There is a vacancy for a chief repair shop and maintenance foreman at the power station of the Great Indian Peninsula Railway, Kalyan, near Bombay.

At the meeting of the Midland Branch of the Association of Mining Electrical Engineers at Nottingham, on December 22nd, a paper was read by Mr. G. W. Grice on "Heating Troubles Encountered by the Colliery Electrician."

The sixth annual commemoration dinner of the Whitworth Society was held at the Holborn Restaurant, London, on December 21st, Mr. F. H. Livens in the chair. Mr. W. H. Fowler was elected president for 1929, and will take office at the summer meeting to be held in Manchester in July. The date of the next annual commemoration dinner will be in March, 1930.

A meeting of the members of the Paisley Association of Electrical Engineers was held on December 18th, Mr. J. R. Bisland, president, in the chair. The lecturer was Mr. A. W. Johnston, and he took as his subject, "Some Notes on Pulverised Fuel." A discussion was entered into by Messrs. Murray, Steel, MacLean, Thom, Bruce, Heys, Kerr, Bisland, May, Brown, Kayes, Hutchison and Hamilton.

A rural telephone exchange has been opened at a farmhouse at New Craig, near Wartle, Aberdeenshire.

Stoke Newington (London) Electricity Committee recommends the supply of electric cookers on the hire system.

Seaham Harbour Electricity Committee has received sanction to borrow £3 000 for its assisted wiring scheme.

Weymouth Electricity Committee is obtaining sites for substations in connection with the supply to Upwey and Wyke Regis.

The Commissioners of His Majesty's Works, etc., have invited tenders for the erection of a telephone exchange at Sunbury, Middlesex.

A new hire-purchase system in connection with wiring installations for private houses and other premises is to be put into force at Hereford.

Bedford Electricity Committee has reconsidered the question of the appointment of a lady demonstrator to give instruction on electric cookers.

The Postmaster-General denies the report that the G.P.O. intends buying 300 000 telegraph poles direct from the Polish State forests, instead of through intermediaries.

In his annual letter to the staff of Glasgow tramways department, Mr. L. Mackinnon, general manager, says they should adopt every desirable improvement in the means of transport and cultivate the art of salesmanship.

The Borough Electrical Engineer of Barnsley has submitted to the Electricity Committee a plan showing proposals for floodlighting an advertisement on the cooling tower at the electricity works as a cost of £85, and the Committee recommends that it be approved.

The Postmaster-General announces that a new issue of the London Telephone Directory is in course of preparation. Anyone contemplating the installation of a telephone and wanting a place in the new directory should give his order before January 9th.

Shipley Electricity Committee has received a claim on account of wireless apparatus rendered useless by the change-over from d.c. to a.c., and has referred it to a sub-committee, with power to settle.

With reference to our comments in last week's issue on page 728 under the title "Smoke and Electricity," Mr. H. C. Lamb has pointed out that the paragraph may convey a wrong impression. In order to make certain that there shall be no misunderstanding however, we would point out that the smoke alluded to was, of course, the sulphurous fumes referred to in the legal column in the same issue and not to coal smoke.

At a meeting of the Institution of Civil Engineers, on January 6th, Mr. H. H. Dalrymple-Hay will give an address entitled "Merits and Demerits of Alternative Methods of Taking Water for Modern Power Stations from Tidal Waters." At a students' meeting on January 9th, Mr. Archibald Page will deliver a lecture on "The Development of the Generation and Distribution of Electric Power in the British Isles." A students' visit to Deptford power station has been arranged for January 12th.

ONE of the greatest engineering works now in progress in Great Britain is the water power scheme for the British Aluminium Co.'s new factory near Fort William. The scheme has involved the construction of a tunnel through Ben Nevis, through which water will be conveyed from Loch Treig to a point 600 feet above Fort William, and thence in pipes 5 feet 9 inches in diameter to the power house.

LEGAL INTELLIGENCE.

S. G. Brown *v.* Lektophone in Loud Speaker Litigation.

MR. Justice Tomlin, on December 19th, resumed the hearing of the action by the Lektophone Corporation against S. G. Brown, Ltd., for an injunction restraining alleged infringement of the Hopkins patent for sound reproducing machines.

Mr. W. H. Ballantyne, witness called for the defence, said the plaintiffs' patent was indexed at the Patent Office under "phonographs, gramophones, and the like sound-producing and reproducing instruments," and not under the headings where loud speakers were generally found.

In cross-examination, Mr. Trevor Watson suggested that the "Mascot" loud speaker was first shown at the wireless exhibition in 1927.

Sir Duncan Kerly, K.C. (for defendants), said it was put on the market at Christmas, 1925.

Mr. Ballantyne said he might have heard of the Hopkins patent before 1927, but he remembered that in 1927 the campaign of advertising in regard to licences began. He knew that the plaintiff company had a working arrangement with Standard Telephones and Cables, Ltd.

Mr. Stafford Cripps, K.C., summed up the case for the defence. He said Hopkins's patent, and the tests which had been made, had no bearing whatever upon whether these loud speakers were useful for the purpose for which they were designed, viz., the reproduction of music. There was no suggestion that the form of cone shown in Hopkins's specification was more advantageous than any other.

Mr. Whitehead, K.C., replied on behalf of the plaintiffs. He said the case against him had proceeded from beginning to end on the fallacy that a patent could be destroyed by agglomerating bits from a number of other documents. The law did not allow a patent to be destroyed in that manner. He contended that Hopkins had described and claimed an article which was incontestably new.

His lordship on December 21st reserved judgment.

Electric Signs.

In the King's Bench Division, on December 17th, Mr. Justice Humphreys heard an action in which the Empire Palace of Varieties, Middlesbrough, sought to obtain a declaration that two electrical numerical signs erected by the Electrical Name and Numerical Sign Co., Ltd., of Little Newport Street, London, were the property of plaintiffs. Further, they asked for the return of £130, money paid to the defendants by mistake.

Mr. Fredk. Grant, for the plaintiffs, said the two signs were erected on either side of the stage in the theatre, and indicated to the audience the number of the next "turn."

Giving judgment, Mr. Justice Humphreys held that there had been no acceptance by the plaintiffs of the contract, and they were not entitled to a declaration. The plaintiffs had also failed to satisfy him that the payment of £130 was made by them in mistake. Judgment was entered for the defendants on the claim and counter-claim—£3 5s. for repairs.

Mr. Justice Eve, in the Chancery Divison, on December 10th, confirmed the reduction of capital of the Tungsten Manufacturing Co., Ltd., from £150 000 to £39 330.

Mr. Gedge, for the company, said the reduction was necessary because of a loss in the value of certain assets. The shares which were to be reduced were really founders' shares.

His Lordship: "I think it is all in order."

Mr. Justice Eve, in the Chancery Division, on December 10th, confirmed an alteration of the articles of association of Falk, Stadelmann and Co., Ltd.

Mr. Farwell, K.C., for the company, said they wished to extend their objects. The company was incorporated in 1887, and began in a modest way, with a capital of £10 000; it was now £1 100 000. The only extension asked for was with regard to wireless apparatus. The company wanted power to carry on a wireless business, which could be conveniently carried on with its existing business.

His Lordship: Take your order.

Mr. Justice Clauson, in the Chancery Division on Tuesday, December 11th, granted to the British Thomson-Houston Co., Ltd., an injunction restraining J. Solomon and Sons and S. Solomon, of Clarence Road, Gorleston-on-Sea, Yarmouth, from infringing the plaintiffs' patent for gasfilled electric lamps, an inquiry as to damages, costs, and delivery up or destruction of the infringing lamps.

There was no defence.

PERSONAL.

MR. J. T. Mould has been elected chairman of the R.M.A. Executive Council and Mr. R. B. Weaver vice-chairman.

Ald. G. B. Brooks has been appointed chairman of Marylebone Electricity Committee.

We congratulate Captain Wedgwood Benn, M.P., brother of Sir Ernest Benn, upon the birth of a son on December 30th.

Mr. J. F. Edgecombe has been promoted to the rank of Commander in the W Division of the Metropolitan Special Constabulary Reserve.

Mr. W. Forbes, manager of Aberdeen Tramways Department, has been recommended for appointment as manager of Cardiff tramways at a salary of £1 150, in succession to Mr. R. L. Horsfield.

Estate of the gross value of £2 153, with net personalty, £1 565, was left by the late Mr. Charles Guthrie Conradi, managing director of Electromobile (Leeds),Ltd., who died aged 50 years.

Edinburgh Transport Committee has recommended that Mr. F. A. Fitzpayne, assistant transport manager, be appointed manager of the Transport Department, in succession to Mr. R. Stuart Pilcher.

Mr. H. C. Parsons, sales engineer, with Newtons, of Taunton, is leaving after over 20 years' service, to take up an appointment with the British Electrical and Allied Manufacturers' Association. He has been presented by the staff at Taunton and the London office, to which he was recently transferred, with an eight-day clock.

At their meeting on December 19th, Blackpool General Purposes Committee approved a recommendation of the Salaries Committee that the suggested increase in the salary of Mr. C. Furness, electrical engineer, from £1 250 to £1 600 per annum, be deferred until the transport policy of the Corporation was finally decided.

Estate of the gross value of £90 909, with net personalty, £90 103, was left by the late Sir Alexander Blackie William Kennedy, F.R.S., for some years Professor in Engineering in University College, London, afterwards consulting electrical engineer to various railway companies and municipal undertakings (acting in that capacity for the London County Council in the founding of the electric tramway system), chairman of the Electric Railway Advisory Committee of the Ministry of Transport, who died on November 1st, aged 81 years.

Mr. W. J. Jones has been appointed manager of the E.L.M.A. Lighting Service Bureaux in succession to Mr. W. E. Bush. Mr. Jones was trained at the Technical College, Finsbury, under Dr. Sylvanus P. Thompson, taking the college certificate and Associateship of the City and Guilds Institute, and became senior student at the college. He joined the staff of Siemens Brothers and Co., Ltd. in their X-ray and appliances department, and later entered the electric lamp department of the same company. After having experience in charge of the works of A. C. Cossor, Ltd., he finally joined the staff of the E.L.M.A. Lighting Service Bureaux under Mr. W. E. Bush. He is an associate member of the Institution of Electrical Engineers and is on the Council of the Illuminating Engineering Society.

Obituary.

MR. JOHN LEE, on December 24th, aged 61 years, on board s/s "Laconia," east bound. He entered the Post Office service at Liverpool as a telegraphist in January, 1883, reached the grade of assistant superintendent in May, 1901; was transferred to headquarters as assistant traffic manager for telephone purposes in October, 1907; and rose by successive promotions to be deputy chief inspector of telegraph and telephone traffic in April, 1916. A short term as Postmaster of Belfast followed, and in 1919 he was brought back to headquarters as Controller of the Central Telegraph Office.

MR. ALEXANDER T. HOLLINGSWORTH. The world of technical publishing is a good deal the poorer by the death, which took place on Monday, of Mr. Alexander T. Hollingsworth, chief proprietor, and for many years the mainstay, of our contemporary "Engineering." Mr. Hollingsworth, who had reached his eighty-second year, is rightly regarded as a leader in the world of publishing. Entering the office of "Engineering" as a young accountant, he quickly achieved success as a journalist and publisher, a success on which he subsequently built other publishing triumphs, for he was chairman of Weldons, among several other concerns in which he was interested. We offer our sympathy to the family, and to the staff of "Engineering."

BUSINESS ITEMS.

THE address of the Liverpool branch of PHILIPS LAMPS, LTD., has been changed to 25, Stanley Street.

Regarding the electric radiator referred to on pages 745 and 749 of our last issue, DOMESTIC ELECTRIFICATION, LTD., points out that the type reference should be R.C.F. in both cases.

BRITISH INSULATED CABLES, LTD., announce that they have transferred the commercial and counting house staffs at the Helsby Works to the registered office of the company at Prescot.

The ELECTRIC HEATING CO., of Croydon, has appointed The BEDFORD ELECTRO HEATERS, of Howbury Street, Bedford, as sole agents for Lancashire, and would be pleased to hear from other firms desirous of arranging agencies.

Richmond Board of Guardians has appointed Messrs. BREWER, SMITH AND BREWER, architects, to prepare specifications and supervise the work of rewiring the dining hall and laundry blocks of the Institution. Tenders are to be invited.

The WESTERN ELECTRICITY SUPPLY CO., LTD., Cairncross, Stroud, held an electrical exhibition at Dilton from December 17th to 19th as an official inauguration of supplies to the village. The exhibition was organised to enable the public to see demonstrations of electric cooking, ironing, cleaning, etc.

The ENGLISH ELECTRIC CO., LTD., Queen's House, Kingsway, W.C.2, has received an order from the Halifax Corporation Tramways for seven complete double-deck tramcars, with top covers, for mounting on 4-wheeled trucks. The electrical equipment will comprise double 50 H.P. motors, and will include controllers, type DK magnetic brakes, and Maley and Taunton's air-break attachments. In addition, the order includes a further six motors, six controllers and three magnetic brakes.

WILD-BARFIELD ELECTRIC FURNACES, LTD., Elecfurn Works, North Road, London, N.7, announce that by arrangement with Vickers-Armstrong, Ltd., they will be exhibiting a Vickers-Pyramid diamond hardness testing machine at the Physical Society and Optical Society Exhibition. They will also be showing at the Manchester Electrical Exhibition various types of electro-magnetic furnaces, high-speed steel furnaces, and an internally heated carburising furnace fitted with automatic temperature control.

BRITISH INSULATED CABLES, LTD., Prescot, Lancs, have received orders from the G.P.O. for telephone cable between Preston and Blackpool. The distance is approximately 21 miles. This is the second cable that has been laid by this firm between these two points. They have also received an order for approximately 16 miles of telephone cable for the Isle of Man. These cables are to link up Douglas, Castletown and Port Erin with the mainland through the new submarine cable, which is shortly to be laid between Fleetwood and Douglas.

A new departure of great importance in trade journalism is announced by BENN BROTHERS, LTD., which recently acquired the business of William Agnew, Ltd., the publishers of "The British Trade Journal," among other papers. "The British Trade Journal" was the first export trade journal, and has led that field for the last sixty-seven years. Benn Brothers, Ltd., established thirty years ago "The Export World," which has had a highly successful career. It has now been decided that these two publications should join forces under the title of "The British Trade Journal and Export World." The first number of the combined publication, which will be larger, more comprehensive and more influential than any export journal ever published, will appear in February in good time for the business opportunities presented by the British Industries Fair.

Electric furnaces and baking ovens will be among the chief exhibits at the Industrial Electrical Exhibition at Belle Vue, Manchester, from January 7th to 12th. The Lord Mayor of Manchester (Lt.-Col. G. Westcott) will perform the opening ceremony on January 7th. Organised by the E.D.A., in conjunction with Manchester and Salford Corporations Electricity Departments and the Lancashire Electric Power Co., the exhibition will be open daily from 2 p.m. to 9 p.m., admission being free. The exhibitors will include the Metropolitan-Vickers Electrical Co., Ltd.; the Premier Electric Welding Co.; Marryat and Place; Wild-Barfield Electric Furnaces, Ltd.; the Leeds Electrical Construction Co., Ltd.; Birmingham Electric Furnace Co., Ltd.; Electric Furnace Co., Ltd.; Young, Osmond and Young, Ltd.; the British Resister Co., Ltd.; the General Electric Co., Ltd.; Ferranti, Ltd.; and Sulzer Bros.

IN PARLIAMENT.

Discussion in the House of Lords on the Imperial Telegraphs Bill.

IN the House of Lords on December 20th the Earl of Plymouth moved the second reading of the Imperial Telegraphs Bill, which had already passed through the House of Commons. He said that the Bill gave statutory authority for the sale of the Pacific Cable and West Indian Cable undertakings, at present managed by the Pacific Cable Board, and for the sale of the Transatlantic cables worked by the Postmaster-General. It was an essential part of the scheme for the reorganisation of the wireless and cable services proposed by the Imperial Conference last July. The problem the Imperial Conference had to face was how to preserve the cables while at the same time providing the beam service with the fullest opportunity for expansion. The Government came to the conclusion that the only solution lay in the amalgamation of all the wireless and cable undertakings, so as to secure unity of control and direction. The sale had been confirmed by the Imperial Cable and Wireless Conference, and the Government was satisfied that the arrangement was a perfectly fair one.

With regard to the Imperial Advisory Committee, of what benefit could it be in a matter of this kind? Was it in the least likely that such a committee would have anything like effective control? The Government was throwing away the most valuable public property without a single figure being given to justify its action.

The Earl of Plymouth said if this arrangement were not made the cable companies would have been crushed out of existence. The Government had come to the conclusion that it was absolutely necessary for the companies to be carried on.

The amendment was negatived, and the Bill read a second time.

Replies to Questions.

Telephones are installed at 38 rural railway stations in Devon.

The number of rural public telephone call offices in England and Wales is about 6 500.

The surplus on the telephone system was £3 713 379 for the year 1925-6, £3 961 735 for 1926-7, and £4 200 000 for 1927-8.

Main trunk and other telephone cables containing approximately 18 000 and 270 000 circuit miles of wire respectively have been provided in this country during the past 12 months.

On the information before him, the President of the Board of Trade does not think there are at present sufficient grounds for proposing legislation to compel ships to carry certified electricians, in addition to certified engineers.

The Minister of Transport is aware that statements have been made that American capital is employed in purchasing shares of companies interested in the electrical supply industry of this country. He does not contemplate the introduction of legislation on the subject.

The Board of Trade does not propose, at present, to make it compulsory for every passenger boat to carry at least one motor lifeboat fitted with wireless apparatus. The question will be considered next spring at the International Conference on Safety of Life at Sea.

The Electricity Commissioners have received representations from consumers regarding the Clyde Valley Electrical Power Co.'s new scale of charges, which, it is alleged, mean an increase of 33⅓% to some consumers for domestic purposes, and the Commissioners are taking steps to investigate them.

The Prime Minister has informed Captain Wedgwood Benn that the consent of the House of Commons will not be sought before the Postmaster-General leases the beam wireless system. The lease will be granted under the general powers conferred upon the Postmaster-General by the Post Office Act of 1908. There is no necessity to submit for approval of Parliament the details of the contract with the Communications Company in reference to the sale of the cables.

Replying to questions regarding the transfer of the beam wireless service to the new Communications Co., Mr. A. M. Samuel, Financial Secretary to the Treasury, states that the main terms of the arrangement are set out in the White Paper. The agreements for giving effect to these arrangements are being prepared, but he is unable to make any statement until terms have been agreed with the companies and, as far as necessary, approved by the Dominion and Colonial Governments concerned.

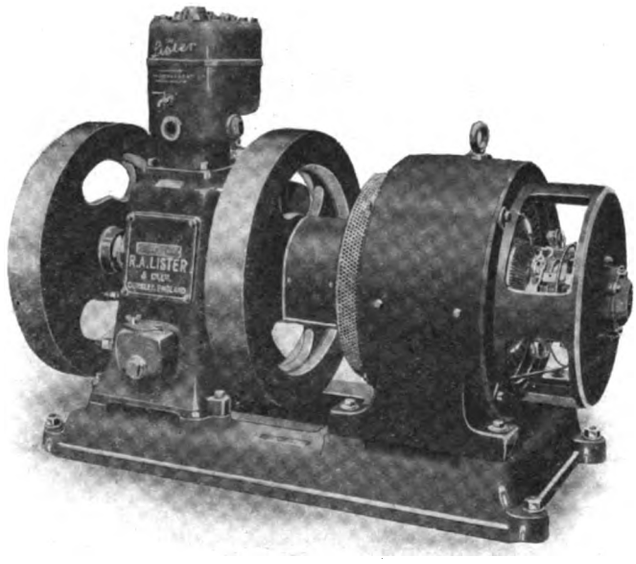
PLANT AND EQUIPMENT.

THE country house lighting plants of R. A. LISTER AND Co., of Dursley, range from 600 W up to 11 kW and over, each set being complete with cells, switchboard, etc. The 600 W set is designed for the direct lighting of 24–25 W lamps, and is



An example of the larger sets for country house lighting made by R. A. Lister and Co.

fitted with a fuel tank capacity to allow of 7 hours' running. The capacity of the 1 kW set on direct lighting is 110-25 W lamps, and that of the 1½ kW set 60 lamps. Of the bigger sets the 11 kW equipment is capable of lighting 440–25 W lamps with a fuel consumption of 1 pint per 12 hours' running. The engine is a twin-cylinder 20 H.P. with a speed of 600 r.p.m. The voltages for the bigger sets are 110/162, while the 2·25 kW set is also made to give pressures from 50–73 V. The 1 and 1½ kW equipments are made with three voltage outputs, these being 32/43, 50/73 and 110/162 V. The 600 W set has an output of 32/43 and 50/73 V.

A comprehensive range of resistances is made by ISENTHAL AND Co., LTD., Victoria Road, London, W.3, and includes tubular and carbon plate types, slate resistances, load and stand-by resistance units, meter calibration resistances, dimmers for incandescent lighting, arc regulators, etc. The same company also offers a portable calibrating set for overload and other protective relays, current transformers, etc. This consists of a combination of transformer, resistances, selection switches and ammeter, which enables the proper resistance section to be interlocked with part of the multiple switch for series connection with the transformer primary. With this unit a current range of 0·4 and 1200 A, which may be extended for a few seconds to 2 600 A, is made available. The range of the set is given as 1 200 A and 500 V, and the weight 60 lb. The same firm also offers a range of vitreous enamelled units with a standard accuracy of ± 5%.

A wide selection of lighting accessories suitable for motor and other yachts, etc., is offered by D. H. BONELLA AND SON, LTD., 46 and 48, Osnaburgh Street, London, N.W.1. Their fittings include a number of attractive berth lights, deck lights, corridor and other fittings. Ceiling lighting fittings suitable for small tonnage craft are included in a number of novel designs, while anti-dazzle bridge and chart-room lights are also offered in a variety of types. Plugs and sockets, flush and surface type switches, searchlights, navigation lights, engine-room and inspection lights are also included in the range, together with lighting plants for house-boats, launches, etc., where 6 to 10 lights are required.

A BOOM YEAR FOR PATENTS.

It is estimated that at least 38 500 patent applications will have been filed at the Patent Office in the past year. This is approximately 2 000 in excess of the existing record of 36 680 of a few years ago. Messrs. Hughes and Young, the patent agents of Warwick Court, Holborn, state that the particulars of this year available on their records show a number of patent applications far in excess of any previous year, and it is estimated that the capital invested this year in inventions is over 35 millions.

ELECTRICITY SUPPLY.

Increase of Capacity of Preston Station—Aylesbury to take Bulk Supply.

MANCHESTER Electricity Committee has obtained sanction to borrow £24 800 for sub-station equipment.

The sub-station at Newton Abbot for supplying the growing suburb of Milber was put into operation on December 23rd.

Shoeburyness U.D.C. has received sanction to a loan of £6 644 for carrying out an electricity supply scheme for the town.

Fulham (London) Electricity Committee is to carry out mains extensions in various roads, at an estimated cost of £577 10s.

The note which appeared in our issue of December 21st, on page 718, relating to West Ham, should have read East Ham, and not as printed.

Weymouth Corporation is to make application for consent to the erection of overhead lines for supplying electricity to the Weymouth Bay Estate.

The Lighting Committee of Barnes U.D.C. has instructed the Electrical Engineer to report on the question of the reduction in the flat rate and rateable value tariffs.

Ilford Electricity Committee is seeking a Fringe Order to supply premises in Epping rural district. The Committee is to seek sanction for a loan of £5 000 for the free wiring scheme.

Oldham Electricity Committee has agreed to receive a deputation on behalf of several cotton mill owners, etc., to discuss the possibility of a reduction in the charges for electricity supplied to them.

Kingston-on-Thames T.C. has received sanction to borrow, for mains, £4 695; plant, £2 401; and works consequent upon change of system, such as changing consumers' lamps, apparatus, etc., £7 251.

Brighton Electricity Committee has agreed to a fee of 800 guineas to Messrs. Kennedy and Donkin and Mr. H. Dalrymple Hay for advising and supervising the circulating water scheme for the Southwick works.

Battersea (London) Electricity Committee is to instal electricity services to 125 premises at a cost of £1 170 15s., and to extend mains for private services at a cost of £866 and mains for public lighting at a cost of £344.

Douglas (Isle of Man) T.C. has presented to the Tynwald a petition for leave to extend the optional area for the supply of electricity to certain districts outside the borough. The Tynwald has referred the matter to a committee.

Col. F. Gordon Tucker held a Ministry of Transport inquiry on December 20th respecting objections to the erection of poles for 11 000 V cables to the Holbeach Long Sutton, and Sutton Bridge districts, by the Boston Electricity Supply Co., Ltd. As a result of the inquiry, several objections were disposed of.

Reigate R.D.C. recently deferred for a month the request of the Dorking Electricity Supply Co., Ltd., for consent to its application for a Special Order. The Council has been informed that the Commissioners have been asked to dispense with its consent or to exclude the parishes of Betchworth and Buckland.

Lichfield T.C. has received sanction to loans of £4 100 in connection with the extension of mains to Whittington and £4 407 for excess expenditure. Twenty public lamps are to be provided at Whittington, at a cost of £4 1s. 6d. each, and a loan of £2 850 has been applied for to cover extension of the mains to Shenstone.

The Commissioners have authorised Preston Corporation to borrow £46 000 for the modification of certain generating plant already installed or under construction, so as to increase the capacity of the Ribble Station from 50 000 kW to 60 000 kW. They have also sanctioned a loan of £3 500 for the purchase of property adjoining the Crown Street works.

Morecambe Electricity Committee has instructed the Electrical Engineer to call the attention of the Borough Engineer to the necessity of any damage to cables or other works being reported immediately.—The Committee is to seek sanction from the Electricity Commissioners to supply the L.M. & S. Railway with electricity for purposes other than traction.

An offer of a temporary bulk supply of electricity from the Central Electricity Board has been accepted by Aylesbury T.C. The Council is to pay for a maximum demand not less than 1 000 kW. The Council has adopted a scheme for carrying out within the next twelve months the provision of h.t. and l.t. lines and other works in the rural areas, at a cost of £16 000.

THE DAVIS CINEMA.

Interesting Electrical Details of New Installation at Croydon.

THE electrical installation at the Davis cinema, which was opened just before Christmas, has been carried out to the design of Mr. Basil Davis, and the following details give a general outline of the work.

The supply is taken from the Croydon Corporation, who feed into the h.t. room at 2 000 V and transform down by means of two transformers to 230 V single-phase for all supply to the building. From the h.t. room feeds are taken to the main intake room switchboard, which consists of seven panels and supplies the lighting, power, stage and motor generator services. Two sets of motor generators are installed, one acting as stand-by, and each is capable of an output of 250 A at 50/80 V; each machine is controlled by one panel of a d.c. switchboard, also situated in the main intake room. For the auditorium lighting, services are taken to the dimmer room situated behind the lower circle and close to the projector room. The general auditorium lighting, known as "amber" from the colour chosen, is controlled in the dimmer room by motor-driven push-button dimmers, and the coloured lighting in red, blue and green is also actuated from this room, where fifteen sets of dimmers are fixed. These sets—five in all for each colour—control respectively the colour lighting in the proscenium arch, the proscenium flutings left and right, the large and small domes, and pendant fittings. Thus an independent effect formed by any combination of three colours can be set up at each or any of these positions. The proscenium arch, the main dome, and flutings are covered with a broken silver reflecting surface which accentuates the effects. In addition to the auditorium and general lighting, "maintained" and "secondary" systems have been installed. The maintained lighting is fed from the corporation supply on a separate system, while the secondary installation is supplied from two direct-coupled d.c. Crossley paraffin sets of 6 kW capacity. The maintained and secondary lighting systems are controlled from the stage switchboard. In all, some 6 000 lamps have been used in the building on the six sets of lighting. The stage switchboard is of the dead front type and controls the battens, float, dips, and arena with master control for each colour, together with a black-out pilot switch. Each batten, etc., and each colour thereon, has its own dimmer, with master dimmer control for each colour. For exterior lighting 18 floodlights, each of 500 W, are employed, while the marquise is illuminated by means of 150-20 W and 100-60 W opal lamps. Three neon signs, one horizontal and two vertical surrounding the principal façade, give prominence to the name of the cinema. Provision is made for electric cooking in the tea-room, a 50 kW main having been laid, and it is intended to use electrical cooking apparatus throughout. The installation in its entirety has been carried out by TROUGHTON AND YOUNG, LTD., of 143, Knightsbridge, S.W., under Mr. Davis's supervision.

ELECTRICAL WOMEN.

Branch Meetings and Visits of the Electrical Association for Women.

MEMBERS of the E.A.W. Evening Classes were pleased to welcome Lt.-Col. W. A. Vignoles on December 10th, at the E.L.M.A. Lighting Service Bureau, 15, Savoy Street, Strand. His lecture on "Safety in the Electrical Home" described in a simple way accidents which could occur through shock and fire in connection with faulty installations. He mentioned the fact that such accidents could only occur if a certain unfortunate combination of circumstances were present.

The chair was taken by Mrs. Dickenson, of the Bermondsey Electricity Department, and the vote of thanks to Lt.-Col. Vignoles was proposed by Mrs. Hammer.

The Manchester Branch of the Association for Women is continuing its interested and varied programme of lectures on the uses of electricity in the home. At the Manchester Corporation electricity showrooms on November 23rd, Mrs. Flack spoke on "Electric Appliances and their Uses in the Home."

On December 5th a visit was paid to the showrooms of Frigidaire, Ltd., where Mr. F. Jones gave an instructive address on "Automatic Electrical Refrigeration, particularly as applied to Domestic Requirements." Demonstrations were given.

CHURCH LIGHTING.

Successful Lighting Installation at Truro Cathedral.

THE system of lighting by gas electroliers, at Truro Cathedral, has been replaced by electricity. A scheme of concealed lighting has been installed, and the illumination of the whole of the nave, transepts and sanctuary was carried out by means of G.E.C. silvered glass floodlight reflectors. The triforium arches are each sub-divided into four smaller ones, and the floodlights are arranged under each of the first four arches looking east, at a mounting height of approximately 36 ft. from the floor level. The reflectors are arranged to floodlight the nave both forward and across from each side, at the same time avoiding the possibility of spill light producing bright patches on the triforium pillars. Similar methods are employed in the chancel, the units on the north side being grouped together in several of the arches, since a suitable fixing could not be obtained in the first two, due to the presence of the organ pipes. A number of floodlights are employed, the units at the eastern end being directed towards the sanctuary and altar, in order to assist in the lighting of these sections. The illumination of the sanctuary is arranged to produce a graduated contrasting increase of intensity, as the eastern end of the cathedral is approached. In the centre, an intensity of 4-ft. candles is obtained by means of several correctly-disposed floodlighting units installed on the arches of the triforium in the chancel. It was found that the area below the central tower could not be illuminated by projectors mounted high up and adjacent to the upper walls and gallery of the tower without a large proportion of spill light illuminating the upper walls to a high intensity. It was, therefore, decided to illuminate the area under the tower by means of floodlights concealed in the triforium arches of the transepts, and the units were so disposed and directed to illuminate the transepts effectively in addition to the central tower area. The equipment for lighting the altar and sanctuary was designed to provide the maximum amount of vertical rather than horizontal illumination, and although light was obtained from the floodlighting units in the chancel, it was decided that the main lighting of the altar could be effected more advantageously by means of 12-lamp lengths of striplite reflector arranged vertically on either side, and concealed in the recesses of the stone columns. The north and south choir aisles are also illuminated by G.E.C. silver glass distributing reflectors, each mounted in the apexes of the truncated arches, and directed eastwards. Similar reflectors are used for the lighting of the north and south main aisles. The area under the west gallery is illuminated by means of reflectors recessed into the underside of the gallery forming the ceiling.

Some idea of the effectiveness of the lighting at Truro Cathedral is given by this illustration.

The main switchboard is installed in the north transept. The wiring for the main floodlights illuminating the nave and chancel is concealed inside the triforium, whilst the wiring to the units in the aisles, etc., is carried out in lead-covered cable. J. H. DEEBLE AND SONS, Falmouth, were responsible for the whole of the wiring and installation of the fittings, etc., while the scheme was designed by the GENERAL ELECTRIC CO., LTD., acting in collaboration with Mr. F. L. Pearson, Mr. Oswald Swete, and the Diocesan Authorities.

SCOTTISH LIGHTING.

Third Annual Report of the Scottish Electric Lighting Service Bureau.

ACCORDING to the third annual report of the Scottish Electric Lighting Service Bureau, the activities of the bureau have been well maintained. The free use of premises at 20, Trongate, has again been granted by Glasgow Corporation Lighting Department, and the equipment has been added to from time to time, when new developments have occurred. In addition to the apparatus for demonstrating correct principles of lighting, lent by the manufacturers, there has been added a number of ancient lighting devices, which give further interest to the exhibits. The Electric Lamp Manufacturers' Association contributes to the bureau the services of the District Engineer. The eight months which constitute the "lighting season"—September to April—naturally coincide with the period of greatest lecturing activity, and during the past year all except four of the total of 57 lectures fell within this period. The policy heretofore has been to obtain Press notices, etc., without insertion of any advertising matter. This year, however, a slight change has been made, and a full-page advertisement has been inserted in the Year Book of the Electrical Contractors' Association of Scotland.

The Royal Technical College Electrical Engineering Class have made their visit to the bureau for two lectures on Illumination Principles and Design, a regular annual feature. Several rotary clubs are on the list, as also are various trade associations, co-operative guilds, clubs, societies, etc., having many different interests. Co-operating with the various electrical committees, demonstrations and lectures have been given at four exhibitions during the year, viz., at Helensburgh, Wishaw, Aberdeen and Cumnock, and an exhibit was also made at the Educational Exhibition at Kelvin Hall, Glasgow. The publication of a brochure, fully illustrated and descriptive of the bureau and its work, was completed in the spring, of which 11 800 have been distributed to date at lectures, and from manufacturers' showrooms and through the post, a card index system of industrial and electrical establishments, etc., which has been prepared, being used for mailing purposes. Another interesting publicity development has been the writing of articles dealing with "Shop Window Lighting," and these have appeared in a large number of the Scottish trade papers.

For the year now entered upon there has been arranged a considerable number of lectures, and several of these have already been given. Included in the number are those arranged in connection with the "Factory and Workshop Lighting Campaign." Another Illumination Design Course, consisting of weekly lectures, and given principally by lecturers from the London Lighting Service Bureau, is now being conducted, and promises to be of considerable value to members of the electrical industry.

TRADE PUBLICATIONS.

BRITISH INSULATED CABLES LTD., Prescot, have published leaflet P. 243 dealing with single-phase meters. P. 221 has been withdrawn.

THE WHOLESALE FITTINGS CO., LTD., 23-37, Commercial Street, London, E.1, has published list No. 223 dealing with this season's "Alto" model electric fires.

A questionnaire in the form of a postcard has been received from HERBERT MORRIS, LTD. Loughborough, dealing with the company's conveyors, and inviting further information from potential clients so that a representative may call.

THE BENJAMIN ELECTRIC, LTD., Brantwood Works, Tariff Road, London, N.17, has sent us a special booklet explaining the Benjamin lighting service. The issue is well illustrated and gives full particulars of both the company's service and the advantages gained from good lighting.

Bulletin No. 54, published by ALLOY WELDING PROCESSES, LTD., 14-16, Church Street, London, N.1, gives applications of electric arc welding to the repair and maintenance of machinery on board ship. The company's Bulletin No. 57 deals with a new electric dynamo for welding purposes.

We have received from HOBDAY BROTHERS, LTD., 21-27, Great Eastern Street, London, E.C.2, a supplementary catalogue to the main radio publication No. 70. The purpose of the supplement is to include the outstanding features of the 1928 Radio Exhibition and wireless picture receivers. There is also incorporated a special chart to direct telephone calls to their correct department.

TRADE CALENDARS.

THE 1929 calendar of BRITISH INSULATED CABLES LTD., Prescot, Lancs, takes the form of a desk or wall type refill with white letters on a black background.

The 1929 calendar of the KEY ENGINEERING CO., LTD., 4, Queen Victoria Street, E.C.4, has been received. As in past years, this has been produced in pocket size.

In presenting their calendar for 1929, C. A. PARSONS AND CO., LTD., Heaton Works, Newcastle-upon-Tyne, have combined a selection of their various products with illustrations of places of local and historical interest.

A bold looking calendar suitable for office use is that of CROSSLEY BROTHERS, LTD., Openshaw, Manchester. Above each calendar month is shown a large picture of some of the company's products, with brief descriptions.

The 1929 calendar of the A.E.G. ELECTRIC CO., LTD., 131, Victoria Street, London, S.W.1, is a bold production, illustrated by various pictures of power stations, transmission lines, electric traction designs, domestic appliances, etc.

We have received from the DUBILIER CONDENSER CO. (1925), LTD., Ducon Works, Victoria Road, Acton, W.3, two block calendar refills for 1929, for the "Business Desk-Memo Kalendar," supplied by the same firm some years ago.

The calendar of the MARCONIPHONE CO., LTD., Tottenham Court Road, London, this year takes the form of a gilt disc edged with green laurel leaves. In the centre is shown the globe with the signature of G. Marconi across it. The daily calendar portion is in large block figures.

This year's calendar of the MULLARD WIRELESS SERVICE CO., LTD., of Denmark Street, London, W., again takes the shape of a P.M. valve containing the head and shoulder portrait of an unknown but charming lady. The calendar is of the block type in red and black.

We have received from the D.P. BATTERY CO., LTD., of Bakewell, Derbyshire, a calendar for 1929 which illustrates in colour "The Surprise," Hathersage, Derbyshire, by E. A. Chadwick. The publication is mounted on strong board, while the calendar numerals are bold and clear.

The 1929 calendar of the NORTH METROPOLITAN ELECTRIC POWER SUPPLY CO., Broadway Buildings, Westminster, S.W.1, is made up with 52 week panels bearing large figures, mounted on a gilt-edged board, depicting a figure representing Electricity. The background of the board is blue, while the figure is in bronze.

A reproduction of a crayon drawing of the old Parish Church, Church Road, Leyton, lends interest to the calendar of the LONDON ELECTRIC WIRE COMPANY AND SMITHS, LTD., of Leyton, London, E.10. The board upon which both picture and calendar are mounted is stiff and the publication makes an attractive wall decoration.

A delightfully coloured picture entitled "The Sleeping Beauty," reproduced on silk from the original water colour by W. H. Margetson, forms the illustration for this year's calendar of MAWDSLEY'S, LTD., Zone Works, Dursley. The story in abbreviated form is given on the back of the calendar, the whole making a very pleasing wall decoration.

As is customary with the VEREENIGING VAN DIRECTEUREN VAN ELECTRICITEITSBEDRIJVEN IN NEDERLAND, of Arnhem, the association's 1929 calendar is designed to bring home to the public the advantages of electricity. This year the pictures chosen show the developments of lighting from the early ages. Explanations are given on the back of each picture, while the colourings are, as usual, particularly attractive.

We have received from Mr. GEORGE BARNARD, of 1, Nile Street, Birmingham, a desk-type calendar for 1929 in leather finish. Each of the twelve months is arranged on a metal sheet, while the date indicator is of magnetised iron, with the result that the latter will stay in any position without any support other than that given by magnetic attraction. The subject matter surrounding the calendar is neatly printed, and deals with Vinculum electrical concrete for cable covers, posts, boxes, etc.

The LIVERPOOL ELECTRIC CABLE CO., LTD., Linacre Lane, Bootle, Liverpool, has sent us a very attractive calendar illustrating the Gladstone Dock. The well-printed colours of the picture, showing a number of vessels alongside the dock, make a pleasing setting.

The 1929 calendar of CALLENDER'S CABLE AND CONSTRUCTION CO., LTD., Hamilton House, Victoria Embankment, London, E.C.4, takes the form of a large portrait of Sir Tom O. Callender, mounted in a gilt "frame."

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, when available.

CASTLEFORD URBAN DISTRICT COUNCIL.—Electric light installation at Barnes Road Maternity Home. Particulars from Mr. Fred Scatchard, architect, Midland Bank Chambers, Castleford.

DIRECTOR OF ARMY CONTRACTS.—Manufacturers who are not already on the War Office list of tenderers are invited to apply to the Director of Army Contracts, Caxton House (West), Tothill Street, Westminster, London, S.W.1, for form 1, on which application for inclusion in the list may be made. Among the goods for which tenders are invited from time to time are electric cables, electrical plant, electrical and wireless stores, scientific instruments, various machinery, metals, earthenware, etc. Applicants must be on the King's National Roll, and must comply with the fair wages resolution of the House of Commons.

RICHMOND-ON-THAMES GUARDIANS.—Rewiring 15 circuits at the Infirmary, dining hall and laundry blocks. Particulars from the architects, Messrs. Brewer, Smith and Brewer.

CENTRAL ELECTRICITY BOARD, January 4th.—Supply and erection of 132 000 V transformers, under the South-East England Electricity Scheme, 1927. Specification (No. S.E.E. P.T.1) and form of tender from Mr. J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

COLWYN BAY URBAN DISTRICT COUNCIL, January 4th.—Wiring houses under assisted wiring scheme. Specifications, etc., from the Electrical Engineer, Council Offices, Colwyn Bay.

NORTHERN IRELAND MINISTRY OF FINANCE, January 4th.—Electric lighting and bell systems and mechanical ventilation in the Custom House, Belfast. Specification can be seen at the offices of the Ministry, 15, Donegall Square West, Belfast (Room 34).

SALFORD CORPORATION, January 4th.—Supply of e.h.t. and l.t. paper insulated, lead covered and armoured cables. Particulars from the City Electrical Engineer, Frederick Road, Salford.

BELFAST CORPORATION, January 7th.—Manufacture, delivery, and erection of h.t. armour-clad switchgear. Specification (No. W. 76) and form of contract from Mr. F. H. Whysall, city electrical engineer and general manager, Electricity Department, East Bridge Street, Belfast; deposit £2 2s.

GOVAN DISTRICT BOARD OF CONTROL, January 7th.—Electric lighting installation in the Solarium at Hawkhead Asylum, Crookston, Glasgow. Schedules from the clerk, Mr. Angus Baillie, 51–52, Carlton Place, Glasgow, C.5.

GRIMETHORPE MINERS' WELFARE COMMITTEE, January 7th.—Electric lighting and heating of pavilion. Particulars from the architect, Mr. C. L. Goddard, Royston Road, Cudworth; deposit £3.

MANCHESTER CORPORATION, January 7th.—Supply of single-phase electricity meters for period ending September 30th, 1929. Specifications, etc., from Mr. H. C. Lamb, Electricity Department, Town Hall, Manchester; deposit £1 1s.

GLASGOW CORPORATION, January 8th.—Supply of steel poles and bases, for street lighting. Specifications, etc., from the Inspector of Lighting, 20, Trongate, Glasgow.

NORTHERN IRELAND GOVERNMENT, January 10th.—Electrical supplies to various Government estabslishments during twelve months ending January 31st, 1930. Forms of tender, etc., from Ministry of Finance, 15, Donegall Square West, Belfast; deposit £1.

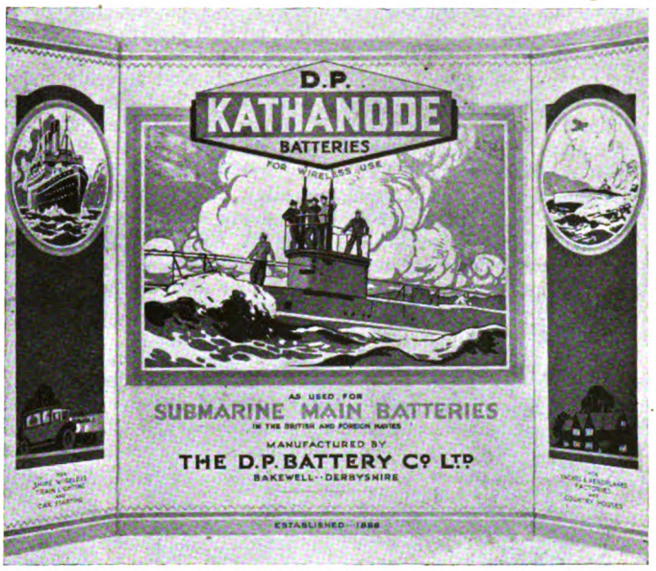
SHEFFIELD CORPORATION, January 11th.—Supply of 1 000 tons of tramway rails, copper bonds, etc. Specifications, etc., from Mr. A. R. Fearnley, General Manager, Tramways and Motors Department, Division Street, Sheffield.

ASHFORD (KENT) URBAN DISTRICT COUNCIL, January 14th.—Heavy-oil engine, to drive 600 kW three phase 50 period alternator, with starting air bottles, piping, fuel service tank, etc.; also supercharger silencer, centrifugal pump and fuel oil tank. Further particulars from the Clerk.

BETHNAL GREEN (LONDON) BOROUGH COUNCIL, January 14th.—Electric lighting and power and telephone installations at Public Baths and Washhouses in course of erection in Old Ford Road. Specification, etc., from the Borough Engineer, Town Hall, Bethnal Green, E.2; deposit, £3 3s.

CAMBERWELL (LONDON) BOROUGH COUNCIL, January 14th—Maintenance of electric lighting, heating and power installations (section L) and supply of electric lamps (section S) for twelve months. Forms of tender from Borough Engineer and Surveyor, Town Hall, Camberwell, S.E.5.

EDINBURGH CORPORATION, January 14th.—Boiler feed-water de-aerafing plant for Portobello power station. Specification (No. 96) from Mr. Edwin Seddon, electrical engineer and manager, Electricity Department, Edinburgh; deposit 10s. 0d.



A new window card by the D.P. Battery Co., Ltd. It is treated in colours and makes an attractive background for display purposes.

HUDDERSFIELD CORPORATION, January 14th.—Electrical work for new baths. Particulars from the borough architect, Mr. L. Smith, 26, Ramsden Street, Huddersfield.

STOKE-ON-TRENT CORPORATION, January 16th.—Supply and erection of an electrically-driven air compressor at the central power house, Hanley. Specification, etc., from the City Electrical Engineer, St. George's Chambers, Kingsway, Stoke-on-Trent; deposit £2.

STOKE-ON-TRENT CORPORATION, January 16th.—Wiring and fitting of eight electric houses in Avenue Road, Hanley. Specification, etc., from the City Electrical Engineer, St. George's Chambers, Kingsway, Stoke-on-Trent; deposit £2.

STOKE-ON-TRENT CORPORATION, January 16th.—Supply of low tension d.c. switchboard, for electricity sub-works, Bagnall Street, Stoke-on-Trent (contract 2 836); and supply of e.h.t. ironclad type switchgear at Central power house, Hanley (contract 2 839). Specifications from the City Electrical Engineer, St. George's Chambers, Kingsway, Stoke-on-Trent; deposit £2 for each.

KEIGHLEY CORPORATION, January 17th.—Supply and erection of water-tube boiler, to evaporate 30 000 lb. of water per hour, for the Electricity Department. Specifications from Mr. H. Webber, borough electrical engineer, Coney Lane, Keighley; deposit, £2 2s.

ISLINGTON (LONDON) BOROUGH COUNCIL, January 18th.—Manufacture and supply of one 5 000 kVA Scott-connected transformer, for three-phase system, 6 600 V and 2 000/2 300 V per phase, with voltage regulator; and 375 kVA and/or 750 kVA Scott-connected transformers, for three-phase system, 6 600 V and 2 000/2 300 V per phase. Specification, on and after December 1st, from the Borough Electrical Engineer 60, Eden Grove, Holloway, N.7.

ISLINGTON (LONDON) BOROUGH COUNCIL, January 18th.—Supply of cables; electricity meters; terminal, service, network and fuse boxes; oil circuit breaker switches; elec-

Digitized by Google

trical sundries; wires; lamps; transformers, etc., for one year. Specification from the Town Clerk.

WEST RIDING EDUCATION COMMITTEE, January 19th.—Electric light installations in Norton New School and in Glass Houghton Ashton Road Council School and caretaker's house. Specification, until January 14th, from Education Department, County Hall, Wakefield.

ESSEX COUNTY AND COLCHESTER HOSPITALS COMMITTEE, January 21st.—Internal electric wiring of Brentwood Mental Hospital, with fuseboards, motors, etc. Specifications, etc., from Mr. H. H. Gepp, 66, Duke Street, Chelmsford; deposit £5 5s. Only registered contractors are invited to tender.

NEWBURY CORPORATION, January 21st.—Direct-coupled electric motor and centrifugal pump, etc. Specification, etc., from Messrs. H. Humphries and Sons, 28, Victoria Street, Westminster, S.W.1; deposit £1 1s.

LIVERPOOL CORPORATION, January 31st.—Twelve months' supply of various materials, including (E.S.1) cables, compounds and tapes; (E.S.2) insulated cables; (E.S.3) electricity meters; (E.S.4) cartage; (E.S.5) incandescent lamps; (E.S.6) brass and copper castings; (E.S.7) a.c. motors and starting gear; (E.S.8) stoneware troughing, etc.; (E.S.9) oils. Tender forms from City Electrical Engineer, 24, Hatton Garden, Liverpool. State number of form desired.

RIPON CORPORATION, February 1st.—Overhead 11 000 V transmission line and small quantity of e.h.t. underground cable (contract No. 2). Persons desiring to tender must communicate their intention to Mr. W. C. C. Hawtayne, 9, Queen Street Place, London, E.C.4, before January 11th. Specifications, etc., will be issued on or about January 18th to persons who, after receiving notice from Mr. Hawtayne, send to the Town Clerk a deposit of £2.

CENTRAL ELECTRICITY BOARD, February 18th.—Supply and erection of 132 000 V overhead transmission lines, in connection with the North-West England and North Wales Electricity Scheme. Specification (No. N.W.E.-P.L. 1) and form of tender from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, February 18th.—Supply and erection of 132 000 V overhead transmission lines, in connection with the Central England Electricity Scheme. Specification (No. C.E.-P.L. 1) and form of tender from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

DUBLIN BOROUGH COMMISSIONERS, January 5th.—Supply of (1) capping, casing and wire, and (2) electric time switches. Specifications (5s. for each) from the City Electrical Engineer, Fleet Street, Dublin.

TURKISH DIRECTOR-GENERAL OF POSTS, TELEPHONES AND TELEGRAPHS, January 5th.—Supply of 60 000 porcelain insulators and 15 000 swan neck fittings. (Reference B.X. 4 904.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 8th.—Supply of switching equipment and relays, for use in automatic telephone exchanges (schedule C. 381). (Reference B.X. 4 880.)

INDIAN STORES DEPARTMENT, January 8th.—Three oil engine driven 12½ kW generator sets (order No. N/9248). (Reference B.X. 4 956.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 8th.—Supply of protective apparatus for telephone equipment, including fuses, heater coils and arresters (schedule C. 380). (Reference B.X. 4 881.)

ROUMANIAN MINISTRY OF COMMUNICATIONS, January 10th.—Supply of 17 000 insulators; iron, steel, copper and bronze wire; and 11 000 copper coupling rings. (Reference A.X. 7 289.)

SOUTH AFRICAN RAILWAYS AND HARBOURS (extension of date), January 10th.—Supply of five electrically-driven traversers and one 5-ton hand-operated crane (tender No. 1 344.) (Reference A. 7 023.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, January 10th.—Supply of telegraph material, including cross arms, insulators, copper wire, copper binders and tapes, g.i. stay wire, steel spindles and stay rods, and c.i. pole-bases (tender No. 1389.) (Reference A.X. 7 301.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 15th.—Supply of loading coil pots. (Ref. B.X. 4 879.)

BULAWAYO MUNICIPALITY, January 18th.—Supply of street lighting material, transformers, h.t. and l.t. cable, h.t. kiosks and pillars, and busbar material. (Reference B.X. 4 965.)

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, January 21st.—Supply of static power transformers, for Young-Wyangala section of Burrinjuck hydro-electric development transmission lines (contract No. 235/28). (Reference B.X. 4 995.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, January 22nd.—Supply of two concrete mixers, with electric motors (contract No. D.W. 67/107). (Reference A.X. 7 315.)

BOMBAY, BARODA AND CENTRAL INDIA RAILWAY CO., January 23rd.—Supply of 400 kW heavy oil engine-driven generating set. Specification, etc. (20s.), from Mr. S. G. S. Young, secretary, White Mansion, Petty France, Westminster, S.W.1.

CAPETOWN MUNICIPALITY, January 23rd.—Supply of electric cable (specification 446/1928). (Reference B.X. 4 978.)

JOHANNESBURG MUNICIPALITY, January 24th.—Supply of weatherproof copper wire, with fireproof coatings and outer braiding, for use on overhead electric lines. (Reference B.X. 4 976.)

JOHANNESBURG MUNICIPALITY, January 24th.—Supply of electric cable (contract No. 109). (Reference B.X. 4 977.)

JOHANNESBURG MUNICIPALITY, January 24th.—Supply of oil switches (contract No. 114). (Reference B.X. 4 994).

EGYPTIAN MINISTRY OF THE INTERIOR, January 27th.—Supply of transformer kiosks, electric cables and accessories required for the extension of the electric supply of Mit-Ghamr power station. (Reference B.X. 4 893.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 29th.—Accumulator batteries and counter E.M.F. cells (schedule C. 390). (Reference B.X. 4 906.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, January 29th.—Single core, paper insulated lead covered cable. (Reference B.X. 4 954.)

WAIRARAPA (N.Z.) ELECTRIC POWER BOARD, January 29th.—Supply of 15 sets of earth leakage protection equipment (contract No. 78). (Reference B.X. 4 950.)

EGYPTIAN MINISTRY OF THE INTERIOR (SECTION DES MUNICIPALITES ET COMMISSIONS LOCALES), January 31st.—Diesel engine driven generator set, d.c. rotary balancer, and accessories, for Kafrel Zayat electric station. (Reference B.X. 4 931.)

MANAWATU-OROUA (N.Z.) ELECTRIC POWER BOARD, January 31st.—Supply of automatic re-closing 11 000 V switchgear for pole platform mounting (contract No. 57.) (Reference B.X. 4 988.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, January 31st.—Supply of electrically driven locomotive turntable (tender No. 1 386). (Reference A.X. 7 253.)

VICTORIAN ELECTRICITY COMMISSION, February 4th.—Supply of 11 000 V switchgear, in connection with the Yallourn power station extensions. (Specification No. 29/5). (Reference B.X. 4 897.)

VICTORIAN ELECTRICITY COMMISSION, February 4th.—Supply of 22 000 V switchgear and accessories, for Richmond Terminal Station. (Reference B.X. 4 901.)

VICTORIAN ELECTRICITY COMMISSION, February 4th.—Supply of 11 000 V switchgear, for installation in the Richmond Terminal Station (specification No. 29/3). (Reference B.X. 4 898.)

VICTORIAN ELECTRICITY COMMISSION, February 4th.—Supply of pillar insulators, with metal parts, for use on 132 000 V outdoor circuits. (Reference B.X. 4 921.)

INDIAN STORES DEPARTMENT, NEW DELHI, February 5th.—Supply of turbo-alternator, boiler, economiser, switchgear and cables. (Reference B.X. 4 944.)

EGYPTIAN STATE RAILWAYS, February 9th.—Electrification and equipment of Heluan line, including equipment of power station, overhead transmission lines, track bonding motor and trailer coaches, etc. Tenders to General Manager, Cairo Station.

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, February 11th.—Supply, erection and maintenance of hydro-electric generating plant, in connection with Hume reservoir hydro-electric development. (Reference B.X. 4 989.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, February 12th.—Supply of 110 kV switchgear, and controlling equip-

Digitized by Google

ment, for Waitaki power scheme, section 3. (Reference B.X. 4 848.)

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, February 12th.—Supply of dry cells, for telephone work. (P. and T. 151/1 205.) (Reference B.X. 4 991.)

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, February 28th.—Supply of six-conductor telephone cordage (No. P. and T. 151/1 234). (Reference B.X. 4 990.)

Tenders Accepted.

MORECAMBE CORPORATION.—Ferranti, Ltd., supply of 400 kVA transformer, £197 10s.

ROTHERHAM CORPORATION.—British Thomson-Houston Co., Ltd., supply of new nozzles for 30 000 kW set, £84.

ROTTERDAM MUNICIPALITY.—Metropolitan Vickers Electrical Co., Ltd., supply of two 42 000 kW turbo-generators.

GREAT INDIAN PENINSULA RAILWAY.—Metropolitan-Vickers Electrical Co., Ltd., supply of 21 electric passenger locomotives.

PRESTON CORPORATION.—English Electric Co., Ltd., transformer plant for Blackpool additional supply scheme, £35 100.

BELFAST CORPORATION.—Robert Craig and Sons, Ltd., erection of four sets of electrically driven pumps, for Gregg's Quay pumping station.

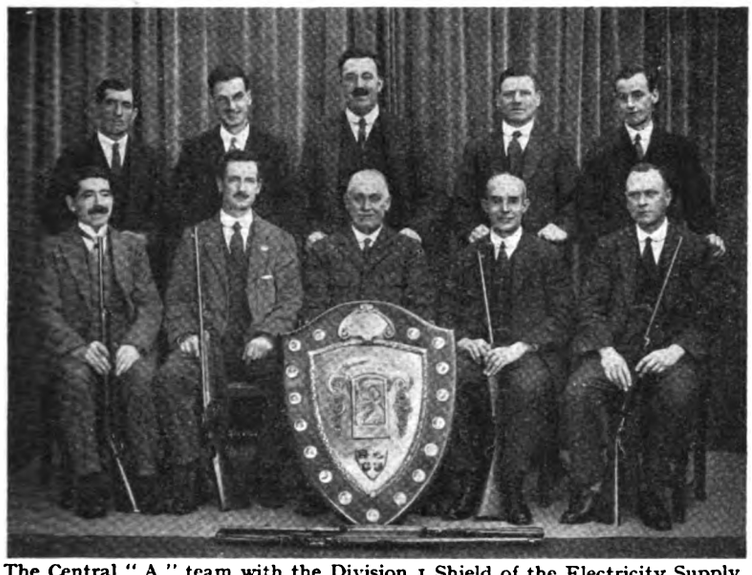
HACKNEY (LONDON) BOROUGH COUNCIL.—C. A. Parsons and Co., Ltd., supply of 30 000 kW turbo-alternator and condensing plant, £101 052.

EGYPTIAN GOVERNMENT.—Pirelli-General Cable Works, Ltd., manufacture and installation of a telephone trunk line between Alexandria and Cairo, £193 000.

ST. PANCRAS (LONDON) BOROUGH COUNCIL.—H. J. Toms and Sons, wiring and fitting twenty-four flats at Wicklow Street, £56. (Recommended.) Other tenderers: Taylor and Goodwin, £56; Sims and Sims, £57; City Electrical Co., £59; Bucknalls, Ltd., £62; White, Boys and Davey, £63; F. E. Pickering, £65; E. S. Russell and Co., £95; J. A. Wigg and Co., £100.

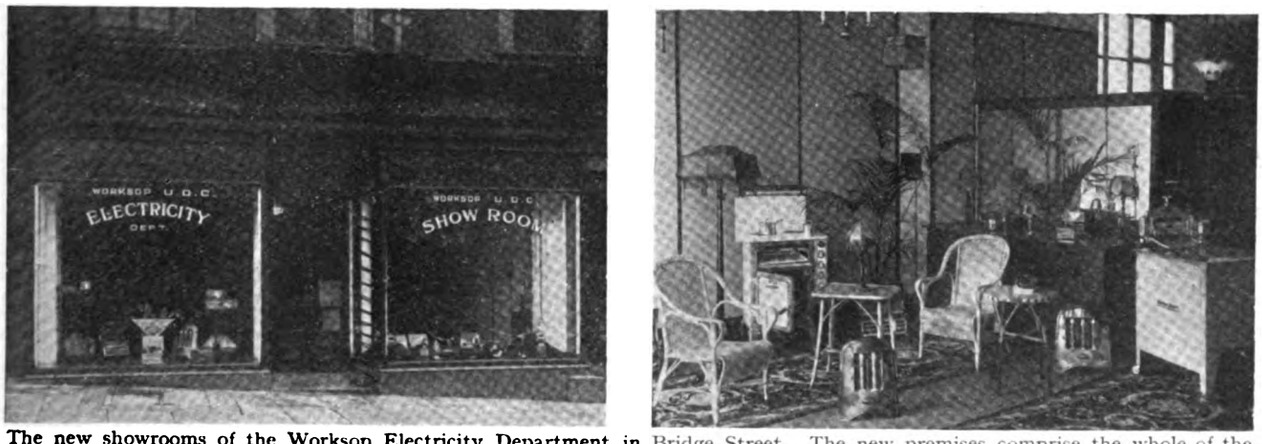
HESTON AND ISLEWORTH URBAN DISTRICT COUNCIL.—Supply of cables: Enfield Cable Works, Ltd., 5 000 yds. 0·01 twin-armoured, £510, 2 250 yds. 0·15 by 0·08 by 0·15 three-core armoured, £1 118. (Both recommended.) Also tendered: British Insulated Cables, Ltd., £522 and £1 145; Callender's Cable and Construction Co., Ltd., £518 and £1 135; Enfield Cable Works, Ltd., £510 and £1 118 (recommended); W. T. Glover and Co., Ltd., £520 and £1 136; Macintosh Cable Co., Ltd., £530 and £1 161; Pirelli General Cable Works, Ltd., £523 and £1 145; Siemens Bros. and Co., Ltd., £526 and £1 154; Union Cable Co., Ltd., £532 and £1 157.

ELECTRICAL NEWS OF THE WEEK IN PICTURES.



The Central "A" team with the Division 1 Shield of the Electricity Supply Rifle League, which was won after a tie with the City Co.'s "A" team. Reading left to right, the top row shows Messrs. W. Pearce, F. Smith, W. Owen, W. G. Wright and A. J. Beale. In the bottom row are Messrs. J. Lyons, E. E. Lee, W. C. Young, H. P. Gaze and A. E. Northop.

Mr. W. J. Jones, whose appointment as manager of the E.L.M.A. Lighting Service Bureaux in succession to Mr. W. E. Bush is announced on page 14. Mr. Jones has already played a prominent part in the Factory Lighting campaign.



The new showrooms of the Worksop Electricity Department in Bridge Street. The new premises comprise the whole of the double-fronted shop, while in the rear are the offices of the chief engineer and manager, Mr. M. S. Mason. A special feature of the new showrooms is a lounge (right) wherein is shown an extensive range of electrical fittings of domestic interest. Hitherto customers had some difficulty in keeping in touch with new developments, but with the present facilities a considerable extension of business is anticipated.

COMPANY NEWS.

Marconi Marine Shares Relapse—Siemens-Schuckertwerke Improved Dividend—Westinghouse Brake and Saxby Signal Co. Increased Profit and Dividend—Directors' Reports and Dividends—New Companies Registered.

MARCONI Marine shares, which immediately after Christmas were as high as 77s. 6d., have this week relapsed to 71s. 3d.; Marconi's Wireless shares, which after the holidays rose to 78s. 9d., have maintained that higher level. Henley's Telegraph Works ordinary have also maintained their higher quotations of 115s. Eastern Telegraph stock has shed half of last week's 10-point rise. British Insulated Cables have this week improved 2s. 6d. to 82s. 6d.; British Electric Transformer preference are 3s. lower than before Christmas. Metropolitan Supply ordinary shares last week rose 2s. 6d. to 47s. 6d.

WESTINGHOUSE BRAKE AND SAXBY SIGNAL CO., LTD.—Pft. for year to Sept. 30, 1928, after deducting int., £152 464, includg. £7 582 brt. in, agst. £117 372, includg. £10 254. Div. of 10%, less tax at 3s. 9½d., recommended, agst. 8% less tax. Fwd. £13 227. To res. £27 000, agst. £20 000.

WHITEHALL ELECTRIC INVESTMENTS, LTD.—It is reported that the American and Foreign Power Co. has agreed to sell to Mr. J. H. Macdonald, representg. Whitehall Electric Investments, Ltd., for $19 600 000, 100 000 shs. of the American and Foreign Co. $6 pfd. and £10 000 000 of 6% collateral notes of the South American Power Co.

MANN, EGERTON AND CO., LTD.—Pft. for year ended Sept. 30, 1928, £30 674, agst. £34 510. Pref. div. 8%; ord. div. 9d. p. sh. It is also proposed to pay 5% on and to allocate £8 000 to redemptn. of fundg. certs. Fwd. £12 312, subject to tax on fundg. certs. redeemed, compared with £9 826 brt. in. Subsidiary co. named Mann Egerton Finance, Ltd., has been registered to finance hire purchase operations.

HALIFAX AND BERMUDAS CABLE CO., LTD.—Credit blce. from workg. during year ended June 30, 1928, £34 378, or £31 244 after deducting income tax, compared with £26 949 for previous year. Brt. fwd. £82 083, makg. £116 461. Deductg. £3 134 income tax payable in England and intm. div. 10%, tax free, leaves £108 327, which is placed to gen. res. From gen. res. directors propose to pay bonus of £12 p. sh., absorbg. £120 000.

BENGAL TELEPHONE CORPORATION, LTD.—After paymt. of int. on mtge. bonds. Rs. 291 395, placing Rs. 145 530 to sinkg. fund for their redemptn., and provisn. of Rs. 722 206 for depreciatin., net pft. was Rs. 684 762, plus Rs. 17 420 brt. in. Div. on pref. shs. for half-year to Dec. 31, 1927, required Rs. 105 000, leavg. Rs. 597 182. Div. on pref. shs. for half-year to June 30, 1928, has been authorised. Div. on ord. shs. 7½%. Fwd. Rs. 32 897.

INTERNATIONAL TELEPHONE AND TELEGRAPH CORPORATION.—This corporation, wh. recently made an offer for the United River Plate Telephone Co.'s ord. shs., has authorised the issue of 10-year convertible 4½% gold bonds, redeemable, at the option of the corporation, in amts. of not less than $10 000 000 at 102½% on and after Jan. 1, 1930. Hldrs. will have the option of convertg. the bonds at par into common stk. at $200 p. sh. from July 1, 1929, to July 1, 1932, at $210 p. sh. up to July 1, 1935, and afterwards at $220 p. sh.

COMPANIES TO BE STRUCK OFF THE REGISTER.—The following companies will be struck off the Register of Joint Stock Companies unless cause to the contrary is shown before

Digitized by Google

February 28: Bastian Electric Co., East Lancashire Electrical Co. (Accrington). The following will be struck off unless cause to the contrary is shown before March 4: B. Barnett (Electrical Engineers, Leyton), Chase Electrical Manufacturing Co., Codd Arc Lamp Co., Electrical Distributing Co., International Radio Manufacturers, Morgan and Taylors Radio Electric, Northern Wireless Schools, Premier Electrical Supplies, Yera Electrical. The following will be struck off unless cause to the contrary is shown before March 14: Alphian Wireless, Ebonite Manufacturing Co., Essex Radio (Ilford), Hygienic Telephone Attachment Co., London and South Wales Electrical Engineers, Luen Electrical Supplies, Radiodyne, Radio Experimental Co., Spa Radio Co. The following will be struck off unless cause to the contrary is shown before March 18: Electrical Co., Electro Steel Foundries.

New Companies.

LISBELLAW ELECTRIC LIGHTING CO., LTD.—Cap., £1 000. To carry on business of electricity company. Reg. office: Lisbellaw.

ELECTROCORD, LTD.—Cap., £2 000. Manufacturers of and dealers in apparatus incidental to synchronising of mechanical music to cinematograph pictures, etc. Reg. office: 1, Cookridge Street, Leeds.

VERNON WISE (SHEPHERDS BUSH), LTD.—Cap., £100. To carry on business of authorised "Exide" battery service station agents, electrical, wireless and television engineers, etc. Reg. office: 298, Sandycombe Road, Kew.

SHROSBERY, BAKEWELL AND CO., LTD.—Cap., £1 000. To acquire business now carried on at Attleborough, Norfolk, as "A. J. Shrosbery," and to carry on the business of electrical engineers and contractors, etc. Reg. office: 69, Crouch Street, Colchester, Essex.

EINSTEIN'S ELECTRO CHEMICAL PROCESS, LTD.—Cap., £500 000. To acquire from Vladimir I. Einstein process invented by him for metalising materials by electro-chemical action, to carry on business of electricians, etc. Reg. offices: 16, St. Helens Place, London, E.C.3. (Public co.)

AVELING AND BARFORD AND PERKINS (SALES), LTD.—Cap., £10 000. Engineers, manufacturers of electric and other engines, dynamos, refrigerating and heating apparatus, etc. Solicitors: Durrant, Cooper and Hambling, 70–71, Gracechurch Street, London, E.C.3. (Public co.)

L. AND E. BRISTOW, LTD.—Cap., £2 000. To acquire the business of electrical engineers and contractors formerly carried on by L. Bristow and E. Bristow, at 40, Sloane Street, 5, Maddox Street, Buckingham Gate, and 21, Astwood Mews, London, and to carry on the same, etc. Reg. office: 40, Sloane Street, London, S.W.1.

UTILITIES CORPORATION (POLAND), LTD.—Cap., £400 000. To acquire, hold and deal in investments and securities of all kinds, to promote, finance, etc., electrical, mining and other businesses, and carry on business of engineers and contractors, etc. Reg. office: 33, Gracechurch Street, Lombard Court, London, E.C.3. (Public co.)

PEARL ELECTRICAL CO., LTD.—Cap., £100. To adopt an agreement with Lunar Electrical Co., Ltd., and to carry on the business of agents, factors, and importers of electrical goods and equipment, electrical and mechanical engineers, etc. Solicitors: Herbert Oppenheimer, Nathan and Vandyk, 1, Finsbury Square, London, E.C.2.

METAL AND CHEMICAL PRICES.

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debts. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

ELECTRIC INSTALLATION CO., 25, St. Mary's Row, Birmingham, electrical engineers. £13 1s. 11d. November 14th.

GROSS, Thos., Westfield Electric Co., 81, Burley Street, Leeds, electrician. £52 8s. 10d. November 22nd.

HOLLAND, Mr. W. H., 10, Pitville Street, Cheltenham, wireless dealer. £62 13s. 11d. November 14th.

LOWMANS, 113, Broadwall, Blackfriars, S.E., electricians £15 14s. 9d. November 23rd.

Bills of Sale.

BELLONI, Massino, 1, Harewood Place, Marylebone, N.W., electrical engineer. Dated December 19th, filed December 19th. £150.

REIDPATH, Archibald Stewart, 36, Elmfield Mansions, Upper Tooting, electrical engineer. Dated December 18th, filed December 20th. £200.

London Gazette, etc.

Bankruptcy Information.

ANDERSON, Robert, Talbot Street, Grangemouth, electrical engineer. H. C. M'Millan, accountant, 13, Dundas Street, Glasgow, has been elected trustee, and P. E. Smith, electrical supplier, 19, Castle Street, Edinburgh, and W. J. Magowan, electrical supplier, 60, West Regent Street, Glasgow, have been elected commissioners. The examination of the bankrupt will take place at the Sheriff Court House, Falkirk, on Monday, January 21st, at 11 a.m. The creditors will meet in the chambers of M'Millan and Henderson, accountants, on Thursday, January 31st, at 3.30 p.m.

BROWNHILL, Harold James, back of 48, Whitehouse Street, Walsall, electrical engineer. First meeting, January 11th, 11.30 a.m., Official Receiver's Office, 30, Lichfield Street, Wolverhampton. Public examination, February 20th, 10.15 a.m., Court House, Lichfield Street, Walsall.

Company Winding-up Voluntarily.

HICKMAN, LIMITED. By special resolutions, November 30th, confirmed December 17th. A. C. Nash, York House, 5 and 7, St. Mary Axe, London, incorporated accountant, appointed a liquidator.

Application for Discharge.

WALLIS, Cyril Kenneth, 51, Mons Avenue, formerly Bedford Street, and Longford Road, Bognor, Sussex, electrical engineer. Hearing, February 14th, 12 noon, Court House, Church Street Brighton.

Orders Made on Applications for Discharge.

BROWN, William Lewis, carrying on business in co-partnership with another as SEWELL AND BROWN, at 6A, The Exchange, Muswell Hill, Middlesex, electrical and radio engineers. Discharge suspended for six months until May 27th.

HODGE, Wilfred Percy, 92, Cannon Street, London, E.C., wireless salesman. Discharge suspended for two years, November 30th.

Partnerships Dissolved.

S. W. BLIGH (Sydney William BLIGH and James FULLAGAR) 1 and 2, North Lane, Canterbury, radio and electrical engineers, by mutual consent, December 18th, 1928. Debts received and paid by S. W. Bligh, who will continue the business.

MORLEY AND BOOTH (Frederick Hampson MORLEY and Herbert Coulson BOOTH), electrical engineers and agents, Star Buildings, Newcastle-upon-Tyne, as from December 31st, 1928. F. H. Morley will carry on business at Star Buildings, and H. C. Booth will carry on business at 20, Saville Row, Newcastle-upon-Tyne.

ROYAL RADIO CO. (Donald William MORPHY and Robert George McCALL) manufacturers of wireless apparatus, 4 and 5, Dorset Mews North, Upper Gloucester Place, London, by mutual consent as from December 10th, 1928. Debts received and paid by D. W. Morphy, who continues the business.

Bankruptcy Proceedings.

TURTON, John William, Market Place, Banbury, Oxon, electrical engineer. This debtor's statement of affairs shows unsecured liabilities of £715, due to 68 creditors, and assets (including book debts £114) estimated to produce £258, or a deficiency of £457. The debtor has been sued for some months by creditors, several of whom had obtained judgment against him at the date of the receiving order, which was made on his own petition, two executions having been levied. Debtor's books had not been balanced since 1925.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

301 983 A. Graham and Co., Ltd., and A. C. Brockies. Manually operated selecting switches for telephone and like systems. (24/9/27.)
301 989 Sterling Telephone and Electric Co., Ltd., N. Blades, and J. R. Beard. Loud-speaking telephones. (27/9/27.)
301 991 British Thomson-Houston Co., Ltd., and C. H. Hastings. Systems of electric motor control. (28/9/27.)
279 086 Allmanna Svenska Elektriska Aktiebolaget. Arrangement in commutator machines connected in cascade to induction machines. (15/10/26.)
302 009 H. P. Bramah and Metropolitan-Vickers Electrical Co., Ltd. Electric locomotives. (22/10/27.)
302 012 T. Harden and H. A. Mepham. Electrical plugs. (27/10/27.)
282 020 F. S. Smith. High-voltage system and apparatus for use particularly with X-ray tubes. (27/10/27.)
302 024 Electrical Improvements, Ltd., and L. C. Grant. Electric circuit-breakers. (7/11/27.)
302 025 British Thomson-Houston Co., Ltd., and E. G. Parrott. Electric contact-breakers. (8/11/27.)
302 039 V. Hope. Electric fuses and isolators. (24/11/27.)
302 048 A. B. Field, A. N. Hanworth and Metropolitan-Vickers Electrical Co., Ltd. Electric circuit-breakers. (10/12/27.)
302 057 G. Pate and J. R. Laird. Flickering devices for imitation fires. (17/12/27.)
282 449 A. Pouchain. Negative electrode for electric accumulators. (20/12/26.)
282 693 Siemens-Schuckertwerke Akt.-Ges. Arrangement for protecting stationary dry surface contact rectifiers from overload. (22/12/26.)
302 063 T. Yamanouchi. Clamps or connectors for electric cables. (29/12/27.)
282 827 International General Electric Co., Inc. Temperature responsive devices. (30/12/26.)
302 064 Imperial Chemical Industries, Ltd., and J. H. Paterson. Electrodes for use in arc welding. (30/12/27.)
302 066 Electrical Improvements, Ltd., and H. B. Poynder. Thermo-electrically operated devices for the protection of rotary dynamo-electric machines. (3/1/28.)
302 068 J. Brighouse. Couplings for electric conduits. (12/1/28.)
302 071 Allmanna Svenska Elektriska Aktiebolaget. Air-drying apparatus for oil-immersed electrical transformers. (4/1/28.)
285 870 S. Schild. Automatic protection and control of electrical installations. (21/2/27.)
302 107 F. Whipp, Whipp and Bourne, Ltd., and Mather and Platt, Ltd. Automatic electric cut-in and cut-out switches for battery-charging systems. (19/1/28.)
289 418 H. J. Kuchenmeister. Valve-amplifying device combined with a reproducing apparatus for sound films. (2/11/26.)
302 109 J. E. Long. Electric sign. (27/1/28.)
290 975 W. Rebikoff. Planet gear-drive for electromechanical phonographs. (10/9/27.)
291 441 Electroacustic Ges. Leads for sounding purposes. (2/6/27.)
292 071 Bergmann Elektricitatswerke Akt.-Ges. Alternating-current motors with short-circuited armatures. (11/6/27.)
292 010 C. Tourne. Incandescent electric lamps and the like. (23/6/27.)
302 128 B. Quast and F. Lomberg. Electrically driven roller wavs. (25/1/28.)
302 130 G. Pate and J. R. Laird. Resistance elements for electric fires and the like. (6/7/28.)
299 035 Siemens-Schuckertwerke Akt.-Ges. Submersible electric machines. (20/10/27.)
297 434 Marconi's Wireless Telegraph Co., Ltd. Coupling arrangements for use in high-frequency circuits. (21/9/27.)
301 964 F. Berg. Electric control switch constructions. (6/8/27.)

Applications for Patents.

November 29th.

35 217 J. B. Hansell and Metropolitan-Vickers Electrical Co., Ltd. Devices for measuring temperature in oil-immersed electrical apparatus.
35 182 B. Hesketh. Electric switches.
35 200 International General Electric Co., Inc. Electric protective arrangements. (29/11/27, Germany.)
35 215 Metropolitan-Vickers Electrical Co., Ltd. (Westinghouse Electric and Manufacturing Co.). Electric elevator control systems, etc.
35 186 M. P. A. Wireless, Ltd., and J. F. Shaw. Control of electric sound reproducing apparatus.
35 228 E. F. Northrup. Electric induction furnaces. (8/6/27.)
35 171 H. H. Perry. Electric heating apparatus.
35 125 W. Rogers. Electric lamp holders.
35 041 Standard Telephones and Cables, Ltd. Automatic telephone exchange systems, etc.
35 143 S. J. Tamen. Electrically-operated fastening.

November 30th.

35 331 Allmanna Svenska Elektriska Aktiebolaget. Current transformers. (17/2/28, Sweden.)
35 318 R. L. Aspden. Combined gramophone and wireless instruments.
36 363 British Electrical Reproduction Co., Ltd., and C. Berrage-Moulton. Loud speakers.
35 308 D. S. Burleigh. Electric drives for gramophones.
35 321 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Alternating current rectifiers.
35 337 Electrical Research Products, Inc. Television systems, etc. (6/4/27, U.S.)
35 272 H. J. Fisher. Electric cables.
35 360 A. F. Harrison and O. L. and S. M. Peard. Electric heaters.
35 345 E. B. Higgins and United Water Softeners, Ltd. Electrolytic production of sterilising agents, etc.
35 312 J. Keefe. Electric heating and cooking apparatus.
35 330 W. E. Lawton and S. Livingston. Apparatus for controlling electric advertising signs.
35 339 C. Lorenz Akt.-Ges. Piezo-electric control of valve oscillation generators. (2/12/27, Germany.)
35 323 G. Marr. Electric switches.
35 303 Metropolitan-Vickers Electrical Co., Ltd. Control systems for elevators, etc. (30/11/27, U.S.)
35 371 Siemens and Halske A.G. Telephone systems. (9/12/27, Germany.)
35 380 F. Warburton. Telegraph printers.
35 298 Western Electric Co., Ltd. (Bell Telephone Laboratories, Inc.). Acoustic devices.

December 1st.

35 491 F. G. Baum. Dynamo-electric machines.
35 413 J. H. O. Harries. Television systems, etc.
35 427 Landis and Gyr Soc. Anon. Electric measuring instruments. (24/1/28, Switzerland.)
35 490 C. Lorenz Akt. Ges. Vacuum tube oscillators. (2/12/27, Germany.)
35 411 R. Nicol. Electrical signalling apparatus for controlling vehicles.
35 426 A. Reynolds and Wandsworth Electrical Manufacturing Co., Ltd. Manufacture of operating dollies of electric switches.
35 466 Siemens and Halske A.G. Discharge vessels having electrically-heated cathodes. (2/12/27, Germany.)
35 483 E. Scott-Snell. Domestic electrical fixtures.
35 445 Walker, Hunter and Co., Ltd., and J. Walker. Electrically-heated ovens.

December 3rd.

35 534 C. D. Barklie. Thermionic valves, etc.
35 652 Benjamin Electric, Ltd., and G. Campbell. Shock absorbing mounts for thermionic valves, etc.
35 640 E. Bornand and H. A. Schlaepfer. Electric furnace. (8/12/27, Germany.)
35 612 British Thomson-Houston Co., Ltd. Electric contactors. (1/12/27, U.S.)
35 613 British Thomson-Houston Co., Ltd. Electric discharge devices. (2/12/27, U.S.)
35 636 Burovax, Ltd., and S. C. Winfield-Smith. Transformers for loud-speakers.
35 585 N. R. Campbell, and General Electric Co., Ltd. Electric discharge tubes.
35 505 L. I. Dennett. Electric gas lighters.
35 528 H. Hastings. Telephone transmitters.
35 501 E. V. Mackintosh. Moving-coil loud speakers.
35 565 H. Plein. Electric cut-outs.
35 627 R. Pollak-Rudin. Recording electric currents.
35 660 A. W. Saulter. Drums for carrying cables, etc.
35 661 A. W. Saulter. Containers for wound wire, etc.
35 655 Soc. Francaise Radio-Electrique. Alarm devices. (2/12/27, France.)
35 560 G. E. Taylor. Pedestals for electric conductors.
35 535 F. Wood. Thermionic valves.

December 4th.

35 703 British Thomson-Houston Co., Ltd., and J. C. Read. Transformers.
35 704 British Thomson-Houston Co., Ltd., L. R. Nixon and A. A. Pollock. Constant current distribution systems.
35 705 British Thomson-Houston Co., Ltd. Electric lamps. (6/12/27, U.S.)
35 729, 35 730, 35 731 P. Freedman. Thermionic valves.
35 770 Metropolitan-Vickers Electrical Co., Ltd. Electricity meters. (9/12/27, U.S.)
35 776 Nederlands Telegraaf Maatschappij Radio-Holland. Coupling devices for wireless telegraphy, etc. (6/12/27, Holland.)
35 698 J. W. Patrick. Electric fuse holders.
35 762 H. J. Round. Means for recording and producing sound.
35 785 Siemens and Halske A.G. Telephone installations. (23/6/28, Germany.)
35 686 F. L. Smith. Moving-coil loud speakers.
35 700 J. Swinburne. Selenium cells.
35 724 Westinghouse Brake and Saxby Signal Co., Ltd. Traffic controlling apparatus. (8/12/27, U.S.)

December 5th.

35 903 J. L. Baird and Television, Ltd. Television, etc., apparatus.
35 835 J. W. Bannister. Electromagnetic devices for actuating valves of organs, etc.
35 900 H. H. Berry. Signs.
35 886 British Thomson-Houston Co., Ltd., and A. A. Pollock. Dynamo-electric machines.
35 882 M. Dieterlen, H. Richter, and Siemens Schuckertwerke A.G. Crossfield d.c. machine.
35 836 G. Fieldhouse. Inductance coils.
35 807 G. E. Goodyear. Telephone apparatus.
35 925 P. St. J. Heaton and Radiovisor Parent, Ltd. Electric switches.
35 852 B. B. Johnson and Relay Automatic Telephone Co., Ltd. Electrical selectors.
35 911 L. Levy and A. Rio. Electromagnetic delay devices. (30/12/27, France.)
35 899 London Electric Wire Co. and Smiths, Ltd., and E. L. Wildy. High-tension cables.
35 919 A. I. Milledge. Electrical toys, etc.
35 907 H. J. Round. Microphones.
35 853 J. B. Snowden, and Young, Osmond and Young, Ltd. Resistance units.

December 6th.

36 043, 36 044 Associated Telephone and Telegraph Co. Telephone systems. (13/8/27, Belgium.)
36 057 Ateliers Vaucanson, and P. Marchal. Electric starting apparatus for motor vehicles, etc. (8/12/27, France.)
36 000 F. Baker, and Siemens Bros. and Co., Ltd. Electric contacts, etc.
36 010 F. G. Baum. Dynamo-electric machines. (6/12/27, U.S.)
35 988 G. A. Betulander. Electric relays.
36 028 British Thomson-Houston Co., Ltd. Apparatus for interconversion of sound and electrical impulses. (6/12/27, U.S.)
36 003 W. A. Cuthbert. Low frequency amplification.
35 990 Electric Fires, Ltd., and F. L. Newhouse. Thermostats.
36 014 H. Fairbrother (Vigilant Automatic Fire Alarm Co.). Fire alarms.

Coming Events.

Friday, January 4th.

Institution of Electrical Engineers (Meter and Instrument Section.)—Institution, Savoy Place, Victoria Embankment, London. Discussion on "Precautions in the Use of Standard Instruments." To be opened with a short paper by Mr. W. H. Lawes. *7 p.m.*

Monday, January 7th.

Institution of Electrical Engineers (Mersey and North Wales—Liverpool—Centre.)—The University. Paper by Mr. W. B. Woodhouse on "Overhead Electric Lines." (To be presented by a deputy.) *7 p.m.*

Tuesday, January 8th–Thursday, January 10th.

Physical and Optical Society's Exhibition.—Imperial College of Science and Technology, Imperial Institute Road, South Kensington.

Tuesday, January 8th.

Institution of Electrical Engineers (North-Western Centre.)—17, Albert Square, Manchester. Paper by Mr. J. L. Carr on "Recent Developments in Electricity Meters, with particular reference to those for special purposes." *7 p.m.*

Electrical Power Engineers' Association.—Junior Institution of Engineers, 39, Victoria Street, Westminster. Lecture on "Domestic Electrical Appliances: Design, Construction and Efficiency." *7.15 p.m.*

Institution of Electrical Engineers (Scottish Centre.)—Royal Technical College, Glasgow. Paper by Mr. L. G. H. Sarsfield on "The Electrical Equipment of X-Ray Apparatus." *7.30 p.m.*

Wednesday, January 9th.

Institute of Wireless Technology.—Engineers' Club, Coventry Street, London. Paper by Mr. J. Priechenfried on "Picture Transmission." *7 p.m.*

Thursday, January 10th.

Institution of Electrical Engineers.—Savoy Place, Victoria Embankment, London. General discussion on "A Study of the Future Development of Demand and the Economic Selection, Provision and Layout of Plant, as illustrated by Telephone Systems on the one hand and Power Systems on the other." Introductory papers by Captain J. M. Donaldson and Captain J. G. Hines. *6 p.m.*

Institution of Electrical Engineers (Dundee Sub-Centre.)—University College, Dundee. Paper by Mr. W. M. Mackay on "Static Rectifiers." *7.30 p.m.*

Friday, January 11th.

Institution of Electrical Engineers (London Students' Section.)—Institution, Savoy Place, Victoria Embankment, London. Paper by Mr. J. A. H. Lloyd on "Telephone Repeaters." *7 p.m.*

Gas Lighting on Railways.

IF there were any necessity to emphasise the danger of gas lighting of railway rolling stock the recent Charfield disaster—in which the death roll was materially increased by deaths from burns following the explosion of gas cylinders used for train lighting—provided undeniable proof. Nevertheless, there is no indication that the railway companies have taken any new steps to expedite the equipment of their older coaches with electric lighting sets. In Col. MOUNT'S report on a recent Welsh railway collision reference was made to an escape of gas from the passenger train involved, and though no explosion or fire occurred, the risk was present. It is understood that the subject of gas lighting generally on railway trains is being dealt with in the report on the Charfield accident, and we shall look forward with interest to the Ministry of Transport's recommendations. Meanwhile, the railways will be well advised to expedite their conversion plans. The railways have already lost a lot of custom to more attractive transport media, and indefinite continuation of the risk of cremation may be expected to encourage still more passengers to seek less hazardous means of locomotion. Although we shall continue to stress this safety aspect of railway lighting, we must also deplore the dismal appearance of many of the gas-lighted railway stations. Station after station at which one may stop on a main-line journey is enshrouded in gloom the profundity of which seems only to be emphasised by the dim glimmer of the antiquated gas lamps overhead. Apart from the depressing effect which such archaic lighting must exert on travellers, the railway companies might well consider how much these antiquities cost in reduced efficiency on the part of their employees. It is all very well to explain away these things by saying that even now the railways are not paying propositions. So long as a goodly proportion of their rolling stock and stations continue as throw-backs to the Victorian age, so long will the railways find difficulty in deriving financial reward. Safe lighting for all coaches and brighter and more efficient lighting for stations are among the necessary preliminaries to greater prosperity.

Wiring "Economy."

THE view that some form of compulsory registration for electrical installation contractors is really necessary continues to gain adherents, and though, as we have frequently pointed out, we cannot envisage a compulsory registration scheme until all the properly qualified contractors are included in the voluntary scheme of the National Register, two instances which have come to our notice within the present week certainly emphasise the need. In one case a well-known contractor sent one of his men to repair an ironing circuit in a house. He found that this had been added to the original installation put in some years ago. It was a metal sheathed job, and the ironing plug had been wired with a single 18's metal sheathed wire, and the sheathing used as a return. The sheathing was not properly bonded to the main installation, and had in consequence burned out. Comment on this case is equally as obvious as that of the other example brought to notice by a well-known firm of cable manufacturers. Receiving a request from an "electrical engineer and contractor" for a price list of wires and cables, they complied with his request, but were not unnaturally astonished to receive, a few days later, a request from that same "electrical engineer" for a diagram of connections for two-way switching!

Bare Wire Signalling Circuits.

CONSIDERABLE interest attaches to the report—recently referred to in our pages—on an investigation of the safety, in the presence of firedamp, of certified bare wire mine signalling bells when connected in parallel, which has been carried out at the Mines Department Testing Station at Sheffield. Since 1917 facilities have been afforded for the testing of mine bells and relays, and those that have passed the tests have been certified as safe for bare wire signalling underground with any source of current and at any pressure up to a maximum of 25 V. But, as pointed out in Mines Department Circular No. 24 of 1927, the certificate did not cover the use of such instruments in parallel, and the investigation, the results of which are now published, was undertaken to determine under what conditions they can be so used with safety. The inquiry has shown that the safety of the circuit is secured by limiting the current to a certain value below that which the resistance of the instruments themselves would allow to pass. The simplest and most reliable method of ensuring this current limitation is shown to be the use of a type of cell with a relatively high internal resistance, such as a 3-pint wet Leclanché cell, made in accordance with the specification in the Report. A list of the certified bells and relays which the use of this type of cell makes it safe to operate in parallel on bare wire circuits, which is also given, comprises most, but not all, of the certified types. Alternatives to the use of this type of cell, which are envisaged, include:—(i) A new type of

Digitized by Google

battery; (ii) the use of insulated cables; and (iii) combinations of bare wires and insulated cables.

A "Reciprocal Understanding."

THE understanding which has been arrived at between the Radio Wholesalers' Federation and the Wireless Retailers' Association, details of which will be found on another page in this issue, implies that a strong need for co-operation exists on that side of the radio industry not covered by the R.M.A. The membership of the R.W.F. appears to include most of the large radio factors in the country, and it seems likely, therefore, that membership of the W.R.A. will be accepted as adequately establishing an applicants' right to trade terms. If our appreciation of the position is correct, it is expected that this aspect of affairs will become steadily of more importance as the modes of obtaining illicit discounts become increasingly restricted, a condition which we are given to understand both associations intend to bring about. The more closely the clauses of the "understanding" are examined the clearer will it be that they are intended to constitute a check on the price cutting practices so prevalent in the trade, and there seems little doubt that, given the support of the generality of wholesalers and dealers, changes for the better could be affected. The success or otherwise of this effort to stabilise the retail side of the radio industry depends very largely upon the willingness of dealers to join the W.R.A., for even though the R.W.F. agree to supply only the W.R.A., members of the former must still supply non-W.R.A. dealers if the membership of the latter is not sufficiently large to absorb their stocks. The theory of the "understanding" appears to be satisfactory enough, but in practice the man that pays the piper, in this case the dealer, usually calls the tune.

The "Listener."

FOLLOWING upon the recommendation of the Sir HENRY HADOW'S Committee which, it will be remembered, concluded, early in November, its inquiry into the possibilities of broadcasting in relation to adult education, the B.B.C. has decided to publish a paper to be called the "Listener." This new weekly publication will make its appearance on January 16th, and will confine itself mainly to personal subjects and matters associated with programmes. It is believed that the new paper will not enter into competition with other weekly journals of wireless interest, but will, we are given to understand, make broadcast talks more effective by publishing such addresses after they have been put "on the air." Whether this publishing of all the talks that are given is likely to be popular is a matter which does not concern us, but the fact that the B.B.C. has stated that it does not intend to compete with the popular technical journals dependent upon the radio industry and listening public is reassuring. The microphone publicity at the command of the B.B.C. is of such value, that were the Corporation to advertise a technical paper of its own publishing in the same way that it puffs its two well-known programme journals, we believe that the unfair competition would quickly tell on the company-owned wireless papers at present enjoying good circulations. The B.B.C. has at its unlimited disposal a form of publicity which cannot be bought in this country, and though such monopoly has not to our knowledge ever been abused, we trust that the "Listener" will not prove an exception to the rule. Some three years ago the B.B.C. used to broadcast a review of the popular wireless papers each week, with the result that the editors of such journals used to compete for the most "honourable" mention. The feature was, however, discontinued after some little while, leaving in its wake the weekly "puffs" on behalf of the "Radio Times" and "World Radio." Presumably we shall soon have the somewhat doubtful pleasure of listening also to reviews of the contents of the "Listener."

A Portable Lamp Warning.

AT an inquest at Poplar (London) last week, a jury returned a verdict of "accidental death through neglect of the firm in using defective gear." The facts of the case were that the man whose death was the subject of the inquiry was using a portable electric lamp attached to about 25 ft. of flexible conductor. Investigation at the inquiry showed that the porcelain of the lamp top was broken, and the current, at a pressure of 250 V, passed through the brass guard to the man's hand. The Coroner, Dr. W. B. PURCHASE, not only very properly condemned the use of this type of lamp in such circumstances, but also pointed out that safer lamps were obtainable. As most lamp manufacturers and contractors are already aware, portable lamps which have their tops and holders completely cased in insulating material have been on the market for some time, and if electricians of works permit the use of metal hand guards which can possibly become alive, they not only do an injury to the electrical industry, and probably in the long run, to their own interests, but also endanger life. Both users of portable lamps and electricians who are not well informed on the subject would do well to visit the Home Office Industrial Safety Exhibition, in Horseferry Road, Westminster, and inspect the portable lamps on view there. The exhibits include several genuine safety lamps, as well as a number of examples which have been responsible for fatalities.

Electrical Refrigeration.

ELECTRICAL refrigeration has made rapid strides in Brazil during the last few years, mainly through the sales and propaganda work of three American firms. So considerable has been the progress made that in the larger cities, such as Sao Paulo and Rio de Janeiro, electric refrigeration is enjoyed by the average household. According to a "Commerce Report" of American origin, this general adoption of electrical refrigerators is the outcome of advertising and installing the machines in newly built houses and flats, with the result that electric refrigerators are being introduced with reasonable success after comparatively easy selling. In this country, where at the moment there is also a considerable number of houses and flats in course of erection, though we find gas boilers and geysers installed, we have never heard of an electric refrigerator being fitted and included in the purchase price of the house. The idea, however, appears to be worthy of development, and in the case of those houses where the purchase price is over four figures, the addition representing the cost of the refrigerator would appear small by comparison with the rest of the expenditure.

The Physical and Optical Societies' Exhibition.

THE nineteenth annual exhibition of the Physical and Optical Societies, which was held from Tuesday until Thursday, at the Imperial College of Science and Technology, South Kensington, was, if possible, a more comprehensive show than that of former years. The exhibits included a number of new and fascinating measuring instruments, including a wave-meter incorporating a four-electrode valve. This instrument has been developed by Dr. N. W. MCLACHLAN and is so designed as to produce a radio frequency oscillation modulated at audio frequency. The instrument will be described in greater detail in our next issue. Many of the research laboratories in the country, including the National Physical Laboratory, exhibited working models, while in many cases, exhibitors showed on their stands apparatus in section and in component form in order to convey to the visitor a better understanding of the merits claimed. It has not been possible to give a complete review of the exhibition in a single issue, and, though the descriptions of a number of the exhibits are unavoidably held over, the pages devoted to the exhibition this week indicate the trend of development in instrument design during the past year. The good attendance at the Imperial College during the three days of the show undoubtedly indicates the interest which measuring and other instruments hold for those of a mathematical turn of mind, interest which must be gratifying to both manufacturers and organisers alike.

LAMINATED SYNTHETIC RESIN PRODUCTS.

Notes on the Work of Early Experimenters—The Use of Paper or Fabric Bases—Importance of Control of Chemical Change—Varnish-paper and Varnish-fabric Boards and Tubes—Necessity of Guarantees to B.E.S.A. Specifications.

By A. R. DUNTON, A.M.I.E.E., and A. W. MUIR, D.S.O., M.C., B.Sc.

ALTHOUGH synthetic resin products have only recently come into general use in electrical engineering, and are still so incompletely understood by some engineers that they are viewed with a certain amount of suspicion where guaranteed reliability is demanded, it is interesting to note that some of the earliest experiments with such materials were made more than fifty years ago. Notable work in the production of resinous condensation products of aldehydes and phenols was carried out and described by Adolf Baeyer about 1872, and later by Kleeberg about 1891, by which time formaldehyde was a commercial product, and by Dr. L. H. Baekeland, who succeeded in producing a synthetic resin which could be controlled to a certain extent as it passed from the liquid stage into the final solid insoluble mass.

This development led to the production of materials in which a paper or fabric base was first impregnated with the resin and finally converted into a hard mass, and these materials found commercial application as a substitute for natural resin and shellac products, which are limited in their use by poor heat resisting properties, and especially by their low melting points.

The formation of synthetic resins generally involves the use of phenol and formaldehyde, the condensation product being obtained by heating definite proportions of these materials, either alone or, more usually, with a catalyst which may be either acid, alkali or neutral in character. In the process of manufacture the condensation process is arrested in order to produce a material which will readily soften at some definite temperature best suited to its use, as, for instance, its application to paper or fabric or mixture with fillers for moulded materials. The treated material is finally subjected to a further heating, which completes the condensation process and gives the hard characteristic material in its finished form.

The behaviour of the synthetic resin in the final change depends to a large extent upon the control of the chemical change in the first process, and owing to the difficulty of effecting this control considerable variations often occur in each fresh quantity of synthetic resin produced.

Manufacture of Boards and Tubes.

One of the most important applications of synthetic resin is in the manufacture of varnish-paper or varnish-fabric boards and tubes such as are now very extensively used in the electrical industry. For the manufacture of varnish-paper products, which are typical, long lengths of paper are passed through drying chambers where they are coated with synthetic resin varnish, which is usually applied in liquid form by the paper passing over rollers immersed in a suitable bath, and dried by the circulation of hot air in the chamber. The drying process calls for careful control in order to obtain the varnish-coated paper in exactly the right condition of dryness, or, as it is termed, "greenness." A varnish paper in too "green" a condition will give off an undue quantity of vapour during the later process of conversion, and a poor electrical product will result. If, on the other hand, it is dried too much, the varnish passes prematurely into the final stage of conversion and the adhesion between the laminæ of the final product will be weak.

The treated paper at this stage should not have a moisture content exceeding 3% by weight, and if not required immediately it should be carefully stored in a dry place, but not for too long a time, as a slow chemical change continues to take place.

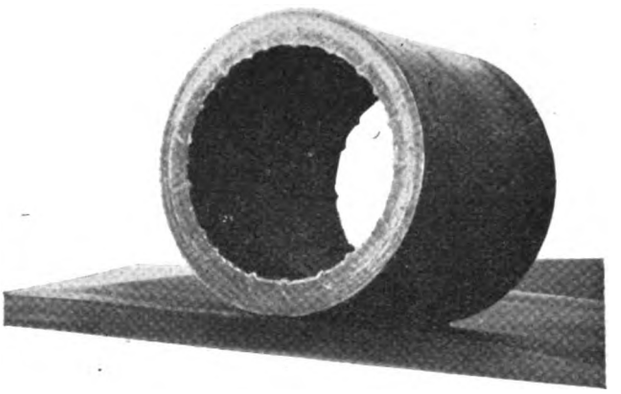

Fig. 1.—Synthetic resin paper tube showing effect of moisture absorption.

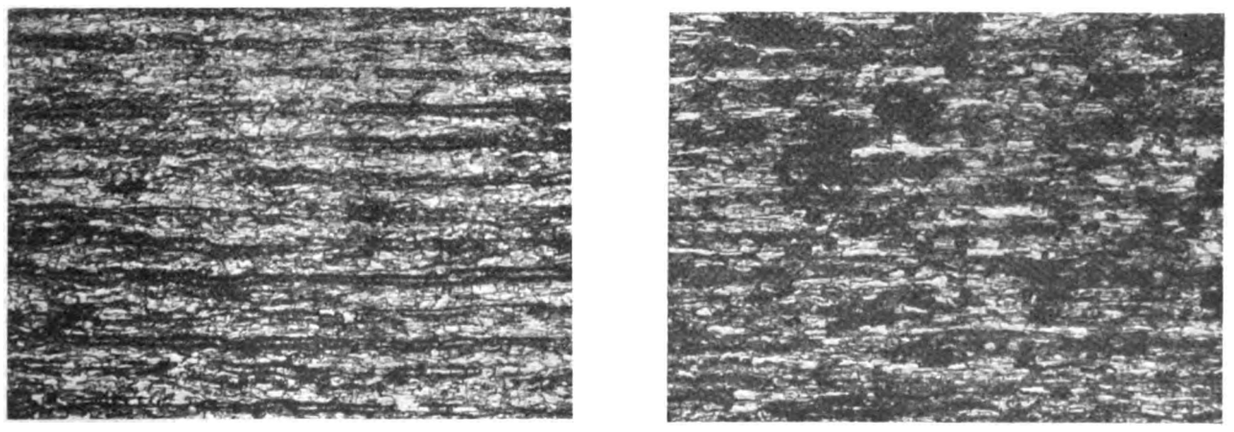
For the manufacture of boards the varnished paper is cut into suitable lengths and piled into stacks, which are subjected to a heat treatment under hydraulic pressure between highly polished metal plates. The pressure applied is approximately 1 000 lb./sq. in. and the temperature is maintained at about 150 to 170° C. The process is continued until complete conversion of the resin has been effected, the time required in some cases being at least four hours.

For making tubes and cylinders the process is in some respects more simple, since the treated paper can be run direct on to the mandrels of special winding machines. There is, however, quite an art in the control of temperature, and of the rate at which the paper is passed on to the machine.

In both the manufacture of boards and tubes there is often the temptation to hurry the process, as it is impossible to detect by casual observation the difference between good and bad products. For this reason the standard B.E.S.A. Specifications which are shortly to be issued detailing the desirable qualities of these materials will be of great value to all users. Guarantees to these standards should be insisted upon, and, wherever possible, the properties should be checked by suitable tests.

The class of board or tube depends not only upon the kind of carrying medium used but on the particular variety of that medium, and careful selection of medium is necessary according to the purpose in view.



Figs. 2 and 3.—A micro-photograph of laminated synthetic resin board (left) showing incomplete diffusion and (right) a similar photograph showing less distinct lamination due to more complete diffusion.

Digitized by Google

A study of the characteristics of available board or tube made from different varieties of paper or fabric medium shows that a variety of grades exist, differing in their properties and

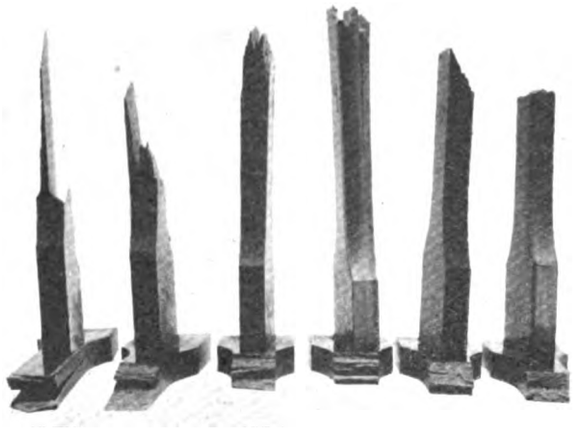


Fig. 4.—Fractures of synthetic resin paper tubes by tensile test.

therefore in the applications for which they are suitable. It is not sufficient, therefore, to specify simply " bakelite " board or tube, but the service must be considered and the suitable grade indicated.

It was at one time time thought that all synthetic resin boards and tubes were unaffected by moisture, but even some of the highest quality materials of their grade are seriously affected electrically by humid conditions. The drastic effect of moisture upon some grades is illustrated by Fig. 1, which shows the distortion of the inner layers and swelling at the ends of a tube which has been left immersed in water for some time. The degree of this effect depends on the thoroughness of diffusion of the resin through the carrying medium. Figs. 2 and 3 are reproductions of micro-photographs of cross sections of boards showing a marked difference in this respect. The board shown in Fig. 2 has a definite layered structure in which, if the material is not impregnated, the paper will act as a moisture conducting wick. The diffusion in the board shown in Fig. 3 is much more complete, giving a much better resistance to moisture penetration.

The nature of the structure of boards and tubes is also shown by the kind of fracture obtained in tensile tests, as illustrated in Figs. 4 and 5, which show the result of tests on specimens obtained from British, Continental and American manufacturers of repute. The specimens are arranged, from left to right, in the order of their tensile strength, the breaking points ranging from 23 000 lb./sq. in. in the case of the strongest material, having the layered structure and rugged fracture shown on the left of Fig. 4, to 9 000 lb./sq. in. in the case of the weakest material, having an almost homogeneous structure and the short fracture shown on the right of the same group. In boards and tubes giving a rugged fracture

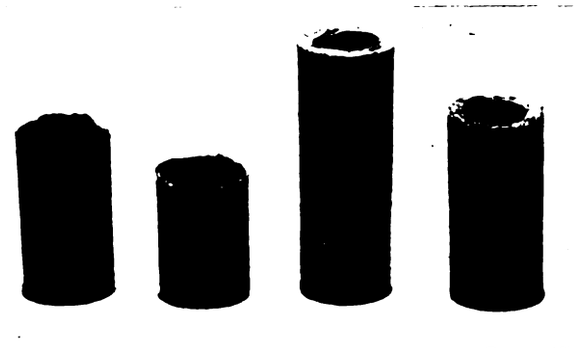

Fig. 5.—Specimens of synthetic resin paper tubes.

the resin content is approximately 30 to 40% and the mechanical features predominate, while the short fracture shows a material which has a resin content of about 60% or more, and which may be regarded as mechanically weak, but electrically far superior under humid conditions. For service under hot oil both kinds of material will be found to be equally satisfactory on electrical grounds.

Some idea of the average values for electric strength of synthetic resin paper-boards is given by Fig. 6, which is reproduced from " Electrical Insulating Materials,"* by Allan Monkhouse. The curves are given as based on information from various sources, including tests made on 29 different grades of materials supplied by 19 firms. The values for synthetic resin tubes and cylinders are considerably higher.

Some comparatively cheap variations of synthetic resin paper products are produced which have a low resin content, due to the use of a paper of low absorptive capacity, and even these materials may be satisfactorily used for electrical purposes in a limited field of application and under suitable conditions; for example, under dry transformer oil, but even under ideal conditions such materials should be given a suitable protecting film of at least three coats of a high grade moisture resisting baking varnish.

Acknowledgments are made to the Metropolitan-Vickers Co. for the use of photographs and information, and especially to the company's research department, where the investigational work and tests mentioned were carried out.

MICA PRODUCTION IN CANADA.

United States of America as the Biggest Buyer of Canadian Mica.

SHIPMENTS of Canadian mica during 1927 totalled 2 738 tons, valued at $174 377, according to finally revised statistics just issued by the Mining, Metallurgical and Chemical Branch of the Dominion Bureau of Statistics at Ottawa. The production in 1926 was 2 545 tons, worth $229 204. Increases were recorded in 1927 in shipments of rough-cobbed, thumb-trimmed and scrap mica; a considerable decrease was reported in shipments of mica splittings. Rough-cobbed and thumb-trimmed mica exported amounted to 165 tons; splittings, 159 tons; and scrap and waste, 4 536 tons. The total value of Canadian mica exported during 1927 was $326 846, which included shipments worth $304 781 to the United States and $21 035 to the United Kingdom.

In addition to the firms engaged in the primary production of mica there were four firms engaged in the secondary occupation of trimming and splitting mica. Nine of these mica trimming shops were in operation during 1927. Production from this source was valued at $285 555; employees numbered 479; salaries and wages reached $119 002; and raw materials cost $130 764.

ELECTRICITY IN QUARRIES.

In addition to orders which BLACKSTONE AND CO., LTD., of Stamford, report that they are receiving from all parts of the world for oil engines, the Jersey Granite and Concrete Co., Ltd., of St. John's, Jersey, which is modernising its power plant, has placed orders for the installation of the company's spring injection heavy-fuel oil engines to the extent of 450 H.P. This, we are informed, will result in reducing the cost of quarry output and ensuring favourable competition at English ports.

ELECTRICAL DRIVING OF CEMENT MANUFACTURING MACHINERY.

Advantages of Electric Drive—Details of Plant Required—Economic Considerations—Working a Rotary Kiln—Electrical Excavating Equipment—Some Interesting Installations Described.

IN order that this country should maintain its pre-eminent position as the home of the best Portland cement, it has been necessary for unceasing attention to be paid to the scientific aspect of manufacture and to the development of highly specialised machinery. In this connection, it is interesting to note that, whether the wet or the dry process of manufacture is adopted, electrical driving is extensively used, the individual driving of machines and perfect control of every operation which this method ensures being of particular value to the industry.

The raw materials include limestone, marl, chalk, marine shells, clay, shale, slate, and blast furnace slag, the chief operations for the manufacture of Portland cement being embraced under the headings: preparation of the raw materials, burning, and grinding. For this work the necessary machinery may be classified as the excavators, crushers, screens, grinders, mixers, wash mills, tube mills, pulverised fuel plant, rotary kilns, rotary coolers, pumps, elevators and conveyors, packers and weighers.

Description of Process.

The wet process is almost universally adopted in this country for the manufacture of Portland cement, but as the difference between the two processes lies only in the preparation of the raw materials, it is sufficient in this article to refer in outline to the sequence of operations for the wet process. Thus, if hard chalk and clay are the raw materials, the initial operations are crushing and screening of the chalk, mixing with water and grinding fine in a wet grinding mill. The resulting slurry is fed to a mixer, this being a large tank with some form of mechanically-driven paddles, which keeps the slurry of uniform consistency. This slurry is passed, as required, to the wash-mill, where it meets the clay; which has previously been broken up into small pieces in crushers of the roller type. The resulting slurry is further treated in a slurry mixer, this being similar to the chalk mixer previously mentioned, but it may be added that, instead of paddles, a method of air agitation may be employed. The next process is one for very fine grinding, either in what is known as a combination mill or in a ball mill followed by a tube mill, then, after being dried in a rotary drier, heated either by waste heat or separate firing, the burning operation takes place with crushed, dried and pulverized coal in a rotary kiln. The resulting product is cooled, and, in the form of clinker, is the desired cement, ready for grinding down in clinker grinding mills to the requisite fineness, feeding to the storage hoppers and weighing and packing into bags.

It will be seen that a considerable amount of conveying plant in the form of pumps and pipe lines, bucket elevators or band conveyors may be necessary, and a few facts about some of the items of machinery with relation to the electric driving requirements may be interesting. Various reasons have led to the widespread adoption of electric driving, and it may be mentioned that notable economies have resulted from installations utilising electric power, increased output for a given power consumption being obtained in consequence. Under normal conditions, cement mills are kept in continuous production, operating 24 hours a day for seven days a week, although the preparation machinery may be in operation for a shorter time, and it is important that the shutting-down of any one machine shall not affect the remainder of the plant. This condition is fulfilled by the sub-divided drive possible with electric power, and at the same time a continuous record can be obtained of the amount of power used in each of the different sections of a mill. Thus an accurate check can be kept on the cost of manufacture and condition of the machinery. Most of the machines start under heavy overload, even up to 200 or 300 per cent., and some are liable to overloads when in operation. Electric motors run at very high efficiency during normal operation, and yet can be obtained with a large margin of overload capacity which is drawn upon automatically at any time either at starting or when in operation.

With the exception of rotary kilns, the majority of the larger machines used in the manufacture of cement are of the constant speed type, so that, as the electricity supply available is usually three-phase a.c., induction motors form ideal driving units in most instances, but for some of the larger powers synchronous motors are often used. The preliminary crushing of hard materials is generally effected with gyratory or jaw crushers driven through belting, and sometimes provided with a break-pin in the driving pulley as a protection against damage. Individual driving or group driving of three or four crushers with their attendant elevators and conveyors is usually adopted. The starting torque required is generally somewhat more than the full load torque of the motor. Ball mills take more than normal torque at starting, this being due to the high frictional effect and the weight of the steel balls, which will all be at the bottom of the cylinder when this is at rest. When, in operation, the screens may become temporarily clogged, so that as the material continues to feed into the mill, it may gradually fill up and require more power to drive it. This overload, however, is not likely to exceed 25%, and lasts only for a short time. These mills revolve at about 20 r.p.m., and are supplied with a countershaft geared to the drum. Belt drive from the electric motor to the countershaft is generally adopted, though the motor may be coupled to the countershaft through enclosed gearing or, in some instances, direct through a flexible coupling.

Tube mills are used to finish the product of the ball mills. The essential components are a steel cylinder lined with some special hard wear-resisting material, and about half-filled with flint pebbles or cast iron pellets. The cylinder is supported on trunnion bearings and is rotated at a comparatively slow speed. The material enters through a hollow trunnion, moves through the whole length of the mill body, while it rotates, and is discharged at the opposite end of the mill in a very finely pulverised condition. Sometimes considerable variation in the power required and output of a given size of mill may be noted, due to the quantity of pebbles in the mill, and, as the pebbles wear down, the power required by the mill decreases. In determining the size and type of motor, careful consideration must be given to the starting torque required, which may be about twice the full load torque of the motor.

Rate of Feed.

In order to obtain the best results with the rotary kiln, the firing process necessitates careful control of the rate of feed of raw material, rate of feed of fuel and speed of kiln. The raw material feed and the coal feed should have a wide speed range with a very large number of intermediate speeds, and if a d.c. supply is available, a d.c. variable speed motor may be used for this duty, while on a.c., a variable speed a.c. commutator motor is suitable. A speed range of 3 to 1 is normal with motors of this type, brush-shifting control giving an infinite number of intermediate speeds. Thus the motors meet the requirements for feeding the pulverised coal and slurry to the kilns, and as the brush-shifting arrangement is easily adapted to remote control, a sensitive control of slurry and coal feeds can be obtained from the firing platform. In addition to variation in the rate of feed of material, it has been general practice to demand also speed variation of the kiln from maximum down to 75 or in some cases, 50% of maximum. The speed control is obtained either by retention of the older line shafting with speed changing gears giving two or three speeds, or with cone pulleys giving a range of two or three to one, the driving motor being of a constant speed type, or by using a variable speed motor for each kiln. The drive may be taken from the motor through the medium, either of belt or gearing, but as the questions of ventilation and room temperature are important, belt drive is usually adopted, an incidental advantage being that the motor is thereby removed further away from the hot kiln.

If variable speed a.c. motors are used, these may be either of the induction type with wound rotors or of the commutator type, but for speed variation of between 25 and 50%, which is ample in most cases, induction motors have proved quite satisfactory. The speed variation is obtained by means of adjustable resistance connected across the slip-rings, and, although the method does not give the highest electrical efficiency, no serious objection can be taken, as the kiln drives account for only a few per cent. of the total

Digitized by Google

power requirements in a cement works. It should be mentioned that by adding resistance to the secondary circuit the speed change for a given change in load is increased, and the greater the resistance the greater is the speed change, so that, when operating at low speeds, changes in torque have a noticeable effect on the speed of the kiln. These changes may be gradual, as when due to such causes as the partial blocking of the kiln by the formation of a clinker ring, or they may occur every revolution, due, for example, to the kiln being unbalanced.

In addition to synchronous motors, squirrel cage and slip-ring induction motors, as mentioned above, synchronous induction motors, "no-lag" power factor correction motors and a.c. variable speed commutator motors manufactured by the British Thomson-Houston Co., Ltd., Rugby, are extensively used in the cement manufacturing industry, and it is of interest to note some of the applications of the last types mentioned. "No-lag" motors are started and stopped in exactly the same manner as ordinary slip-ring induction motors, but run at or above unity power factor, so as to improve the power factor of the a.c. system to which they are connected. The effect of this is that more useful power can be generated with the same generating plant at the power station than if only ordinary induction motors are connected to the supply system: as a result the user obtains more advantageous terms for power, not only for that taken by the "no-lag" motors, but for all power taken from the system. Motors of this type have similar speed torque characteristics to those of ordinary slip-ring induction motors, and, therefore, can be used for any duty where slip-ring motors are suitable, whereas synchronous motors have a more limited field of application. In some cases a higher speed than the synchronous speed of the equivalent slip-ring induction motor may be required, and this can be obtained if a "no-lag" motor is used, as when being designed this special speed can be arranged for. As an example, reference may be made to motors of this type driving bag filling machines at the works of the Associated Portland Cement Manufacturers, Ltd. B.T.H. variable speed a.c. commutator motors are applied to various other kinds of drives than those previously mentioned, including the driving of coal screws for feeding pulverised coal to kilns, silo emptiers, slurry elevators, etc.

Some Examples.

Fig. 6 on the opposite page gives a view in the cement works of Greaves, Bull and Lakin, Ltd., Harbury, near Leamington. The electric motor on the left is driving a rotary cooler, and the motor on the right a rotary kiln. The first mentioned is rated at 15 H.P., and the second at 50 H.P. Both are of the slip-ring type manufactured by the British Thomson-Houston Co., Ltd., Rugby, the supply being at 433 V, three-phase, 50 cycles. In Fig. 5 is seen another example of electrical driving in the same works; the squirrel-cage induction motor illustrated is of 22 H.P., and drives a crusher and elevator. An instructive illustration of the ease of converting from steam engine to electric motor drive is given by Fig. 7. Here is seen part of the original engine-room of John Ellis and Sons, Ltd., at Barrow, near Loughborough, with a protected type slip-ring induction motor of 175 H.P. installed to drive some of the original line shafting of the mills through "Fabroil" pinion gearing. The motor-control gear is also shown, the motor speed being adjustable by the use of resistance in the rotor circuit through the medium of a controller of the tramway type. Connected to the shafting are two three-roll grinding mills, brick presses, elevators and conveyors. The illustration shows a stage in the conversion, the policy pursued by Messrs. Ellis having been to adopt electric motors for all extensions, retaining the steam engine (which was built in 1883) in service until fairly recently.

Another interesting electrical installation to which reference may be made is that at the works of the Rugby Portland Cement Co., Ltd. Here also the plant is now electrically driven, the motors being fed at 433 V, three-phase, 50 cycles. The motors range from 2½ H.P. to 250 H.P., three of the larger size being of the "no-lag" type. In Fig. 1 are seen a 250 H.P. "no-lag" motor driving a tube mill and a 100 H.P. protected type slip-ring induction motor driving conveying plant. One of the other 250 H.P. "no-lag" motors drives two "clinker and ball" mills, and another drives a crusher, tube mill and elevator. An example of a synchronous induction motor in a cement works is seen in Fig. 2, which shows a 600 H.P., 710 kVA 0.7 leading power factor, 250 r.p.m., 440 V, three-phase, 50-cycle machine driving a tube mill in the works of the Holborough Cement Co., Ltd., Snodland, Kent. This motor is shown in greater detail in Fig. 4.

In conclusion a word should be said about excavating equipment; electrically operated navvies are becoming increasingly popular for surface mining operations. In a plant which works continuously, the ability of the electric excavator to work 24 hours a day is of great value, and since there is no necessity to provide for transporting coal to the navvy, the wagon service can be organised for maximum efficiency. In addition to the elimination of coal handling, the cost and difficulties of supplying feed water are non-existent, and no delays are experienced through freezing in winter. A fairly large machine with complete electrical equipment is shown in Fig. 3, digging chalk at the Bevans Branch (Northfleet), of Associated Portland Cement Manufacturers, Ltd.

PLANT FOR THE HANDLING OF SACKS.

Lifting and Handling by means of Electrical Equipment—Its Adoption at Buenos Aires.

THE adoption of electric drives for lifting and handling plant has made it possible to build equipments which satisfy every requirement as regards simplicity in design and reliability in service. Experience has, in fact, shown that it is advantageous to adopt such mechanical means for the handling of goods, even when the latter are light in weight. An interesting equipment of this description is that installed by the Oerlikon Company at the sack factory of Messrs. Bunge and Born, at Buenos Aires; the plant in question, which is fully described in Bulletin No. 91, just issued by Oerlikon, Ltd., of 28-31, Essex Street, Strand, W.C.2, is intended for serving the various storerooms and workrooms of this factory. The storerooms for the rolls of material and for the completed sacks, consist of three parallel bays, each equipped with a travelling crane. The service between storerooms and workrooms is ensured by an overhead conveyor, on which circulate a number of electric motor hoists, the runway being provided with the necessary points for the different tracks. The travelling cranes of the storerooms are of standard design and fitted with a runway girder to link up with the runway of overhead conveyor. The motor hoists can thus run on to the travelling cranes and the whole storerooms can be served. The runway of conveyor is so arranged that separate access is provided to each individual crane. The points of the runway are set by hand from the driver's cab on the motor hoist. It is possible to run the motor hoists forwards or backwards, as required. The whole installation is operated with three-phase current at 200 V, 50 cycles.

CARDIFF CONTRACTORS.

Annual Dinner of the Cardiff Branch of the E.C.A.

AT the annual dinner of the Cardiff Branch of the Electrical Contractors' Association, which took place on January 3rd, with Mr. R. L. Booth, chairman of the Branch, in the chair, Mr. J. W. Beauchamp said he was extremely interested in the welfare of the electrical contractors. In these days, when the purchasing power of the people was greatly reduced and a great number of them had not much money to spend, there was more reason why they should try to develop some hobby interest in electricity. They wanted to bring their electrical gear into the interesting hobby category. With regard to the schemes of the Central Electricity Board they could not fail to reduce the cost, but people must not expect too much. He thought it necessary that they should have some accurate information as to what the scheme would really mean.

Mr. T. E. Algar, proposing the toast of "The Visitors," coupled with the names of Mr. Morley New and Mr. H. Coope, said Mr. New had always been a good friend to electrical contractors.

Mr. C. G. Morley New mentioned the interesting fact that during the last twelve months he had been able to place £25 000 worth of work in the hands of local contractors. A large proportion of that had gone to the members of the E.C.A. The £25 000 covered no less than 3 000 separate orders, and those were given during a period of great depression. The department had opened showrooms, and in this connection they had recognised the E.C.A. and discussed sales arrangements with them.

Mr. L. C. Penwill said the advent of women had proved a great advantage to the industry. The Electrical Association for Women had already become a great power.

BOOK REVIEWS.

Das Rechnen Mit Vektoren in der Elektro-Technik. By R. LUNDHOLM. (Stockholm : Centraltryckenet). Pp. 99.

This monograph consists of three chapters of about 20 to 30 pages each. The first chapter gives a complete analysis of three-phase circuits under conditions of unbalanced loading. With the rapid development of technical theory it is difficult to know how much must be taken as generally accepted and how much novel, and it is best perhaps to summarise the methods introduced in this chapter.

The system is based primarily on the well-known resolution of an asymmetric three-phase system of vectors into two symmetrical three-phase systems and one uniphase vector, special symbols being used to denote the asymmetrical and the forward and inverse sequence symmetrical systems. The notation is based on the polar system of co-ordinates which, though frequently found in American works is rarely used in this country in spite of its many advantages.

A special form of product—effective product—is introduced as well as the usual symbolic or complex product, and is defined as the product of the first vector and the momentary value of the second. This reminds one of the two products of the Heaviside-Gibbs three-dimensional vector geometry, but of course the definitions are different. Very considerable use is also made of the properties of conjugate functions, in particular the property that the sum of a complex function and its conjugate is equal to the real part of either.

The solution of differential equations is treated in terms of Heaviside's Operational Calculus, particular use being made of the method of expressing the impressed force as a function of the operator-p.

Considering the ground covered in approximately twenty pages the exposition is exceedingly lucid, but the work is decidedly of an advanced character. For example, the literature on Heaviside's operators is now very large—as a glance at the bibliography at the end of Carson's recent work will show, but it is a highly specialised subject appealing to telephone and telegraph engineers, and it is doubtful if many others could follow this part without reference to a more complete exposition.

The methods set out in the first chapter are applied with considerable skill in the second and third to the study of electrical machinery, and the problems of magnetic saturation and stable parallel operation are considered. This deserves the attention of machine designers and transmission engineers. Experience will show whether so complete an analysis is often required.

Selected Papers on Wave Mechanics. By L. DE BROGLIE and L. BRILLOUIN. (London : Blackie and Son.) Pp. 151. 15s. net.

Collected Papers on Wave Mechanics. By DR. E. SCHRODINGER. (London : Blackie and Son.) Pp. xiii+146. 25s. net.

The electrical laws which the engineer knows so well and uses so successfully fail completely when they are applied to the interior of the atom. These books are reprints of original papers suggesting modifications of electro-mechanics which render it applicable to the interiors of isolated atoms.

These modifications are similar to those which convert geometrical optics into the undulatory theory of light. Just as we can no longer speak of the path of a ray when diffraction occurs, we can no longer assign a precise meaning to the position of an electron, when the scale considered is small compared with the " spread " of the wave-group associated with the electron. The group " spreads " at least once round the " orbit of the electron in the atom," so that we can no longer speak of the " position of an electron in its orbit."

The waves in question are not electric waves nor (according to Schrodinger) are they even waves in space, but are propagated in " configuration-space " (space of three times as many dimensions as there are atoms under discussion). Their connection with electromagnetic waves arises from the fact that the square of the modulus of the field-scalar (the " thing the waves are waves of ") is identified with density of electric charge. The wave mechanics provides a " natural " as opposed to an " artificial " explanation of the discontinuous nature of energy exchanges.

The principal application of wave mechanics is to the prediction of wavelengths and relative intensity of spectral lines, but the method also predicts new vagaries for the electron. To take a somewhat hypothetical case, suppose we have a beam of moving electrons as in a cathode-ray oscillograph, and we wish to reduce the lateral spread of the beam consequent on their mutual repulsion. Then, on classical electrodynamics, we might make the lateral spread zero by passing the beam through two pinholes each so small that two electrons could not scrape through side by side. The emergent beam would consist of single electrons following one behind another.

But the wave mechanics asserts if such a pinhole could be realised the electrons would be diffracted in going through it, and the beam would become a series of concentric cones (just as, in a pinhole camera, if the pinhole is made too small, the definition actually gets worse). Thus, he would be a rash man who said that the wave mechanics had identically no bearing on electrical engineering, though the connection is, at the moment, very remote.

The subject is still growing, and, as Dr. Schrodinger points out in his preface, it is not yet possible to give a complete and satisfactory exposition of wave mechanics. He, therefore, issues his collected papers in book form as a temporary measure, for the convenience of specialists in this work. Both books tax one's mathematical ability to the full, Thus, de Broglie discusses Kaluza and Kleins' " Universe of Five Dimensions." (" In the five-dimensional Universe the world line of every material particle is a geodisic.") Leon Brillouin introduces us to an ingenious physical assumption which, on statistical treatment, yields Einstein's formula for the fluctuations of black radiation. To this treatment he applies the curious name " the new statistics " ; one is tempted to murmur with Lord Goschen, " You can prove anything by statistics."

C. R, BURCH.

Automatic Telephony Simplified. By G. W. BROWN. (London : Sir Isaac Pitman.) Pp. 68+viii. 6s. net.

Originally appearing in the " Telegraph and Telephone Journal " as a series of articles, the contents of this book deal with the principles and practice of automatic telephony as adopted by the British Post Office. The book is an excellent introduction to the Strowger system of automatic working. Commencing with an introductory chapter, in which step-by-step switching, remote control, impulsing and the subscriber's dial are described, the reader is led in a very able and systematic manner to the more difficult phases of automatic telephony, viz., multi-exchange working and large exchange areas. The illustrations and diagrams accompanying the text will be found extremely useful to the reader in following the various schemes explained. This especially applies to Chapter IV, which deals with " Diagrams and Circuits."

The book can be confidently recommended to students of automatic telephony, and to those who wish to further their knowledge of circuit detail the references in Appendix I will be found useful.

A. S. C.

The Call Indicator System of Automatic Telephony. By A. G. FREESTONE. (London : Sir Isaac Pitman.) Pp. 112+xii. 6s. net.

Although this book is intended primarily for students of automatic telephony, it should appeal to others whose interest is of a more practical nature, and who wish to become conversant with the methods adopted to enable " manual " exchanges to be worked in conjunction with " automatic " exchanges during the period of conversion from the former to the latter type of working. Owing to the fact that the author has been granted permission by the Engineer-in-Chief to use the drawings and illustrations prepared by the Department, the book may be accepted as indicative of the present methods adopted by the Post Office.

Thoughout the book the author has adopted the excellent plan of preceding the description of each circuit by a schedule of the facilities it provides. With the aid of the inset diagrams provided, the reader should have little or no difficulty in understanding the operation of these circuits. It is a pity, however, that the inset diagrams have been placed in the book with so little regard to the need for continuous reference between them and the text.

The book appears to be free from material errors, and can be thoroughly recommended to those who wish to obtain further knowledge of machine switching principles, as applied to modern circuit problems.

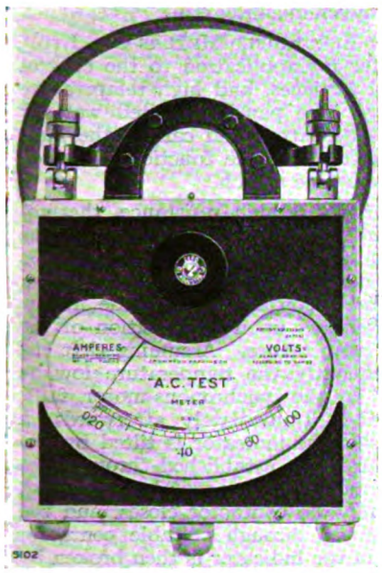
PHYSICAL AND OPTICAL EXHIBITION.

Many Electrical Exhibits Shown for First Time—A New Larsen-Potentiometer—Electroscope Development—An Improved Portable A.C. Multi-Range Instrument.

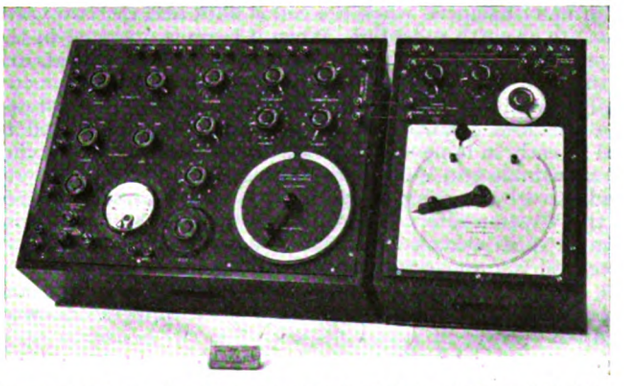
THE nineteenth annual exhibition of the Physical and Optical Societies was held on Tuesday, Wednesday and Thursday, at the Imperial College of Science and Technology, South Kensington, S.W.7.

The exhibits of the COX CAVENDISH ELECTRICAL CO., LTD., comprised induction coils, actino-therapy apparatus and sundry electro-medical and surgical instruments. The stand of CROMPTON PARKINSON, LTD., showed a wide range of instruments, including what is known as the "A.C. Test" portable a.c. multi-range ammeter and multi-range volt meter with single movement, an example of which was exhibited for the first time at the 1928 exhibition, but was shown this year with various new attachments. The instrument consists essentially of a ring of iron stampings forming a magnet and having a cylindrical gap in which the movement, somewhat on the lines of the ordinary moving iron movement, but with specially shaped moving irons, is fitted. When a conductor carrying current is passed through the ring of iron stampings these become magnetised, and the flux in the gap causes the moving irons to turn and tend to bridge the gap. The instrument has no windings, and as an ammeter is not connected electrically to the circuit to be measured. For current measurements the "A.C. Test" has an infinite number of ranges in a downward direction from the maximum for which it is scaled, depending only on the number of turns of the current-carrying conductor passed through the iron arch. Standard multi-turn attachments are made for instruments scaled 0/100, enabling them to be used for low current measurements down to a few milliamperes, and also as voltmeters up to 600 V. Other exhibits were portable d.c. multi-range testing sets, demonstration sets for laboratories, complete potentiometer equipment, Crompton-Robertson bridge potentiometers, etc. The DUBILIER CONDENSER CO. (1925), LTD., exhibited a wide range of radio condensers, both fixed and variable for laboratory use, as well as wave-meters and measuring instruments of more general type. The EDISON SWAN ELECTRIC CO., LTD., showed representative examples of transmitting and receiving valves, battery eliminating devices, resistances, tubular condensers, and loud speakers. Accumulators and batteries were also shown. Electrically-driven vacuum pumps were shown by W. EDWARDS AND CO. in operation, and, where possible, sections, components, and drawings were displayed to illustrate the construction of the apparatus.



The "A.C. Test" instrument, by Crompton Parkinson, Ltd.

Among the exhibitors were BAKELITE, LTD., who showed a variety of bakelite mouldings, varnishes, cements, laminated sheets, etc., in addition to a new flaked fabric moulding material which is claimed to be particularly resistant to shock. The CAMBRIDGE INSTRUMENT CO., LTD., exhibited for the first time a number of instruments, including a frequency recorder, which consists of a recording potentiometer, together with an electromagnetically operated vibrating member which is tuned approximately to the frequency to be recorded. This member carries two contacts, and at each oscillation one of these contacts completes a circuit through a precision mica condenser and a standard cell. The circuit is then broken, and the second contact made, which connects the condenser through a resistance to the potentiometer, thus enabling the condenser discharge to be measured and recorded. The provision of a standard cell ensures a constant charging voltage, so that the value of the condenser discharge depends on the frequency with which it is charged and discharged per second, that is, on the frequency of the circuit connected to the electromagnet actuating the vibrating member. The resultant temperature coefficient of the condenser and standard cell is so small as to render the arrangement almost independent of temperature variations. The record is traced on a continuous chart 7 in. wide, the range of frequency covered being 8 cycles per second, which gives a very open scale. The instrument shown had a range of from 46 to 54 cycles per second. If desired, the recorder can be replaced by an indicator. Another new instrument was a Campbell a.c. potentiometer (Larsen type), patented, by means of which it is possible to measure an unknown alternating current voltage in terms of its in-phase and quadrature components with reference to a fixed standard current i. In the ordinary Larsen type of potentiometer with adjustable resistance r and mutual inductance m, the unknown voltage v is obtained in the form $(r+j\omega m)\ i$, where the pulsatance $\omega = 2\pi \times$ frequency; so, to obtain the quadrature component, it is necessary to multiply the m reading by ω. In the present instrument this is avoided. By means of a loop-shunt system, the current in the primary of the mutual inductance can be set to any desired multiple of the standard current i. It is only necessary to observe the frequency and set its value directly on the shunt dials, when it will be found that the reading M of the inductometer gives the quadrature component directly without multiplication by ω, and $v = (r+jM)\ i$. Thus the two components are read directly in millivolts to an accuracy of 0·0 mV. The standard alternating reference current i is set and held constant by a thermal null method, in which it is balanced against a constant direct current (set by a standard cell and resistance), the balance being continually indicated by an auxiliary galvanometer. The mutual inductance part of the instrument consists of the recently developed inductometer, in which the impurity is reduced to a minimum; this can be used as a separate instrument with a maximum of 10 mH, and reading to 0·02 microhenry on its lowest stage. Other new exhibits of electrical interest were a portable electro-cardigraph, a high range thermionic voltmeter, an improved Paschen galvanometer with lamp, a circular pattern Lindeman electrometer with earthing switch, an l.t. Schering bridge, a self-contained decade Wheatstone bridge, and l.t. inductance decade resistance boxes.



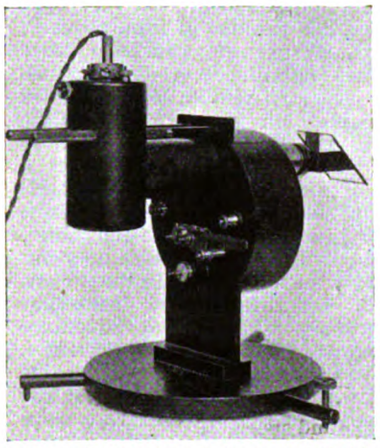
A new a.c. potentiometer of Larsen type, by the Cambridge Instrument Co., Ltd.

THE CAMBRIDGE INSTRUMENT CO., LTD., showed a valve method of controlling h.t. supply. When the thermionic valve system is operated entirely from one source of electrical energy, the anode currents of the valves will be very sensitive to fluctuations in the supply voltage unless some form of control is employed. The apparatus shown was operated from several windings on one transformer. The d.c. high-tension supply was obtained by full-wave rectification, and was applied, through an ohmic resistance, to the anode of the control valve, the filament of which was heated from a winding on the same transformer. The actual voltage at the anode of the control

Digitized by Google

valve will depend on the ratio of the fixed ohmic resistance to the resistance or impedance of the valve. An increase in the supply voltage will be reflected both in the rectified a.c. and in the filament winding, and in the latter instance it will have the effect of decreasing the impedance of the valve. The value of the ohmic resistance can therefore be adjusted so that the voltage at the junction of this with the anode is independent of variations in the main supply. This control can be adjusted to compensate for changes induced in any auxiliary apparatus, and is also applicable where both high and low tensions are obtained from separate windings on a rotary generator.

The Research Laboratories of the GENERAL ELECTRIC CO., LTD., also exhibited, and among the instruments shown was one which is a development of the electroscope which was exhibited in conjunction with a machine for rating lamps at the last exhibition of the Physical Society. It employs the same form of tungsten filament for an indicator—an inverted flexible pendulum held rigidly at the base. The filament is attracted to one or other of two adjustable electrodes, between which there is a constant difference of potential usually of the order of 100 V (i.e. +50 V and −50 V respectively, the body of the instrument and the filament at zero reading being 0 V), and its image is projected on to a screen by means of a 6 V lamp, condenser and microscope objective. By adjusting the position of the electrodes, or varying the potential difference, the whole range of the scale may be varied from about 4 V to 400 V or more. Zero adjustment is obtained by levelling the whole instrument, which can be used for accurate work only when mounted on a solid bench, owing to its extreme sensitiveness to changes of level; on the other hand, the filament is robust, and the whole instrument may be carried from place to place without risk of damage or derangement of parts. The volts-deflection curve is very closely a straight line. Other exhibits were two photometric integrators arranged so that the light from the test lamp integrator passed into the smaller integrator containing the photoelectric cell, through an aperture over which is an adjustable Wratten filter. In this arrangement the cell is connected to a valve bridge, which is normally balanced when the cell is dark and the two valve grids are at earth potential. When a lamp is operated in the large integrator the voltage produced on one valve grid, due to the cell, can be opposed by an adjustable potentiometer until the galvanometer indicates that the bridge is restored to a balanced condition. The potentiometer is arranged to read directly in lumens. The scale range is altered by varying the adjustable grid leak across the cell. The colour sensitivity is adjusted by varying the proportion of the aperture covered by the Wratten filter. In order to prevent errors which arise from external electrical disturbances it is necessary to earth screen all the apparatus connected with the valve amplifier, and, for convenience of construction, demonstration and inspection, cubical instead of spherical integrators were used.



The electroscope shown by the General Electric Co., Ltd.

A self-contained photoelectric set which works entirely from the a.c. mains was also demonstrated. The set is of robust construction, and is designed for industrial use. The method of using the photo-cell is to cause an intermittent current to pass through the cell when the illumination falls below a certain value. When the illumination rises above that value the current becomes continuous. The intermittent current is amplified and rectified, and then operates a relay, which can be made to operate any desired mechanism in accordance with a change of light falling on the photo-cell connected in the set. Various applications were demonstrated at the exhibition, these including burglar alarms, street lighting, failure of plant for purifying blast furnace gas, etc.

The BRITISH THOMSON-HOUSTON CO., LTD., exhibited an apparatus for tracing visual characteristics of loud speakers and amplifiers. The loud speaker to be tested is faced by a calibrated condenser microphone and supplied (through an appropriate valve) with constant grid voltage at varying audio frequency. The latter is obtained from a beat oscillator giving substantially constant voltage over a range from 0 to 10 kilocycles. The output from the microphone passes through a straight-line amplifier and operates a special type of hot wire galvanometer which traces the characteristic on a screen. The vertical deflection of the light spot is controlled by the sound energy output (as picked up by the microphone) and the horizontal deflection by the movement of a mirror attached to the condenser controlling the frequency. Further details of this exhibit will be given in a later issue.

A feature of the exhibit of ELECTROFLO METERS CO., LTD., was a new control pyrometer for application to the control of electric, gas and oil-fired furnaces, and high temperature industrial heating generally. The panel exhibited was for application to electric furnace control, and carried the indicating control pyrometer, a coil box, the function of which is described later, a relay, and a time switch.

The instrument is essentially a high resistance thermo-electric indicator, calibrated for the required range. The control mechanism consists of a depressor bar, which is periodically raised and lowered by means of a Warren synchronous motor, and causes contact to be made in one of two electric circuits, depending upon the position of the pointer, i.e., the operating temperature. Assuming that the furnace is cold, and consequently the temperature low, as the depressor arm, operated by the synchronous motor, falls, the bottom contact is made. Immediately afterwards, a mercury vacuum switch inside the indicator is tilted by the synchronous motor, and a circuit is established through the relay coil. This causes the mercury relay switch to establish circuit to the contactor coil; the contactor closes, and the furnace current is switched on through suitable contactor gear. The mercury switch in the indicator is then broken by the operation of the synchronous motor, which, an instant later, raises the depressor arm. The circuit through the relay coil is broken, but the current is maintained in the contractor circuit by means of a holding switch also operated by the relay coil. The furnace temperature continues to rise until the indicator pointer is above the control index, when, on the depressor arm falling, the alternative top contact is made. The mercury switch is then tilted as before, and a circuit is established which shorts the relay coil. The relay switch then falls back, breaking the contactor coil circuit, and the contactor is then open. When the furnace temperature drops, the indicator falls below the control index and the cycle of operation is repeated, the furnace being maintained at the determined temperature by the position of the control index. The object of the coil box, also mounted on the panel, is to cause the indicating pointer to deflect to the right of the control index in the event of the thermo-couple burning out or becoming disconnected. This is a patented system which ensures that the electricity supply to the furnace is cut off, so that no damage occurs to the charge or furnace, as might otherwise be the case.

ELLIOTT BROS. (LONDON), LTD., exhibited various interesting types of apparatus, including moving coil, moving iron and dynamo meter measuring instruments, portable and switchboard patterns, indicating and recording types, testing sets, etc., as well as miniature instruments, comprising switchboard and portable ammeters, milliammeters, voltmeters and testing sets, and instruments for radio frequency, with heater insulated from the couple. The type "O.L." instrument shown while intended primarily for a.c. measurements, fulfils all the requirements of an accurate ammeter or volt-meter for direct or alternating current. When used on alternating current circuits the guaranteed accuracy is "substandard" in accordance with British Standard Specification No. 89–1926. It is also quite suitable for use on d.c., and when thus employed, although errors may be slightly increased, these are claimed to be within the limits obtained with most other makes of ammeters and voltmeters used for such purposes. Another interesting instrument was an averaging recorder for bulk power supplies. This instrument with chart 6 in. wide, gives the total consumption and also the maximum demand averaged over a definite time interval. It can be calibrated as a kVA meter if desired.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

Load-Factor Fallacies.

[To the Editor.]

Sir,—I have read with interest the article by Mr. Edward V. Clark in the January 4th issue of The Electrician, and quite agree with your remarks in "Current Topics" that this article will doubtless give rise to no small amount of criticism, and that Mr. Clark's contentions run counter to the expressed opinions of many electrical engineers. I also agree with you that in view of Mr. Clark's position, his views at least deserve consideration, and it is because of this that I think municipal engineers should register their opinions on this article.

A careful study of Mr. Clark's contentions, and they are only contentions, must reveal the fact that there are more fallacies in his violent straining after his object than there are in the load factor question which he considers has been overrated. Mr. Clark would appear to contradict himself, for in one part we read "that better load-factors will permit of lower average costs of electricity is unquestionable" and later he sets out to prove that a 40% load factor is better than 100% load factor—but in order to do so he changes the selling price from 0·375d. to 0·5d. only doing one fifth of the business at the higher price. By subtle changes like this in any contention one can make figures prove anything.

Mr. Clark's trouble would appear to be in his economics, not ethics, as he would have us assume from the first paragraph on page 6 where he refers to hot water in large quantities being a luxury. A commodity is something which satisfies a human want; we have no judgment to pass on whether people ought to want it, and yet some of our most urgent necessities are not commodities, for example—air. Mr. Clark says "this matter is only referred to because of the frequent assumption that reduced prices of commodities are necessarily beneficial to the community," but surely Mr. Clark is aware of the fact that reduced prices bring increased consumption, which means increased output, and every increase of output from any industry puts into operation a set of economic forces which inevitably provides other industries with an opportunity of increasing their output, so that it seems to me the community must benefit from the reduction in price of a commodity.

Well, let us leave the economic question and return to his fallacies of load-factor. By far the most objectionable feature in Mr. Clark's article is the opprobrium he pours on the municipal undertaking; for example, to the company, the profit and loss account and balance sheet are all-important. The municipal undertaking considers more statistical figures, etc., then again, from these considerations it naturally follows that, in general, companies are much less interested in load factor as such, than are municipal undertakings. The former must regard any new business upon its merits, the assumption being that municipal undertakings do not. Anyone who knows anything about munieipal undertakings knows that such a statement is manifestly incorrect and unfair, as evidenced by the many successful municipal undertakings selling electricity at prices below company prices in the same area.

There is a wealth of truth in Dr. S. Parker Smith's statement "to make cheap electricity a possibility. Probably improvement of load-factor by better utilisation has much more significance." In early 1926, when the Government's Electricity Bill was in the committee stage, we were asked to criticise the Bill, and the writer contributed an article on The Government Scheme versus Improved Load-factor. At that time much was written in the lay Press, and politicians talked glibly about "Bus Mains" and "Grids." Journalists also showed us the way "Through Power to Prosperity." The object of the writer at that time was to show that to provide—to use Mr. Baldwin's words—that over the whole country the source of light and power should be materially cheapened, the first step was to improve load-factors on existing stations, the second step being standardisation, and the third step linking up. Mr. R. A. Chattock, in his Presidential address to the I.E.E. in 1925, made the following statement: "In conclusion, two most urgent problems in the supply field are load factor and cost of distribution."

In the example which Mr. Clark works out for a station with an annual load factor of 25%, and then assumes this station to have a load factor of 100%, it seems to me that if the additional units only cost 0·35d. he forgets that by increasing the output to 300% the average cost per unit of the original output is reduced considerably, because standing charges, remaining the same, are divided by a number three times as large as before, thus reducing this factor in the cost per unit. Mr. Clark suggests ignoring load-factor and concentrating on diversity factor. But how can one ignore load factor for the diversity factor when the diversity factor is an element in the station load-factor? To equal the factors we have:

$$\text{Station Load-factor} = \frac{\text{Diversity Factor} \times \text{units sent out}}{\text{sum of separate maxima,}}$$

each expressed over a given period of time, so that so far as the station is concerned the diversity factor does not concern us much, as the station maximum load is proportional to the total of the separate loads divided by the diversity factor, and as the separate maxima demands do not remain constant and may not be ascertainable, the relation can only be of very little use. On distribution networks the diversity factor is of utmost importance as between various areas or feeders in a given area, but in each case it is still only an element of load factor as mentioned before, so that load factor cannot be ignored, any more than one could ignore capital or standing charge apart from running costs in considering the cost of a unit of electricity to an undertaking.

In Mr. Clark's concluding paragraph he assumes that supply engineers have not given diversity factor its due consideration. It is difficult for one engaged in the supply industry to understand why this assumption is made. One can agree that with a bulk supply, and the tariff for such supplies known in advance, the position will be cleared, but this does not help us to sell cheap electricity if the tariff is wrong or too high to start with. The difficulties Mr. Clark refers to in the self-contained station regarding the assessing of costs to standing charges and running costs has not prevented us from supplying electricity cheaper than one of the largest supply companies in Britain and making handsome profits, after providing for all charges to sinking funds, reserve and special reserve funds, and contributing, in times of stress, to the rates.—I am, etc.,

T. D. Martin,
South Shields Corporation Electricity Supply Dept.

Trade Credit.

[To the Editor.]

Sir,—Correspondence on the B.E.A.M.A. Report is raising a crop of interesting questions. We are in the midst of a host of difficulties arising from the necessity of rapidly adjusting our economic system to the needs of a changing world. Unfortunately, it is assumed that the brunt of this readjustment must be borne by industry, as the function of finance appears to be regarded either as too esoteric to be understood, or too sacrosanct to be exposed to examination or revision.

The function of industry is to produce goods, and so great has been the advance in technical skill and scientific knowledge, that any kind of goods, except food, can now be produced in lavish abundance. But the manufacturer, having surmounted the difficulties of production, is confronted with the difficulty of selling his goods, a difficulty created by the fact that persons who need his goods have often too little money or credit with which to buy them. In other words, the financial machine fails to liberate money or credit for purchase as rapidly or as plentifully as the industrial machine can liberate goods for use.

Lack of co-ordination appears to be the trouble. Do the goods producing agencies (manufacturers) and the credit producing agencies (bankers) realise the true nature of the relationship that should exist between them? It is tacitly assumed that industrial policy must bow to the needs of financial policy. But the industrialist has to conduct his business within the very rigid limitations imposed upon him by the nature of the materials and power he uses on the one hand, and the needs of his customers on the other, and seeing that in the whole field of economic activity money is the only factor that is entirely man-produced and entirely man-controlled, it would appear reasonable to expect that any necessary readjustment should first be made in the domain of finance, if only for the reason that it is easier and more simple.

In any case, the ordinary citizen is perfectly justified in expecting that the financial system should enable him to enjoy the products of artistic creation and technical skill which industry can place so lavishly at his disposal, and if some defect in the financial machine short circuits this desirable consummation, the industrialists, who are the first to feel the brunt of this deprivation, are perfectly justified in asking that the defect shall be discovered and if possible, removed.—I am, etc.,

Geo. S. Francis.

London, N.W.3.

NEWS IN BRIEF.

Hull Corporation and Electric Houses—I.M.E.A. Annual Convention—Loan for Leeds Wiring Scheme—New Fire Alarms for London—Irish Free State's Imports of Electrical Goods—Brighton's Electrical Exhibition.

A NEW lighting system is to be installed at the Llanfabon Schools, Nelson.

Residents of Birtley are agitating for electric street lighting.

Coventry Electricity Committee has obtained sub-station sites in the Dovedale and Foleshill Hall estates.

The Incorporated Municipal Electrical Association will hold its annual convention at Torquay next June.

Leeds Corporation Electricity Committee is to seek sanction for a loan of £50 000 for the assisted wiring scheme.

Warrington Corporation has accepted a tender for the erection of a sub-station on the Bewsey housing estate.

Electric power is now used for ringing the 800-years' old curfew bell in Rouen, which has hitherto been tolled by hand.

The houses to be erected in Burton Stone Lane, Hull, by the Corporation's housing department will be of the all-electric type.

Prestatyn U.D.C. has adopted a recommendation of the Electricity Committee to sell electrical apparatus, with a limitation of appliances.

A tender, amounting to £905, for the erection of a sub-station in Lime Grove, Seaforth, is recommended for acceptance by Liverpool Corporation.

An apparatus for the transmission of photographs by wireless has been received from Germany and installed in the Central Telegraph Office at Leningrad.

The "Telegraph and Telephone Journal" states that there are about 32 500 000 telephones in use in all parts of the world, an increase of 1 500 000 over the number in use a year ago.

Douglas (Isle of Man) T.C. has placed contracts for foundations and steel work in connection with the new power station at Pulrose, amounting to £3 386 and £4 506 respectively.

Mr. C. H. Yeaman, city electrical engineer of Stoke-on-Trent, is to advise as to the installation of electricity plant at Stallington Hall, which the corporation is converting into a mental institution.

The British Columbia Power Corporation announces that another hydro-electric project is to be carried out at Ruskin at an expenditure of £1 450 000, and that the Bridge River plant is to be extended at a cost of £200 000.

Sidmouth U.D.C. has decided that its gas and electricity undertakings shall be separately managed as from March 31st, 1929, and will meet to consider the conditions under which the respective posts of gas manager and electricity manager are to be held.

Hull Electricity Committee has obtained a site in Hardy Street for the erection of a sub-station in connection with the electrical developments in the Cottingham Road area, and a site in Lowfield Road for a sub-station for supplying electricity to Anlaby village.

When the shops of Helston, Cornwall, were lighted electrically on December 19th, for the first time, one enterprising tradesman illuminated one of his windows with gas and the other with electricity, in order to demonstrate the improvement effected by the latter.

London County Council Fire Brigade Committee proposes to introduce a new experimental fire alarm system at a cost of £3 000. A closed circuit system has been prepared by the General Post Office, and it is proposed that the 26 fire alarms now connected with the headquarters fire station shall be replaced by the new system.

Two contracts, amounting to about £5 000 and £3 000, respectively, for the foundations of the towers for the crossing of the river Forth and the foundations of the sub-station at Yoker have been placed by the Central Electricity Board. The contracts for the foundations of the sub-stations at Motherwell and Port Dundas have also been given out, the amounts being about £5 000 and £5 500.

The Empire Industries News Service calls attention to the fact that in the four industries which were safeguarded as from July 1st, 1925, numbers of insured persons (between the ages of 16 and 64) actually in employment expanded from 276 600 in July, 1925, to 320 000 in July, 1928, an increase of 16%, while the increase in all other manufacturing industries, which include some safeguarded industries, was from 4 856 000 to 4 972 574, an increase of less than 2½%.

Tenders have been accepted for 38 additional police telephone boxes for Manchester.

Electric lighting will probably be adopted in the Mercer Hall, Great Harwood.

A contract for the electric lighting of the town of Nazareth has been given to the Rutenberg Electric Corporation.

The United Methodist Church at Tywardreath, Cornwall, is the first building in the village to be lighted by electricity.

Axminster Board of Guardians has accepted a tender of £112 for the electric light wiring at the Poor Law institution.

Birmingham Watch Committee has authorised experiments in automatic traffic control in certain thoroughfares in the city.

An election for membership to the Institution of Heating and Ventilating Engineers is due to take place at an early date.

Stoke-on-Trent Electricity Committee has purchased a site in Greenbank Road, Burslem, for the erection of a sub-station.

A new 500 kW rotary converter at Whittlefield electricity sub-station, Burnley, was put into operation for the first time on December 21st.

The telephone cable facilities between Sweden and Finland are expected to contribute to livelier commercial relations between the two countries.

Southend T.C. has decided to instal electric water heating apparatus in ten houses recently erected in Pavilion Drive, if the tenants are agreeable.

Imports of electrical machinery and apparatus into the Irish Free State during November, 1928, amounted to £73 244, as compared with £39 763 for the same month last year.

The Executive of the Association of British Chambers of Commerce has passed a resolution expressing the opinion that the amalgamation of the cable companies will be of benefit to British trade.

Worcester electrical contractors have issued to members of the City Council a statement that they do not consider it desirable that the Corporation should carry out its municipal electricity showroom scheme.

Large firms rent from the Post Office private telephone lines to their branches throughout the country at reduced rates, and the Treasury has now decided that a similar concession shall be made in regard to lines to subsidiary companies.

The next luncheon meeting of the Engineering Section of the I.S.B.A. will be held at the First Avenue Hotel, London, on January 18th, when Mr. H. W. Kefford, will introduce the subject of "Getting the Raw Material for Engineering Advertising."

A special matinee of "Many Waters" will be held at the Ambassadors Theatre, London, to-morrow (Saturday), all proceeds going to the Lord Mayor's Fund. Tickets may be had at the theatre or from Mrs. Malone, 6, Phene Street, Chelsea, S.W.3.

Brighton Corporation has approved the recommendation of the Lighting Committee for the organisation of an Electrical Exhibition from October 3rd to 12th, 1929, at the Dome and Corn Exchange, and has agreed to contribute £1,000 towards the cost.

In the New Zealand Parliament, Sir Joseph Ward recently submitted the first instalment of the Government's financial policy in the form of a Bill extending the existing appropriations by £825 000 to provide for additional railway and road construction, hydro-electric development, etc.

The meeting of the Institute of Fuel which was to have been held on Wednesday, has been postponed until January 16th. The paper which was to have been presented by Mr. H. A. S. Gothard, has been cancelled, and, in its place, Messrs. Berg and Vogt will read an address entitled "Continental Experience in Pulverised Fuel Practice."

Taunton T.C. has adopted the Electricity Committee's recommendation that installations for lighting only, exclusive of lamps, shades and special fittings, be put in consumers' premises by the Council, payment for the installations to be quarterly and extend over three years. Some members of the Council advocate a free wiring scheme, but the committee does not consider it at present a paying proposition.

PERSONAL.

MR. W. Aitken desires us to point out that his address is now 14, King's Avenue, Muswell Hill, London, N.10.

Mr. F. J. Pryer, shift charge engineer, Dover electricity department, resigned his appointment as from December 31st, 1928.

Estate of the gross value of £11 031, with net personalty £4 276 was left by the late Mr. William Simms, electrical engineer, Felixstowe.

Mr. E. J. Strange, J.P., of Strange and Sons, Ltd., electrical engineers, Tunbridge Wells, has consented to be nominated to fill a casual vacancy on the Town Council.

Estate of the gross value of £100 919, with net personalty £91 886, was left by the late Sir Horace Darwin, a director of the Cambridge Scientific Instrument Co., Ltd.

At last week's meeting of the Blackpool branch of the National Association of Local Government Officers, Mr. C. Furness, borough electrical engineer, was elected president.

Mr. G. E. Naylor, electrical engineer and tramways manager at Nelson, is to take control of the engineering side, and a new manager of the tramways and bus undertaking will be appointed.

Estate of the gross value of £4 759 with net personalty £3 904, was left by the late Dr. Robert Knox, editor of the "British Journal of Radiology," who died on September 21st, aged 60 years.

The staff of the Corporation tramways have presented Ald. C. F. Wright, chairman of Colchester Tramways Committee, with an inscribed umbrella, upon his attaining 21 years as a committee member.

Mr. C. C. Hill, assistant erecting engineer to Metropolitan-Vickers Electrical Co., Ltd., Newcastle Branch, has been appointed to the position of assistant shift engineer at the North Road Works, Brighton.

Estate of the gross value of £2 558, with net personalty of £1 549, was left by the late Mr. Charles James Jewell, general manager of Norwich Electric Tramways, who died on November 2nd last, aged 56 years.

The staff and employees of the Derby tramways department, numbering about 500, were associated with a farewell presentation to Mr. F. Harding, who has just resigned the position of manager of the department.

Coun. W. J. Perrett has been appointed chairman of the newly constituted Light Railways and Transport Committee of Southend Corporation, it having been decided to separate the undertaking into two distinct departments.

Mr. J. Aldworth who has been general manager of Nottingham Corporation's tramways for 30 years, vacated that position on December 31st, and is succeeded by Mr. W. G. Marks, hitherto manager of the Chesterfield tramways.

Mr. J. Alex. Chew, of the staff of the Welwyn Garden City Electricity Co., Ltd., on his marriage to Miss Dora Coggins, for nine years supervisor at the Harpenden telephone exchange, has been presented by his colleagues with a collection of household electrical appliances.

The triennial award of the Coopers Hill War Memorial Prize and Medal, which fell in 1928 to the Institution of Electrical Engineers, has been made by the Council to Mr. W. Phœnix for his paper on "Electricity in Agriculture, with special reference to Electro-Culture."

According to information received in London, the Radiological Society of America has awarded the Gold Medal for Merit in X-ray Science to Dr. Bouwers, the British inventor of the Metalix X-ray tube. Dr. Bouwers is shortly visiting the United States to lecture to American radiologists.

Mr. George Parker, general secretary of the National Union of Enginemen, Firemen and Electrical Workers, has relinquished his position and has been succeeded by Ald. S. Hall, Mayor of Rotherham. Mr. Parker has served on the Joint Industrial Council for the Electricity Supply Industry since its inception.

Mr. Arthur Teasdale, for many years electrician to the Westhoughton Coal and Cannel Co., near Wigan, has retired, after 46 years' service, and has been presented with a gold watch. He was the firm's first electrician, and took charge of the first electrical plant installed at the Colliery, following a fire at the pit bottom caused through an oil lamp.

Major H. Derby, who has relinquished the position of general manager of the Aldershot and District Traction Co., which he has held for six years, has been presented by the employees with a grandmother clock and a gold wristlet watch, and by the drivers and conductors with an illuminated address. Mrs. Derby was given a pair of silver vases.

Mr. C. Remington, who for the past twenty years has been attached to the engineering section of the Automatic Telephone Co., Ltd., Liverpool, has resigned his position to take up the post of general manager and engineer to Messrs. Garnett, Whiteley and Co., Ltd., Liverpool. He was presented with a gold hunter watch, suitably inscribed, by his old friends and colleagues.

Following our notice of the impending retirement of Mr. T. L. Miller, consulting engineer, we are advised that he has transferred his practice and all office records to Mr. A. B. Mallinson, of Worsley Street, Salford, and St. James' House, Brazennose Street, Manchester. Mr. Miller's Liverpool office will be closed, and Mr. Mallinson will deal with any inquiries from Manchester, where he has been in practice as a consultant for seventeen years.

The Council of the Physical Society has awarded the Sixth (1928) Duddell Memorial Medal to Dr. Charles Edouard Guillaume, the Director of the Bureau International des Poids et Mesures, Sèvres. Dr. Guillaume is known to the world for the invention of three metallic alloys of great importance, invar, elinvar and platinite. Speaking industrially the last one of the three is the most important. It is a nickel-iron alloy having approximately the same temperature co-efficient of expansion as glass, so that it can be fused into glass and used as the wire for introducing the current into electric incandescent lamps. The wire is frequently covered with a thin coating of copper to which the glass adheres, and in this form the wire is known as "red platinum." The other two alloys are of scientific importance. Invar, a nickel-steel, discovered in 1896, has practically no temperature co-efficient of expansion, so that if a surveying tape is made of it the length is almost unaffected by temperature. The third material, elinvar, was invented by Dr. Guillaume for the manufacture of the balance springs of watches.

Obituary.

MR. JOHN EDWIN COLES, aged 82 years. He was formerly connected with Veritys, Ltd.

MR. MARTIN HAWKE, on December 20th. He was managing director of the Carborundum Co., Ltd.

MR. RICHARD EVANS, engineer in charge of electricity and other plant at Bodfari poor law institution, at Carnarvon.

MR. EDWARD SIMON AMES, on January 1st, aged 56 years. He was in the employ of the Bradford Corporation Electricity Department for about 26 years, and for over 20 years was the chief meter inspector.

MR. C. O. CLARK, on December 1st, aged 53 years. He was an electrical engineer at 4, Northampton Street, Dover, and Mill Road, Deal, with branches in London and Horsmonden. He established the East Kent Electricity Works, in Mill Road, Deal, seven years ago.

DR. DAWSON TURNER, on December 25th, aged 71 years, from illness caused by thirty years of X-ray work, as medical electrician to the Royal Infirmary, Edinburgh. Prior to 1925 he had lost three fingers and one eye as a result of his pioneer work in X-ray investigation.

MR. W. E. ROBERTS, on December 25th. He was outside representative for the London Electric Wire Co. and Smiths, Ltd. for several years and was well known in the electrical trade. He had been associated with the company for 29 years having joined them in January, 1900.

MR. STEPHEN PAGET LUKE, on January 1st, aged 83 years. He was appointed to the Indian Telegraph Department in 1868. In 1890 he was appointed Director of the Construction Branch of the Telegraph Service. In 1895 he was promoted to be Deputy Director-General of Telegraphs, represented India at the International Telegraph Conference at Budapest in 1896 and retired in 1897. Mr. Luke was a director of the Telegraph Construction and Maintenance Co., Ltd., and was for some years chairman of the Calcutta Electric Supply Association.

SIR HENRY TRUEMAN WOOD, secretary of the Royal Society of Arts, on January 7th. He was born on November 13th, 1845, and had been associated with the Society since 1872, when he became editor of its "Journal." He was appointed secretary in 1879. Amongst the useful work which he did for the Society was that of securing a number of prominent men to serve on the Council, and he also earned a reputation as an organiser in connection with the Health Exhibition in 1883, the Inventions Exhibition in 1885, and the Paris Exhibition in 1889.

BRITISH INDUSTRIES FAIR.

Advance List of Exhibitors of Electrical Interest at Birmingham and London.

THE preliminary list of exhibitors of electrical interest at the Birmingham Section of the British Industries Fair, which opens at Castle Bromwich on February 18th, shows that an even greater number than last year will participate. The firms so far included in the list are :—

Aerostyle, Ltd., H. E. Ashdown (Birmingham), Ltd., Attwoods Spraying Equipment Co., Ltd., British Brass Fittings Co., Ltd., Bulpitt and Sons, Ltd., Carron Company, Davis and Timmins, Ltd., Gregson Manufacturing Co., Ltd., John Harper and Co., Ltd., Ingram and Kemp, May and Padmore, Ltd., Parker, Winder and Achurch, Ltd., the Rawlplug Co., Ltd., the Ruberoid Co., Ltd., E. Showells and Sons, Ltd., H. C. Slingsby, Spring Washers, Ltd., Sturge and Baker, Ltd., G. and J. Swingler, Herbert Terry and Sons, Ltd., Vac Tric, Ltd., Willis and Bates, Accles and Pollock, Ltd., Allen-Liversidge and Co., Ltd., W. and T. Avery, Birkby's, Ltd., Blackstone and Co., Ltd., the Bromford Tube Co., Ltd., Bull Motors, Ltd., W. Canning and Co., the Cape Asbestos Co., Ltd., Clear Hooters, Ltd., the Commutator Grinding Block Co., Crossley Bros., Ltd., the Crosthwaite Engineering and Furnace Co., Ltd., Davey Paxman and Co., Ltd., Davidson and Co., Ltd., Dexine, Ltd., the Diamond Fibre Co., Ltd., R. and J. Dick, Ltd., Die Castings, Ltd., W. H. Dorman and Co., Ltd., the Drayton Regulator and Instrument Co., Ltd., Earle, Bourne and Co., Ltd., Fielding and Platt, Ltd., Thomas Firth and Sons, Ltd., the Foster Instrument Co., Gillespies, Ltd., Frank B. S. T. Gilman, Ltd., Hadfields, Ltd., Thos. L. Hale (Tipton), Ltd., Alfred Herbert, Ltd., the Hewittic Electric Co., Ltd., Heyes and Co., Holden and Hunt, Hollings and Guest, Ltd., the Horstmann Gear Co., Ltd., R. Johnson, Clapham and Morris, Ltd., Lacy-Hulbert and Co. (1921), Ltd., R. A. Lister and Co., Ltd., Low Temperature Carbonization, Ltd., M. C. L. Repetition, Ltd., the Midland Fan Co., Ltd., T. H. Mold and Son, Negretti and Zambra, W. and C. Pantin, Petters, Ltd., Ransomes Sims and Jefferies, Ltd., the Rapid Magnetting Machine Co., Ltd., the Ray Engineering Co., Ltd., Reavell and Co., Ruston and Hornsby, Ltd., Silvertown Lubricants, Ltd., Stewarts and Lloyds, Ltd., Stuart Turner, Ltd., the Sturtevant Engineering Co., Ltd., Tangyes, Ltd., Taylor and Callen, Thomas Bertram, Thor Lamps and Supplies, Ltd., Tubes, Ltd., Turner Bros., Asbestos Co., Ltd., T.V.E., Ltd., the Uniflo Pump Co., Ltd., C. C. Wakefield and Co., Ltd., Henry Wiggin and Co., Ltd., Timmins Wynn and Co., Bakelite, Ltd., Berkeley and Young, Ltd., Berry's Electric, Ltd., the Birmingham City Electric Supply Department, Birmingham Electric Furnaces, Ltd., Geo. Bray and Co., Ltd., the British Sangamo Co., Ltd., the British Thomson-Houston Co., Ltd., Brook Motors, Ltd., S. G. Brown, Ltd., the C.M.A., Callender's Cable and Construction Co., Ltd., the Castle Fuse and Engineering Co., Ltd., Chesterton Jones and Co., the Chloride Electrical Storage Co., Ltd., Credenda Conduits, Ltd., Donovan and Co., Ltd., the Edison Swan Electric Co., Ltd., Electric Furnaces, Ltd., the Electrical Power Engineering Co. (Birmingham), Ltd., the E.P.E.A., Geo. Ellison, the Ever Ready Co. (Great Britain), Ltd., Fox and Offord, Ltd., the General Electric Co., Ltd., Gent and Co., Ltd., the Hackbridge Electric Construction Co., Ltd., W. C. Holmes and Co., Ltd., the Jackson Electric Stove Co., Ltd., Chas. Joyner and Co., Kelvin Bottomley and Baird, Ltd., Lighting Trades, Ltd., the Liverpool Electric Cable Co., Ltd., the London Electric Wire Co. and Smith's, Ltd., the Metropolitan-Vickers Electrical Co., Ltd., Micanite and Insulators, Co., Ltd., Moffatts, Ltd., Moorwoods, Ltd., Wm. McGeoch and Co., Ltd., Mudies Electrical Co., Ltd., the Omega Lampworks, Ltd., C. H. Parsons, Ltd., Peebles and Co., Ltd., Pritchett and Gold and Electrical Storage Co., Ltd., Record Electrical Co., Ltd., Restlight, Ltd., the Revo Electrical Co., Ltd., A. Reyrolle and Co., Ltd., Shropshire, Worcestershire and Staffordshire Electric Power Co.. Ltd., Siluminite Insulator Co., Ltd., Spauldings, Ltd., Sperryn and Co., Ltd., Streetly Manufacturing Co., Telegraph Construction and Maintainence Co., Ltd., Thermo Path Co., Ltd., J. H. Tucker and Co., Ltd., Welsbach Light Co., Ltd., Young, Osmond and Young, Ltd.

London Section.

The exhibitors of electrical interest in the London Section, which opens on the same date as Birmingham, include radio manufacturers and makers of medical equipment. The chief exhibitors comprise :—

The "Attracta" Electrical Co., Ltd., Berry's Electric, Ltd., Dexine, Ltd., George Nobbs, Ltd., Ernest Turner, Joseph Bourne and Son, Ltd., Doulton and Co., Ltd., James A. Jobling and Co., Ltd., Bakelite, Ltd., Birkby's, Ltd., Ellis Simpson and Saunders, Ltd., Goodworks, Ltd., Ferranti, Ltd., S. G. Brown, Ltd., the Brownie Wireless Co. of Great Britain, Ltd., H. Clarke and Co. (Manchester), Ltd., A. C. Cossor, Ltd., the Dubilier Condenser (1925), Co., Ltd., J. Dyson and Co., Ltd., J. J. Eastick and Sons, the Ever Ready Co. (Great Britain), Ltd., the Fuller Accumulator Co., Ltd., Garnett Whiteley and Co., Ltd., the Igranic Electric Co., Ltd., the Langham Radio, Ltd., the Loewe Radio Co., Ltd., the M.L. Magneto Syndicate, Ltd., M.P.A. Wireless, the Ormond Engineering Co., Ltd., Spauldings, Ltd., the Watmel Wireless Co., Ltd., Wright and Weaire, Ltd., Lissen, Ltd., the Mullard Wireless Service Co., Ltd., the Westinghouse Brake and Saxby Signal Co., Ltd., Creswick C. Atkinson, E. K. Cole, Graham Farish, Ltd., the Halcyon Wireless Supply Co., Ltd., Belling and Lee, Ltd., the Formo Co., Ltd., the Telegraph Condenser Co., Ltd.

Official Visits.

In connection with the Electrical Section at Birmingham, a representative Advisory Committee was set up some six months ago, the personnel of which is as follows :—Messrs. H. H. Berry (chairman), T. R. Martin (deputy chairman), A. Page, F. Anslow, Ll. B. Atkinson, E. G. Batt, R. A. Chattock, D. N. Dunlop, Sir J. M. Gatti, Lt.-Col. W. J. Kent, Mr. A. Nichols Moore, Col. R. K. Morcom, Messrs. A. H. Railing, T. Stretton, C. W. Sully, Lt.-Col. W. A. Vignoles, Messrs. W. H. Walton and E. J. Jennings.

The arrangements for official visits of Associations connected with every phase of electrical industry are now complete, and a conference arranged by the South Midland Area Committee of the British Electrical Development Association will be held in the Conference Hall on February 22nd, at 11.30 a.m. A luncheon on the same day in the Royal Dining Room, "C" Building, will be attended by representatives of the Incorporated Municipal Electrical Association, the Incorporated Association of Electric Power Companies, the Provincial Electric Supply Association, the British Electrical Development Association, the Municipal Tramway and Transport Association, Inc., and the Tramways and Light Railways Association. Representatives of the Electrical Power Engineers' Association will attend luncheon in the same room on February 23rd, while in the afternoon the South Midlands Students' Section of the I.E.E. will assemble for tea. After luncheon members of the E.P.E.A. will attend a conference in the Conference Hall. On March 1st a luncheon will be given in the Royal Dining Room, Building "C," to the Institution of Electrical Engineers, the Association of Consulting Engineers, the Association of Supervising Electrical Engineers, the Electrical Contractors' Association, the Electrical Contractors' Association of Scotland, the Electrical Wholesalers' Federation, Ltd., the Electrical Merchants and Manufacturers' Association, the Illuminating Engineering Society, and the Association of Mining Electrical Engineers. In the afternoon the Electrical Association for Women (Birmingham and Midlands Branch) will be entertained to tea.

"WIRELESS TRADER" YEAR BOOK.

Many Additions and Improvements to be Found in 1929 Edition.

THE 1929 edition of "'The Wireless Trader' Year Book and Diary," just published is likely to be more valuable than ever to all associated with the wireless and allied trades. An addition is the incorporation of gramophone information and trade lists. A new section has been devoted to this giving practical information for the use of traders catering for the wireless and gramophone public. All sections of the book are revised and up-to-date. Besides some 100 pages of trade, technical, and general information covering the wireless, gramophone and allied trades, there are comprehensive trade lists including trade and professional addresses of manufacturers and manufacturers' agents; trade and professional addresses of factors; a classified buyers' guide to goods supplied and services rendered; names of proprietary goods and their manufacturers. In addition a diary for 1929 is provided, giving one week at opening and interleaved with blotting paper.

The price of the book is 5s. 6d. post free.

Application for Extension of Patents.

Standard Telephones and Cables, Ltd., has applied for a five-years' extension of the terms of patents No. 5 653/1913, No. 3 358/1914, and No. 3 359/1914, for "Improvements in machine telephone switching systems"; No. 25 774/13 for "Improved method and apparatus for electric code impulse signalling systems"; No. 3 360/1914, for "Improvements in impulse control systems for automatic telephone exchanges"; No. 3 699/1914, for "Improvements in electromagnetic relays"; and No. 104 719 (dated March 11th, 1916), granted to the Western Electric Co., Ltd., and F. R. McBerty, for "Improvements in impulse control systems for automatic telephone exchanges." An originating summons, issued on behalf of Standard Telephones and Cables, Ltd., asking for the extension of the terms of the patents will come before Mr. Justice Tomlin, in the High Court of Justice on January 15th.

Digitized by Google

INDUSTRIAL HEATING.

Some of the Exhibits at the Manchester Show which Opened on Monday.

IN connection with the Industrial Heating Exhibition which opened at Manchester on Monday, under the auspices of the E.D.A. and Manchester Corporation, the GENERAL ELECTRIC CO., LTD. displayed an 8 kW electric furnace having a chamber approximately 18 in. long by 12 in. wide by 10 in. high. This furnace has a maximum working temperature of 950° C. A 30 kW furnace was also shown, the chamber being 21 in. wide by 44 in. long by 17 in. high. It is designed for use in the annealing of metals and for similar processes carried out at temperatures up to 1 000° C. such as vitreous enamelling. Another exhibit was a small electric japanning oven specially suitable for garages and similar establishments. A specimen of the "Magnet" air heater also figured in the exhibition. This heater consists of a bank of elements enclosed in a box-like structure through which air is drawn by an extractor fan and distributed for heating buildings, etc. It has a maximum loading of 7 kW.

Among other items shown by the G.E.C. were a wax tank, having a capacity of approximately 4 gallons, a maximum loading of 2 kW, and three heat control; 1 kW oil pipe heater, incorporating a type of element adapted for clamping round pipes conveying oil or other viscous fluids to raise the temperature; a conforming steamer for hats; and a water still, arranged with a loading of 4 kW to deliver one gallon of distilled water per hour. One of the standard "Magnet" type of single-deck baking ovens with a 18 kW loading was also shown.

Other Exhibits.

Among the exhibits of the METROPOLITAN-VICKERS ELECTRICAL CO., LTD., was an induction furnace equipment of 5-cwt. capacity. An interesting feature of the equipment is that the furnace operates on a supply of power at 500 cycles. This frequency is, we understand, lower than was previously considered efficient for this type of work. The equipment includes a motor generator set which takes power at 50 cycles frequency and gives a supply at 500 cycles for the furnace. Two banks of condensers are provided for power factor correction, one bank being permanently connected in parallel with the furnace coil, and the other bank being arranged in sections for switching in or out as required. The time required for melting a charge is approximately one hour and the overall power consumption is from 700 to 900 kWh per ton, depending on the casting temperature and other conditions.

For enamelling, drying, heat-treating, and other industrial baking processes involving the use of temperatures up to 600° F., a Metropolitan-Vickers type "K" oven was exhibited accompanied by specimens of typical products. These ovens are manufactured in a range of sizes, the exhibit being of medium size with a baking chamber 3 ft. 9 in. high, 3 ft. wide and 3 ft. deep, with a rating of 10 kW. A 2-deck electric peel type oven suitable for baking bread and confectionery was another exhibit by the Metropolitan-Vickers Electrical Co. The ovens are supplied with one, two or three decks, each deck forming a separate and portable unit, which can be used by itself or assembled with others as required. The oven exhibited was a 2-deck combination of ½ sack capacity. Each hearth is 4 ft. by 4 ft. in size and each deck is rated at 10 kW. The elements of each deck are disposed at the top and bottom of the chamber, each group being controlled by a separate three heat switch. It is claimed that an oven of the size exhibited will heat up to 450° F. in about an hour and thereafter maintain this temperature with a consumption of 5 to 6 kW.

Electric furnaces were also shown by WILD-BARFIELD ELECTRIC FURNACES, LTD.; the LEEDS ELECTRICAL CONSTRUCTION CO., LTD.; BIRMINGHAM ELECTRIC FURNACES, LTD.; the BRITISH RESISTOR CO., LTD.; and the ELECTRIC FURNACE CO., LTD. Other exhibitors were SULZER BROS. (electric thermal storage system); FERRANTI, LTD. (thermal storage, heating elements, thermostats, and control relays); BRITISH INSULATED CABLES, LTD. (electric rivet heaters and welding equipment); YOUNG, OSMONDE AND YOUNG (tubular heaters); MARRYAT AND PLACE (electric welding equipment and rivet heaters); the PREMIER ELECTRIC WELDING CO., LTD. (electric welding plant). The E.D.A., Manchester and Salford Corporations, and the LANCASHIRE ELECTRIC POWER CO., LTD., were also represented.

IN PARLIAMENT.

Electricity Supply Special Orders Approved by the House of Commons.

THE House of Commons has approved Electricity Supply Special Orders in respect of (1) Dronfield urban district; (2) Burnham-on-Sea urban district; (3) part of county of East Lothian; (4) part of Burnley rural district; (5) parts of East Ashford rural district; (6) Kirkham urban district and parts of Fylde and Garstang rural districts; (7) part of Woodbridge rural district, and amendment of Felixstowe and Walton Electric Lighting Order, 1900; (8) West Mersea and Wivenhoe urban districts, parts of Lexden and Winstree, Maldon and Tendring rural districts and part of Samford rural district; (9) part of Hambledon rural distict; (10) the burgh of Tain; (11) Dawlish urban district and parts of St. Thomas and Newton Abbot rural districts; (12) the borough of Louth; (13) Middlesbrough rural district; (14) Monks Kirby rural district and parts of Foleshill, Meriden, Nuneaton, Rugby and Warwick rural districts; (15) Lynton urban district, and part of Barnstaple rural district; (16) Hursley rural district; (17) part of West Lancashire rural district, and (18) constitution of joint board consisting of representatives of Alderley Edge and Wilmslow Urban District Councils and joint exercise of powers under the Electricity Acts.

Replies to Questions.

The following are points from answers to questions in the House of Commons:—

It is not proposed in the near future to reduce inland telegraph rates.

Seven wireless beacons around the coast of Great Britain are being erected. Six of these should be in operation by April next.

Means for telephone communication between a number of persons speaking from different places are already available in this country.

The new telephone cable for use between the Isle of Man and this country is being manufactured, and it is hoped that it will be laid next July.

The Minister of Transport has seen in the Press some reference to the proposal for utilising the tidal power of the Wash, but neither he nor the Electricity Commissioners have given it any countenance or approval.

The total number of wireless receiving licences in force on October 31st last in Wales was about 80 600, which is equivalent to a rate of 36·5 per thousand of population. The corresponding rate for England is 62·8, for Scotland 37·3 and for Northern Ireland 21·9.

The amount standing in the telephone department's books as subscribers' deposits at September 30th last was about £2 500 000. The amounts standing in the books as deposits are, as a rule, more than balanced by accrued liabilities of subscribers for which accounts have not yet been rendered.

There have been 75 inquiries during the past two years respecting the erection of overhead transmission lines. The average time which has elapsed between the application and the inquiry has been about 5½ weeks, and between the application and the announcement of the decision of the Minister of Transport about 17 weeks.

The question whether inventions and improvements relating to cables and wireless discovered by employees of the Communications Co. will be the property of that company, will depend on the terms of the agreement between the merger and Communications companies, which have not yet been formed.

The Central Electricity Board states that contracts have been let for approximately 246 miles of grid main line transmission in Scotland, and 550 miles in South-East England. The erection of the line has been commenced on two routes in Scotland—52 miles in length—and on one route in England—10 miles in length.

The British delegate at the Ninth Assembly of the League of Nations opposed the acceptance of the schemes submitted for setting up a wireless station as part of the peace machinery of the League, on the ground that it would be difficult to justify in present circumstances any expenditure of a considerable sum by the League with the object of assuring a means of communication of very doubtful efficiency to be used only in a hypothetical and, it is to be hoped, remote case. The matter will come up again for decision next September.

BUSINESS ITEMS.

HARDING BROS., Ltd., of Commercial Street, Hereford, have opened new electrical showrooms.

BROOKHIRST SWITCHGEAR, LTD., announces that a service engineer has been attached to the London staff at Australia House, W.C.2.

A special window show of Thor electrical appliances is being given by Mr. F. C. I. MORGAN, electrician, 149, Brighton Street, Wallasey.

THORPE AND BOSCO, LTD., advise us that their day telephone numbers have been changed to Gerrard 8313/4 and the night number to Streatham 8530.

HIGGS MOTORS, Witton, Birmingham, announce that their London address has been changed to Dudley House, 36/38, Southampton Street, Strand, W.C.2.

OMEGA LAMPWORKS, LTD., Rodney Place, London, S.W.19, announce that they have completely reorganised, re-equipped, and restaffed their technical departments.

The address of the REVO ELECTRIC CO., LTD., has been changed to 30, Great Queen Street, London, W.C.2; trade entrance, 26, 28 and 30, Parker Street, W.C.2.

The TUNGSRAM ELECTRIC LAMP WORKS, LTD., announce that they have inaugurated a shop window campaign, having engaged expert window dressers for the purpose.

Electric Sirens.

A Swiss firm is desirous of getting into touch with supplier of electric sirens for factories. Further information from the Department of Overseas Trade, reference B.X. 4 894.

A confidential report on the electric light and power public service and industrial installations in Chile, has been received by the Department of Overseas Trade, reference B.X. 4 853.

The Swedish Educational Authorities, who are embarking on an extensive scheme for the provision of wireless receivers in schools, have decided to use the Marconiphone moving coil instruments.

Mr. James Fullager has retired from the firm of S. W. Bligh, electrical and radio engineers, 1 and 2, North Lane, Canterbury, and the business will be continued by Mr. Sydney William Bligh.

A fire occurred in a portion of the private offices of the HACKBRIDGE CABLE CO., LTD., at Hackbridge, on Monday. It destroyed nothing of importance, and the works were not involved in any way.

The Department of Overseas Trade announces that a Swiss firm desires to be placed in touch with suppliers of electric sirens for factories. Further particulars from the Department upon quoting reference B.X. 4891.

THE METROPOLITAN-VICKERS ELECTRICAL CO., LTD., and the ELECTRIC FURNACE CO., LTD. (who are sole licensees for the British Ajax-Northrup patents) have entered into an agreement whereby each company has the right to manufacture and supply coreless induction furnaces incorporating the Ajax-Northrup and Metropolitan-Vickers patents.

Messrs. TAMPLIN AND MAKOVSKI, electrical engineers, have carried out considerable extensions to their premises in Brighton Road, Redhill. There are new offices, and the showroom now fills the whole of the space previously occupied by the old showroom.

The S.A. DES FOYERS AUTOMATIQUES, of Paris, has obtained an order from the Etablissements Gillet, of Lyon, to instal at their works at Villeurbanne, Lopulco pulverised fuel equipment for two boilers, each of 3 750 sq. ft., complete with two 4-ton Raymond roller mills, raw coal-handling equipment, combustion chambers lined with Murray fin tubes, water screens and air heaters.

The ALTON BATTERY CO., LTD., Alton, Hants, has recently received orders for nine batteries for Sydney, Melbourne and Tasmania. These orders bring the number of Alton batteries ordered for Australia since 1926, to nearly thirty, which represents an interesting development in the export business of the Alton company. Further recent contracts cover batteries for Mansoura, Egypt and Lisbon.

SIR W. G. ARMSTRONG, WHITWORTH AND CO., LTD., of Kinnaird House, Pall Mall East, S.W.1, advise us that Felten and Guilleame, cable manufacturers, of Koln Mulheim, have recently ordered monometer three-ton capacity cable furnaces, with all latest improvements, such as anti-oxidation system, automatic temperature control, and atmospheric syphon type burners. The A.E.G. Cable Works, Oberspree, have also placed an order for a three-ton monometer cable furnace.

The MARCONIPHONE CO., LTD., has just completed a wireless receiver for Mount Lavinia Hospital, near Singapore, capable of supplying ten loud speakers and a number of headphones. Owing to the climatic conditions, a special panel is used, mounted on a strong angle iron frame, which also carries a complete switching and charging system for high and low tension accumulators. Every possible precaution has been taken to render the equipment immune from leakage due to the humid atmosphere, and the whole installation is of British manufacture throughout.

The MEDICAL SUPPLY ASSOCIATION, LTD., 167/185, Gray's Inn Road, London, W.C.1, announces that instructions have been received from the Lord Mayor of Buenos Aires to supply a large quantity of ultra-violet ray apparatus, massage apparatus, high frequency current apparatus, static electrical apparatus, radiant heat apparatus, and electro-medical apparatus generally for the equipment of the Instituto de Radiologia, Buenos Aires. It is believed that this is the largest order for electro-medical apparatus ever placed in this country by a foreign power.

INTERNATIONAL COMBUSTION, LTD., Africa House, Kingsway, W.C.2, announce that the Combustion Engineering Corporation has received orders from the Mead Pulp and Paper Co., of Chillicothe, Ohio, for one Lopulco pulverised fuel storage system, complete with air heater, fin tube furnace and settings, and one boiler of 46 000 lb. evaporation; the Ford Motor Co., of Fordson, for four Raymond 15-ton 6-roller mills; the Dupont Rayon Co., of Waynesboro', Virginia, three Lopulco pulverised fuel storage systems, complete with fin tube furnaces, water screens and settings; and three boilers, each of 27 500 lb. evaporation; the Philip Carey Co., of Lockland, Ohio, two steam generators of 1 800 lb. pressure per sq. in. This point is of interest in that it is claimed to be the highest boiler pressure so far selected for the United States.

International Combustion, Ltd., also announces that the French company, Société Anonyme des Foyers Automatiques, of Paris, has secured orders for Lopulco pulverised fuel equipment from the Sociétié Houillère de Sarre and Moselle, of Merlebach, and the Compagnie Auxiliaire d'Électricité, of Brussels. The first plant, to be installed at Merlebach, is equipment for one S.A.C.M. boiler of 10 760 sq. ft. heating surface, 255 lb. pressure, 100 000 lb. normal evaporation, complete with suspended arch and Lopulco water-cooled walls. The second plant, to be installed at Antoing, is equipment for one B. and W. boiler of 8 070 sq. ft. heating surface, 710 lb. pressure, 56 000 lb. normal evaporation, complete with a six-ton Raymond mill, two of the new "R" type horizontal burners, suspended arch and water-cooled walls.

Welding Equipment.

We are informed that ALLOY WELDING PROCESSES, LTD., 14–16, Church Street, London, N.1, have secured a contract for the supply of a motor generator electric arc welding plant for two operators for the Assam Bengal Railway Co. This machine is to be fitted with their latest B.P. type dynamos, which are self-stabilising, drooping characteristic machines, giving the arc voltage at their terminals. The special features of the "A.W.P." generator are that no separate series resistance, reactors, or transformers are required, neither is separate excitation necessary. The company has supplied similar equipment to the East Indian Railway, the Nigerian Railways, the South African Railways, the Rangoon Dockyard, the Rhodesian Railways, the Eastern Bengal Railway, the Crown Agents for the Colonies, the Singapore floating dock, and Woolwich Arsenal.

The MARCONIPHONE CO., LTD., 210/212, Tottenham Court Road, E.C.4, has prepared a short lecture on the subject of screen grid valves, illustrated by eighteen slides. This deals with the subject quite comprehensively, and is timed to last between forty and fifty minutes. It is proposed to loan a copy of the lecture and a set of slides to secretaries of radio societies for reading by a member on occasions when an outside lecturer cannot be present. It will also be of use to members of the trade who wish to lecture before their local societies. It is intended shortly to arrange a second lecture on the subject of power from a.c. mains, wherein high and low tension and grid bias circuits will be fully explained with about twenty slides. The number of lectures is limited. The Marconiphone Co., Ltd. has also drawn our attention to the fact that the Sterling luminous bell system is being installed at the new "Oddenines" Hotel and Restaurant in Regent Street, London. In this system the bells are replaced by lamps so disposed that a waiter, valet or chambermaid may be called at will from any part of the building to any room in his or her particular section.

A NEW SHOWROOM.

A Comprehensive Display of Domestic Lighting Fittings and Appliances.

A NEW electrical showroom for the benefit of the trade was opened on Monday, by the Welsbach Light Co., Ltd., Welsbach House, King's Cross, London, W.C.1, the layout and arrangements being to the designs of Mr. R. F. Tempany, manager of the electrical department. The showroom is divided into sections approached from a main aisle running the whole length of the room. On entering one views a full range of wood fittings arranged in an appropriate setting, while an attractive fireplace with an electric fire installed gives to this section an atmosphere of uncrowded comfort not often met with in showrooms of this kind. In addition to lighting fittings this same section houses electric fires, bowl fires, etc., including the "Kern" and 1 and 2 bar electric "Handy" heaters. Another section is decorated in colours specially chosen to give effect to dressing table pendants and bedroom fittings, while in still another section is displayed a range of crystal fittings, the wall decorations again being of such colours as to show the fittings to their best advantage. Other sections in various colour schemes are devoted to the display of amber fittings, domestic appliances, cookers, bowls, and fancy and indirect lighting fittings. Along the main aisle full ranges of dining room counter weight fittings, elaborate bowls, etc., are also displayed. Glass showcases are included as part of the showroom appointments, and in these are displayed silk shades of all kinds. Glassware shades of various colours and shapes are arranged in groups round the columns of the centre aisle, the whole showroom presenting an orderly arrangement conducive to comfort and easy selection. The two photographs which we reproduce on page 47 indicate to some extent the simple yet pleasing surroundings. It may be mentioned that among the exhibits is a range of "architectural" fittings for wall and ceiling decoration. These take the form of open and closed designs, and are shown to very good effect in the indirect lighting section. That portion of the showrooms devoted to electric cookers and similar equipment was not complete at the time of the opening, but we understand that a comprehensive range will be carried, while the space allotted to the section indicates that considerable attention will be paid to the display of this class of equipment.

The visit was terminated with a luncheon at the Midland Hotel, King's Cross, with Mr. A. T. Metcalf, general manager, in the chair.

TRADE PUBLICATIONS.

ELECTRIC light fittings are the subject of a new issue by OSLER AND FARADAY, LTD., Lanthorne House, Newman Street, W.1.

The current issue of the "B.E.N. Bulletin," published by B. E. N. PATENTS, LTD., of 92, Tottenham Court Road, W.1, has been received.

The BRITISH THOMSON-HOUSTON CO., LTD., Crown House, Aldwych, W.C.2, has published leaflet L.452 describing ceiling and wall attachments.

A catalogue of wireless receivers and components has been published by the SUN ELECTRICAL CO., LTD., 118-120, Charing Cross Road, London, W.C.2.

The A. E. G. ELECTRIC CO., LTD., 131, Victoria Street, S.W.1, has published a green folder on time switches, automatic circuit breakers, special instruments and fractional H.P. motors.

"Rational Cleaning of Coal," by R. Lessing, has been reprinted from the "Journal of the Institute of Fuel," and is being distributed by the CLEAN COAL CO., LTD., 317, High Holborn, W.C.1.

Aluminium foundry practice is dealt with in a new publication of the BRITISH ALUMINIUM CO., LTD., Adelaide House, King William Street, London, E.C.4. The reference is No. 313, and the issue supplements publication No. 190.

Floodlights and floodlighting are dealt with in a new issue of the GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, W.C.2. The publication is illustrated throughout with striking examples of floodlighting and gives details of the projectors. The reference is F. 4 822.

The MULLARD WIRELESS SERVICE CO., LTD., Denmark Street, W.C.2, has published leaflet W.A. 18 relative to the "P.M." potential divider; V.R. 56, type P.M. 5B valves; V.R. 57; P.M. 1A type valves; V.R. 58, type P.M. 3A valves; V.U. 7, DU/10 valves; V.T. 7, VO/50 valves, and V.R. 65, relative to P.M. 12 and P.M. 14 valves.

WIRELESS NOTES.

"Reciprocal Understanding" Between the R.W.F. and the W.R.A.

A "RECIPROCAL understanding" has been arrived at between the Radio Wholesalers' Federation and the Wireless Retailers' Association of Great Britain, embodying points which the Councils of both organisations recommend their members to observe. These recommendations are to the effect that members of the W.R.A. should give preference in purchasing to firms and companies that are members of the R.W.F.; that members refrain from purchasing from firms and companies acting as wholesalers but who compete with them either openly or otherwise, by selling retail as well as wholesale; and that W.R.A. members communicate to the R.W.F. the name of any wholesaler or manufacturer offering radio goods at prices or on conditions other than manufacturers' listed prices and or terms. The "understanding" also points out that the R.W.F. agrees to circulate amongst its members, after verification, the names of applicants for trade terms who, in its view, do not comply with recognised trading requirements, and recommends its members to use their influence with their retail customers to induce them to become members of the W.R.A.

In connection with above paragraph it is interesting to note that the membership of the Radio Wholesalers' Federation comprises: Brown Brothers, Ltd., Mayall and Co., Ltd., Lawrie and Co., Southern Motor Factors, Ltd., F. Riddiough and Son, Superlamp, Ltd., Sloan Electrical Co., Ltd., Wholesale Fittings Co., Ltd., Murdoch Trading Co., Flinders (Wholesale), Ltd. James Bridger, Ltd., F. D. Newcombe and Co., T. Beadle and Co., Ltd., Carr and Childe, Ltd., Cook's Wireless Co., Ltd., Albion Electric Stores, Fred Dawson, Ellison and Hillman, Houghton-Butcher (Great Britain), Ltd., H. Wadsworth Sellers, Midland Motor Factors, Ltd., Downes and Davies, Sidney Hathaway and Co., Richardson's, Accessories (Edinburgh), Ltd., A. J. Dew and Co., Ecco Radio Co., Ltd., Enterprise Manufacturing Co., Ltd., Harris and Russell, Ltd., London Electric Stores, Ltd., Young and Wildsmith, Hirst, Ibbetson and Taylor, Ltd., R. O'Brien and Co., Arthur Jones and Co., Thomson and Brown Brothers, Ltd., Harris and Russell, Ltd., J. F. Irvine and Co., Ltd., Wood and Cairns, Ltd., Michael Black, William Harper and Co., North British Machine Co., Ltd., James Robertson.

Broadcasting in East Africa.

The Office of H.M. Trade Commissioner in East Africa reports that the programmes of the British East African Broadcasting Co., Ltd., comprise transmissions on 33·5 metres (1 kW), with a range of approximately 1 000 miles, and also on 400 metres (4 kW), with a range of approximately 60 miles. Broadcasting will take place each evening simultaneously. It is estimated that at least 2 000 sets will be sold within the next twelve months in the area served by the station. The most popular set will probably be the three-valve short-wave set with a loud speaker, designed to pick up British, American and Dutch broadcasting services in addition to the local station, and adapted also to receive the 400-metres station. A smaller set of two valves with headphones will probably be demanded as a cheaper alternative, and crystal sets for use with the 400-metre station may also be in demand. British firms interested may obtain the names of likely importers of wireless apparatus on application to the Department of Overseas Trade, 35, Old Queen Street, London, S.W.1.

COLLEGES' REPORTS.

The report of the work of the Department of Technology of the City and Guilds of London Institute for the session 1927-28 has been issued by Mr. John Murray, Albemarle Street, London; price 1s. net. It contains lists of the members of the Council and the Executive Committee, the results of the examinations in England, Wales, Scotland and Ireland, lists of prize winners, etc.

The annual report of the Royal Technical College, Glasgow, on the 132nd session, is also to hand. The book contains the names of the governors, members of Committees, Board of Studies and Staff, statistics showing the numbers of students and enrolments, the names of students who have graduated at the University, other distinctions gained by students, diplomas and certificates granted, donations and bequests to the College, the publications of members of the College during the past year, the recent additions to the electrical engineering laboratory equipment, etc.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, when available.

BRENTFORD GUARDIANS.—Installation of electric lift at West Middlesex Hospital, Isleworth. Particulars from the Clerk to the Guardians, Toolands House, Isleworth.

CARLISLE SOUTH-END CO-OPERATIVE SOCIETY.—Electric lighting installation in business premises at Longsowerby. Particulars from the architect, Mr. S. W. B. Jack, Lloyds Bank Chambers, Carlisle.

WEST RIDING EDUCATION COMMITTEE.—Electric light installation at Gildersome Street Lane Council School. Specifications from Mr. B. Sheard, Education Offices, 8, St. John's North, Wakefield.

SHEFFIELD CORPORATION, January 11th.—Supply of 1 000 tons of tramway rails, copper bonds, etc. Specifications, etc., from Mr. A. R. Fearnley, General Manager, Tramways and Motors Department, Division Street, Sheffield.

ASHFORD (KENT) URBAN DISTRICT COUNCIL, January 14th. —Heavy-oil engine, to drive 600 kW three phase 50 period alternator, with starting air bottles, piping, fuel service tank, etc.; also supercharger silencer, centrifugal pump and fuel oil tank. Further particulars from the Clerk.

BETHNAL GREEN (LONDON) BOROUGH COUNCIL, January 14th.—Electric lighting and power and telephone installations at Public Baths and Washhouses in course of erection in Old Ford Road. Specification, etc., from the Borough Engineer Town Hall, Bethnal Green, E.2; deposit, £3 3s.

CAMBERWELL (LONDON) BOROUGH COUNCIL, January 14th. —Maintenance of electric lighting, heating and power installations (section L) and supply of electric lamps (section S) for twelve months. Forms of tender from Borough Engineer and Surveyor, Town Hall, Camberwell, S.E.5.

CENTRAL ELECTRICITY BOARD, January 14th.—Supply and erection of 132 000 V transformers, in connection with Central England Electricity Scheme. Specification (C.E.-P.T.1) and form of tender from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, January 14th.—Supply and erection of 132 kV outdoor switchgear for transforming stations in area covered by the Central England Electricity Scheme. Specification (C.E.-P.S.1) and form of tender from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

EDINBURGH CORPORATION, January 14th.—Boiler feed-water de-aerating plant for Portobello power station. Specification (No. 96) from Mr. Edwin Seddon, electrical engineer and manager, Electricity Department, Edinburgh; deposit, 10s. 6d.

HUDDERSFIELD CORPORATION, January 14th.—Electrical work for new baths. Particulars from the borough architect, Mr. L. Smith, 26, Ramsden Street, Huddersfield.

KETTERING URBAN DISTRICT COUNCIL, January 14th.— Supply of (*a*) high and low tension cables; (*b*) transformers. Specifications from Mr. W. A. Walker, Electricity Works, Kettering; deposit £1 1s. for each.

STOKE-ON-TRENT CORPORATION, January 16th.—Supply and erection of an electrically-driven air compressor at the central power house, Hanley. Specification, etc., from the City Electrical Engineer, St. George's Chambers, Kingsway, Stoke-on-Trent; deposit, £2.

STOKE-ON-TRENT CORPORATION, January 16th.—Wiring and fitting of eight electric houses in Avenue Road, Hanley. Specification, etc., from the City Electrical Engineer, St. George's Chambers, Kingsway, Stoke-on-Trent; deposit, £2.

STOKE-ON-TRENT CORPORATION, January 16th.—Supply of low tension d.c. switchboard, for electricity sub-works, Bagnall Street, Stoke-on-Trent (contract 2 836); and supply of e.h.t. ironclad type switchgear at Central power house, Hanley (contract 2 839). Specifications from the City Electrical Engineer, St. George's Chambers, Kingsway, Stoke-on-Trent; deposit, £2 for each.

KEIGHLEY CORPORATION, January 17th.—Supply and erection of water-tube boiler, to evaporate 30 000 lb. of water per hour, for the Electricity Department. Specifications from Mr. H. Webber, borough electrical engineer, Coney Lane, Keighley; deposit, £2 2s.

EDINBURGH DISTRICT BOARD OF CONTROL, January 18th. —Electric power and lighting installation at Gogarburn, Edinburgh. Specifications from Mr. Stewart Kaye, 14, Hill Street, Edinburgh.

ISLINGTON (LONDON) BOROUGH COUNCIL, January 18th.— Manufacture and supply of one 5 000 kVA Scott-connected transformer, for three-phase system, 6 600 V and 2 000/2 300 V per phase, with voltage regulator; and 375 kVA and/or 750 kVA Scott-connected transformers, for three-phase system, 6 600 V and 2 000/2 300 V per phase. Specification from the Borough Electrical Engineer, 60, Eden Grove, Holloway, N.7.

ISLINGTON (LONDON) BOROUGH COUNCIL, January 18th.— Supply of cables; electricity meters; terminal, service, network and fuse boxes; oil circuit breaker switches; electrical sundries; wires; lamps; transformers, etc., for one year. Specification from the Town Clerk.

WEST RIDING EDUCATION COMMITTEE, January 19th.— Electric light intallations in Norton New School and in Glass Houghton Ashton Road Council School and caretaker's house. Specification, until January 14th, from Education Department, County Hall, Wakefield.

ESSEX COUNTY AND COLCHESTER HOSPITALS COMMITTEE, January 21st.—Internal electric wiring af Brentwood Mental Hospital, with fuseboards, motors, etc, Specifications, etc., from Mr. H. H. Gepp, 66, Duke Street, Chelmsford; deposit, £5 5s. Only registered contractors are invited to tender.

NEWBURY CORPORATION, January 21st.—Direct-coupled electric motor and centrifugal pump, etc. Specification etc., from Messrs. H. Humphries and Sons, 28, Victoria Street, Westminster, S.W.1; deposit, £1 1s.

GLASGOW CORPORATION, January 28th.—Electrical installation and heating installation, in connection with conversion of Family Home, St. Andrew's Street, Glasgow, for use as additional police headquarters. Specifications, etc., from the Office of Works, 64, Cochrane Street, Glasgow; deposit £3 3s.

BELFAST CORPORATION, January 29th.—Installation of automatic telephones in the Infectious Diseases Hospital, Purdysburn. Specification, etc., from Mr. R. Meyer, town clerk; deposit £2 2s.

LIVERPOOL CORPORATION, January 31st.—Twelve months' supply of various materials, including (E.S.1) cables, compounds and tapes; (E.S.2) insulated cables; (E.S.3) electricity meters; (E.S.4) cartage; (E.S.5) incandescent lamps; (E.S.6) brass and copper castings; (E.S.7) a.c. motors and starting gear; (E.S.8) stoneware troughing etc.; (E.S.9) oils. Tender forms from City Electrical Engineer, 24, Hatton Garden, Liverpool. State number of form desired.

RIPON CORPORATION, February 1st.—Overhead 11 000 V transmission line and small quantity of e.h.t. underground cable (contract No. 2). Persons desiring to tender must communicate their intention to Mr. W. C. C. Hawtayne, 9, Queen Street Place, London, E.C.4, before January 11th. Specifications etc., will be issued on or about January 18th to persons who after receiving notice from Mr. Hawtayne, send to the Town Clerk a deposit of £2.

SHEFFIELD CORPORATION, February 14th.—Equipment for new generating station at Blackburn Meadows, Sheffield, including turbo-alternator, with condensing, evaporating and steam preheating plant (specification B.M. 67); water-tube boilers, with chimneys, superheaters, stokers (or pulverised fuel firing equipment), economisers, valves, etc. (B.M. 68); wagon tippers, conveyors and elevators (B.M. 70); cooling towers (B.M. 72); and overhead electrically and hand-operated cranes (B.M. 73). Specifications from Mr. S. E. Fedden, general manager and engineer, Electric Supply Department, Commercial Street, Sheffield; deposit £3 3s. for each.

CENTRAL ELECTRICITY BOARD, February 15th.—Supply and laying of 66 000 V cables in London area, in connection with South East England Electricity Scheme. Specification (S.E.E.-L.C.1) and form of tender from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, February 18th.—Supply and erection of 132 000 V overhead transmission lines, in connection with the North-West England and North Wales

Digitized by Google

Electricity Scheme. Specification (No. N.W.E.-P.L. 1) and form of tender from Sir J. R. Brooke. Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit, £2 2s.

CENTRAL ELECTRICITY BOARD, February 18th.—Supply and erection of 132 000 V overhead transmission lines, in connection with the Central England Electricity Scheme. Specification (No. C.E.-P.L. 1) and form of tender from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit, £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

VICTORIAN ELECTRICITY COMMISSION, January 14th.—Supply of 11 000 V transformers and spares (specification No. 29/1). (Reference B.X. 4 900.)

NEW ZEALAND POSTS AND TELEGRAPHS, January 15th.—Supply of telephone cords (tender No. P. and T. 151/1 084). (Reference B.X. 4 847.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, January 15th.—Supply of vitreous enamel indicating plates. (Reference B.X. 4 927.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 15th.—Supply of timing clocks (schedule C. 382). Reference B.X. 4 905.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 15th.—Telephone transformers (schedule C. 383.) (Reference B.X. 4 878.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 15th.—Supply of loading coil pots, (Ref. B.X. 4 879.)

TURKISH DEPARTMENT OF POSTS, TELEGRAPHS AND TELEPHONES, January 16th.—Supply of underground telegraph cable, and accessories. (Reference B.X. 4 942.)

• VICTORIAN RAILWAY COMMISSION, January 16th.—Rotary converter or rectifier set, for Glen Waverley sub-station. (Reference B.X. 4 893.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, January 17th.—Air compressor, arc welding set, electrically-driven wheel lathe, motor-driven foundry sand and loam mill, motor-driven rattler and motor-driven stone crushing machine (tender No. 1 367.) (Reference A.X. 7 226.)

BULAWAYO MUNICIPALITY, January 18th.—Supply of street lighting material, transformers, h.t. and l.t. cable, h.t. kiosks and pillars, and busbar material. (Reference B.X. 4 965.)

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, January 21st.—Supply of static power transformers, for Young-Wyangala section of Burrinjuck hydro-electric development transmission lines (contract No. 235/28). (Reference B.X. 4 995.)

GRAHAMSTOWN (SOUTH AFRICA) MUNICIPALITY, January 22nd.—Supply and erection of centrifugal pumps, motors and cable (Contract B. of 1928). (Reference A.X. 7 187.)

GRAHAMSTOWN MUNICIPALITY, January 22nd.—Supply of cable, transmission lines and transformers (contract C. 1 928). (Reference B.X. 4 913.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, January 22nd.—Supply of two concrete mixers, with electric motors (contract No. D.W. 67/107). (Reference A.X. 7 315.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 22nd.—Supply of telephonists' telephones. (Reference B.X. 4 888.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 22nd.—Telephone transmitters and associated parts (schedule C. 386.) (Reference B.X. 4 889.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 22nd.—Telephone receivers and associated parts (schedule C. 387). (Reference B.X. 4 890.)

BOMBAY, BARODA AND CENTRAL INDIA RAILWAY CO., January 23rd.—Supply of 400 kW heavy oil engine-driven generating set. Specification, etc. (20s.) from Mr. S. G. S. Young, secretary, White Mansion, Petty France, Westminster, S.W.1.

CAPE TOWN MUNICIPALITY, January 23rd.—Supply of electric cable (specification 446/1928). (Reference B.X. 4 978.)

EGYPTIAN MINISTRY OF THE INTERIOR, January 24th.—Supply and installation of electric system for Beba. (Reference B.X. 4 916.)

JOHANNESBURG MUNICIPALITY, January 24th.—Supply of 4 500 porcelain insulators (Contract No. 106). (Reference B.X. 4972.)

JOHANNESBURG MUNICIPALITY, January 24th.—Supply of weatherproof copper wire, with fireproof coatings and outer braiding, for use on overhead electric lines. (Reference B.X. 4 976.)

JOHANNESBURG MUNICIPALITY, January 24th.—Supply of electric cable (contract No. 109.) (Reference B.X. 4 977.)

JOHANNESBURG MUNICIPALITY, January 24th.—Supply of oil switches (contract No. 114). (Reference B.X. 4 994.)

JOHANNESBURG MUNICIPALITY, January 24th.—Supply of steel lighting and tramway poles (Contract No. 107). (Reference A.X. 7302.)

SOUTH AFRICAN DEPARTMENT OF POSTS AND TELEGRAPHS, January 24th.—Supply of telephone switchboards (tender No. 143). (Reference B.X. 4 912.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, January 24th.—Supply of two small d.c. generating sets, running on crude oil, for Maquassi. (Reference B.X. 4 943.)

EGYPTIAN MINISTRY OF THE INTERIOR, January 27th.—Supply of transformer kiosks, electric cables and accessories required for the extension of the electric supply of Mit-Ghamr power station. (Reference B.X. 4 893.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 29th.—Accumulator batteries and counter E.M.F. cells (schedule C. 390). (Reference B.X. 4 906.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, January 29th—Single core, paper insulated lead covered cable. (Reference B.X. 4 954.)

THE stands of the Marconiphone Co., Ltd. (left), and Marconi's Wireless Telegraph Co., Ltd. (right), at the Physical and Optical Societies' Exhibition, which took place at South Kensington from Tuesday until yesterday, Thursday. Details of some of the exhibits are given on pages 33 *and* 34.

Digitized by Google

WAIRARAPA (N.Z.) ELECTRIC POWER BOARD, January 29th.—Supply of 15 sets of earth leakage protection equipment (contract No. 78). (Reference B.X. 4 950.)

CHILEAN MINISTRY OF MARINE, January 30th.—Two electric travelling cranes. (Reference A.X. 7353.)

EGYPTIAN MINISTRY OF THE INTERIOR (SECTION DES MUNICIPALITES ET COMMISSIONS LOCALES), January 31st.—Diesel engine driven generator set, d.c. rotary balancer and, accessories, for Kafrel Zayat electric station. (Reference B.X. 4 931.)

MANAWATU-OROUA (N.Z) ELECTRIC POWER BOARD, January 31st.—Supply of automatic re-closing 11 000 V switchgear for pole platform mounting (contract No. 57). (Reference B.X. 4 988.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, January 31st.—Supply of electrically driven locomotive turntable (tender No. 1 386). (Reference A.X. 7 253.)

VICTORIAN ELECTRICITY COMMISSION, February 4th.—Supply of 11 000 V switchgear, in connection with the Yallourn power station extensions. (Specification No. 29/5.) (Reference B.X. 4 897.)

VICTORIAN ELECTRICITY COMMISSION, February 4th.—Supply of 22 000 V switchgear and accessories, for Richmond Terminal Station. (Reference B.X. 4 901.)

VICTORIAN ELECTRICITY COMMISSION, February 4th.—Supply of 11 000 V switchgear, for installation in the Richmond Terminal Station (specification No. 29/3). (Reference B.X. 4 898.)

VICTORIAN ELECTRICITY COMMISSION, February 4th—Supply of pillar insulators, with metal parts for use on 132 000 V outdoor circuits. (Reference B.X. 4 921.)

INDIAN STORES DEPARTMENT, NEW DELHI, February 5th.—Supply of turbo-alternator, boiler, economiser, switchgear and cables. (Reference B.X. 4 944.)

EGYPTIAN STATE RAILWAYS, February 9th.—Electrification and equipment of Heluan line, including equipment of power station, overhead transmission lines, track bonding motor and trailer coaches, etc. Tenders to General Manager, Cairo Station.

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, February 11th.—Supply, erection and maintenance of hydro-electric generating plant, in connection with Hume reservoir hydro-electric development. (Reference B.X. 4 989.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, February 12th.—Supply of 110 kV switchgear, and controlling equipment, for Waitaki power scheme, section 3. (Reference B.X. 4 848.)

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, February 12th.—Supply of dry cells, for telephone work. (P. and T. 151/1 205.) (Reference B.X. 4 991.)

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, February 12th.—Supply of v.i.r. wire (No. P. and T. 151/1184) (Reference B.X. 4 951.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, February 14th.—Supply of 15-ton electrically-driven portal titan crane (tender No. 1 366). (Reference A.X. 7 272.)

INDIA STORE DEPARTMENT, February 15th.—Supply of hydro-electric plant, comprising four 12 000 kW water-wheel driven alternator sets, auxiliaries and spares (schedule 4). Forms of tender (5s.) from the Director-General, Belvedere Road, London, S.E.1.

NEW SOUTH WALES DEPARTMENT OF PUBLIC WORKS. Extension of date.—February 18th.—Supply and erection of hydro-electric generating plant for Burrinjuck development. (Reference 4 938.)

NEW ZEALAND POSTS AND TELEGRAPHS, February 19th.—Supply of bronze wire and copper binding wire. (Reference A.X. 7 252.)

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, February 19th.—Supply of 120 000 galvanised steel spindles for insulators. (Reference B.X. 4 948.)

CAPE TOWN MUNICIPALITY, February 20th.—Pumping equipment for storm water, etc., for the electricity department (specification 445/28). (Reference A.X. 7345.)

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, February 28th.—Supply of six-conductor telephone cordage. (No. P. and T. 151/1 234.) (Reference B.X. 4 990.)

WHANGAREI (N.Z.) HARBOUR BOARD, February 28th.—Supply of one 15-ton electrically-operated level luffing gantry crane (contract No. 35). (Reference A.X. 7 263.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 5th.—Supply of seven single-phase 5 500 kVA transformers, for Waitaki power scheme, section 4. (Reference B.X. 4 873.)

VICTORIAN ELECTRICITY COMMISSION, March 18th.—Supply of 1 300 strings of suspension insulators, 600 strings of tensioning insulators, 1 300 conductor suspension clamps, 350 conductor tensioning clamps, 50 semi-anchor clamps for "V" strings of insulators, 200 semi-anchor clamps for single strings of insulators, 475 earth wire suspension clamps and 125 earth wire tensioning clamps. (Reference B.X. 4 997.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 19th.—Supply of 110 000 V transformer, for Mangahao electric power scheme (section 204). (Reference B.X. 4 952.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 19th.—Supply of 11 000 V switchgear, for Mangahao power development (section 203). (Reference B.X. 4 953.)

TANGANYIKA GOVERNMENT, June 1st.—Concession for utilisation of Pangani River Falls for the development of electric power. Copies of the draft concession may be obtained from the Crown Agents for the Colonies, 4, Millbank, London, S.W.1.

STATE ELECTRICITY WORKS, MONTEVIDEO, July 8th.—Construction and equipment of 50 000 kW power station.

Tenders Accepted.

WAR OFFICE.—Edison Swan Electric Co., Ltd., supply of bell brackets and bell bracket cases.

STOKE-ON-TRENT CORPORATION.—A. Bew, electric lighting installation at Copeland Street stores, £95.

BEDFORD CORPORATION.—Cambridge Instrument Co., Ltd., supply of recorder and indicator outfit, £50.

WARRINGTON CORPORATION.—Brush Electrical Engineering Co., Ltd., supply of extraction water pump.

INDIAN STORES DEPARTMENT.—General Electric Co., (India), Ltd., feeder panel for switchboard, Rs. 1 560.

NAVAN COUNTY COUNCIL.—Gilbert Bros., electric light and power re-wiring in County Hall, Navan, £84.

BERMONDSEY (LONDON) BOROUGH COUNCIL.—United Electrical Works, rewinding of motor armature, £13.

SOWERBY BRIDGE URBAN DISTRICT COUNCIL.—Harrison and Co., of Halifax, electrical work at 16 houses.

GREAT WESTERN RAILWAY CO.—Holt and Willets, 25-ton portable electric crane, for Millbay (Plymouth) pier.

EAST HAM CORPORATION.—Crompton Parkinson, Ltd., spare armature for charging plant at sewage works, £107 10s. (Recommended.)

ISLINGTON (LONDON) BOROUGH COUNCIL.—Hardy and Padmore, Ltd., supply of 12 steel tube lamp columns, £24 18s. each. (Recommended.)

HACKNEY (LONDON) BOROUGH COUNCIL.—A. Reyrolle and Co., Ltd., switchgear, for generating station extension, £56 045 3s. (Recommended.)

HERNE BAY URBAN DISTRICT COUNCIL.—S. Terry, (331 18s. 7d.) or E. C. Spray (£333). electric light installation at King's Hall. (Recommended.)

SHOREDITCH (LONDON) BOROUGH COUNCIL.—Elliston, Evans and Jackson, Ltd., electric light installations at 155 tenements in Bleyton Dwellings, £595.

STAFFORD CORPORATION.—English Electric Co., Ltd., insulators, transformers, etc., in connection with alterations to machinery at electricity works, £95 19s.

HIGH WYCOMBE EDUCATION COMMITTEE.—Wycombe (Borough) Electric Light and Power Co., Ltd., electric light installation at new schools at Terriers, £67 5s.

BEDFORD CORPORATION.—Barber and Colman, Ltd., installation of electric traffic signals at St. Peter's, £179 5s., and at St. Mary's, £141. (Both recommended.)

BRIDLINGTON.—Service Co., electricians and plumbers' work in connection with erection of semi-detached villas, Sands Cottage estate, Bridlington, for Mr. A. Russling, £156.

ILFORD CORPORATION.—Crompton Parkinson, Ltd., supply of 1 000 kW rotary converter equipment, £3 235 10s.; Foster Engineering Co., Ltd., supply of 200 kVA transformer, £144.

BIRMINGHAM EDUCATION COMMITTEE.—Ellis and Ward, Ltd., electrical installations at Ada Street and Yardley Wood schools; W. J. Sheath, electrical installation at Gower Street school.

SPENBOROUGH EDUCATION COMMITTEE.—F. W. Birkett and Sons, Ltd., electric light installation in connection with alterations and additions at South Parade School, Cleckheaton.

LONDON COUNTY COUNCIL.—E. Showell and Sons, Ltd., and Yorkshire Switchgear and Engineering Co., Ltd., supply of controller segments, fingers, tips, etc., to the tramways department during 1928-9.

FULHAM (LONDON) BOROUGH COUNCIL.—J. Lever and Sons, and H. A. Lamb and Sons, wiring of consumers' premises

Digitized by Google

under rental wiring scheme, at schedule of prices set out in contract. (Recommended.)

LONDON COUNTY COUNCIL.—Dorman, Long and Co.; supply, during year 1929-30, of tramway track rails, etc., £55 381; bolts, and nuts, £1 075; and slot rails, £4 846, Frodingham Iron and Steel Co., Ltd., supply of conductor rails during year 1929-30, £10 464.

ST. PANCRAS (LONDON) BOROUGH COUNCIL.—Greenwich Cable Works, Ltd., supply of l.t. cable, £968. (Recommended.) Also tendered: Hackbridge Cable Co., Ltd., £1 029; Siemens Bros. and Co., Ltd., £1 044; Pirelli-General Cable Works, Ltd., £1 071; British Insulated Cables, Ltd., £1 084; Standard Telephones and Cables, Ltd., £1 085.

DUBLIN CITY COMMISSIONERS.—Supply of arc lamp carbons: British Thomson-Houston Co., Ltd., 9mm. by 15 in. flame carbons, £3 4s. per 1 000, and 9mm. and 8mm. by 15 in. flame carbons, £6 per 1 000 pairs; Roper Bros., Dia carbons, 25mm. by 270mm. and 16mm. by 240mm., £74 1s. 6d. per 1 000 pairs, and Dia carbons, 22mm. by 260mm. and 19mm. by 240mm., £7 10s. per 100 pairs.

DOVER CORPORATION.—Pirelli-General Cable Works, Ltd., supply and laying of about 2 500 yards of e.h.t. cable, suitable for 6 600 V, £2 232. Also tendered: W. T. Glover and Co., Ltd., £2 360; British Insulated Cables Ltd., £2 422; Macintosh Cable Co., Ltd., £2 406; Standard Telephones and Cables, Ltd., £2 424; Siemens Bros. and Co., Ltd., £2 406; Watsham's, Ltd., £2 295; E. E. Garrard, £2 183 (French cable); Johnson and Phillips, Ltd., £2 421; W. T. Henley's Telegraph Works Co., Ltd., £2 424; Callender's Cable and Construction Co., Ltd., £2 372; Enfield Cable Works, Ltd., £2 377; Power Lines Construction Co., Ltd., £2 295; Liverpool Electric Cable Co., Ltd., £2 409; Switchgear and Cowans, Ltd., supply and erection of 2 200 V switchgear, £530. Also tendered: Metropolitan-Vickers Electrical Co., Ltd., £868; Crompton Parkinson, Ltd., £925; New Switchgear Construction Co., Ltd., £1 150; Ferguson, Pailin, Ltd., £870; J. G. Statter and Co., £660, alternative £635; Erskine, Heap and Co., Ltd., £880; British Thomson-Houston Co., Ltd., £1 129, alternative £1 136; A. Reyrolle and Co., Ltd., £895; English Electric Co., Ltd., £786; Whipp and Bourne, Ltd., £1 587; Park Royal Engineering Co., Ltd., £1 105, alternative £1 200; General Electric Co., Ltd., £905.

TRADE CALENDARS, &c.

A LARGE wall-type calendar, illustrating some of the company's products, has been received from PETTERS, LTD., Yeovil.

A daily date-slip refill for the holder supplied some years ago has been received from the SUN ELECTRICAL CO., LTD., Charing Cross Road, W.C.

A "Kleer-figure" calendar has been received from the SIEMENS AND GENERAL ELECTRIC RAILWAY SIGNAL CO., LTD., Central House, Kingsway, W.C.2.

The ENGINEERING AND LIGHTING EQUIPMENT CO., LTD., Sphere Works, St. Albans, Herts, has issued a calendar quoting and illustrating famous sayings. The drawings are in each case by Will Owen.

We have received from VENNER TIME SWITCHES, LTD. of 45, Horseferry Road, London, S.W.1, a gift of a thermometer. The instrument was accompanied by a card containing New Year greetings in verse and epigram, a sample of which is given below:—

What tho' distance fahr-en-heit immense
Come between ourselves and you,
To show our feelings most intense
We've centigrade of wishes true.

The 1929 calendar of METRO-VICK SUPPLIES, LTD., Trafford Park, Manchester, is illustrated by a coloured picture by Bert Wilson, showing in the right foreground part of a small standard lamp with yellow shade, with a dark-haired, smiling girl in the background. The picture is mounted upon a dark brown board and makes a very pleasing whole. A distribution has already been made to the trade, but a few copies are still available for those who have not yet had one.

An attractive calendar has been sent to us by CROMPTON PARKINSON, LTD., Guiseley, comprising four large coloured sheets showing on each a quarter of the year and an illustration relative to certain of their manufactures. The first quarter is illustrated by a large liner in dry dock coupled with d.c. motors for marine use; the second quarter shows a mining view coupled with motors for use in damp, dust or fumes; the third quarter is illustrated with a picture of a power station and transformer; while the last quarter depicts another dock scene, coupled with crane and haulage motors.

REDUCTIONS IN CHARGES.

THE following reduced charges for electricity are announced. Figures in parentheses represent the former rates:—*Whitchurch and Pangbourne Electric Supply Co.*, lighting, 10d. (1s.). *Spenborough*, power 1½d. (3d.), lighting 5½d. (6d.), public lighting 2d. (3d.). *Prescot Urban District* (British Insulated Cables Ltd.), minimum charge of 10s. per quarter during summer months is abolished. *Dorchester*, sliding scale, first 2 500 kWh per annum, 9d. per kWh, all above, 8d. *Walton-on-Thames*, lighting, 7½d. (9d.), heating and cooking, 2d. (4½d. for first 100 kWh and 3½d. beyond), power, first 100 kWh, 6d. per kWh (7d.), next 3 000 3½d. (4d.), beyond 2½d. (3d.); minimum charges abolished; shop window lighting between 7 p.m. and 10 p.m. 50% of new tariff. *Chatham and Rochester* (Kent Electric Power Co.), lighting, 6½d., power, heating and cooking, 2d. *Weybridge* (Urban Electric Supply Co., Ltd.), power and heating: first 3 000 kWh per quarter, 3d. per kWh, all over 3 000, 2d., heating, 2½d.

Heating at Three-Farthings at Derby.

Derby, lighting, first 1 000 kWh p. qrtr, 4d. per kWh, next 1 000, 3¾d., beyond, 3½d.; heating and cooking, first 2 000 kWh per quarter, 1½d. per kWh, next 2 000, 1d., beyond, ¾d.; rateable value system, minimum account per quarter to be 7s. 6d., power, flat rate, 1½d.; water heating, by storage method, restricted service from 9 p.m. to 7 a.m., ½d., continuous service, ¾d. Combined scale for power continued at £5 per H.P., but charge for current reduced to 0.6d. kWh (0.7d.), 0.5d. per kWh for all in excess of 150 000 kWh per month; domestic lighting and heating combined, for Council houses, 1s. per week, to cover 30 kWh per quarter, 1d. per kWh beyond (in lieu of fixed payment of 1s. per week and 1d. per kWh all round). *Dewsbury*, lighting: first 500 kWh 4d. per kWh, next 500, 3¾d.; beyond, 3½d.; maximum demand, lighting, first hour per day, 6d. per kWh, beyond 2d., shop window lighting after closing hours, 2d., heating 1½d., cooking 1d., heating with cooking, 1d., street lighting, 2d.; power, maximum demand, first hour per day, 2¾d. per kWh, beyond, ½d., less 2½ per cent. for prompt payment; special charge for restricted hours: up to 5 000 kWh per quarter, 1d. per kWh, up to 12 500, 0.9d., up to 25 000, 0.8d., beyond, 0.7d. net; rateable value, lighting and heating, 15 per cent. of rateable value, plus ¾d. per kWh, minimum of 600 kWh per annum to be consumed, automatic meters, 5d.; ordinary meter rents reduced to 3s. per annum. *Dumfries*, shop window lighting after closing hours throughout year, 4d. per kWh, with minimum annual charge, 20s. *West Hartlepool*, domestic rate and business premises, from ¾d. (1d.) per kWh, plus a fixed charge; two-rate tariff, lower rate at present charged on power scale reduced to flat rate of 1d.; public lighting, 1½d. (1¾d.). *Taunton*, lighting, under 501 kWh per quarter, 4½d., under 1 001, 3½d., beyond, 2½d.; heating, winter quarters, 1d., summer quarters, ¾d.; power, under 4 001 kWh per quarter, 1½d., exceeding 4 000 per quarter, 1¼d., exceeding 32 000, per annum, 1d., pre-war charges. In the outside area consumers are charged 25 per cent. extra. *Bury* (*Lancs*), present scale for power retained for ordinary class of consumers, but for consumers who agree to take a supply for at least five years, and to guarantee a minimum annual payment of £200 the scale is 2d. per kWh for first 1 000 per quarter, 1½d. for next 1 500, 1d. for next 35 000, 0.8d. for next 125 000, and 0.6d. beyond, lighting for such consumers to be charged at the rate of 10 per cent. of power consumption at the consumer's average power rate, and remainder at 3d.; cookers, suitable for small families, and washing boilers hired at 2s. 6d. per quarter, free length of service increased from 12 to 20 yds. *Glossop* (Urban Electric Supply Co., Ltd.), lighting, 8d., subject to minimum charge; power, 4d. per kWh for first 3 000 per quarter, 2½d. for next 15 000 and 2d. beyond. *Hendon Electric Supply Co., Ltd.*, lighting, 3½d. (3¾d.); domestic purposes (other than lighting) and heating and power installations up to 2 kVA, first 120 kWh per quarter, 2½d. per kWh (2¾d.), all in excess ¾d. (⅞d.); industrial purposes (other than lighting) and exceeding 2 kVA but not exceeding 150 kVA installed or 75 kVA maximum demand, 1¼d. (1⅜d.), or, alternatively, fixed charge of 10s. per quarter per B.H.P. installed, plus ¾d. (⅞d.) per kWh; domestic tariff (dwelling houses only), quarterly fixed charge, plus ¾d. (⅞d.); business tariff, lighting, a quarterly charge of 1s. for each 15 W of maximum demand in quarters ending March 31 and December 31, and of 1s. for each 40 W of maximum demand in quarters ending June 30 and September 30, and, in addition, 1½d. (1¾d.) per kWh, rentals for demand indicators range from 1s. 6d. per quarter up to 15 A capacity, to 3s. up to 50 A.

ELECTRICITY SUPPLY.

Arbroath and Dereham Supplies Commenced—Cables and Switchgear for West Ham—Loan for New Equipment at Birkenhead—Llandrindod Wells Plant Extension—Victoria Embankment Lighting Proposals.

BIRTLEY P.C. has decided to apply for a loan of £2 600 for public electric lighting.

Electricity supply at Forfar was inaugurated last week, current being taken from the Arbroath power station.

Dereham urban district has now a supply of electricity, obtained from Norwich Corporation. The U.D.C. has undertaken the distribution.

Greenock Dean of Guild Court has granted permission to the Central Electricity Board to erect four towers in the upper part of the town for carrying the 132 000 V lines.

Leeds Electricity Committee recommends that consumers taking 100 000 kWh or over per annum for lighting be offered an alternative tariff of £10 per kW of maximum demand, plus ½d. per kWh.

Sheffield Electricity Committee has agreed to take back its recommendation that the 10% charged on rateable value to domestic users of electricity be charged on the basis of the new assessments.

Bolton Electricity Committee has obtained sanction to supply electricity to premises at Walker Fold, in the area of supply of the Horwich U.D.C., and also consent to the erection of the requisite overhead line.

Kensington (London) B.C. has granted permission to the Brompton and Kensington Electricity Supply Co. to open up certain carriageways and footways for the purpose of laying electricity cables. The company proposes to lay a sufficient number of ducts to provide for the requirements of the district for many years to come.

A Ministry of Transport inquiry was held recently by Mr. A. D. Erskine, respecting the application of the Leicestershire and Warwickshire Electric Power Co., to erect 13 poles at Melbourne (Derbyshire). Derbyshire County Council opposed the application, on the ground that, for the safety of the public, it was undesirable to erect additional poles on the highways.

Mr. J. H. Bowden, borough electrical engineer, having reported to Poplar (London) Electricity Committee that the long and continued delay in connection with the erection of the new sub-station in the central district is severely taxing the converting plant at the main station, the Committee has decided to proceed with the purchase of the necessary land.

The Electricity Commissioners have appointed Col. T. C. Ekin to hold an inquiry at Guildford on January 15th into the applications for the following special orders:—Aldershot District Electricity (Extension) No. 1, No. 2, and No. 3, Petersfield Electricity (Extension), West Sussex Electricity, Steyning Electricity (Extension), and Alton Electricity (Extension).

West Ham Electricity Committee is to seek sanction from the Electricity Commissioners to the borrowing of £69 300 for the provision of h.t. feeder cables and switchgear to comply with the terms of the agreement with London County Council for the provision of a h.t. feeding cable to its pumping station, and to meet the steadily increasing demand in the northern part of the borough.

The Electricity Commissioners state that they are unwilling to confer upon Warrington Corporation competitive powers of supply in the area of another authorised undertaker (the Mersey Power Co.), and they see no reason to alter their decision to exclude from the area of supply under the Corporation's proposed extension Order the five parishes in the rural district of Runcorn.

Brampton R.D.C. has received from Carlisle Corporation a letter with regard to the proposed extension of the electricity supply to the area, and asking whether the Rural Council is desirous of taking a bulk supply and to act as distributor or whether it would be willing for the Corporation or a private company to carry out the distribution. A deputation is to discuss the matter with the City Electricity Committee.

The question of an electricity supply for the district was again considered by Milton Regis U.D.C. on December 4th, when the Clerk reported that at a joint meeting of representatives of Sittingbourne Urban and Milton Rural Councils, and of E. Lloyd, Ltd., who have offered a supply of electricity, has taken place. The Commissioners are to be asked whether they would be likely to grant a Special Order to the Councils.

Birkenhead Electricity Committee has obtained sanction to borrow £3 582 for mains and £11 200 for other equipment, including £666 for transformers and £2 730 for switchgear.—The Committee has obtained consent to the placing of overhead lines in the parishes of Prenton, Landican, Thingwall, Irby, Thurstaston and Heswall, for the transmission of energy at 11 000 V for the purposes of the area covered by the Wirral and Neston Electricity Special Order, 1925.

Aberdeen Electricity Committee has decided to recommend the Council to oppose the Grampian Electricity Supply Co.'s application for a Provisional Order, on the ground of safeguarding the interests of its own undertaking. The powers sought include the supply of parts of Aberdeenshire, Banffshire and Kincardineshire. The Aberdeen undertaking supplies an area extending as far west as Culter, eight miles from Aberdeen.

The new extension to the electricity works owned by Llandrindod Wells U.D.C. was formally opened on December 12th, by Mrs. C. C. Hughes, wife of Mr. C. C. Hughes, J.P., chairman of the Council. Mr. Hughes mentioned that since the Council took over the electricity works, just over five years ago, the price of current for lighting had been reduced from 1s. 2d. to 8d., power from 10d. to 5d., heating and cooking from 10d. to 2d., while their consumption had increased by 45%.

London County Council Highways Committee proposes to accept an offer by the Charing Cross Electricity Supply Co., Ltd., to install and supply current to electric lanterns suspended over the centre of the road on the Victoria Embankment, to supersede the present lamps on the kerb of the footway. The lanterns will be 140 ft. apart, and each will contain two 1 500 W gasfilled lamps. The initial cost of this work and of equipment for lighting lamps on three standards in the Northumberland Avenue approach and the Embankment refuge and parapet lamps is estimated at £14 184.

Southwark (London) Electricity Committee reports that in 1926 it decided to extend its generating plant at the power station to cope with the future demands. The Electricity Commissioners declined to sanction the extension, and decided that a partial bulk supply should be obtained from one of the electric light companies. The Committee is of opinion that a financial expert should be engaged to advise the Council upon the cost of taking a partial bulk supply and the possibility of meeting such cost by an increased demand. The Committee recommends the engagement of an expert at a fee of £400.

Stoke-on-Trent Electricity Committee is to extend mains at a cost of £1 500 to supply premises which are being erected by the Burslem and District Co-operative Society, the premises of the Silverdale Co-operative Society, etc., in Oxford Road, Basford, and 70 or 80 houses which are being erected by Messrs. Phillips and Co., at Sneyd Green.—The Electricity Department has received a letter from Messrs. Alfred Meakin (Tunstall), Ltd., stating that the company has in contemplation the erection of an electrical kiln for the purposes of firing enamel goods at its Newfield factory. Subject to the firm entering into the usual agreement, the three-phase e.h.t. main is to be extended to the pottery, and application will be made for sanction to borrow £2 400 to defray the cost.

Brighton Electricity Committee has received from Mr. W. H. Overton, a detailed estimate of the cost of the alterations to be carried out at the North Road electricity works, and it has been decided to apply to the Electricity Commissioners for sanction to borrow £35 577, made up as follows: building work, £19 989; constructional work, £5 055 10s.; heating, £3 000; electric light and power, £1 500; clerk of works' salary, £832; fire protection, hydrants, etc., £500; contingencies, £3 000, and architect's fees and expenses, £1 700.—The Electricity Committee has authorised mains extensions at a cost of £1 870.—The Central Electricity Board has inquired whether the Corporation would be willing that the terms already agreed for the supply of current to the Board to enable them to supply the Worthing Corporation should extend to a proposed supply to the Haywards Heath and District Electric Supply Co. The Electricity Committee is of opinion that the circumstances in the case of the proposed supply to Haywards Heath are not such as to justify

ELECTRICAL NEWS OF THE WEEK IN PICTURES.

In order to overcome the necessity of climbing to the starting point of the toboggan run at Oberhof, Germany, an electric "lift" to convey both craft and passengers has been installed.

This photograph of an early type of electric vehicle has been sent to us by a reader, and shows a vehicle brought back from retirement for service during the war-time petrol shortage. We understand that it was used almost every day during the greater part of the war, in spite of its age without breakdown.

Two views of the new showrooms of the Welsbach Light Co., Ltd., referred to on page 41. The first shows the entrance hall, where are displayed wood fittings and pedestal and other heaters, while the second picture shows a general view looking towards the entrance, and includes on the left a portion of one of the sections devoted to classified fittings. As will be seen, the pillars down the aisle are arranged for the display of glassware, while dining-room pendants, bowls, etc., are also shown in the aisle.

the specially reduced rate of charge made to the Board in respect of the supply to Worthing, but further consideration will be given to the question upon receipt of the reasons why the Board suggest that the charge is appropriate.

The Dawlish Electric Light Co. has secured an Order authorising it to supply electricity in Kenton and Starcross, Dawlish West, Ashcombe and Mamhead. At the recent inquiry, the application by Devon County Council for the insertion of a clause providing that in the case of any road widening the company should be responsible for removing and re-erecting the electric poles or standards, was rejected.

Settle R.D.C. has approved a draft Special Order for a supply of current in the Council's district (except Ingleton and Thornton-in-Lonsdale), to be provided by Crompton Parkinson, Ltd. The maximum charges are to be for the quarters ending March 31st and December 31st, 12s. 6d. up to 15 kWh and 10d. per kWh for all in excess, and for the quarters ending June 30th and September 30th, 8s. 4d. up to 10 kWh and 10d. per kWh for all further consumption.

Hull Electricity Department has received an inquiry whether there is any possibility of Hull undertaking to supply electricity to Hornsea within the next two years. Hornsea is not included in the proposed added area. The Electricity Committee has promised to discuss the matter if and when approached by the Hornsea Council.—The Committee has asked the Engineer to report on the question of the lighting by electricity of courts, passages and other places not lighted at present by gas.

Owing to the very limited use of electric cooking and heating apparatus by the majority of the hirers at Dover, the Borough Electrical Engineer recommends that the rates charged for hire be increased by 50%, and he considers that a system of hire-purchase would be a better proposition than the present hiring system, as the apparatus would then receive more careful attention from the users. The supply of apparatus on hire for the lighting of shop windows after closing hours is proving a success.

Applications have been made by Messrs. Thomas Wilkinson, Ltd., of Arnside, for the inclusion of the parishes of Warton and Silverdale in the proposed electricity scheme for Westmorland, which has been approved by Carnforth U.D.C. The company intends to utilise the waste gases at Carnforth Ironworks for the generation of electricity, and, when the works are closed, to take supply from the Government's grid. The proposed prices are 1¼d. per kWh for power and 8d. for lighting. The station would be of 12 000 kW.

COMPANY NEWS.

Appreciation of Electrical Manufacturers' Shares—County of London Co's Shares also Improve—Extension of Perak River Hydro-Electric Power Co's Plant—Wireless Pictures (1928) Statutory Meeting—New Companies Registered.

ELECTRICAL manufacturing shares have been active this week, and most of the favourites have risen in price, under the lead of General Electrics. These, as the result of American buying, right at the end of last week, jumped to 62s. 6d., from which they have since relapsed to 55s., leaving the quotation 11s. 3d. higher on the week. British Insulateds and Callender's are respectively 5s. and 4s. higher, Siemens' 2s. 6d., and Henley's 1s. 3d. Ever Readys have shown especial strength, and at 33s. 6d. are 5s. up. In the supply section, County of London shares are 5s. 6d. higher at £2 10s.

LISBON ELECTRIC TRAMWAYS, LTD.—Intm. div. 3% net on ord. shs (same rate as last year).

METROPOLITAN RAILWAY CO.—Traffic receipts for 1928 were £1 854 000, an increase of £59 000.

SHAWINIGAN WATER AND POWER CO.—Div. of $1½ p. sh. on common shs. for qrtr. ended Dec. 31, 1928, payable Jan. 10.

VICTORIA FALLS and TRANSVAAL POWER CO., LTD.—Net earngs. for qrtr. ended Sept. 30, 1928, £298 169, before providg. for taxation.

ANGLO-ARGENTINE TRAMWAYS CO., LTD.—Divs. of 2s. 9d. p. sh. on 5½% cum. 1st pref. and 3s. p. sh. on 6% cum. 2nd pref. for half-year are announced.

MONTEVIDEO TELEPHONE CO., LTD.—Net pft. for year ended July 31, 1928, £35 809. To res. £20 000 Fin. div. 5%, tax free, makg. 8% for year. Fwd. £3 655.

B.B. PICTURES (1928), LTD.—After paying intm. div. at rate of 2½% p.a., less tax, and transferrg. £1 000 to gen. res., carry fwd. is £1 387, subject to directors' fees.

OHIO EDISON CO.—Regular quarterly divs. h. bn. declared on 6%, 6·6%, 7%, and 5% qrtrly, pfd. stk. and regular monthly divs. on 6% and 6·6% monthly pfd. stk.

S. SMITH AND SONS (MOTOR ACCESSORIES), LTD.—At an extraordinary meeting last week a resolution to subdivide unissued £1 ord. shs. into 1s. dfd. shs. was confirmed.

NORTH METROPOLITAN ELECTRIC POWER SUPPLY CO.—It is proposed to issue 250 000 new £1 ord. shs., part of the additional cap. authoris. by Companies' (Consolidatn.) Act, 1928.

COUNTY OF DURHAM ELECTRIC POWER SUPPLY CO.—Rev. for 1927, £329 793, blce. to net rev. acct. £29 690; div. payable amtd. to £27 546; fwd. £2 589, includg. amt. brt. in from previous acct.

WEST GLOUCESTERSHIRE POWER CO.—This company has acquired the ownership of the Chepstow Electric Lighting and Power Co.'s undertaking by the purchase of over 98 per cent. of its shares.

CONSOLIDATED SIGNAL CO., LTD.—Div. for year to Sept. 30, 1928, 17½%, less tax at 3s. 9½d, in £1, agst, 12½%. Co. owns 391 112 ord. shs. of Westinghouse Brake and Saxby Signal Co., Ltd.

MONTREAL TRAMWAYS CO.—Directors recently authorised issue of 10 000 shs. of $100 par value at $150 p. sh., of which $75 p. sh. must be paid by Jan. 21 to Aldred and Co., 24-28, Lombard Street, London, E.C.

FOUNDATION CO., LTD.—Pft. for year ended June 30, 1928, after provisn. for depreciatn., £21 281, agst. £21 056. Taxatn. required £6 000, and £5 000 has been placed to housing res. Div. on pref. 8% less tax. Fwd. £18 112, agst. £17 431.

AMALGAMATED WIRELESS (AUSTRALASIA), LTD.—Div. of 6% for year ended June 30, 1928 (first div. since 1922), is announced. Pendg. result of wireless cable negotiations, board thinks it desirable to postpone further the ord. gen. mtg.

CLEVELAND AND DURHAM COUNTY ELECTRIC POWER CO.—Rev. receipts in respect of the separate undertakgs. for year to Dec. 31, 1927, £399 732. Workg. costs £380 089; blce. to net rev. acct. £19 643. Int. on deb. stk. and on loans, etc., absorbed £19 644.

EVER READY CO. AND LISSEN, LTD.—Negotiations have taken place in regard to a suggested amalgamation of the Ever Ready Co. (Great Britain), Ltd., and Lissen, Ltd., radio engineers, but we are informed that no definite decision on the matter has yet been reached.

LANARKSHIRE TRAMWAYS CO.—A special general meeting will be held on Jan. 14th, to submit to shareholders draft Provisional Order to change name of co., to make provision as to abandonment of co's tramways, to enlarge powers with regard to running of omnibuses, etc.

UNITED RIVER PLATE TELEPHONE CO., LTD.—It is announced that the holders of over 1 150 000 ord. shs., representg. more than 90% of the voting power, have accepted the offer of Morgan, Grenfell and Co. for the purchase of their shares. The time has bn. extended until Jan. 24 for other holdrs. of ord. shs. to accept the offer.

SOCIETA ITALIANA RADIO MARITTIMA.—Debs. to the amount of 12 061 500 lire are to be issued, and the proceeds used to complete paymt. for apparatus purchased from the Marconi International Marine Communication Co. and the Cie Generale Télégraphie Sans Fils and installed on Italian ships, and to

Digitized by Google

ensure regular development of services conceded to the Italian Co.

ASSOCIATED GAS AND ELECTRIC CO.—Regular div. on class A stk. will be payable on Feb. 1 in class A stk. at rate of 2½% of one sh. (or 10% p.a.) for each sh. held, and an extra div. on class A stk. of 40 cents. p. sh. is also announced. Regular div. in stk. will be paid to all stkhldrs. who do not request payment in cash.

BRAZILIAN TRACTION, LIGHT AND POWER CO., LTD.—Co. has offered to buy, at £2 17s. 6d. p. sh. the ord. shs. of the City of Santos Improvements Co., conditionally upon acceptance of the offer by hldrs. of 75% of the ord. sh. cap. by Jan. 15. The purchase price will be payable through Greenwood and Co., 28, Austin Friars, London, E.C.2.

CALCUTTA ELECTRIC SUPPLY CORPORATION, LTD.—Rev. in 1927, £930 291, agst. £779 790 in 1926; houses connected 24 985, agst. 22 200; electricity sold 129 090 227 kWh, agst. 108 895 477. Div. on ord. shs. 12%, plus cash bonus 4d. p. sh., agst. 12%, plus sh. bonus. Sales in 9 months to Sept. 1928, 109 560 177 kWh, increase 12 849 569.

BRITISH COLUMBIA ELECTRIC RAILWAY CO., LTD.—Earngs., including int. and divs. from allied and subsidiary cos., for year to June 30, 1928, £642 051, agst. £611 483, after mtg. depreciatn., sinkg. funds, and renewals. Int. on debs. and deb. stk. £462 747, agst. £431 775. After provisn. for pref. div., directors propose fin. paymt. of 1% on pfd. ord., making 6%, less tax at 2s. 0½d. in £, agst. £6 4s. %, tax free, for 1926-7. Fin. div. is proposed of 3% on dfd. ord., making 8%, less tax, agst. 8% tax free. To res. nil, agst. £130 000. Fwd. £182 228, agst. £70 639.

COMPANIES TO BE STRUCK OFF THE REGISTER.—The following companies will be struck off the register of joint stock companies unless cause to the contrary is shown before March 7: Auto Electrics; Cambrian Electricity Supply Corporation; Elco Electric Manufacturing Co.; Electrical Coils; Electrical Insulating Composition Co.; Electricity, Gas, Share, Debenture, Investment and Guarantee Trust; Halstead Electric Supply Co.; Headphones (Manchester); Lighting and Power Finance Corporation; Magnetic Car Co.; Magneto Accumulator and Generator Services; Radiant Heating; Radio and Electrical Supplies (Bolton); Radio Appliances; Radio Engineering Co.; Roddis Electric; Shaftesbury Wireless and Engineering Co.; Victor Radio; Whitfield Electrical Co.; Willesden Electric. The following will be struck off the register unless cause to the contrary is shown before March 11th: Automobile Electrical Repairers; Bucks Electric Wire and Engineering Co.; Domestic and General Electrical Co.; Perfecta Electric; Sunbeam Lamp Co.; Wireless Experts.

Company Meetings.

BOGOTA TELEPHONE CO., LTD.—Mr. Harry Kahn, presiding at the recent meeting, said there was a cash balance of £72 144, after about £83 000 had been expended in connection with the new extensions, and there were reserves appearing as a depreciation account of £40 700 and a share premium account of £25 400. Profit and loss account was scarcely as satisfactory, for although subscriptions rentals, etc., at £44 535 were £1 043 higher than last year, maintenance and general expenses, at £25 167, showed an increase of £3 443, the working profit being, therefore, £2 400 to the bad, due to the cost of the strike and higher wages. They must hope that the municipality would see the justice of their appeal for higher rates. An interim dividend of 5%, less tax, was paid on April 5th, 1928, and a final dividend of 5%, less tax, was now recommended. The report and accounts were adopted.

PERAK RIVER HYDRO-ELECTRIC POWER CO., LTD.—Viscount Elibank, presiding at the annual general meeting, said a further £50 000 had been received from the Federated Malay States Government in respect of the 500 000 8% preference shares, making them 14s. paid at July 31st, 1928, and since that date the final 6s. per share had been paid. During the year, power demands in the concession area warranted a further extension of the steam station by the addition of a third unit of 6 000 kW, making the total capacity of the station 18 000 kW. On June 19th, the 7% participating debenture stockholders approved the board's proposal to increase the 7% participating debenture stock by £250 000. Applications for power accepted to date represented a demand of about 13 000 kW, or 80 million kWh per annum. Inquiries under negotiation, if they all became contracts, would more than double that output. The station was put into definite commerical operation on December 12th. The hydro-electric station should be able to link in with the steam station by March or April, 1930. During his visit to Malaya, from November to March last, he negotiated the formation of a small local company, the Kinta Electrical Distribution Co., Ltd., with an issued capital of $350 000 (about £41 000), which would retail to certain towns and villages power purchased in bulk from their company. In addition, he negotiated a satisfactory contract with the Federated Malay States Government for the supply of power in bulk to Ipoh, the largest town in the State of Perak. Under this contract the Government would purchase 75 000 of the unissued £1 ordinary shares at par. The report and accounts were adopted.

FOUNDATION CO., LTD.—Mr. J. G. B. Stone, presiding at the general meeting, said the net profit for the year to June 30th, 1928, was £21 281, compared with £21 055 for the previous year, and the balance brought forward from 1927, £17 431, made a total balance available of £38 712, about £1 000 more than last year. After provision for taxation, housing reserve, and dividend on preference shares at the rate of 8 per cent. per annum, the balance carried forward was £18 112, compared with £17 430. An interim dividend for the six months ended December, 1927, was paid on July 1st, 1928, and the final dividend paid on January 1st, 1929. They had expanded considerably in connection with the erection of overhead lines for power transmission under the Government grid scheme, and they had also entered the building trade, as instanced by the new office building at St. James's Park Station for the Underground Railway Co., which was now nearing completion. While they had retained and probably improved their position as contractors for the erection of super-electrical power stations, the delays inevitable from Government control had made the year disappointing, and in respect of general heavy engineering work competition had increased because of the unexpected reduction in demand; but they had specialised in comprehensive works, where mechanical and electrical engineering could be combined with civil engineering, not only in respect of electric generating plant, but also in general factory construction, and to-day they believed they had an organisation almost unique in this respect, which they hoped to utilise to advantage when industrial development became more general. The report and accounts were adopted.

WIRELESS PICTURES (1928), LTD.—Presiding at the recent statutory meeting, Lieut.-Col. Adrian F. H. S. Simpson said there appeared to be some confusion in the public mind as to the difference between the company's activities and what was commonly known as television. Television dealt with transmission and reception of moving pictures, whilst the Fultograph dealt with what they termed still pictures. In the case of television no permanent record was obtained of the transmitted picture. With the Fultograph a visible record was obtained. Captain Fulton had evolved a system of transmission and a receiver which for the first time brought picture reception within the reach of the general public. He had produced a receiver which was being sold for £22, whilst the transmitting apparatus, similar to that employed by the B.B.C. to-day, could be sold for approximately £250. He (the chairman) believed it to be only a question of time and price before its application became general for the reception of broadcast news and for educational and amusement purposes in the home. Experiments were being conducted to apply its principle to the land line, so that illustrations and current pictorial news could be supplied at minimum cost to members of the Provincial Press. The managing director (Mr. W. H. Lynas) said on the formation of the company the only instruments in existence were those manufactured by Fultograph companies in Europe. The companies in Berlin and in Paris, who were actually manufacturing the Fultograph for the Continent, agreed to increase their production considerably, to allow for deliveries to the English market of machines incorporating the necessary modifications. These deliveries were beginning to materialise, and about 250 machines had already been received and distributed in this country. It was not intended to continue importing from abroad any longer than could be helped, but it was thought desirable to make an effort to begin supplying without delay the immediate demand for the picture receiver in this country. Several British manufacturers had already been approached, and many others had asked to be allowed to quote. Within, probably, a few days definite contracts would be placed for manufacture of Fultograph in Great Britain. Negotiations were well under way with regard to the sale of the company's apparatus in Australia and India, or, alternatively, the disposal of their rights, which ever seemed the most profitable way. In Canada and South Africa the directors were also in touch with firms interested in acquiring the rights of handling the apparatus.

NEW COMPANIES.

W. AND F. WILLS (LONDON), LTD.—Cap., £2 000. Electrical and consulting engineers, etc. Reg. office: 30, College Street, Dowgate Hill, London, E.C.4.

PYE (RADIO), LTD.—Cap., £100. Manufacturers of and dealers in wireless sets and apparatus, electrical appliances, etc. Solicitors: Bartlett and Gluckstein, 199, Piccadilly, London, W.1.

DARLINGTON DRY BATTERY CO., LTD.—Cap., £500. To acquire business of dry battery manufacturers carried on by J. Thompson and W. V. Taylor, at Valley Street, Darlington, Durham.

F. O. COWARD, LTD.—Cap., £1 500. To acquire business of electrical engineer and battery service station proprietor now carried on by F. O. Coward at 21, Lower Castle Street, Bristol.

D. EDWARDS AND SON, LTD.—Cap., £2 500. To acquire business of dealer in electrical instruments, etc., carried on by D. Edwards at Abertillery, Mon, and elsewhere, as "D. Edwards and Son."

KING'S INVENTIONS (ELECTRIC), LTD.—Cap., £7 500. To adopt agreement with W. C. King and to carry on business of electrical and general engineer carried on by him at Liverpool. Solicitor: A. M. Hannay, 41, Castle Street, Liverpool.

POLPERRO ELECTRIC AND COLD STORAGE SYNDICATE, LTD.—Cap., £200. To carry on the business of electric light supply at Polperro and elsewhere. Solicitors: Spring and Co., 12–13, Henrietta Street, Covent Garden, London, W.C.

"NEW ERA" TIME AND TELEPHONE SYSTEMS, LTD.—Cap., £100. To carry on business of financing and installing synchronised time, signalling and automatic or other telephone systems, etc. Secretary: H. R. Hayes, 7, Pall Mall, Manchester.

MARWEB CO., LTD.—To adopt agreement with H. C. Gamble, to carry on the business of electric sign manufacturers, publicity contractors and agents formerly carried on by him as "Marweb Co.," at 36, Causeway Lane, Leicester, and to acquire trade mark "Marweb" and device.

BRECKNELL, MUNRO AND ROGERS (1928), LTD.—Cap., £75 000. To acquire certain property and assets of Thrissel Engineering Co., Ltd., lately known as Brecknell, Munro and Rogers, Ltd., to carry on the business of electrical engineers, electricians, etc. Solicitors: Trower, Still and Keeling, 5, New Square, Lincolns Inn, London, W.C.

WRIGHT (ELECTRIC POWER SPECIALITIES), LTD.—Cap. £6 000. To acquire business of electrical engineers and manufacturers of electrical appliances carried on at Halifax and elsewhere as Wrights Motors, Ltd., and to carry on same and business of cable makers, etc. Solicitors: Hirst, Whitley and Akeroyd, 5, Harrison Road, Halifax.

AEONIC RADIO, LTD.—Cap., £225 000. To acquire the whole or any part of undertakings and assets of J. L. Gottlieb and Co., Ltd., and Aeonic Wireless, Ltd., to carry on business of manufacturers, maintainers and repairers of, and dealers in, wireless, telegraphic and telephonic apparatus, electricians, etc. Solicitors: Jenkins, Baker and Co., 3, London Wall Buildings, London, E.C.2. (Public company.)

GALA RECORDS, LTD.—Cap., £100. **Manufacturers of and dealers in apparatus, machines, instruments or materials for recording, transmitting or reproducing speech or other sounds, or for the transmission or reception of telephonic or telegraphic communications and messages, and the transmission by means of wireless apparatus of pictures, etc.** Solicitors: Herbert Oppenheimer, Nathan and Vandyk, 1, Finsbury Square, London, E.C.2.

GRIPSOK, LTD.—Cap., £2 000. To adopt an agreement with D. Robinson for the purchase of the trade mark "Gripsok" in respect of goods relating to electrical terminals of ordinary metal, and also for the purchase of certain patents granted to him for an invention relating to electrical terminals and any subsequent improvements in or upon their manufacture which may be effected by the said D. Robinson, to carry on the business of electrical engineers, etc. Solicitors: Andrews, Barrett and Wilkinson, 69, St. Thomas Street, Weymouth.

ELECTRICAL TRADE MARKS.

RIALTON (SIGN).—493 621. Class 8. Wireless telephonic apparatus and parts thereof. H. and S. Scott, Ltd., Bradford House, 21A, Barbican, London, E.C.1; export merchants. July 26th, 1928.

CLARMAC.—494 666. Class 8. Fitted electrical switchboards. The Clarmac Engineering Co., Ltd., 108, Douglas Street, Glasgow; engineers. September 1st, 1928.

PENTOFORMER.—495 881. Class 8. Instruments and apparatus for use in wireless telephony and telegraphy. Igranic Electric Co., Ltd., 147, Queen Victoria Street, London, E.C.4; electrical engineers. October 12th, 1928.

ROTUNDA.—495 991. Class 50. Electrical insulating materials. Rotunda, Ltd., 260, Manchester Road, Denton, near Manchester; manufacturers of insulating materials. October 16th, 1928.

490 903. Class 50. Artificial flowers, combs (for the hair); steam and hydraulic packing, and electrical insulating substances of asbestos. Radium-Gummiwerke mit beschrankter Haftung (a company duly incorporated under the laws of Germany), Grafenmuhlenweg 109, Koln-Dellbruck, Germany; manufacturers. April 27th, 1928. (To be Associated. Sect. 24.)

BALLIT.—492 562. Class 50. Plastic composition for use as substitutes for wood for manufacturing shaped articles or for application to articles of furniture and other wooden articles for filling holes and cracks or for modifying the shape of such articles; and articles manufactured from such compositions, namely, picture frames; buttons; handles for razors, knives, forks, files, taps, doors, dishes, jugs, pots and kettles; brush backs; ornaments (not being jewellery); candlesticks; trays; door-plates; panels, mouldings, picture rails and the like for walls; piano insulators; bases, knobs, formers, bolders, frames, panels and boxes for philosophical, scientific and like instruments and apparatus; cases for watches and clocks; statuettes; busts; shoe-lasts and similar articles, and adhesives (for celluloid, for leather, for mending broken articles, for tipping billiard cues) and dressings for leather, for belting, for floorcloth and for india-rubber goods. I.G. Farbenindustrie Aktiengesellschaft (a joint stock company organised under the laws of Germany), Mainzerlandstrasse 28, Frankfort-on-Main, Germany; manufacturers. June 20th, 1928.

AUTOCYCLE.—493 696. Class 8. Instruments, apparatus and parts thereof for use in wireless telegraphy and wireless telephony; and talking machines, gramophones and sound reproducing appafatus and parts thereof and accessories therefor. Frank Cory Yeo, Shinfield Lodge, Shinfield, near Reading, Berkshire; colliery proprietor. July 30th, 1928.

AUDIOVISOR.—488 775. Class 8. Philosophical instruments, scientific instruments and apparatus for useful purpose, instruments and apparatus for teaching. Radiovisor, Ltd., 26, Church Street, Cambridge Circus, London, W.C.1; manufacturers. February 22nd, 1928. (To be Associated. Sect. 24.)

PHONESTRAD.—495 788. Class 8. Sound-reproducing apparatus and parts thereof. Stanley Brookham, Brook Mills, Westgate, Cleckheaton, Yorkshire; maker of sound-reproducing apparatus. October 10th, 1928.

THERMATRON.—490 021. Class 8. Apparatus and instruments for use in wireless telephony, wireless telegraphy and television and parts thereof. Albert Edward Wilberforce Finch, 22, Swinburne Avenue, Manor Park, London, E.12; importer. October 16th, 1928.

ELECSON.—496 046. Class 8. Apparatus and parts thereof for use in wireless telegraphy and telephony, talking machines, parts thereof and accessories therefor, and talking machine records and apparatus for the reproduction and amplification of sound. Société Anonyme Elecson (a joint stock company organised under the laws of France), 178, Faubourg Saint Honore, Paris, France; manufacturers. October 17th, 1928.

PHANTOM.—492 706. Class 8. Electrical sound-reproducing and sound-amplifying apparatus for use in connection with gramophones and with wireless telephonic receiving sets. Louis George Sylvester, 1645, Nqrth Washington Avenue, Scranton, Pennsylvania, United States of America; manufacturer. June 25th, 1928.

KODALITE.—496 041. Class 8. Philosophical instruments, scientific instruments and apparatus for useful purposes; instruments and apparatus for teaching. Kodak, Ltd., Kodak House, Kingsway, London, W.C.2; manufacturers and dealers. October 17th, 1928. (To be Associated. Sect. 24.)

PEP (Sign). 486 883. Class 8. Electric cells and batteries. **Etablissements** Veuve P. Delafon and Cie, 82, Boulevard Richard Lenoir, Paris, France, manufacturers.—December 16th, 1927. Registration of this trade mark shall give no right to the exclusive use of the word "Pep."

LASWOR. 495 156. Class 8. Electric batteries (not for medical purposes). Bernard Braunstein, 109, Guilford Street, London, W.2; exporter and importer.—September 19th, 1928.

AVVERLYTE. 495 225. Class 13. Electric lamps (ordinary). Harry Winter, 20, Hampstead Road, London, N.W.1; dealer in electric lamps.—September 21st, 1928.

Opposition to the registration of the following trade marks can be lodged up to January 12th.

KYMORE. 495 331. Class 5. Wire for electric transmission lines. The Kymore Syndicate, Ltd., Balfour House, Finsbury Pavement, London, E.C.2; manufacturers.—September 25th, 1928. (To be Associated. Sect. 24.)

LECITON. 491 235. Class 8. Cables for electrical purposes. The Liverpool Electric Cable Co., Ltd., Linacre Lane, Bootle, Liverpool; manufacturers.—May 8th, 1928. (To be Associated. Sect. 24.)

TRAFCAND. 494 608. Class 8. Apparatus for use in connection with wireless telephony. Alfred Thomas Smee, trading as the Junction Engineering Co., 146, Dukes Avenue, Muswell Hill, London, N.10; and 149A, Junction Road, London, N.19; manufacturer.—August 30th, 1928. (To be Associated. Sect. 24.)

Opposition to the registration of the following trade marks can be lodged up to January 19th.

ARLITA.—495 262. Class 8. Philosophical instruments, scientific instruments and apparatus for useful purposes. Naamlooze Vennootschap Philips' Gloeilampenfabrieken, 1A, Emmasingel, Noord-Brabant, Eindhoven, Holland; manufacturers. September 24th, 1928. (To be Associated, Sect. 24.)

PERMINVAR.—495 367. Class 8. Philosophical instruments, scientific instruments, and apparatus for useful purposes; instruments and apparatus for teaching. Electrical Research Products, Inc., 195, Broadway, New York City; merchants. September 26th, 1928. (To be Associated, Sect. 24.)

UTILUX.—495 806. Class 13. Chandeliers, lamp shade frames, lamp shade supports, lamp shades, lamp holders, lamp standards, reflectors, and electric light fittings. Louis Dernier and Hamlyn, Ltd., 23, Newman Street, Oxford Street, London, W.1; manufacturers. October 10th, 1928.

LEAD MARKET REPORT.

According to James Forster and Co., the lead market opened last week with strength, the prices advancing 10s. per ton, followed by a further 5s. on Wednesday, the next market day. At the opening on Thursday prices were again higher by 3s. 9d. per ton, April selling at £22 17s. 6d., but from this point the market receded, and at the close on January 4th had fallen 7s. 6d. per ton from the top.

The price in New York was put up on January 2nd to 6.65 cents. in sympathy with London.

Closing prices on January 4th were £22 1s. 3d. for January, £22 6s. 3d. for February, £22 8s. 9d. for March, and £22 10s. for April.

COMMERCIAL INFORMATION.

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

BROWNING, T. E., 28, Pleydell Avenue, Stamford Brook, wireless factor. £19 15s. October 31st.

CROSS AND CO., 32, Church Street, Baldock, radio engineers. £10 19s. 10d. November 7th.

INSOLL, H. F., 57, Charlton Road, Keynsham, wireless dealer. £21 19s. 10d. November 6th.

PARKES, William Thomas, 102, Lichfield Street, Walsall, electrical engineer. £30 4s. 10d. November 14th.

WEBB AND ROGERS, 34, King Street, Queen Square, Bristol, electrical engineers. £24 15s. 10d. November 24th.

WESTON ELECTRICAL CONTRACTS CO., 17, George Street, W. £20 1s. 4d. November 6th.

WILLIAMSON, John, P., 6, Belgrave Road, Colwyn Bay, radio engineer. £10 3s. 6d. October 22nd.

Bills of Sale.

THOMAS, Ernest William and THOMAS, Ernest William Benjamin (trading as NORTH EASTERN ELECTRICAL WIRE AND CABLE CO.), 75a, South Street, Ponders End, electrical engineers. Dated December 18th, filed December 22nd. £75.

WOOD, William Frederick, 12, Esk Road, Norton-on-Tees, electrician. Dated December 18th, filed December 27th. £70.

Deed of Arrangement.

TAYLOR, Alfred Robert, trading as A. R. TAYLOR at Lydney, and at 118, John Street, Porthcawl, electrician. Dated December 31st, filed January 4th. Trustee, E. H. Hawkins, 4, Charterhouse Square, E.C., I.A. Liabilities unsecured, £148; assets, less secured claims, £95.

Private Meetings, etc.

[***Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.***]

NEW WILSON ELECTRICAL MANUFACTURING CO., LTD., 18, Fitzroy Street, Fitzroy Square, London, W.1, wireless and electrical factors. In pursuance of the provisions of the Companies (Consolidation) Act, a meeting of the creditors of the above was held on January 2nd, at the offices of the liquidator, Mr. R. Y. Rickard, I.A., 65, Basinghall Street, E.C. He reported that the liabilities amounted to £1 569, and the assets totalled £1 134. From that amount had to be deducted £308 for preferential claims, leaving net assets of £826. The assets included stock in trade on consignment and in the hands of customers, valued at £700; and book debts £378. The liquidator reported that the company was incorporated on July 1st, 1925, to acquire certain rights in patent articles. The company commenced trading almost immediately and was marked by success in the first two years, when profits of £1 516 and £1 816 respectively were made. In the third year, however, there was a loss of £916. Since that date, to the time of liquidation a further loss had been sustained. The sales during the whole time of the company's trading were £20 565, and there was a gross profit of £10 843. After deducting expenses, etc., that figure showed a net profit of £1 820. Included in the liabilities was a claim of £489 by the Inland Revenue. It was also stated that the stock largely consisted of patented articles some of which were partly manufactured, and were valueless if sold in the present condition. There were a number of partly made wireless amplifiers. It was resolved to confirm the voluntary liquidation of the company with the present liquidator.

Mortgages.

[NOTE.—*The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—allowed by the date of the Summary, but such total may have been reduced.*]

ANTI-VIBRATION ELECTRIC LAMP CO., LTD., London, E.C.—Registered December 20th, agreement increasing rate of interest in respect of debentures already registered; charged on property charged by the debentures. *——. December 14th, 1927.

BAILEY AND INCLEDON, LTD., London, S.W., electrical engineers. Registered December 5th. £2 000 debentures; general charge. *Nil. October 31st, 1928.

BAYLISS, MARCH AND NEWEY, LTD., Birmingham, electrical manufacturers.—Registered December 17th, £300 debentures, to J. S. Cooke, 31, Solihull Lane, Hall Green, C.A.; general charge (subject to prior charge). *£300. March 7th, 1928.

CARLISLE AND DISTRICT TRANSPORT CO., LTD. (late CITY OF CARLISLE ELECTRIC TRAMWAYS CO., LTD.), London, E.C.—Registered December 20th, Trust Deed dated December 18th, 1928, securing £60000 prior lien debenture stock; charged on tramways in and about Carlisle, etc., also general charge. *£40 000. May 25th, 1928.

EPOCH ELECTRICAL SOCIETY, LTD., London, E.C.—Registered December 18th, £350 debenture, to A. H. Hurst, Holland House, Bury Street, E.C.; general charge.

EPOCH RADIO MANUFACTURING CO., LTD., London, E.C.—Registered November 20th, £300 debentures, to Freda B. Laserson, 88, Woodstock Avenue, Golders Green; general charge.

HENDON ELECTRIC LAMP CO., LTD.—Registered December 29th, £750 debenture, to J. W. Kilby, 7, Newlands Avenue, Thames Ditton; general charge. *Nil. June 26th, 1928.

"K.N." ELECTRICAL PRODUCTS, LTD., London, W.—Registered December 21st, £1 000 debenture, to P. Ferguson, The Garth, Grange Road, Highgate, N.; general charge.

LEACH (S. G.) AND CO., LTD., London, E., electricians.—Registered December 14th, £3 000 (not ex.) debentures, to M. W. Woods, Ltd., Denmark Street, Colchester; general charge, ranking in priority to certain debentures, already registered. *£14 000 debentures. March 14th, 1928.

LISBURN ELECTRIC SUPPLY CO., LTD., Belfast.—Registered December 17th, £1 450 mortgage, to Ministry of Commerce Northern Ireland; general charge.

NANTWICH ELECTRIC, LTD.—Registered December 18th, £66 mortgage, to G. A. Racklyeft, Pillory Street, Nantwich, furniture dealer; charged on 5, Hospital Street, Nantwich.

RUSHDEN AND DISTRICT ELECTRIC SUPPLY CO., LTD.—Registered December 18th, £250, £1 000, £200 and £1 050 debentures, part of £50 000; general charge. *£25 000. March 6th, 1928.

Satisfactions.

ALDERLEY AND WILMSLOW ELECTRIC SUPPLY, LTD.—Satisfactions registered December 20th, £10 000 outstanding July 1st, 1908, and £5 000 registered June 1st, 1911.

BOWER ELECTRIC (1926), LTD., London, W.—Satisfaction registered December 14th, £1 500, registered March 12th, 1926.

DELABOLE ELECTRIC LIGHTING AND SUPPLY CO., LTD.—Satisfaction registered December 18th, £200, registered September 27th, 1915.

ORIENTAL TELEPHONE AND ELECTRIC CO., LTD., London, E.C.—Satisfaction registered December 17th, £6 965, part of amount registered July 11th, 1905, and June 20th, 1907.

PARK WIRELESS, LTD., Birmingham.—Satisfaction registered December 15th, £100, registered November 27th, 1928.

UNDERWOOD (MANCHESTER) LTD., electricians. Satisfaction registered December 7th, £1 500, balance of amount registered April 29th, 1927.

London Gazette, etc.

Companies Winding-up Voluntarily.

MOHAWK RADIO, LTD.—By reason of its liabilities, December 27th. A. A. Reeves, incorporated accountant, 2, Tyrrel Street, Bradford, appointed as liquidator.

USYM LAMPS, LTD. By reason of its liabilities, December 22nd. G. L. Campbell, 20, Conduit Street, W.1., Chartered Accountant, appointed as liquidator.

Bankruptcy Information.

RITCHIE, James Gray, 54, Woodsley Road, Leeds, electric lamp dealer. Receiving order, January 3rd. Creditor's petition.

Notices of Dividends.

LAWRIE, Andrew, trading as HOUCHIN AND LAWRIE, 9, Melbourne Parade, Palmer's Green, electrical engineer. First and final dividend, 1s. 2¾d. per £, payable, January 23rd, Official Receiver's Office, 29, Russell Square, London, W.C.1.

POOK, Bernard Edwin Mark, 53A, Albert Road, Southsea, wireless dealer. First and final dividend 3⅝d. per £, payable January 12, Official Receiver's Office, 87, High Street, Portsmouth.

Application for Discharge.

DOUGLAS, Henry David, engineer, contractor, merchant and wireless factor, 32, Queen Victoria Street, E.C.4, trading as H. D. DOUGLAS AND CO. Hearing, January 30th, 11 a.m., Bankruptcy Buildings, Carey Street, London, W.C.2.

Partnership Dissolved.

AIRD AND SCOTT (William AIRD and William SCOTT), electrical engineers at 1036, Argyle Street, Glasgow, as at December 25th, 1928, by mutual consent, by the retiral of W. Aird. W. Scott will continue the business under his own name at 1036, Argyle Street, Glasgow.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

302 187 J. L. Baird, and Television, Ltd. High-speed commutator switches in television apparatus. (11/6/27.)
302 373 Pirelli-General Cable Works, Ltd. and H. T. Werren. Method of balancing telephone cables. (16/6/27.)
302 200 Associated Telephone and Telegraph Co. and J. Wicks. Automatic or semi-automatic telephone systems. (9/8/27.)
302 202 M. A. Bolton and J. W. Walker. Electrical conductors and cables. (12/8/27.)
302 256 S. Z. De Ferranti and Ferranti, Ltd. Electric radiator fires. (3/9/27.)
302 259 Creed and Co., Ltd., F. G. Creed, W. H. Storey and R. D. Salmon. Electromagnetic apparatus suitable for use as a relay, switch, motor, or like device. (8/9/27.)
302 296 J. D. Sartakoff. Liquid supply devices for electric batteries. (9/9/27.)
277 362 Telefonaktiebolaget L. M. Ericsson. Fire-alarm systems. (11/9/26.)
284 202 C. M. Longbottom. Protective systems for electrical circuits. (24/1/27.)
302 264 C. F. Burton and H. Burton. Variable condensers. (13/9/27.)
302 298 C. F. Burton and H. Burton. Rheostats. (13/9/27.)
302 301 Siemens Bros. and Co., Ltd., H. E. Humphries and R. G. Dixon. Call-finding arrangements in automatic telephone systems. (14/9/27.)
302 389 British Thomson-Houston Co., Ltd. and J. C. Read. Electric arc-rectifier systems. (15/9/27.)
302 392 Collinson's Precision Screw Co., Ltd. and F. E. Collinson. Holders for thermionic valves. (15/9/27.)
302 394 W. S. Smith, H. J. Garnett and J. A. Holden. Magnetic alloys. (16/9/27.)
302 396 Aronwerke Elektrizitats Ges. and W. Stern. Electrical signalling or control systems. (16/9/27.)
302 397 H. D. Symons. Insulation material for electric apparatus. (17/9/27.)
302 405 A. Kirk. Electrical terminals, contacts, or connectors. (20/9/27.)
302 407 G. A. Mathieu and S. B. Smith. Thermionic-valve holders. (20/9/27.)
302 409 Automatic Telephone Manufacturing Co., Ltd. (C. E. Lomax). Fire-alarm systems. (20/9/27.)
302 418 E. Y. Robinson, E. J. E. Hubbard and Metropolitan-Vickers Electrical Co., Ltd. Vacuum electric tube devices. (23/9/27.)
302 422 Relay Automatic Telephone Co., Ltd., F. W. Davis and F. A. Wilding. Electric relay arrangements. (27/9/27.)
302 424 J. B. Sanderson. Electric lighting systems for road vehicles. (24/1/28.)
302 432 Callender's Cable and Construction Co., Ltd. and A. E. Wilson. Covers for joints in electric cables. (6/10/27.)
302 433 L. Barrett. Switches for electric circuits. (6/10/27.)
302 441 Siemens Bros. and Co., Ltd. and A. E. Caswell. Circuit arrangements in automatic and semi-automatic telephone systems. (12/10/27.)
279 497 Siemens and Halske Akt.-Ges. Cathodes for gas-discharge vessels. (23/10/26.)
281 239 W. Eschbach and W. Friederich. Ignition pellets for electric blasting-fuses. (23/11/26.)
302 463 J. Birch and Sons, Ltd. and C. Birch. Electric switches and fittings therefor. (8/11/27.)
302 466 G. H. Fletcher, A. Tustin and Metropolitan-Vickers Electrical Co., Ltd. Electric motor generators. (9/11/27.)
302 469 Oldham and Son, Ltd. and W. D. Wilde. Lids or covers for galvanic batteries. (10/11/27.)
302 472 Chloride Electrical Storage Co., Ltd. (Electric Storage Battery Co.). Secondary or storage batteries. (21/11/27.)

Engineering Economics.

DURING his year of office as President of the Institution of Electrical Engineers, Mr. FRANK GILL made use of every possible occasion to point out that the real function of the engineer is not merely to apply science, but to apply science economically. In Mr. GILL'S view the modern engineer should know the elements of accountancy, and should know something about balance sheets, interest charges, depreciation, and related matters which are generally thought to be the exclusive province of the accountant. Although at the time the idea met with some opposition —from those who contended that it was wrong to attempt to direct the mind of the technical man into commercial channels, and that he should continue to roam over his interests without troubling about commercial values, on the off chance that great commercial value would often result—there is evidence that the fundamental idea is beginning to sink in. The words Engineering and Economics are coupled together in a new way, and many engineers are realising that as time goes on the need for some economic knowledge becomes increasingly apparent in jobs which were formerly carried on by means of engineering knowledge in association with the somewhat uncertain faculty called judgment. The rapid development of the electrical industry in this country has, of course, been an important influencing factor. Generating stations and distribution systems planned by rule of thumb methods may become obsolescent within a few years because the potentialities were not properly anticipated at the outset, and the gulf between distribution costs and revenue increases with every extension of the network, because the site chosen for the erection of the generating station and/or sub-stations was not economically the right one. Multiplication of these instances shows that the engineer's judgment alone is not sufficiently accurate when large capital expenditures on plant and distribution systems are involved, and we are glad to see that two papers on the anticipation of demand and the economic selection, provision, and lay-out of plant were discussed at last week's meeting of the Institution of Electrical Engineers. Capt. J. M. DONALDSON, who dealt with the subject from the electricity supply point of view, mentioned considerations which place difficulties in the way of strict estimation of future demand; but, so far as he went was able to show the value of economic studies to a supply undertaking. Mr. J. G. HINES, who dealt with telephone systems, went very much more fully into these matters, and outlined the ingenious methods employed by the British Post Office in making telephone development studies, framing layout schemes, and determining the economic period for which to provide plant. We hope that these discussions will not only serve to emphasise the importance of economics in engineering, but will also stimulate thought in the direction of improved and more economical methods of anticipating demand.

Overseas Trade in 1928.

THE Board of Trade returns show that total imports into the United Kingdom during 1928 were valued at £1 196 940 354, a decrease of £21 400 796 on those for 1927, while exports of United Kingdom goods at £723 427 455 show an increase of £14 346 192. It will therefore be seen that the exports are increasing while the imports are declining. The advance in exports was largely due to an increase in machinery and vehicles sent overseas. Imported steel and iron cost this country £9 873 500 less than in the previous year, which seems to indicate that Britain can now compete more effectively than hitherto as regards prices in that trade. With an adverse trade balance for the year of £353 160 408 it would be foolish to suggest that our foreign trade, as a whole, is yet in a flourishing condition, but, as the balance is lower by £33 246 600 than that of 1927, 1928 at least shows some improvement on the previous year. The movement in this country in the direction of reducing operating costs, the comparative freedom from industrial disputes that has characterised the past year, and the expediting of railway rate reductions make the immediate outlook more promising than it has been for some years past. With regard to the electrical industry, while the total exports of electrical goods at £18 333 623 show a decrease of £255 469 on last year's figures, this represents a comparatively small proportion of the total, and can hardly be said to justify the pessimistic prognostications of the B.E.A.M.A. Trade Surveys. There is, after all, a certain amount of solid comfort in the knowledge that the British-made exports of such goods exceeded the value of imports of similar commodities by nearly £12 000 000. British exports of motors and generators, other than railway and tramway motors, increased by £91 330, submarine telegraph and telephone cable by £82 303, and electrical goods and apparatus classified as "all other

Digitized by Google

sorts" by £194 167. On the other hand, imports of rubber insulated cables and wires, other than telegraph or telephone, increased by £63 503, telegraph and telephone instruments and apparatus by £239 388, and electrical goods and apparatus, "all other sorts," by £178 531. Although the electrical industry is shown by the statistics to be in a better position than most with regard to the balance of overseas trade, it is to be hoped that during the coming year the export set-back, slight though it is, will spur exporters of British electrical goods to still more energetic efforts to establish a new high record. When it is remembered that so recently as 1922 our electrical exports only totalled about £11 500 000, the progress made in six years appears to justify a little restrained optimism.

The Electric Fittings Committee.

NINE months after the completion of its first session—also of nine months—the Electric Fittings Statutory Committee, appointed by the Commissioners in 1927 to determine questions raised under Section 48 of the Electricity (Supply) Act, 1926, as to the recognised retail or trade prices of electric fittings, has issued its first report. Although it was expected that this influential and representative committee was destined to have a busy and somewhat uncomfortable time, there is little evidence of it in the report. Abandoning the original design of keeping an up-to-date record of current prices in favour of determining, as and when required, what the prices were at a date on which a particular transaction took place, the Committee found no occasion to operate in either direction as no complaint of underselling had been received. A similar lack of incident characterises the initial period of the Installations Sub-Committee, which was appointed to ascertain whether, and, if so, on what terms agreement could be reached between the municipal and contracting interests as to the prices to be charged for installations. The matter, it appears, was still in discussion at March 31st, and further official information on the development of a discussion, the result of which greatly interests a large section of the industry, is presumably unavailable at the present time. The freedom from complaints which the report records, suggests either that the previously warring factions have buried the hatchet more readily than was anticipated, or that the existence of the Committee was not very widely known.

Contractors and Compulsory Registration.

IN our efforts to raise the status of the electrical installation trade we have repeatedly "pilloried" examples of "jerry" wiring which have come to light. These exposures, which have been illustrated by photographs of the actual work, have shown that there are still in existence quite a number of so-called installations which are revelations of untutored effort and misplaced ingenuity. Evidence has not been lacking that the publicity given to this shoddy work has brought home to many supply engineers and others—and in a way that no amount of argument would—the folly of entrusting unqualified people with the important work of connecting up buildings to a public source of electricity supply. Now that a rapidly increasing proportion of the reputable electrical installation engineers is enrolled under the voluntary registration scheme of the National Register of Electrical Installation Contractors there is no excuse for anyone to be a party to the employment of the "kerbstoner." The further example of dangerous workmanship which is exposed on a later page of this issue by Mr. H. Moss reinforces the arguments of those who desire the immediate introduction of compulsory registration for electrical installation contractors. On practical grounds, it will be remembered, we have doubted the wisdom of pressing for compulsion until the voluntary system has attained its maximum development. The experience of the plumbers, as disclosed at the livery dinner of the Worshipful Company of Plumbers on Monday, supports our view. As long ago as 1883 the Company extended to those plumbers who were able to prove their ability and sound workmanship an opportunity to take advantage of a scheme of voluntary registration. Much time and money has been spent on educational purposes, and though the registration scheme has in practice, and within its limits, worked extremely well, full State recognition of the Register has not yet matured. Nevertheless, the existence of the Register itself, and the good work that is being done by the Registration Council and the local committees in harmony with the Institute of Plumbers, has shown that great value is attached by plumbers to the privilege of being allowed to affix the letters "R.P." to their names. Taking the experience gained by the plumbers with their registration scheme, we feel, with one of our correspondents in this issue, that the first definite step towards State recognition of the National Register of Electrical Installation Contractors will be possible when that organisation can say that its roll includes the names of all the reputable contractors in the kingdom. There might be found a short cut in the form of combined action with the Worshipful Company of Plumbers, but, even so, the electrical case would be materially strengthened by a National Register of something like 5 000 contractors. The figure may seem optimistic, but the present rate of development of the Register, both in influence and numbers, offers real ground for hope. The matter is undoubtedly of grave importance, and though our own views are well known, we are anxious to give publicity to any suggestions which are likely to assist in the solution of the problem.

Domestic and Colour Lighting.

ACCORDING to the E.D.A. publicity calendar, January is the month in which special attention is being drawn to domestic and colour lighting possibilities. The organisers have certainly done their part, with special advertising, posters, and a variety of suitable booklets, not to mention two very simply arranged, but most effective, window displays for contractors' and other electrical showrooms. The trade response, on the other hand, does not, so far, seem to have been overwhelming, judging by the absence of the special displays from most of the windows observed in London and several other important centres. The E.D.A. is right, if a little late, in its insistence on the fact that in selling, as in many other things, "it pays to specialise," but the idea of devoting a whole window to a single well-defined purpose does not yet seem to have been thoroughly "sold" to the electrical trade. The vague fear that a member of the public, seeing a window filled with a special display of lamps, will not realise that he can buy an electric fire or a percolator inside, seems to be at the back of this conservatism. In these columns we have frequently pointed out the fallacy of such views, and have, from time to time, presented practical suggestions for specialised seasonal and topical displays. We therefore hope that every supply undertaking and electrical contractor with a display window will make fuller use of the window schemes put forward by the E.D.A. during the coming year. The January programme is full of possibilities for business in ordinary lamps alone, but from the domestic point of view the coloured lamp potentialities have barely been touched as yet. Handled in the right way, the coloured light campaign, both for shops and houses, can be made very profitable indeed.

Neglected Lamp Business.

IT would be interesting to know the total of the sales of electric Christmas tree lamps in this country last month, and also the number of contractors who did not sell any. Such speculations may seem trivial, but they achieve some importance when one considers that more than 50 000 000 of these lamps were available for sale in the U.S.A. during December. Dividing this huge total by the figure necessary for true comparison, the potential sales in this country were tremendously greater than the actual turnover. And so it is with so many of the so-called side-lines of our industry. Given their proper quota of sales and publicity effort these small items would add materially to the revenue obtained from domestic electrical appliances.

DOMESTIC TARIFFS.

Foundations of a Sound Policy—Encouraging Maximum Consumption—Some Results from Amsterdam—Objections to "Restricted" Periods—Two Interesting Tariffs.

By DR. LULOFS (Director of the Amsterdam Electricity Works). Translated by H. HORWOOD.

THE foundation for the construction of a sound tariff policy is a radical investigation into the costs and into the relationship of all factors affecting the generation and distribution of electricity, that is, of all factors affecting the price charged for current.

There are many engineers who do not sufficiently recognise how important is a thorough and scientific study of this matter and how necessary this study is, to attain the highest possible degree of perfection in the management of the undertaking and at the same time to serve in the best way, both directly and indirectly, the population of the current distribution area.

Many believe that the fixing of tariffs can be done exclusively by estimation and by intuitive business spirit; the danger of this is only exceeded by the danger caused by the authorities believing that they can fix tariffs spontaneously on their own initiative.

I still remember how formerly the contract price for large power users had to be first discussed and passed by a municipal committee: here I always met resistance—that caused by a member of the committee, an accountant, who as such was very self-conscious and who was considered an authority on selling prices by his fellow committee members. He always met my tariff proposals by comparing them with the average cost of production, taken from the preceding annual report, a figure which was always higher than that proposed by me as the contract price for the future large power user.

I could only overcome this resistance by convincing the accountant that it was actually because the selling price was lower than the cost of production, that high profits could be attained.

The mathematical proof of this theory, which, although apparently strange, is nevertheless true, is given by the following numerical example:—

Assuming that the production of 40 million kWh cost "y" pence per kWh, the total cost of production becomes $40 \cdot 10^6 y$ pence.

Let us say that owing to extensions of the electrified area, the production can be increased to 60 million kWh, whilst on account of this increase, the cost per unit falls to "$y - x$" pence, the total cost of production would become $60 \cdot 10^6 (y - x)$ pence. The difference is therefore $20 \cdot 10^6 y - 60 \cdot 10^6 x$ so that when the greater output is sold at the lower price still no loss is incurred.

For 20 million kWh one can therefore demand $20 \cdot 10^6$ "$y - 60 \cdot 10^6 x$" without suffering any loss, i.e., "$y - 3x$" per kWh, whilst the cost of production amounts to "$y - x$," which is $2x$ higher; in other words, if one sells current at "$y - 2x$" one remains at "x" pence per kWh under self cost and secures thereby a profit of "x" pence.

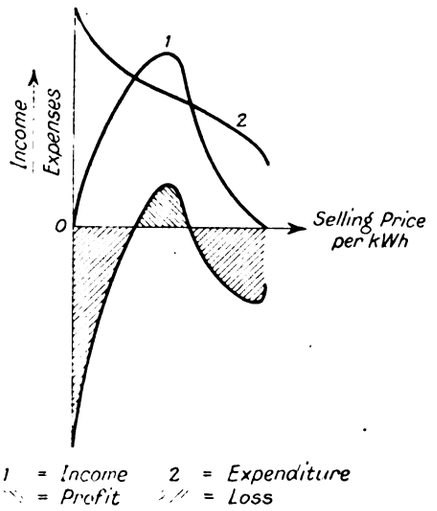

Fig. 1.—Income and expenses dependent on price of current.

If one allows representatives of the authorities too great an influence in the fixing of charges, it generally results in damage to the organisation, caused by the mistakes made by incompetent people who consider the fixing of high charges to be careful policy and who do not consider that too high charges,

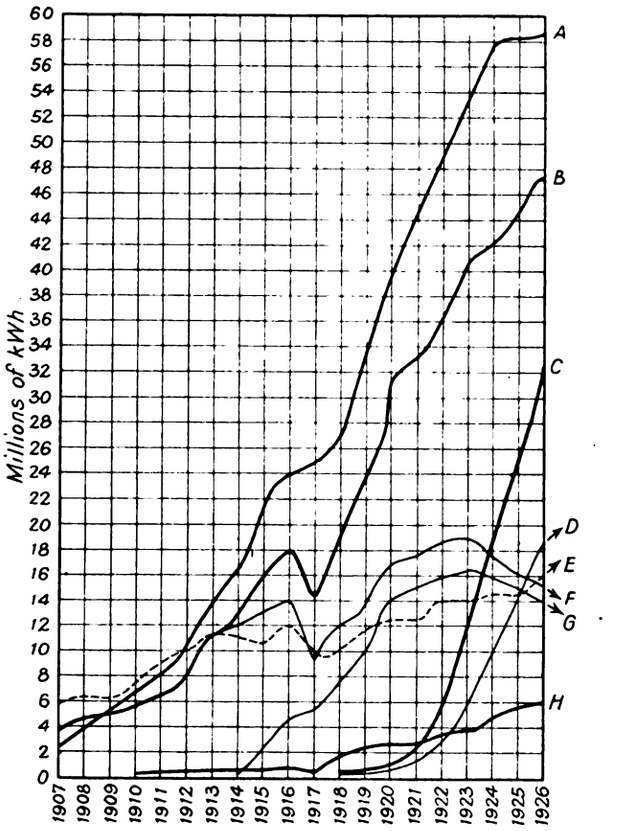

Fig. 2.—Consumption in Amsterdam between 1907-1926.

A—Power Consumption; B—Total lighting consumption in houses, shops etc., (excluding public lighting); C—Heating and power consumption (domestic) at fixed charge tariff; D—Lighting consumption (domestic) at fixed charge tariff; E—Electric traction; F—Lighting consumption through ordinary meters; G—Lighting consumption through prepayment meters; H—Public lighting.

similarly to too low charges, tend to losses or reduction of profit.

Income and expenses in their relationship to price per kWh are represented graphically in Fig. 1. The income line must pass through zero, since for a kWh price=zero, the income also =zero; it then rises with the price of current. In spite of that, however, the rising income line again falls to zero, because the consumption becomes zero as soon as the price per kWh has risen so high that no one will buy at the price.

The expenses line commences very high at a selling price of zero, since the consumption would in that case be very high. The expenses will gradually become less, according to the increase in the kWh price, until they fall to the amount of the overhead charges, when the consumption has decreased to zero. The difference between income and expenses gives the extent of profit or loss. From Fig. 1 it can be clearly seen that losses occur at too low a price, just as they do at too high a price.

One can conclude from this that too high prices cause danger of losses to the same extent that too low prices do. One must, therefore, beware of too high tariffs.

As already stated, the fixing of the two limits between which the tariffs may swing demands a thorough study of the subject on the part of the competent manager.

The following remarks are intended to serve as a small contribution to this study, which, however, is limited to the tariff question for low tension house installations. Endeavours should be made to fix the prices in such a manner, that a

Digitized by Google

maximum result and maximum profit per installation result in a maximum consumption of current (Fig. 2).

The graphical representation, Fig. 3, shows how extensively the household consumption can be cultivated by the introduction of a suitable tariff.

This curve shows how it was possible in Amsterdam, by

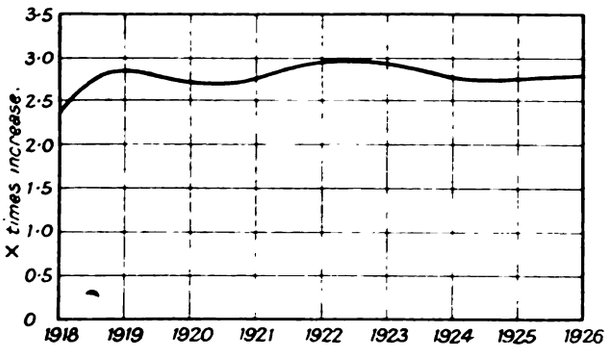

Fig. 3.—Consumption increase $\frac{\text{Total consumption}}{\text{Lighting consumption}}$ by means of a fixed charge tariff.

means of the introduction of a fixed charge tariff to increase the ratio of total household consumption to pure lighting consumption 2·8 times (average).

A Concrete Example.

I believe my remarks will be made much clearer if I work out a concrete numerical example. For this I take as a basis the working results obtained in the electricity works which I conduct. I must emphasise that the figures are solely intended as an illustration to show how the various parts, of which the costs are built up, are related to one another.

Let us take an electricity works with production costs of 5os. capital charges per kW and 0·025s. per kWh.

I propose to divide the distribution charges into three main groups, viz. :—(*a*) distribution costs per kW, (*b*) distribution costs per kWh, (*c*) distribution costs per installation.

To (*a*) belong the costs of the h.t. mains and the h.t. transformation, i.e., the 10 000 V and the 3 000 V mains as well as the corresponding 10 000/3 000 V transformer stations, since capacity, and therefore the costs of the plant, are as good as entirely dependent on the maximum loading introduced to the 3 000/220 V transformer stations.

The costs of the necessary l.t. installation (*b*) bear quite a different character. Neglecting the small power consumption connected to the l.t. mains, and which in cities constitute a comparatively small percentage of the house lighting load, one can say that the whole l.t. cable network and house service boxes, etc., are installed with the sole object of providing the dwelling-houses with light.

In the towns we need a greater cable length per dwelling for large houses than we do for small houses, firstly, because as is the case in Holland, the large houses often contain less—i.e., only one or two dwellings, than the small houses which often contain four or five dwellings; secondly, because the larger dwelling-houses have a greater frontage.

Since the copper cross section of the l.t. ground cable for both does not vary much, the larger dwelling-houses, i.e., each installation, have higher l.t. cable costs, although, on the other hand, a greater lighting load per dwelling house.

Figures have proved that these factors generally approximately equalise one another, so that the capital outlay for the l.t. mains is equal per kWh for all sorts of small consumers. The same remarks apply for the l.t. transformation.

In addition to the costs of the cables, sub-stations, and transformers, there are other distribution costs, viz. :—(2) Installation department; (3) technical checking, mainly meter department; (4) calculating staff, mainly for charging for current, meter reading, collection, etc.; (5) general services, i.e., management, secretary's office, sales department, purchasing department, correspondence office, record office, etc.; (6) social obligations; (7) miscellaneous expenses. I should like to group these items under the heading "Estimating Administration." In practice, these costs are entirely dependent on the number of installations that must be served, and neither the consumption in kWh nor the maximum load in kW have the slightest influence on these costs: they come, therefore, under (*c*) as costs per installation.

The numerical example can now be given as follows :—

The total distribution costs are divided into seven parts as per Table 1.

TABLE I.

Total annual distribution costs in millions of shillings.

(1) Mains, sub-stations and transformers . 3·02	H.T. = 1·55	H.T. cable 1·10	*a*
		H.T. trans. 0·45	
	L.T. = 1·47	L.T. cable 1·15	*b*
		L.T. trans. 0·32	
(2) Installation Dept. .. 1·73			
(3) Technical checking (meter reading, etc.) .. .. 0·17*			
(4) Calculating staff .. 0·87			
(5) General services .. 0·53			
(6) Social obligations .. 0·63			
(7) Miscellaneous .. 0·65			
Total .. 7·60		Total 4·58 (*c*)	

*After deducting meter rent at 1s. 4d.

Let us investigate what influence the above costs have had on the average self cost price per lighting kWh in the house.

The average lighting load per dwelling-house amounted, according to measurement, to 131 kWh per annum, whilst various measurements showed that the average working time of this lighting load was 1 570 hours, so that the maximum load per dwelling-house amounted to 0·0835 kW. (Here the working time of 1 570 hours does not apply to any individual consumer or group of consumers, but to all the dwelling-houses together, and gives the relationship between the total lighting consumption of these dwelling-houses and their total lighting load at the time of the peak load of the electricity works.)

We shall now consider Tables 2 and 3. On the assumption that the average current consumption per installation stands at 131 kWh, the average total self cost price per lighting kWh is 0·338s. This amount is built up with the factors in columns I, II, and III, of Table 3. From this it is seen that not less than 0·235s. of the total self cost price per kWh or, roughly, 70% are absolutely firm expenses.

Now the amount of 0·0535s. (column II) is dependent on the manner in which the current is consumed, i.e., the duration of the consumption, although this dependence is merely relative, as is seen from the following :—

TABLE 2.

Costs of Production.

On the busbars 50s. per kW and 0·025s. per kWh.
On the installation 55s. per kW per annum and 0·0275s. per kWh.

(*a*) H.T. distribution costs per kW.—
57 000 kW max. supplied to H.T. mains = 53 000 kW at the installations.
Costs 1·55 million shillings (see Table 1*a*), i.e. :

$$\frac{1\,550\,000}{53\,000} = 29\cdot3\text{s. per kW and annum.}$$

(*b*) L.T. distribution costs per kW :—
1. L.T. transformation :
109×10^6 kWh* transformed per annum (excluding household).
Costs 0·32 million shillings (see Table 1*b*), i.e. :

$$\frac{320\,000}{109\,000\,000} = 0\cdot003\text{s. per kWh.}$$

2. L.T. mains :
60×10^6 kWh (excluding household) supplied per annum.
Costs 1·15 million shillings (see Table 1*b*), i.e. :

$$\frac{1\,150\,000}{60\,000\,000} = 0\cdot019\text{s. per kWh.—Total } 0\cdot022\text{s. per kWh.}$$

(*c*) Distribution costs per installation :—
Number of installations—148 700.
Costs of the "Estimating Administration" (items 2–7 of Table 1).
4·58 million shillings, i.e., $\frac{580\,000}{4\,148\,700} = 30\cdot8$s. per installation and year.

*Of which 49×10^6 kWh is sold direct at the L.T. busbars.

As already stated, it is found that the average consumption duration of the domestic lighting load is roughly 1 500 hours. Within the very wide limits of 1 000 to 2 000 hours, that part of the kWh price which refers to the maximum load, varies only between 1·0 and 0·5 pence. That is to say, therefore, that a lighting consumer, who only has 1 000 hours' consumption,

Digitized by Google

has an average total lighting kWh price of roughly 4·4d., and for a very good consumer with 2 000 hours of consumption it amounts to 3·95d., so that, should it be possible by means of special precautions to increase the average lighting consumption period from 1 500 hours to 2 000 hours, you would then reduce the costs from 4·05d. by 0·14d., i.e., by only 3·4%.

From this it follows that the effect of the period of duration of the lighting kWh on the total lighting current distribution costs has, between very wide limits, not much importance, so that two conclusions can here be drawn :—

It is useless to try by artificial means to increase the number of consumption hours, particularly since here the remedy is usually worse than the evil.

A much used method is to increase the price of current considerably during the restricted hours and thus keep as many lighting kWh as possible outside the restricted period. The word " restricted " shows that the electricity supplier is on the wrong track, for what other supplier adopts means to limit under any circumstances the disposal of his products ?

I am, on the contrary, generally of the opinion that it is the duty of the electricity supplier to further the consumption of electricity wherever possible, and to do so with the greatest possible convenience to the consumer.

I have, too, very serious objections against the " double tariff " which has the result of increasing the price of current during certain hours and thus, not so much as a main purpose but still as a secondary one, to restrict the current consumption during certain periods.

In general it must be pointed out that this procedure is not at all sound, for where one can only save a few per cent. on the production costs by a greater improvement in the consumption duration, one runs the risk that through this restriction in the peak period the average lighting consumption gets less per installation, and thus the permanent charge per kWh of 0·235s. is directly influenced.

Each per cent decrease in current consumption per dwelling-house and year caused an increase in the production costs of 0·7%, or nearly 0·03d. It does not pay to risk this for a gain of 0·14d., which is only obtainable by an increase of the average lighting period from 1 500 hours as normal to 2 000 hours, which must be considered as the maximum attainable.

Further Disadvantages.

Further disadvantages are that, apart from the fact that one hereby encourages the reduction in consumption, the consumption of electricity is made a burden to the consumer ; also this system opposes the general use of a large variety of apparatus.

Finally, it must be noted that such a system costs the suppliers a good deal of money, for the double tariff meter with time element raises the capital expenses per installation not inconsiderably.

The only form in which a double tariff meter should be used is in the opposite manner, viz., to supply current at very low prices during certain hours, i.e., during the night hours.

I shall return to this later.

TABLE 3.

Average Total Cost for Lighting in Dwelling Houses.

	I. Costs per installation.	II. Costs dependent on the maximum load.	III. Costs dependent on the kWh consumption.	IV. Total costs.
Generation ..	—	0·0835 kW at 55s. per kW : 4·59s.	131 kWh at 0·0275s. per kWh : 3·6s.	8·19s.
Distribution dependent on current supplied	—	0·0835 kW at 29·3s. per kW : 2·45s.	131 kWh at 0·022s. per kWh : 2·88s.	5·33s.
Distribution, not dependent on current supplied	30·8s.	—	—	30·8s.
Total, per house installation for 131 lighting kWh	30·8s.	7·04s.	6·48s.	44·32s.
Total per lighting kWh	0·235s.	0·0535s.	0·0495s.	0·338s.

I now propose to explain which form of tariff I recommend.

As we have seen (from Table 3), the costs per consumer per annum for the average lighting consumer, one who consumes 131 kWh with 1 500 consumption hours, amounts to 30·8s., plus 7·04s., plus 0·0495s. per kWh. The first factor is independent of the individual current consumption. From this it is seen that the supply costs per kWh vary for each consumer,

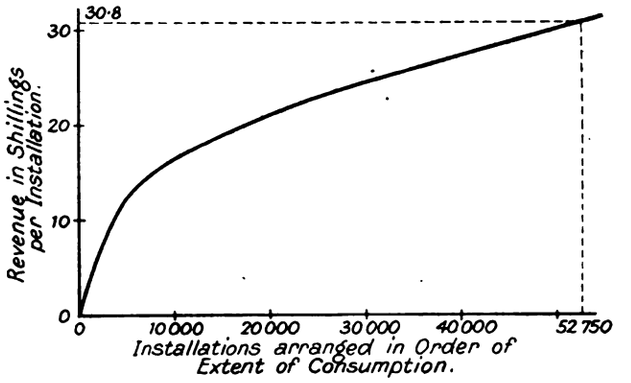

Fig. 4.—Average revenue per installation of the smallest lighting consumers.

depending on his consumption, for where, for a consumer of 100 kWh, the lighting current price is :—

$$\frac{3\,080}{100} + 5{\cdot}35 + 4{\cdot}950 = 0{\cdot}411\text{s.}$$

The price, on the other hand, for a 200 kWh consumer is :

$$\frac{3\,080}{200} + 5{\cdot}35 + 4{\cdot}950 = 0{\cdot}257\text{s.}$$

And now we must ask ourselves whether it is right, when fixing tariffs, to treat each consumer individually, and to keep the lighting price demanded in line with the costs, i.e., inversely proportional to the extent of consumption, or to put all lighting consumers (dwelling-houses) in one group and charge each consumer the average kWh price. The latter system is usual, and in fact is justified : it constitutes a social tariff, and other arguments (which can hardly be gone into now) support the maintenance of this as a general principle.

Assuming that the lighting current price must be equal for all dwelling-houses and must be built up from the average cost price, which can be expressed by : 0·235s. as firm costs, 0·0535s. as maximum load costs, and 0·0495s. as variable costs, in the case where the lighting consumption duration for dwelling-houses can be assumed as being practically constant, the amount of 0·0535s. can be taken as constant, so that the supply costs per lighting kWh may be separated thus : 0·2885s. as firm costs and 0·0495s. as variable costs.

From calculations it is known that the supply costs per kWh for household purposes amount in total to roughly 0·05s., an amount which is of the same order as the variable amount of the lighting kWh. The total supply costs per annum and per installation for x–kWh for light and y–kWh for household purposes are therefore (28·85 multiplied by $x + 5\,x + 5\,y$) ÷ 100 shillings.

TABLE 4.

Sales of Apparatus made by the State Electricity Works of Amsterdam in 1926.

Nature of apparatus.	Quantity.	kW.	Revenue in shillings.
Vacuum cleaners	9 500	1 800	1 937 000
Fires	5 600	6 600	192 000
Hot water accumulators (night load)	900	800	148 000
Ordinary water heaters (six litre capacity)	600	300	51 000
Flat irons	4 000	1 500	31 000
Kettles and saucepans	1 200	600	190 000
Hairdriers	700	350	14 000
Toasters	500	200	11 000
" Instantaneous " water heaters ..	100	300	10 000
Boiling plates	500	400	9 000
Tea warmers	400	50	6 000
Various (fans, warming plates, pastry ovens, foot warmers, washing machines, cookers, etc.)	600	200	20 000
Total	24 600	13 100	2 619 000

Two tariffs can be developed from this :—

(1) 33·8 x + 5 y, i.e., one charges for all kWh for ordinary lighting consumption at one selling price, basing this on the total costs of 0·338s., whilst the total remaining consumption is built up on the costs of 0·05s.

Digitized by Google

(2) One demands the payment of a fixed sum per annum, built up of the normal lighting consumption per annum, which is put down as x, and bases the price on 0·2885s. firm costs, whilst the total consumption, both for light and household purposes, is charged at a price built up from the average total costs amounting to 0·05s.

In using these two tariffs it is therefore necessary to know the individual consumption per dwelling-house. Now there exists an unmistakable connection between the annual consumption in light and the designation and size of a dwelling-room, whereby, at the same time as the size, the status of consumer is taken into consideration. When this connection is reduced to figures, it is possible to calculate the normal lighting consumption for every dwelling-house.

When one has determined the number of lighting kWh for a dwelling-house, one can, with the aid of a " dark hour table," also determine the lighting consumption for each month.

The first tariff therefore arranges that for each month a number of kWh is fixed which are payable at 0·338s. plus profit, whilst each kWh over and above this number in the corresponding month is charged at only 0·05s., plus profit.

In this case, the condition must be made that, should the consumption in any one month not reach the fixed number of kWh, the balance must be added to the lighting consumption for the following month, before the lower tariff based on 0·05s. takes effect.

One objection against this tariff is that considerable office work is entailed and a punctual monthly meter reading is essential. In this respect, the second tariff is better, in which an annual payment of a fixed charge is made, proportional to the lighting consumption x multiplied by 0·2885s. One can demand payment monthly, viz., $\frac{x}{12}$ multiplied by 0·2885s., plus profit, or one can vary it with each month's consumption. The total consumption, i.e., lighting and domestic kWh, will then be charged at the low tariff based on 0·05s.

Now there is still the question to settle as to whether the use of the prepayment meter principle is influenced by the introduction of these tariffs.

From Table 3 it is seen that the firm expenses, independent of the current consumption, amount to 30·8s. per installation.

From statistics we learn that from the 120 000 installations it is just the 52 750 smaller ones that have this amount of revenue per annum, so that more than a third of the consumers bring just this amount in, without paying for their current at all, let alone giving a profit.

Prepayment Meters.

From these figures it becomes clear how important it is to reduce the firm expenses of 30·8s. (Fig. 4). This is possible by using prepayment meters, which should be considered mainly as cheaper collectors, for from this 30·8s. 5·66s. fall away immediately as wages for collectors, meter reading and the appropriate office work. This amount can, by the general use of prepayment meters, be lessened also for these tariffs.

It is now possible to construct prepayment meters for both these tariffs; for tariff (1) a slot meter, which, after it has collected during one month the quantity allotted in that month at the lighting tariff, automatically changes over to the lower tariff. At the beginning of the next month the meter commences to work at the high tariff again, and does not change over to the lower tariff until the allotted quantity of lighting kWh belonging to that period, as well as any arrears from the previous period, have been consumed, whilst at the beginning of a new year all arrears that may be outstanding are cancelled, so that the consumer can start again without arrears.

For tariff (2), the necessary mechanism is limited to an apparatus which, besides the collection for current consumption at a low but constant tariff, simultaneously collects a prescribed fixed charge during a certain period, this charge being quite independent of the consumption.

Table 4 gives a summary of the sales of apparatus at the stores of the Amsterdam State Electricity Works in 1926. This table does not embrace the sales of lamps, flex, fittings, accessories for apparatus, etc.

The consumption will increase considerably as a result of the recent introduction of a night current tariff of 0·033s. per kWh (0·396d.); this serves mainly for water heating on the accumulator principle during the night hours, for the domestic hot-water requirements during the daytime. This tariff, which is exceedingly popular, is allowed between the hours of 11 p.m. and 7.30 a.m.

BOOK REVIEWS.

Classified Examples in Electrical Engineering (2 Vols.). By S. G. MONK. (London: Sir Isaac Pitman.) Vol. I. Pp. viii+77. 2s. 6d. net. Vol. II: Pp. viii+115. 3s. 6d. net.

Questions in Electrical Engineering, taken mainly from the examination papers set during recent years, at the London B.Sc. (Eng.) degree, the A.M.I.E.E., the final City and Guilds and the Whitworth Examination of the Board of Education, form the subject of these volumes. Although mainly questions of a numerical character, the author has included also descriptive questions dealing with important principles. The questions are classified under various headings, and in many cases the examples are fully worked out. References have also been given to enable the reader to obtain further information upon the subject.

Vol. I deals with d.c. work generally, including d.c. machine design, whilst Vol. II is of a more advanced character, covers mainly a.c. work, and includes machinery, transmission and distribution. Generally speaking, these volumes survey a wide field, and should prove of value not only to the student but also to lecturers.

W. S.

Text Book of Telegraphy. By A. E. STONE. (London: Macmillan and Co.). Pp. vii+455. 20s. net.

The author's long experience as a teacher of this subject, has, no doubt, enabled him to appreciate the difficulties which beset the path of the student, for whom this book is primarily intended. The first seven chapters are devoted to the elementary principles of electricity, with which the student should be thoroughly conversant before commencing the study of telegraphy. The following chapters deal with universal battery working, the simpler key systems, double current, duplex telegraphy, central battery and concentrators, quadruplex, Wheatstone automatic, repeaters, type printing systems, line construction, protection, testing and submarine telegraphy.

Modern telegraphy is first met with in the chapter dealing with type printing systems, the text being thoroughly up to date, and descriptions of all apparatus recently tested, and that operated by the Post Office, are included. Although, as the author states, submarine telegraphy and radio telegraphy can only be fully dealt with in manuals exclusively devoted to these branches, the value of the book would certainly have been materially increased by a fuller description of these two systems. Again, it is a pity that the author has not included the system now operated with excellent results by the cable companies, viz., the system of regenerative repeaters.

Worked examples are given to illustrate the use of the various formulæ given in the chapter dealing with alternating currents and propagation of signals. Two appendices are included at the end of the book, one giving a table of exponential and hyperbolic logarithms, which will facilitate the working of examples, whilst the other is a brief résumé of voice frequency telegraphy.

Generally speaking, the book can be thoroughly recommended to students, both elementary and advanced. The formulæ are clearly stated and also evolved from first principles, and the theoretical matter is very carefully dealt with.

SAFEGUARDING THE CONTRACTING TRADE.

An Appeal to the Electricity Commissioners—More Examples of Shoddy Workmanship—Protecting the Public—An Exposure of Daily Risks of Fire—Value of Compulsory Registration as a Safeguard against Bad Work.

By HARRY MOSS, A.M.I.E.E.

THE safeguarding of industries is a matter that has loomed large on the political and trade horizon for some considerable time, and is, at the present moment, exercising the brains of many trade representatives in various spheres of our national life. Now, if the safeguarding of industries for the protection of trade is such an important national matter, how much more important is the safeguarding of life and property, which is being jeopardised, not by foreign competition, but by want of skill and training, in an industry which has grown by leaps and bounds during post-war years.

If there is one branch of trade that requires safeguarding to-day, it is the electrical contracting trade, because, I believe, it is the one that is more abused than any other at the present time. It is a trade that brings either its benefits or its dangers into our homes, churches, shops, factories, and every other class of building. It is a trade that has an open door for any to enter by, be he wise man or fool, skilled or incompetent, old or young, trained or untrained. It is a trade that has no protection whatever, and its ranks have been swollen beyond all reason with thousands of undesirables.

It is a trade that can be dabbled in by anyone who knows a switch from a piece of wire, and cares to style himself an "Electrical Engineer" or "Electrical Contractor."

Isn't it a farce that any incompetent, unskilled person, who cares to have a few cards printed and buy a few shillings'-worth of wire and electrical accessories, should be allowed to style himself an electrical engineer?

Some of these men are neither electricians with a knowledge of the science of electricity, nor engineers with the knowledge of engineering as it is known to-day, and yet they are allowed to proclaim themselves to the public at large, by means of printed matter, posters and signboards, newspaper advertisements, etc., as electrical engineers. These men are gulling and robbing the public daily.

These are the class of men who are laying veritable death-traps in the homes and shops of this country by the way in which they are installing wires and fittings that are called electrical installations, which, in hundreds of cases, are a positive danger to the community. These men have no idea of rules and regulations, of earthing, carrying capacities, loading, etc., yet they keep doing the jobs, and these are connected up to supply systems, either public or private; dangerous extensions are also added to otherwise good installations.

A lot of this work has been exposed of late, and more keeps coming to light, but nothing short of national or Government action can stop the dangerous practices that are now being carried out.

The rapid growth of standardised a.c. supply at 230 V is adding daily to the dangers and risks that are being run with the class of work previously hinted at, and it is being carried out by men who have not the remotest right to call themselves by a name that should command the respect of the public generally.

Government Action.

The safeguarding of the electrical contracting industry can, to my mind, only be brought about by Government action, and this could easily be done by the passing of a short Bill, forbidding anyone to carry out electrical wiring work in connection with the equipment of buildings, other than National Registered Electrical Installation Contractors or members of the Electrical Contractors' Association. Steps should also be taken, at the same time, to prevent anyone styling himself an electrical engineer who has not passed some acknowledged examination or proved his fitness for membership of some one or other of our acknowledged electrical associations or institutions.

Every impostor would have to destroy all his printed matter, take down his false and misleading signs, etc., under very heavy penalties, or be liable to imprisonment; thereafter the style "electrical engineer" and (or) "contractor" would mean something which, to-day, it does not.

Further, there are quite a number of extensions to installations carried out by incompetents, such as so-called "handy men," schoolboys, and dabblers in wireless who do not understand anything more about the work they are doing than the fact that wires will carry current from one point to another, if connected up somehow.

During the last few days the writer has come across several

This remarkable example of shoddy wiring is referred to in the accompanying article. The fuses were not fixed, but hung up, being held together by a piece of twisted wire clamped under the covers. The wire on the left is single lead covered. It is badly joined to one flex, but the other flex is simply twisted around the lead covering. Holes near the free end of the lead covered wire show where arcing had occurred. The separate piece illustrated shows the fuse wire for connection to the switch plug.

C

Digitized by Google

dangerous examples. In one case wires were run loose like pieces of string across walls and through doorways, so that the door nipped the wires every time it was closed, and the bare wires were exposed, within reach from a wet stone floor. The tube system for some lights fed by these wires had not been earthed. On the same job about 8 yd. of flexible cord had been used to extend a light for a distance of about 6 ft., and all the spare wire had been wrapped round hooks, screws, nails, etc., all around the walls, to take up the extra length.

An Ironing Point.

Another case was an ironing plug that had been added to an otherwise good installation, carried out on the metal sheathed system. The culprit had got a supply from a d.p. fuseboard and connected up to two 5 A bow cut-outs of a type not approved by the supply authority; then, from the cut-outs, two single pieces of flexible about 1 ft. long had been used to connect up to a single 1/18s metal sheathed wire, one flexible going to the conductor, and the other twisted round the metal sheathing to form part of the circuit.

At the other end of the run the copper conductor had been taken to one side of the switch plug and the metal sheathing had been connected to the other terminal by a piece of 1/18s lead fuse wire twisted round the sheathing several times.

No attempt at earthing, bonding, soldering, or proper jointing had been made, and the cut-outs were hung up with another piece of wire, not fixed to a baseboard by screws.

All the above items constituted extensions to jobs that had already been passed and approved by the supply authority; no notices of extensions are ever given, and the supply authority knows nothing of these dangerous alterations by fools, who ought to be prosecuted as dangerous criminals.

Needless to say, both jobs gave trouble, and the second one burnt itself out and could easily have "fired" the place. Why should this kind of thing be allowed to continue?

Is it beyond the power of the Electricity Commissioners to make a strong recommendation to His Majesty's Government to safeguard the electrical contracting industry and confine electrical wiring and installation work to approved and competent firms, and thus protect the public from the dangers that exist through the shoddy work that is regularly being connected to the supply mains?

To my mind, the time has also arrived when every supply authority should depute some of their inspectors to go round and make an examination and test of all installations now connected to their mains. When any were found (and thousands would be) where such work as I have described has been installed or added to originally sound installations, they should cut off the supply until the defects were remedied, and should, furthermore, insist on the customer making a declaration of the name of the person who did the faulty work, thereafter taking such action as they might deem advisable against such persons.

I, personally, have condemned lots of additions that I have found grafted on to what was my original installation, and in such cases have told the consumers that unless they gave me an undertaking that such additions were disconnected at once, I would report them to the supply authority, with a view to having the supply cut off. In most cases, when the dangers have been pointed out, consumers have had the reinstatement done in a proper manner.

The ever-increasing uses to which electricity is being put at the present time demand that only safe, reliable work be carried out by "authorised" persons or firms, and the protection of electricity consumers from the "dabbler" who is daily laying "fire risks" and "death traps" for the ignorant unsuspecting public.

The "penny wise and pound foolish" policy in connection with electrical installations has gone far enough, and it is high time that very drastic steps were taken by the highest authorities to call a halt. Otherwise fires and inquests will be a far more common occurrence in the future than they have been in the past, although in this enlightened age everything reasonably possible is "supposed" to be done to reduce their number.

DESIGN OF DOMESTIC APPARATUS.

Discussion on Electric Irons, Kettles, Cookers and Other Apparatus—Possibilities of the Electric Washer—Some Views on Hotplates.

IN a paper before the London Local Technical Group of the E.P.E.A. on January 8th, Mr. F. H. H. Bellamy discussed the design of domestic electrical appliances and some of the latest developments, and intimated what he believed would be the trend of future development. Mr. W. J. Oswald presided.

Dealing with electric irons, Mr. Bellamy referred to various types including one having an element consisting of a spiral wound round a heavy non-corrosive material and embedded in solid metal, the element being insulated from the protective metal case by means of magnesium oxide. He illustrated an iron of this type which was thermostatically controlled, and having an indicator fixed in a convenient place under the handle, which may be set at any point, according to the type of material to be ironed. By means of this heat throttle, the proper temperature for every ironing requirement may be maintained. The lower end of the throttle has a lock-nut which raises and lowers the thermostat blade, which latter extends almost the entire length of the iron, is directly connected to the sole plate, and follows the temperature of the sole plate at all times. The blade is made of two pieces of carefully annealed and heat-treated alloy metal. The lower section is made of a metal which expands more readily than the other metal when sujected to heat. As the iron heats, the thermostat blade bends upwards throwing a rocker spring off the centre. To the rocker spring is attached a rocker arm, at the end of which are suspended the contact points. The rocker arm is made of special alloy spring steel, and it is always under tension when the electric contact is made, ensuring a firm positive contact. The rocker arm is designed with a quick make and break. The contact points are well insulated, and in this iron any temperature between 350 and 520 deg. F. may be maintained with accuracy. When the heat falls below the desired temperature, the thermostat blade contracts and bends downwards, re-making the contact.

Protective devices for kettles took several forms. In one type of kettle a switch had been fitted in the connector box, a bearing arm projecting through a slot underneath. This was a very sound practice, because the user was obliged to put the switch to the "on" position before setting the kettle down on the table, to ensure that the current was on, and the kettle itself rested on the arm and kept it in position. When the kettle was tilted, in order to pour the water out, the switch arm was automatically released, and the current switched off. Another type of kettle was fitted with an automatic cut-out which broke the circuit if the kettle was allowed to boil dry.

Still another type of kettle was fitted with a self-regulating automatic safety device, which did not necessitate the replacing of the fuse, etc., should it boil dry.

Cleaners with Floor Polishers.

Dealing with vacuum cleaners, Mr. Bellamy described a type which is now on the market, and with which is supplied, as an additional attachment, a floor-polishing brush, at very little extra cost. The attachment is fitted to the nozzle of the machine, after removing the belt which drives the revolving brush from the armature shaft of the motor, and releasing the brush from its seating in the nozzle, by clipping on to the wheels of the machine two bands attached to the ends of the floor polishing brush.

Mr. Bellamy expressed the view that electricity supply authorities have not given the electric washing machine as much attention as they should have done, no doubt owing to the fact that the quantity of electricity consumed thereby is practically negligible, most of the machines being operated by a ¼ H.P. motor, and used approximately four or five hours per week. In his view, the revolving drum type was not as efficient as the type having a gyrator fitted in the wash tub. The latter was also quicker in operation, and it was significant that most manufacturers were now producing models on these lines. In an average family of six people, the weekly wash can be carried out efficiently in two or three hours.

Stressing the importance of the electric water heating load, Mr. Bellamy said he had heard it stated that it was of even greater value to supply undertakings than the cooker load. The tendency appeared to be in favour of a well-lagged tank with a heater of not more than 700 or 800 W loading, controlled by an automatic switch.

After discussing the various types of electric radiators available, Mr. Bellamy dealt with electric cookers, and in

Digitized by Google

emphasising the importance of the cooking load, pointed out that in one particular area last year over 45 per cent. of the total units sold were for heating and cooking; the load curves showed that there was very little difference in the character of the Sunday and week-day station load.

Dealing with the construction of the boiling plates, he said that at the moment the general opinion seemed to favour the totally enclosed type. Discussing enclosed types of boiling plate which have been designed to avoid as far as possible loss of heat by conduction from the element to the utensil, he mentioned one embodying an element consisting of a helical coil of resistance wire surrounded by powdered magnesium oxide within a seamless steel tube, the diameter of the tube being then compressed so that the magnesium oxide becomes very hard. The element was not cast into the top plate itself, but could be run in atmosphere. It would seem, he said, that the solution of the boiling plate problem would be found, not in the totally enclosed or the open type plate, but in a compromise between the two. The type mentioned gave all the advantages of a glowing red hot plate on to which utensils could directly be placed, whilst, at the same time, the element was entirely protected from damage due to foods and liquids boiling over. The tubes in which the elements are sealed are calorised, as the result of which a coating is formed of practically infusible metal, impervious to oxidation, carbon, sulphur, and the products of combustion of all common fuels at actual melting temperatures up to 1 800 deg. F. Even if the coating was removed by severe abrasion, it would be reformed automatically when the bare surface was exposed to heat. A plate of this description, with an effective diameter of 6¾ in., and an area of 35·78 sq. in., with a loading of 1 450 W, boiled three pints of water, from an initial temperature of 50 deg. F., in 15¼ minutes—an efficiency of 48·5 per cent. There were great possibilities with this type of construction.

THE DISCUSSION.

Miss C. HASLETT expressed disappointment that Mr. Bellamy had not referred to dish washing machines, because she was frequently asked whether a perfect dish washing machine had been produced. She also suggested that the design of electric kettles might be improved. The lid on the electric kettle which she used daily had a tendency to fall off when the kettle was tilted, and often the lids were too small. With regard to safety, Miss Haslett advocated the more liberal use of insulating material; for instance, the handles of vacuum cleaners might be better insulated. One of the reasons why washing machines were not used more in this country was that drying was difficult, particularly in small flats, and it was preferred to send the clothes to the laundry.

Mr. W. E. ROGERS stressed the importance of providing really robust material for the connections from the terminal to the internal elements of apparatus, and exhibited a sample of a specially insulated wire made by the Liverpool Cable Co. He said he had placed the end of it into the flame from a blow lamp in order to see if it would burn, and he had also baked it up to red heat for two hours, but the insulation still appeared to be fairly good.

Mr. A. F. HARMER, speaking with regard to vacuum cleaners and the possibilities of users receiving shocks from them, suggested that the safest type was that in which the nozzle was fitted to a rubber tube, so that the user was more or less insulated from the electrical part of the machine. The electricity supply authorities were not so much to blame as had been suggested for lack of development of the use of washing machines, because, especially in some parts of London, very few people did their own washing.

Alderman Mrs. HAMMER complained that manufacturers did not give sufficient instructions to householders as to the proper use of their apparatus. She herself was frequently in trouble through over-oiling her apparatus.

Mr. EDINBOROUGH, referring to the author's remarks on the type of hot plate consisting of an element coiled inside a metal tube and insulated with magnesium oxide powder, suggested that there might be difficulty due to the breathing of the element wire. Naturally, there would be expansion and contraction as the wire was heated and allowed to cool, and he believed the movement of the wire would cause the particles of magnesium oxide to disintegrate, and breakdown would occur. On the other hand, if magnesium oxide crystals were used, the crystals dovetailed into one another. A plate of the latter type, with a load of 2 000 W, had been proved to have an efficiency of 50%, whereas the efficiency of the plate mentioned by Mr. Bellamy, in which magnesium oxide powder was used for insulating, was 45% when loaded to 1 760 W. The plate with the magnesium oxide crystals would boil two pints of water in less than 7 minutes.

Miss READING said she had often been asked if there existed an immersion heater which could be plunged into a bath of water and left there for a certain time until the required temperature was reached. Would it be possible to evolve such a heater?

Mr. DARLING claimed that in respect of the electric oven and the grill we had got the gas industry beaten. The boiling plate was not yet perfect, but progress was being made. With regard to irons and kettles, he urged the necessity for keeping their price down to a reasonable level.

Adaptor Irons.

Miss NORVICK recalled that when in Paris last summer she had visited the flat of a well-known Frenchwoman who was leading a big, women's, domestic movement there, and one of the special innovations in that flat was an adaptor iron described as being popular in France. In some cases there were two irons, so that while one was in use the other was being heated automatically to the correct temperature, and all one had to do, when the temperature of one iron became too low, was to change it for the other iron.

Mr. W. E. ROGERS said that nearly 20 years ago in Marylebone that type of iron was used. The iron was pushed on to live contacts in a shielded chamber, and the arrangement had worked admirably.

Mr. GRAVES suggested that the flexible connections on kettles were cumbersome, and that it might be possible to have bare sprung contacts for kettles, similar to those used in the older type of iron mentioned. It would then be possible to dispense with thermostatic control. With regard to boiling rings, he asked why we should not replace them by a heating element to be placed inside the cooking utensils, as in the case of the element in the kettle.

Mr. SKINNER suggested that it would be more practical if the flex attached to an electric iron entered the iron at the side instead of at the back, to avoid risk of shock to the user in the event of a "short." With regard to heaters, he suggested it was wrong for manufacturers to pay so much attention to the ordinary stove type. A room should not be heated from one point, but from points distributed about the room. With regard to boiling on electric cookers, he suggested that a kettle should be supplied with each cooker as part of the complete unit.

Capt. DURTNALL asked why manufacturers provided for the attainment of such very high temperatures as about 2 000 deg. in electric cooking apparatus; the temperature necessary for cooking was not nearly so high, and he suggested that if more moderate temperatures were attained, the efficiency of the apparatus would be greater.

Mr. THOROGOOD pleaded for the organisation of a domestic electrical exhibition in London which would have electrical apparatus only exhibited. He also suggested that the award of prizes for the best types of apparatus would be valuable, in that it would encourage research in the industry.

Mr. WILLIAM F. ANDREWS described a coating of composition for the bottoms of electric kettles which brought water to the boil more quickly. A 6-pint polished copper kettle boiled in 25 minutes on an ordinary element of about 1 500 W. When coated with a black enamel, which gave it a semi-egg-shell finish, the time was reduced to 19 minutes.

Mr. BRYAN said he had found that a well-lagged 20-gallon water tank with an immersion heater of 500 W would give all the hot water required in the household in the usual way.

Mr. BELLAMY, replying to the discussion, said an immersion heater which could be placed directly in the bath might be dangerous, unless the apparatus were enclosed in some chamber and thoroughly well earthed. With regard to the strain on the flexes of irons, he said there were irons into which the leads entered from the sides, and there were others fitted with a ball socket, so that it would swivel and protect the wire of the flex at the point at which it entered the iron. Generally speaking, the supply authorities recommended that kettles should be supplied with cookers, and this was done in a large number of cases.

The Royal Sanitary Institute has asked Sheffield Corporation to arrange an exhibit showing various forms of electric heating, lighting and power appliances at the Cutlers' Hall, Sheffield, during the annual congress to be held in July. The General Manager of the Electric Supply Department has been instructed to arrange an exhibition at a cost not exceeding £200.

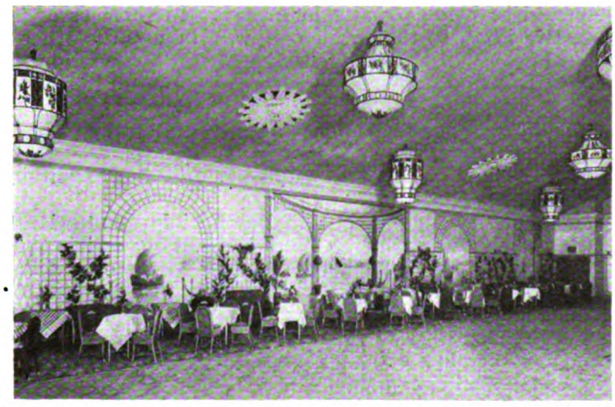
DIFFUSED LIGHTING IN THE BALLROOM.

Cheap and Effective Schemes which Electrical Contractors may Instal—Choice of Coverings for Lamp Shades—Exploiting Possibilities of Colour Lighting.

By AN INSTALLATION ENGINEER.

RAPID strides have been made recently in the lighting of the modern ballroom and cinema, the tendency being to utilise lighting methods which are termed, somewhat loosely perhaps, indirect or concealed lighting. Competition between the older type of building and those newly erected and equipped with all the most up-to-date fittings, however, is very keen, with the result that the older hall has to be brought into line, as far as possible with the new buildings.

The introduction of indirect or concealed lighting involves



Diffused lighting used in the new Rialto ballroom, Liverpool. The decorative scheme of the architects (Gray & Evens, Liverpool) has been carried out in the lighting fittings, of which several shapes are used.

considerable expense in most cases, and the electrical engineer is frequently called in to suggest a method of bringing old buildings more into keeping with modern practice, without the expense associated with an entirely new method. One way of doing this, and in fact the most effective way available, is to use the gigantic lamp shades which are very popular for ballroom lighting at the present time.

With the aid of these large lamp shades, several important advantages are gained. They give a diffused, instead of a direct light: coloured lighting can be employed, in an extraordinarily wide variety of shades; there is an entire absence of naked lights, or "spots."

Owing to the heat which is generated by twenty or more lamps, silk is extremely unsatisfactory as a covering for those shades. The best fabric is a strong, filament-proof calico, which can be treated so as to render it fireproof, and so meet any local by-laws which may have to be complied with. This fabric can be sponged without doing any damage to the shade, so that it can be cleaned regularly. It outlasts silk by two or more years.

When illuminated, this fabric is indistinguishable from silk. It does not require a lining. Parchment or vellum may also be used for covering large lamp shades, but both of these are inclined to buckle with the heat, and in addition to this drawback, they absorb more light than calico. Nacrolaque has been used, but it is difficult, if not impossible, to carry it over curved surfaces.

A diffused light is ideal for a ballroom. Shadowless, free from glare yet giving ample light, soft and kindly to the eye, it is a tremendous improvement on older methods.

Obtaining Colour Effects.

By grouping three colours and white in each shade, some beautiful colour effects can be had. Dimmers are fitted with each colour, and as there are several groups, each consisting of two, four or six shades, it will be realised that there are a great number of colour combinations available. So many, in fact, that in a ballroom of ordinary size, it is possible to have a different combination of colours for every dance, every evening, for a week, without repeating any combination.

The manipulation of the complicated switchboard is becoming somewhat of an art, and operators who can use the combinations with initiative and ingenuity are rare.

The absence of "spots" in the lighting of a ballroom is an effect which is worth striving for. The relief to the eye, once experienced, will fix diffused lighting for ever afterwards in the mind as the ideal way of securing a satisfactory result in the ballroom.

The greatest advantage of the giant lamp shade method, however, lies in the fact that the lighting scheme can be definitely linked up with the decorative scheme. With ordinary methods the architect has had to introduce lighting arrangements as best he could—the source of light in a building had to be provided for, but it was an offence to the eye, a difficulty which for practical reasons, could not be overcome.

By grouping all the lights and enclosing them in a shade, however, the lighting system becomes an artistic triumph instead of an insurmountable difficulty. There is no limit to the size or shape of the shades. They can be made to emphasise the architect's dominant motif; they can be placed in any position; by using appropriate sizes, a low ceiling can be made to appear higher than it really is, or a ballroom can be made to look longer, or shorter than in reality. The architect who plans the building, the furnishing, the decorative scheme, the walls and the ceiling, also decides about the lighting, and the result is one complete whole, as planned and carried out by one and the same artist.

Applied Decoration.

Some type of decoration is usually applied to the shades in the form of stencilled work, or hand painting. The designs are executed in a paint which does not run when the fabric is cleaned, and owing to the varied shapes of the shades, hand painting is more usual than stencils, the latter not being entirely satisfactory on large curved surfaces. The architect also decides what type of decoration is applied, and what colours will be most suitable; for the exterior decoration must not be permitted to interfere with the effect which is to be obtained from the coloured lighting inside the shade.

In view of the luxurious and elaborate ballrooms which are springing up all over the country, a decorative scheme must be correct historically, and architecturally. French styles—Louis XV and Louis XVI—are widely favoured because of the intricate detail which they allow, and for their peculiar appropriateness to the ballroom. With a Louis XV ballroom, the shades can be made in elaborate shapes, and in the decoration full use can be made of the delicate scroll work which is a feature of all the furniture and draperies of the period. The colours of Louis XVI, too, lend themselves to ballroom use, being rose, gold, yellow, ivory and gilt. In the same way, the great English periods are treated. Adam, Hepplewhite and Sheraton "styles" are all ideal for ballroom decoration. Italian, Byzantine, and similar styles are used because of their ornate character and the opportunity they give for display; these periods are perhaps not quite so refined as the English styles mentioned, but nevertheless, they are extremely effective for the purpose.

When the electrical installation engineer is consulted about ballroom lighting, this diffused method ought to be kept in mind. From the electrical point of view, it is perfectly simple. It must be remembered, however, that the fabric of which the shades are made absorbs a good deal of light, and consequently the wattage must not be under-estimated for each shade. In the very large shades, there is a series of rings firmly fixed in the framework, and each ring is fitted with lamp holders for six, ten, twelve or more lamps. There may be four, six or ten rings. The total wattage for each shade is calculated in white lamps; if the total is 1 000 W of white, then there must be at least 2 000 of amber, 3 000 of red and 4 000 of blue, if the colour lighting is going to be correctly proportioned.

Not only should each shade have the colours in those proportions, but each ring should have the proper proportion of white, blue, amber and red lamps; otherwise the shade will not be evenly illuminated for colour lighting.

Where, for financial reasons, a completely new installation cannot be carried out, in this method of lighting results bringing an old building up to date at no great expense, and, in the provinces at least, it is still something of a novelty. The electrical installation engineer who carries out such a scheme will always have an artistic job to which he can refer clients, and he will be able to secure a wide publicity locally, from the fact that the scheme has been carried out by him.

SHOWROOM RADIO DEMONSTRATIONS.

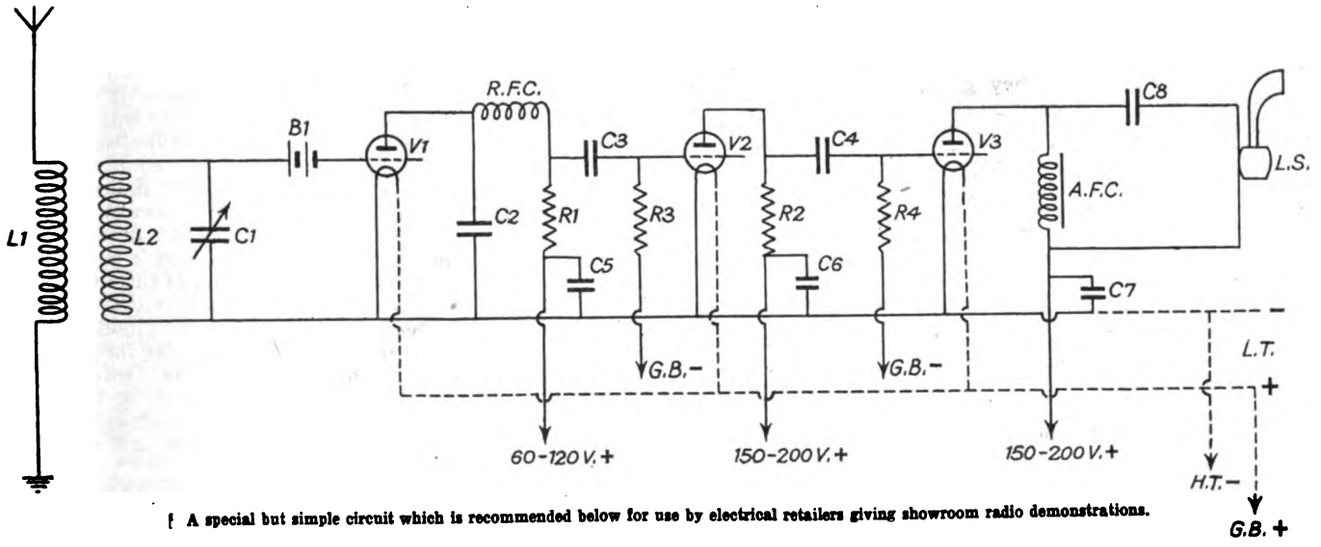
Problem of Securing Good Showroom Reproduction with Ordinary Receiving Sets—A Practical Solution of the Difficulty—Choosing the Loud Speaker.

By A RADIO ENGINEER.

A NOT too critical listener walking near those radio stockists in whose showrooms are given demonstrations during broadcasting hours, is at once impressed by the poorness of quality of most of them. No matter whether it be in London or the provinces, the main object appears to be volume, with little regard to quality and truth of either vocal or musical reproduction.

Of the dangers of such demonstrations, of the losses in sales which result from such unfaithful reproduction little need be said; but of the remedy there is much to say. Demonstrations as given by most showroom attendants are made with the aid of complete receivers of one or the other manufacturers' in conjunction with a cone or moving coil type of loud speaker. Ostensibly, this is the correct procedure, but when it is remembered that the majority of these showrooms are also showrooms for lighting fittings, or are else used with show cases, counters, store cupboards and so on, the acoustics of the room are not conducive to good reproduction with the ordinary type of manufactured receiver.

For showroom demonstration purposes something cleaner and sharper is required, and since, unlike the manufacturers' sets, distance ability may be neglected, the problem is not impossible of solution. After all, the manufacturer is severely handicapped in the matter of receiver design, for he has not only the question of reproduction to consider, but also selectivity, ability to receive foreign stations, a wavelength range up to 3 000 metres, and so on, with the result that the finished article is nothing less than a compromise; an excellent compromise it is true, but nevertheless a compromise. The demonstration of such receivers should therefore be carried out in the home of the prospective purchaser with a temporary indoor or other aerial arrangement, when it will be found that the acoustics of the rooms of the average house are more in keeping with the abilities of the set, and less subject to cause the resonance so prevalent in a showroom.



† A special but simple circuit which is recommended below for use by electrical retailers giving showroom radio demonstrations.

Returning to the latter, the object of giving a lunch-time or other demonstration is generally to attract customers, and for this purpose a special, though extremely simple, circuit should be used. Such a circuit is shown in the drawing above from which it will be understood that three valves are recommended. Four may, of course, be used if desired, but with the volume obtainable with the circuit as given, additional valves are unnecessary.

It will also be seen that reaction is purposely avoided and the reason for this is that every possible cause for distortion shall be eliminated; similarly the grid battery applying potential to the anode rectifier is connected at high potential to earth, the purpose of which is to ensure that the potential is constant, and not subject to a voltage drop as a result of the battery being placed upon a damp bench or other partially earthed object. In the event of this latter happening, the battery will be short-circuited by the earth contact of the accumulator and the earth connection proper. A high resistance earth by comparison with the intentional earth connection perhaps, but still decidedly unfavourable for introduction into the circuit if the best results are desired.

The coils L1 and L2 should, of course, be of such inductance as may be required for the station whose transmission it is intended to use for demonstration purposes. The condenser C1 is of the ordinary type for tuning purposes, of 0·0005 mfd. The valve V1 should be of a high μ value and in its plate circuit in series with the resistance R1 is a radio frequency choke for preventing the high frequency component appearing in the anode circuit from being passed on and amplified by the next valve. Whatever high frequency current may find its way to the anode circuit of the rectifying valve will thus be by-passed by the condenser C2, the capacity of which may be about 0·003 mfd.

The resistance R1 should be of a good robust construction and its ohmic value should be 500 000. The coupling condenser C2 is of a value which experimental results show to be consistent with good volume of all audio frequencies, namely 0·01 mfd,; while the grid leak is of the 2 megohm variety.

The second valve or first amplifier should also have a high μ, while R2, C3, and R4 are of the same value as for V1. The second amplifier V3 should have an impedance of from 4 000 to 6 000 Ω, and for this reason may be one of the many power valves now obtainable. The audio choke calls for no special instruction, save that it should be of good make having an inductance of not less than 80 Henries and should be used with a condenser C4, of 0·01 mfd.

On the subject of loud speakers one could almost pass a multitude of opinions, but for good results consistent with showroom practice, with plenty of volume to overcome traffic noise, and without the possibility of "dithering," it is fairly safe to use one of the moving coil variety. On the other hand, any of the recognised cone makes will also stand up to really loud signals, so long as a cone of ample diameter is chosen. Of the horn type of loud speaker there are, again, many good ones, but for showroom work experience seems to show that the necessarily small diameter air column given by the horn is not suitable for the trying conditions obtaining in most, if not all, showrooms not specially considered from an acoustical point of view. The position of the loud speaker in respect to the remainder of the contents in the showroom is another item of importance, for though few demonstrators appear to recognise the fact, the amount of resonance set up by the sound or air waves with local ornaments, suspending fittings and so on is very considerable, and often mars an otherwise good reproduction.

PHYSICAL AND OPTICAL EXHIBITION.

Further Review of the Electrical Exhibits—X-Ray Equipment—Current Transformers—Recording Rotational Speed of Machinery—Apparatus for Insulation Testing.

(*Continued from page* 34).

A NUMBER of interesting exhibits were seen on the stand of PHILIPS LAMPS, LTD., including examples of the 220 kV "Metalix" X-ray tube, type "F." This is a convenient high voltage tube for deep therapy and radio-metallography. It has a maximum continuous rating of 880 W and embodies its own protection. The cooling of the anti-cathode is effected by means of a thermo-syphon cooling attachment, the whole forming a compact unit. In view of the increasing popularity of valve rectification for X-ray transformers, a high-tension

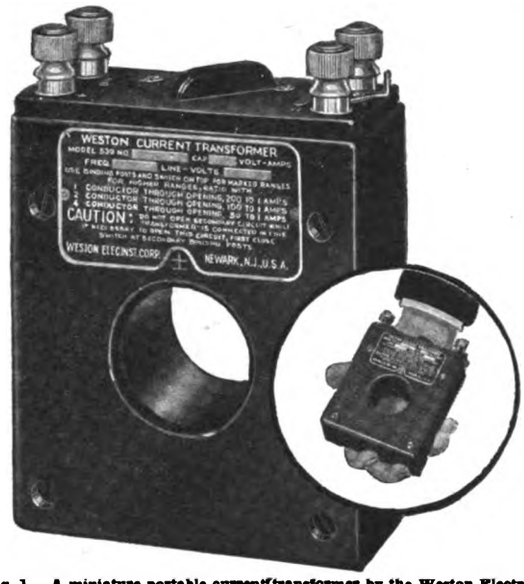

Fig. 1.—A miniature portable current transformer by the Weston Electrical Instrument Co.

valve of a type used by most instrument makers in this country was also shown. Demountable X-ray tubes for pump operation were again shown. These are so designed as to permit the easy insertion of anti-cathodes of different atomic numbers. The body of each tube is composed of a chamber of chromium iron, which alloy possesses the same coefficient of expansion as glass. This permits of a direct glass to metal seal which is vacuum tight. The X-radiation is thus generated entirely within a metal chamber. A screwed union is provided for connection to the pump, whilst the anti-cathode can be removed by unscrewing a nut. Of those displayed, type "A" is arranged with a central window, and is so proportioned that the applied potential is evenly distributed along its length. The central metal portion is, therefore, practically at zero potential, and under favourable conditions may be earthed. The tube has a maximum capacity of 1 kW, i.e., 20 mA. at 50 000 V, r.m.s. Type "B" is only half the overall length of type "A" and is, therefore, only suitable for lower tensions. In this instance, the anti-cathode is arranged at the bottom and may be cooled from the water main, provided that the transformer can be earthed at the anode end. Both types can be supplied with one or three windows as desired. A new form of hot cathode was also on view. Fitted with a Lindemann glass window, this tube emits soft X-rays from 0·8-2 A.U. in wavelength and is constructed for operation at potentials between 8-12 kV. In addition to a wide range of measuring instruments, electroscopes and electrically maintained tuning forks, W. G. PYE AND CO. displayed an X-ray spectrophotogoniometer. This instrument is a combination of a spectrograph and a goniometer for crystal setting, using a collimator and tele-microscope in place of the plate holder and X-ray aperture. All four of these last are readily interchanged and replaced exactly into any definite position. Both half and quarter-plate records may be taken, and there is an attachment for a circular camera. Special attention has been given in the design so that the intensity of the X-ray beam is as strong as possible, so that the extent of adaptability of the apparatus is unimpaired. There is a swinging arm which is so designed that it cannot drop or sag during rotation, and its adjustment is not upset when clamping in any definite position; also, its motion is limited only by the size of the plate holder. Verniers are provided for reading the angle of rotation of both crystal and the swinging arm. The RADIO COMMUNICATION CO., LTD., again showed its wireless direction finding and other nautical equipment, while the RECORD ELECTRICAL CO., LTD., again displayed "Cirscale" measuring instruments. The chief electrical exhibits of SIEMENS BROTHERS AND CO., LTD., were a thermo-electric potentiometer for the measurement of thermo-couple E.M.F.'s, the instrument having five ranges, namely, 7·5, 15, 30, 60 and 75 millivolts; thermo-electric pyrometer stems of various types; thermo-electric pyrometer switchboards and temperature indicators, including one with a 10 in. scale. The principal exhibit of SCHALL AND SON, LTD., was closed-iron core transformer apparatus designed to operate continuously at 90 kV 30 mA. A second item was a transformer designed to operate the filament for a hot cathode rectifying valve, and it may be noted that currents at voltages up to 200 000 may be rectified by this means.

The Codd cell shown by SHIMWELL ALEXANDER AND CO. was of the single fluid type, using ferric chloride as the depolariser, the elements being arranged with the zinc at the bottom of the cell and the carbons depending from the lid. The charge of ferric chloride contains a small amount of inert powder which falls to the bottom of the cell, covering the zinc and acting as a mobile porous septum. The discharge from these cells is extremely constant, the voltage being maintained at a working level till within a few hours of complete exhaustion, and the watt hours are proportionately high. E.M.F. = 1·52 volts. The exhibit consisted of various types of cells suitable for uses in signalling, valve filament heating, railway work, etc., the sizes ranging from 1½ to 6 pints in size, with capacity of from 36 to 144 ampere hours. A small battery of cells having a capacity of 6 ampere hours for h.t. anode current was also shown, together with the cartons containing the necessary recharges.

Electrostatic Voltmeters.

Electrostatic voltmeters in models ranging up to 6 000 V for a.c. and d.c., and up to 15 000 V for a.c. were to be seen on the stand of the STONEBRIDGE ELECTRICAL CO., LTD. These can be made with internal series condenser, as was shown by the instrument exhibited. Between 15 000 V and 120 000 V, external series condensers, preferably combined with protecting fuses, are used for wall mounting. For higher pressures, up to 400 000 V, with multiple ranges, the instruments are built on insulating supports mounted on the floor. Special features are electric distance indicator and electrostatic three-phase earth-detectors. Electric distance indicator or recorder of angular displacement equipment was shown under working conditions. This forms a simple and accurate means of transmitting the position of turbine valves, discharge and throttle valves, switches, automatic discharge apparatus, or any other apparatus having an angular movement. It has a continuous scale and shows any intermediate position. The equipment consists of one transmitting instrument and one receiver instrument, both of the ferro-dynamic type and both exactly balanced electrically. The usual step-resistances of similar equipments are dispensed with.

The exhibits of the WESTON ELECTRICAL INSTRUMENT CO., LTD., included laboratory standard instruments with a 12 in. scale and an accuracy of at least $\frac{1}{10}$th of 1%. Model 5 (exhibited) is a permanent magnet-pivoted moving coil instrument for d.c. circuits only, and is supplied with this accuracy as either voltmeter, ammeter, or volt-ammeter. Model 326 is a dynamometer type that has this same accuracy if used upon d.c. circuits or a.c. of any power factor or frequency up to 133 cycles per sec. These instruments are supplied as ammeters, voltmeters, and wattmeters, and form useful transfer instruments from d.c. to a.c. as they can be checked against a d.c. potentiometer. Standard portable testing instruments with 5¼ in. scales and an accuracy of ½% were also shown. For a.c. testing, a group of dynamometer ammeters, voltmeters, and wattmeters are available that are equally accurate upon d.c. circuits or upon a.c. circuits of any power factor and frequency up to 133 cycles per sec., and can be supplied for frequencies up to 600 and 1 000 cycles per sec. with the same degree of accuracy. A group of smaller portable a.c.

Digitized by Google

testing instruments with an accuracy of ½%, and which may also be used on d.c. circuits, is found in Model 432 wattmeters having the same accuracy for the dual service. A further interesting instrument was Model 539 miniature portable current transformer, by the introduction of which it is possible to measure a.c. currents ranging from 0·2 A to 200 A with small instruments. This equipment consists of the Model 539 transformer weighing only 2⅝ lb., having self-contained primary ranges of 2/5/10/20 A with inserted primary ranges of 50/100/200 A—and a miniature a.c. ammeter, Model 528, having a full scale reading of one ampere. The Model 539 has a one-ampere secondary with a secondary burden of 2 volt-amperes maximum. This transformer, in combination with the Model 528 one-ampere instrument, covers a wide and useful range of current measurements. The transformer has an accuracy of 1% on frequencies of 25 to 150 cycles.

Speed Indication.

Another exhibit was the Weston speed indicator, an electrical device for indicating the speed of rotation of any type of revolving machinery. It consists of a magneto or generator that generates a voltage directly proportional to its speed, connected to an indicating instrument, calibrated to indicate revolutions per min., miles per hour, or any other units desired. The magneto is driven from the machine whose speed is to be measured and is connected to the indicating instrument by means of electric cables. The apparatus has no complicated moving parts, is light, occupies little space, and may be easily installed on machines and devices where the use of more bulky and complicated apparatus would be practicable. It follows variations in speed smoothly and without the jumping which sometimes occurs in speed indicators of the mechanical type.

EVERETT EDGCUMBE AND CO., LTD., displayed extra low a.c. ammeters and voltmeters for the measurement of small alternating currents and of low a.c. voltages. The instruments are available in ranges down to 1 mA for full scale deflection, and as voltmeters can be constructed to take as small a current as 0·001 A at full scale deflection. The instruments are dead-beat, the scales are evenly divided, and the indications are independent of frequency up to 2 000 cycles per second or more. "Precision" moving-iron ammeters and voltmeters were also shown, and these can be relied upon to substandard accuracy on a.c. and on d.c., and even at 500 cycles per second the difference is stated to be negligible. The scale is almost evenly divided from 1/10th of the maximum reading upwards. They are made up in the form of single or multi-range portable "precision" instruments, or combined into multi-range testing sets. A special form of moving-iron a.c. switchboard ammeter has been developed, in which the power consumption has been reduced to a fraction of its usual value, without any sacrifice in working forces, dead-beatness, or other desirable characteristics. These instruments are particularly useful in connection with e.h.t. systems where "single-turn" current transformers are involved. The open scale is noteworthy. The Everett-Edgcumbe-Warren master frequency meter, Warren synchronous motors, synchronous time interval meters, protective relays, etc., were also shown. Many of the latter were shown for the first time, and certain of them are specially suitable for use in connection with e.h.t. single turn current transformers, for which purpose the volt ampere consumption of the relays must be reduced to a minimum, consistently with reliability in action. These relays are made for over- and under-current, balanced, directional (reverse) instantaneous and time lag protection.

Sets for Flash Tests.

EVERSHED AND VIGNOLES, LTD., this year exhibited for the first time the "Dionic" salinometer, an electrical instrument operating on the same principle as the "Dionic" water tester, giving the salinity of a solution directly in grains of chlorine per gallon. The "Megger" earth tester, the applications of which have developed considerably during the past year, was again shown, this time with a number of diagrams illustrating typical applications. An interesting use of this instrument, developed during the past year in America, has been its employment as an aid to geological surveyors. A 6 000 V d.c. motor-driven testing equipment was also shown, this being supplied for flash and other high voltage tests. It is understood that several sets have been supplied to manufacturers for the flash test of insulation of parts, and similar motor generators to university and other testing laboratories for cathode ray and other research work. The Midworth distant repeater was exhibited in three patterns, for transmitting "mechanical" information, such as changes of level in reservoirs, for transmitting "electrical" information, such as total load in power stations, and for distant control of power-driven apparatus, all these being shown in operation. Several minor refinements have been incorporated in the transmitter since last year's exhibition. A number of recording instruments—portable and switchboard—were exhibited, in addition to indicating ammeters, voltmeters, etc., of portable and switchboard patterns. FERRANTI, LTD., again showed a range of thermal instruments, the lowest range being 25 mA. Another exhibit was made up of 2½ in. rectifier instruments for power supply frequencies. The lowest ranges are 1·5 mA and 1 V. The low milliampere range is obtained with a low resistance which requires about 0·4 V only. The low range voltmeters are especially suitable for use with filaments of valves, etc., run from a.c., the current for full scale being either 1·5 or 7·5 mA. This current does not vary with the range. The well-known valve testers, instrument transformers, load levellers, portable a.c. voltmeters and standard switchboard instruments were also shown.

Fig. 2.—A hardness testing machine by Wild-Barfield Electric Furnaces, Ltd.

The exhibits of the FOSTER INSTRUMENT CO., LTD., included an automatic signalling system with four-way strip recorder. This apparatus makes four records on one chart from four thermo-couples by means of an automatic commutator having rare-metal incorrodible contacts. The production of the record is by the usual depression mechanism, which is without detrimental effect upon the moving system owing to the incorporation of the "Resilia" spring mounting. In parallel with the recorder circuit there is also an indicator whose connections are changed by the commutator at the same time as the recorder. The indicator is intended to be fixed in a position remote from the recorder. A second synchronised commutator actuates relays whereby lamp signals show above the indicator which particular thermo-couple is connected at the moment. Another interesting instrument was a "dial recorder" resistance thermometer. The stilus of the apparatus at the end of the recording arm is normally out of contact with the chart, and is therefore free to take up its true deflection. It is periodically tapped forward against the carbon paper behind a translucent chart, which is brought thus in contact with the glass door and leaves a dot on the back of the chart, visible on the front.

Hardness Testing Machines.

A Vickers-Pyramid hardness testing machine was shown by WILD-BARFIELD ELECTRIC FURNACES, LTD. This machine is designed to provide a universal test for the hardness of all metals, etc., from lead to the hardest of heat-treated steels. A single scale is used for all work, and the readings are identical with Brinell numerals which have been scientifically corrected for deformation of the steel ball and other inconsistencies. The readings are truly proportional to the hardness at all points on the scale, independently of what load is used for the test. The application, duration, and release of the load are all automatically controlled. An attachment was shown for testing the hardness of gear teeth on the pitch line, and it is claimed that finished work is not damaged by the test. The ZENITH ELECTRIC CO., LTD., displayed a large range of new tubular adjustable rheostats on heat-resisting steel and porcelain tubes, including patterns fitted with several independent sliding contacts, and arranged for bench and switchboard mounting, incorporating a patented end bracket clamp. Adjustable resistances on slate formers, vitreous embedded wire-wound resistances, carbon plate compression rheostats, box and frame type rheostats with radial contact controlling switches, h.t. and l.t. transformers, etc., were also shown.

Accumulators of all types, trickle chargers, dry and inert cells were shown by the FULLER ACCUMULATOR CO., LTD., while GAMBRELL BROS., LTD., exhibited a range of standard condensers, high tension bridges, vibration galvanometers, etc. Among the apparatus shown by ADAM HILGER, LTD., was Dr. Jean Thibaud's X-ray grating spectrograph for the study of soft X-rays, and of the extreme ultra-violet. In this vacuum spectrograph, a ruled grating is placed so that the incident rays fall almost tangentially upon its surface.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

The Rating of Electrical Machinery.

[To the Editor.]

Sir,—The article by Mr. Wallace Ford in your issue of December 21st is a useful contribution, calculated to stimulate consideration and discussion of this important question.

The establishment of a common and uniform basis of rating for all electrical machinery is a most desirable object, but is not a simple matter to achieve, especially considering that the ideal aimed at is an international basis.

No one will disagree with the pertinence of the query," Why not retain one arbitrary basis for all machines ? " Mr. Ford's comment, however, that the six ratings endorsed by the B.E.S.A. " do not really represent service conditions," though perhaps literally true, does not quite do justice to the spirit of the new B.E.S.A. rating specifications. In the new Specifications for Electrical Performance of Electrical Machinery and Transformers the different classes of ratings do apparently endeavour to approximate, as far as possible, to the service conditions, so that a purchaser can buy a machine to a B.E.S.A. test rating which represents the service duty of the machine sufficiently well for practical purposes.

Mr. Ford's comments on B.S.S. 171 (Transformers) convey the impression that the Transformer and Motor Specifications cannot be used in conjunction with one another, owing to differences in the basis of rating. This is not really the case. In the Transformer Specification, B.S.S. 171, an attempt has been made (for the first time I believe) to provide for the various classes of rating and co-ordinate them with the continuous maximum rating which is reserved as the main basis of rating.

In the specification there are given (Appendix II, Clause 62) tables of overload durations with the transformer starting cold, which give the necessary information for cases of short time rating ; also tables of sustained overloads after running continuously at B.S. rating (continuous maximum rating), which give the necessary information for load plus overload rating. The latter apply for ambient temperatures of 35 deg. C. and less, which condition lines up with that laid down for the sustained overloads applicable to motors, B.S.S. 168, Clause 72.

The information given in the specification makes it usable both for power station transformers, where the continuous maximum rating is preferable and usual, and for industrial transformers for use in conjunction with motors, rotary converters, etc., where sustained overloads are required ; in fact, it effectively provides for all kinds of service. That this is not apparent on the surface may point to the desirability of preparing a series of explanatory notes (similar to the " Erlauterungen " to the V.D.E. Rules ; but the labour of preparing the specifications themselves has, however, already been great.—I am, etc.,

A. G. Ellis, A.C.G.I., M.I.E.E.,
Chief Engineer, Transformer Dept.,
Metropolitan-Vickers Electrical Co., Ltd.

"American Broadcasting."

[To the Editor.]

Sir,—I cannot refrain from commenting on the paragraph entitled " American Broadcasting," which appeared in The Electrician of November 9th, 1928. I refer particularly to the sentence, " Part and parcel of the daily life of the (American) people it certainly is ; they can never escape the blatant blare of the advertiser on the air, and the individual effort and keen imagination only help to make the Americans long for a broadcasting system as free from the defects of super-showmanship and unwanted advertising, etc."

I believe this sentence is an exaggeration, to say the least. I admit that certain of the less prominent broadcasting stations may at times radiate programmes containing objectionable advertising. This is not true, however, of the large majority of the programmes available to the listener, and it is always possible to escape the blatant blare of the advertiser, in the rare case when it is encountered, by the simple process of turning the dial and tuning in on a station connected to one of the large broadcasting networks (one of the National Broadcasting networks, or the Columbia Broadcasting chain of stations).

There is no power that can compel a person to listen to a programme containing any features, such as advertising, which he thinks objectionable, especially when he can find a less objectionable programme by turning a dial. The competition thus set up has resulted in exceptionally high-grade programmes, especially in the case of those broadcast from one of the large chains of stations referred to above. The only advertising is usually the mere mention, at the beginning and close of the broadcast period, of the name of the commercial firm responsible for the programme.

Of course I am not in a position to compare British with American broadcast programmes. However, I do want to correct the impression that American radio listeners suffer from inescapable and objectionable advertising.—I am, etc.,

"Electrical Fires and Hand Extinguishers."

[To the Editor.]

Sir,—I note Mr. Wilson's communication in your issue of December 28th, and thought it might prove of interest to your readers to know that there has been on the market for the past two years a most efficient powder extinguisher, which does not require any mechanical action whatever, and therefore is more simple in use ; and further can break electrical arcs of many thousands of volts and isolate at its source any incipient outbreak. This extinguisher, moreover, is a British-made article, and though it sells for much less than the Continental article, is equally as reliable on electrical fires.—I am, etc.,

W. H. Hodson.

Bury, Lancs.
January 3rd.

Compulsory Registration.

[To the Editor.]

Sir,—As one of the first contractors to be enrolled by the National Register of Electrical Installation Contractors, I have followed its progress with considerable interest, and careful observation has shown that this purely voluntary scheme has, in the comparatively short time in which it has operated, exerted a not inconsiderable effect upon the installation trade as a whole. While it is admitted that unqualified contractors are still giving trouble, those possessing the necessary qualifications are gradually but surely entering the ranks of the registered contractors. In my opinion it would be preferable for the advocates of compulsory registration to concentrate on " roping in " all the remaining eligible contractors for the National Register. Having done this, the difficulties standing in the way of compulsory registration will be greatly reduced. —I am, etc.,

" Registrician."

Liverpool,
January 12th.

LOOKING BACKWARD.

Death of Michael Faraday's Widow Recalled.

FIFTY years ago, according to The Electrician of January 18th, 1879 :—

Mrs. Sarah Faraday, widow of Michael Faraday, died, aged 79 years.

The danger from the breakage of overhead telegraph wires was being hotly discussed.

Liverpool Town Council decided to promote a Bill making provision for the lighting of the borough by electric light.

The Langham Hotel, London, was giving a trial to an electric lighting system with the Serrin burner, and electricity was proposed as the illuminant for several rooms of the Reform Club.

* * *

Twenty-five years ago, it was recorded in The Electrician, dated January 15th, 1904, that :—

Bristol obtained sanction to a £10 000 loan for " free " wiring.

The Great Northern and City " tube " railway was put into service.

The production of a new kind of glass which largely transmits ultra-violet light was announced from Jena.

Mr. A. C. Cramb was appointed borough electrical engineer of Croydon, in succession to Mr. J. Gray Scott, who left to become general manager of the Hong Kong Electric Traction Co.

NEWS IN BRIEF.

Shardlow and Fylde Institution Lighting—New Plant at Horsham—Electrical Engineers' Dance—Worcester Electricity Showroom—Okehampton School Lighting—Henley's Effort for the E.T.B.I.

MONDAY, January 7th, was the second anniversary of the inauguration of the Atlantic telephone service.

The Metropolitan Asylums Board is to improve the electric lighting at the Northern Hospital at a cost of £120.

Shardlow Board of Guardians is to obtain tenders for the electric lighting of the institution, including the infirmary.

The Cheltenham technical school authorities intend to instal two or three motors for their engineering workshops at the Lypiatts.

The change of system at Cheltenham has progressed satisfactorily; up to the present 1 050 consumers have been put on the new system.

New generating plant installed at the electricity works of Horsham U.D.C. was formally started on January 1st by Mrs. N. V. Laughton.

Manchester Corporation Rivers Committee has decided to adopt electricity as the motive power for the whole of the Davyholme works and the extensions.

The Borough Electrical Engineer of Cheltenham is making experiments with regard to improving the public lighting in the promenade, and he is to submit estimates to the Electricity Committee.

East Ham Corporation has decided to instal electric pumping machinery at the sewage works, at a cost of £2 750. The Electricity Committee has obtained a site in Church Road for the erection of a sub-station.

Walton-on-Thames U.D.C. has, as a temporary measure, authorised the electrical engineer to purchase bungalow cookers, as and when required, to let them out on hire-purchase at 7d. per week, and to allow consumers to have kettles on hire for 1½d. per week.

Regulations for directing traffic at street corners and other places in Edinburgh where electrical or mechanical traffic control apparatus may be in operation came into force on Tuesday. Fines not exceeding £2 are to be imposed for contraventions of the regulations.

The Electrical Engineers' dance will be held at the Grand Hotel, Harrogate, on February 1st, as a result of which it is hoped to hand a donation to the Benevolent Fund of the I.E.E. Special arrangements have been made for guests wishing to stay the night at the hotel. The hon. sec. is Mr. H. Cecil Fraser, 36, Park Place, Leeds.

Fylde Board of Guardians has decided to enter into an agreement with Preston Corporation for a supply of electricity for the illumination of the poor law institution and offices at Kirkham, to take the place of the existing gas supply, which has been costing £450 per annum. There is to be a fixed annual charge of £250, plus 1d. per kWh.

Automatic traffic control apparatus is to be used experimentally in London. The first installations will probably be erected in about two months' time at the Albert Gate crossing at Knightsbridge and at the junction of Baker Street and Marylebone Road. The three-light method will be used. It is not proposed to dispense with point policemen.

Newcastle-on-Tyne Watch Committee proposes to proceed with the gradual installation of automatic signals for controlling street traffic. Mr. F. J. Crawley, chief constable, estimates that the expenditure of £1 675 upon 53 lights at certain specified points, plus £265 for cost of wiring and installing, would enable 25 police officers to be released from point duty, representing an annual cost to the city of £6 375.

The annual dinner of the Illuminating Engineering Society will be held at the Trocadero Restaurant, London, on February 13th, when Mr. C. C. Paterson, president, will preside. Amongst those who have accepted invitations to be present may be mentioned Lady and Sir Gerald Bellhouse, Mr. J. H. Colquhoun, Lt.-Col. K. Edgcumbe, Sir Joseph Petavel, and Mr. and Mrs. H. T. Tizard.

Worcester Corporation is establishing an electrical showroom in Queen Street, and instituting a system of hire-purchase for wiring of small houses and sale of electrical apparatus on direct cash or hire-purchase terms; a lady demonstrator at a salary of £160 per annum, rising to £200, and two juniors, are to be appointed. The Commissioners are to be asked for sanction for a loan of £4 000 for assisted wiring and purchase of apparatus for sale or hire, and £1 000 for the purchase of other apparatus.

Electric lighting is being adopted at Okehampton Senior School.

Swansea Electricity Committee has obtained a site at Brynsifi for the erection of a sub-station.

The electrical decorations for the Accrington Hospital Ball, on January 11th, were carried out by Mr. A. W. Clegg, borough electrical engineer.

Col. T. C. Ekin, on behalf of the Electricity Commissioners, will hold an inquiry on January 29th into the application of Glasgow Corporation for consent to the extension of its Pinkston tramways power station.

At the Birkenhead Corporation electricity showroom last week, Mr. J. Huxley, of the General Electric Co., Ltd., gave demonstrations of electric cooking apparatus, particularly those styles most suitable for cafés, hotels, restaurants, and baking establishments.

In the Battalion Orders of the 27th A.A. Battalion, R.E. (London Electrical Engineers), it is announced that the Easter Camp has been provisionally fixed to take place at Biggin Hill from March 29th to April 1st. Recruiting has been good for the time of year, and members are urged to keep at it. A Battalion dance will be held at Headquarters, Rochester Row, London, S.W.1, to-morrow, January 19th, commencing at 7.30 p.m.

The informal meeting of the Television Society and the exhibition of members' apparatus which were to have taken place on February 5th, are postponed until the annual general meeting, to take place on March 5th. The next meeting of the society will take place at the Engineers' Club, Coventry Street, London, W.1, on February 5th, at 8 p.m., when Mr. R. R. Poole will read a paper on "Methods of Light Modulation in Receivers."

The Western Union Telegraph Co. announces the introduction, as from January 13th, of a new service for overnight letters of a lengthy nature at greatly reduced rates between Great Britain and Ireland on the one hand and the United States, Canada and Mexico on the other hand. The chargeable prefix "N L T" must be inserted before the address. The charges range from 8s. 4d. to 25s. for a minimum of 50 words, and from 2d. to 6d. for each additional word.

The current issue of "Distribution," published by W. T. Henley's Telegraph Works Co., Ltd., contains the following paragraph: "The price of this issue is sixpence. We do not ask you to send this increased subscription to us, but if you feel you have had sixpennyworth of interest or amusement out of 'Distribution,' you can send your sixpence, or more if you like, to the Editor, who will hand the total received to the Electrical Trades' Benevolent Institution."

At the meeting of the Physical Society at the Imperial College of Science, London, on January 25th, papers will be read by Prof. G. Vernon Boys, F.R.S., on "A Fused Quartz Pendulum Rod for Clocks," by Mr. G. W. Sutton on "A Method for the Determination of the Equivalent Resistance of Air Condensers at High Frequencies," and by Mr. L. Hartshorn on "The Measurement of the Anode Circuit Impedances and Mutual Conductances of Thermionic Valves."

Marconi's Wireless Telegraph Co. announces that the new night letter service at the reduced rate of twopence a word between Great Britain and New York, with corresponding reductions to other places in the United States of America and Mexico, is also available by wireless "Via Marconi." The new service commenced at midnight on Sunday. Under present arrangements telegrams for the new service will have to be handed in at the Marconi Co.'s own offices in London, Liverpool, Manchester and Bradford, but the facilities will shortly be extended to any postal or railway telegraph office.

The Electrical Association for Women announces a course of evening lectures to be given at the E.L.M.A. Lighting Service Bureau on the dates mentioned, at 7 p.m.: "How Electricity is Generated at West Ham," by Mr. F. W. Purse, with Mrs. Ll. B. Atkinson in the chair, on January 29th; "Radio Progress, and its Connection with the Thermionic Valve," by Mr. H. de A. Donisthorpe (General Electric Co.), with Miss A. Tomlinson-Lee in the chair, on February 12th; and "Some Elementary Facts concerning Electric Motors," by Mr. H. Bourne (Hendon Electric Supply Co.), with Miss D. Vaughan presiding, on March 19th.

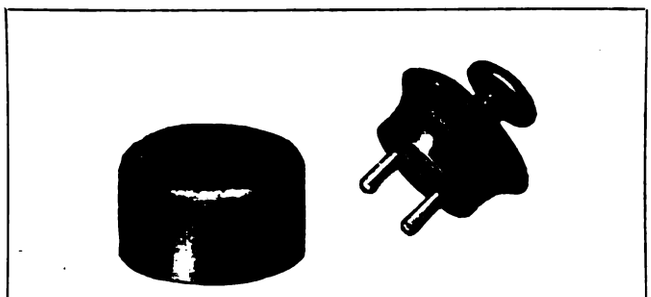
DOMESTIC APPLIANCES AND FITTINGS.

A Neat Socket and Plug with Rotatable Hand Shield—Removable Fire Elements—Self-regulating Safety Kettles—A New Cooking Cabinet.

IN order to meet a widely expressed demand for a 5 A wall socket and plug of somewhat smaller dimensions than the usual type, the GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, W.C., has placed on the market an attractive accessory which complies in all respects with British Standard Specification No. 73/1927, and which will undoubtedly appeal to both installation engineers and users. The socket is designed to supersede the company's



A new 5 A socket and plug by the General Electric Co., Ltd.

5 A socket, which measured 2⅛ in. dia. by 1⅛ in. projection. By a rearrangement of the socket tubes and terminals the new socket, which consists of English vitreous porcelain with polished bakelite drop-on cover, measures only 1 11/16 in. dia. by ⅞ in. projection, this result being achieved without sacrifice of material necessary for perfect insulation of the metal components. The new socket has a much neater appearance than its predecessor, with a perfectly smooth surface devoid of dust-collecting ridges. The plug used in conjunction with the socket is also an improved type. Its chief features are (1) solid hexagonal terminals and circular pins (turned from the hexagonal bar); (2) terminals bedded in recesses moulded into the bakelite disc (replacing the orthodox fibre disc); and (3) a Home Office pattern hand shield top which can be rotated to four positions, for reception of the disc, and therefore allows for any one of five different sizes of flexible to be connected and gripped externally between the disc and cover.

"Alto" Electric Fires.

The WHOLESALE FITTINGS CO., LTD., 23/37, Commercial Street, London, E.1, has sent us particulars of the "Alto" range of electric fires. These are made in a variety of designs including a highly ornamental model with four removable elements. Each of these latter is rated at 750 W, and switches are provided so that one, two, three or four elements may be used as desired. Other models incorporate one or two similar elements with separate switches, while still others of different external appearance incorporate three elements. A special point of interest concerning these fires is in connection with the removable elements. These are made with single split pin plugs mounted at the ends of each element bar, and by means of a slight pull both element and guard can be removed for replacement or cleaning. A semi-circular fire with four elements, each of 750 W, is also made by the Wholesale Fittings Co. This is again fitted with separate switching, and is finished in oxidised copper or silver as desired.

METRO-VICK SUPPLIES, LTD., 155, Charing Cross Road, London, W.C.2, has introduced a self-regulating electric automatic safety kettle for use on standard voltages. The appliance is fitted with three heating elements, each of 350 W. One of them is permanently connected to the terminals of the kettle, while the other two are connected to the main terminals through the medium of a small mercury switch of 10 A capacity. This switch is of a standard type and makes or breaks the current when tilted one way or the other. The switch is mounted by means of a spring clip on a helical spring made of bi-metal strip about ¼ in. wide, and having half its thickness made of brass and the other half of an alloy, which does not expand under heat. Such metal, when heated, bends with the brass side outwards, and when wound into a spring, as in this particular case, the spring tends to uncoil itself when heat is applied. The use of bi-metal in a spring in this way is patented. The mercury switch is so mounted on the free end of the bi-metal spring that the rotation of this end tilts the switch into the "on" or "off" position. The other end of the spring is fixed in a tube, which is capable of rotation (for adjusting purposes) in an outer tube, which projects into the kettle near the bottom. As the water in the kettle gets hotter, the spring uncoils itself slightly, the free end rotating in a clockwise direction. The adjusting lever is set so that just before the water boils the mercury switch breaks contact, leaving only one element in circuit, which is sufficient to keep the kettle boiling gently. If the kettle is switched off and allowed to cool down, or is refilled with cold water, the spring coils itself up again, causing the free end to rotate in an anti-clockwise direction, thus tilting the switch the other way and making contact again. The spring itself is strong enough to render it difficult to force the free end round by hand more than one eighth of a turn. Hence the device is robust and positive in action. By mounting the mercury switch directly on the spring there is no appreciable friction, and the switch is cushioned against any shocks such as might be sustained if the kettle were dropped. This, it is claimed, makes it possible to adjust the device so that it will cut out regularly at 99 deg. C.

Setting of Cut-out.

All kettles are set to cut out at 97–98 deg. C. when filled within an inch of the top. When the kettle is used, say, half full, the cut-out will take place about 40 seconds after it has come to the boil. This does not matter, as it cannot possibly boil over with so little water in it. Of course when the kettle is full the cut-out will take place a few seconds before it comes to the boil, and the heater element remaining in circuit is sufficient to bring it gently to the boil and keep it there.

We have received from GEORGE H. SCHOLES AND CO., LTD.,

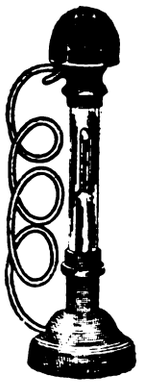
The No. 46 cooking cabinet, by the Jackson Electric Stove Co.

Blantyre Street, Hulme, Manchester details of the "Wylex" switch plug. These plugs are made of bakelite throughout, and are so designed that they will take a large three-core flexible without cutting away, or a small twin flexible. In the case of the 7/10 and 15 A plug the cord grip will cover any superfluous space. In those plugs for the latter capacities flat contacts are fitted. There are four types of switch plug and three sizes in each, thus, surface pattern, 7/10, 15 and 15/25 A; sunk, ironclad and flush types in similar

Digitized by Google

capacities. The same company also manufactures a fuse plug with 7/10 A capacity. The fuse, which is the "Slydlock" type, is fitted in the socket and is easily replaceable. Its purpose is to enable a socket to be fitted where it is most convenient, a loop being taken from the nearest radiator plug, thereby dispensing with trailing flexibles across the floor.

The new Jackson cooking cabinet, illustrated on page 68, which has just been produced by the JACKSON ELECTRIC STOVE CO., LTD., 143, Sloane Street, London, S.W.1, possesses several features of interest, notably the placing of the hob and oven top on one level, an arrangement which is claimed to give greater hob space than on any other "table" model yet produced. The cooker is strongly constructed in cast iron and steel, and the oven, in common with all the new series of Jackson cookers, is constructed in one piece, and all corners are rounded. The oven interior is vitreous enamelled throughout. The cooker can be supplied with all external parts in white and mottled grey vitreous enamel finish. The oven is of the same size as the No. 56, i.e., cooking space 15½ in. high by 13½ in. wide by 15½ in. deep, and a hot cupboard approximately 22½ in. wide by 17 in. deep by 8 in. high. The hob is fitted with two No. 86 hotplates, and a grill 10½ in. by 8 in. The hotplates are loaded to 1·5 kW each, and the grill 1·8 kW. The loading of the hot-cupboard is 500W. The elements are controlled by three-heat switches mounted in the front of the range, and each circuit is fused. The overall dimensions are: Width, 48 in.; depth, 23½ in.; and height, 37 in. without the splashplate.



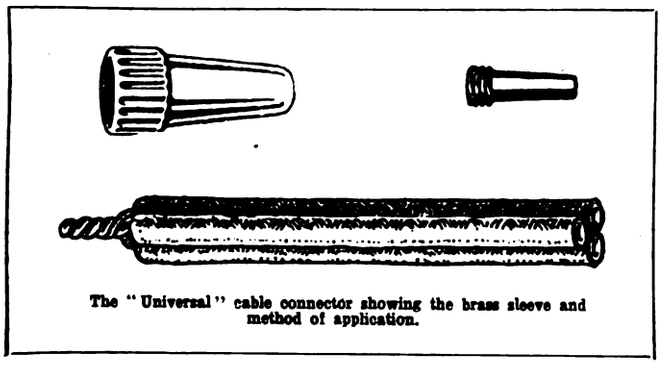
The "Break-not" hydrometer, by F. J. Gordon and Co.

An interesting radio line is the "Break-Not" hydrometer, for which FREDERICK J. GORDON AND CO., LTD., 92, Charlotte Street, London, W.1, have just been appointed sole British agents. This appliance stands only 7½ in. high, and is protected against breakage should it be dropped. It is a useful appliance for testing radio or automobile batteries *in situ*, as well as in the shop or service station. The instrument retails at 7s. 6d.

The ELECTRIC HEATING CO., George Street, Croydon, have just put on the market a complete range of "Elect" polishing irons, from 3 lb. up to 7 lb. in weight. The finish is in nickel plate, highly polished, and the demand, we understand, is already very brisk. The "Elect" ambulance urn made for service in Red Cross stations, private surgeries and hospitals, is of stout copper, highly polished, the loading being a steady 24-hour service of water.

New Cable Connector.

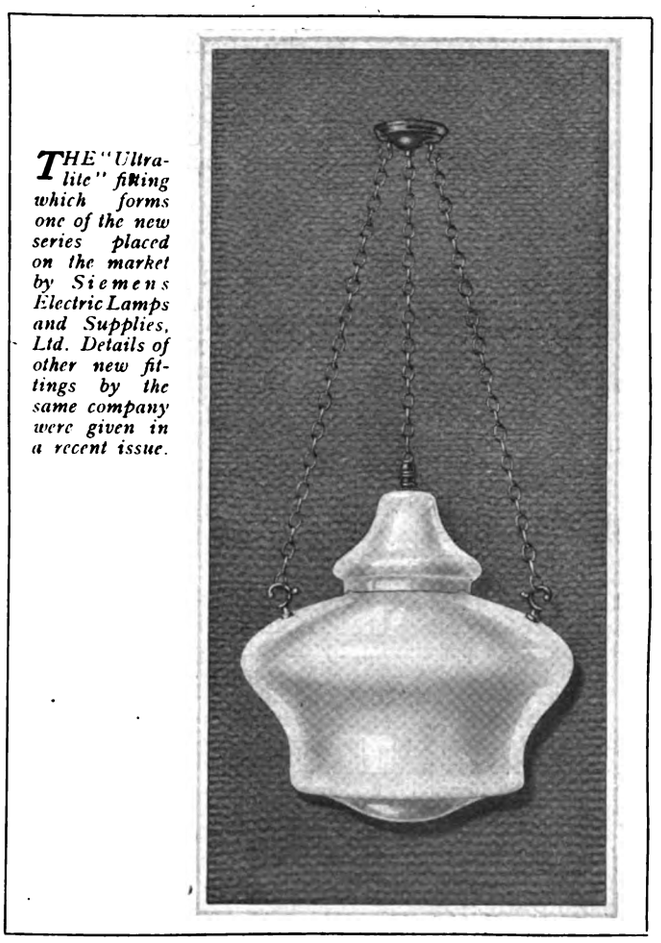
We illustrate below the "Universal" cable connector which is being marketed by Messrs. HUGO SCHLEPER, 4, Bloomsbury Square, London, W.C.1. For connecting wires



The "Universal" cable connector showing the brass sleeve and method of application.

without soldering or other troublesome means, this connector serves a useful purpose. The device consists of a conical porcelain cover threaded inside, containing a conical brass sleeve which is threaded inside and out. The wires to be joined are bared and twisted together, then trimmed to length. The complete connector is then screwed on to the twisted wires by hand and the connection is complete. The connector cuts a thread on the wires, thus giving a perfect grip. The connector can be removed and used again if required. There are four sizes of connector for wires from 1/044 to 7/036, but each size will take from two to four pieces of the appropriate size of wire.

An addition to the already extensive range of valves marketed by the GENERAL ELECTRIC CO., LTD., of Magnet House, Kingsway, W.C.2, is the Point 8 group, consisting (at present) of the H. Point 8, HL. Point 8 and P. Point 8. These



THE "Ultra-lite" fitting which forms one of the new series placed on the market by Siemens Electric Lamps and Supplies, Ltd. Details of other new fittings by the same company were given in a recent issue.

valves have rather unusual filament characteristics, the voltage being of 0·8 V and the current 0·8 A. It has been found that a short thick filament with these characteristics can be supplied with a.c. direct from the mains through a suitable step-down transformer. Unlike the "K" valves, which have indirectly-heated filaments, the Point 8 valves resemble ordinary accumulator-fed valves, inasmuch as the heated element is also the electron-emitter. The H. Point 8 valve is suitable for use with a resistance-capacity coupling in its anode circuit; the HL. Point 8 is a general-purpose valve, while the P. Point 8 is intended for use as a low-frequency valve. With a.c. mains of a reasonably good wave form, the HL. Point 8 may also be used as an anode bend rectifier with success. (Leaky grid rectification should not be employed with these directly heated valves.) The only departure from general practice in such a combination is in the grid-return connections. Thus, whereas gb+ and h.t.− are usually connected to l.t.−, in the Point 8 circuit g.b.+ and h.t.− must be taken to the slider of a low resistance potentiometer, the winding of which is shunted across the 0·8 V filament transformer. Another point of difference is the necessity for filament leads of sufficient thickness to carry the total filament a.c., which, in a three valve set with all Point 8 valves, amounts to 2·4 A.

BRITISH INSULATED CABLES, LTD., Prescot, have published leaflet P. 243 dealing with single-phase meters. P. 221 has been withdrawn.

A price list of receivers, h.t. supply units, loud speakers, battery chargers, and all radio components has been published by PHILIPS LAMPS, LTD., 145, Charing Cross Road, W.C.2. The same firm has also issued new leaflets dealing with trickle chargers, cone loud speakers, and electrical pick-ups.

Digitized by Google

PERSONAL.

MR. T. Smalley has been appointed manager of the Barrow-in-Furness tramways and omnibus undertaking.

Mr. H. Ford has been appointed manager of the Kirkwall electricity undertaking, in succession to Mr. W. C. Roy.

Mr. J. N. Waite, hitherto deputy city electrical engineer, Hull, took up his new duties as city electrical engineer on Monday.

Mr. A. J. Macphail, recipient of a long service medal from British Insulated Cables.

Mr. R. L. Horsfield has arrived in Leeds, to take up the management of the Corporation tramways and omnibus undertakings.

Hull Electricity Committee has recommended the appointment of Mr. E. H. Taylor, at present employed as assistant shift engineer, as charge engineer.

Mr. S. R. Mullard, chairman and managing director of the Mullard Radio Valve Co., has joined the board of Everlite, Ltd., the subsidiary of the Metropole Gramophone Co.

Mr. D. E. Bell, manager of St. Helens Corporation Tramways, has been appointed to succeed Major F. J. Chapple, as manager of the Yorkshire (Woollen District) Electric Tramways, Ltd.

Middlesbrough Gas and Electricity Committee recommends an increase of the salary of Mr. R. H. Scotson, electrical engineer, from £750 per annum, by annual increments of £50, to £1 000.

Mr. Mervyn Saunderson, second assistant engineer with the Manx Electric Railway Co., Ltd., has accepted an appointment with John Jackson, Ltd., as electrical engineer on the construction of the new naval base at Singapore.

At Brierfield Council, on December 13th, Mr. G. F. Naylor, Nelson Electrical Engineer, was appointed consulting engineer for the electricity conversion scheme at a fee of £150. He was asked to present his scheme at an early date.

Major F. J. Chapple, formerly manager of the Yorkshire (Woollen District) Electric Tramways, who is leaving to take up a position at Harrogate, was recently presented by the Woollen District tramway employees with a bookcase, dinner wagon and clock.

Bedwellty U.D.C. has fixed the salary of the electrical engineer, Mr. Ben Jones, at £425 per annum. This was the commencing salary when Mr. Jones became electrical engineer about 12 months ago, but the figure was reduced to £371 a month ago, in accordance with the general policy of the Council.

Mr. W. F. Vinehill, of the staff of the Tunbridge Wells Corporation Electricity Works, who has obtained an appointment at the Coventry city power station, has been presented by his colleagues with a hide suit case. The presentation was made on November 30th by the chief engineer, Mr. R. N. Torpy.

With the approval of His Majesty's Government, which has consulted the other Governments represented at the Imperial Wireless and Cable Conference, 1928, the boards of the Eastern and Associated Telegraph companies have nominated Sir Basil Phillott Blackett and the Earl of Clarendon to be chairman and a director, respectively, of the proposed Communications Company.

Members of the staff of the Bristol Electricity Department held a social last week, to mark the retirement of Mr. F. W. Prosser from the position of secretary and sales manager. In the absence, through illness, of the chief engineer and general manager (Mr. H. Faraday Proctor), Mr. A. J. Newman, deputy general manager, presented Mr. Prosser with a pedestal desk and tea trolley.

At the Prescot works of British Insulated Cables, Ltd., 463 employees have put in over 20 years' continuous service, and of this number 75 have had over 30 years. On January 11th a presentation of long service medals was made by Mr. Dane Sinclair and Mr. G. H. Nisbett. It is interesting to note that Mr. Nisbett, Mr. W. Kerfoot, Col. Bates, Mr. A. J. Macphail, Mr. Wolburn, Mr. Nash, Mr. J. L. Packer, and Miss A. Bradbury have all had more than 30 years' service. The above number only applies to the Prescot works of the company, the total number of medals being 813 (see page 77).

MR. JOHN LEE.

An Appreciation by Sir Charles Bright.

WE are glad to publish the following appreciation of the late Mr. John Lee, by Sir Charles Bright. Mr. Lee's death was recorded in our issue of January 4th.

"For a man who started life from the lowest rung of the ladder, to reach the position he did with H.M. Post Office naturally implies much. But had John Lee been spared to us, he would undoubtedly have achieved a great deal more, for he was an essentially stirring personality of a remarkable outstanding character.

"His industry, ability and imagination were all of an immense order—especially in the matter of organisation. Probably his undoing for this life was that he could never spare himself properly—despite doctors' warnings—owing to a profound enthusiasm for work.

"With a rare gift of sympathy, he naturally made countless friends amongst all classes in various walks of life. Those who attended the crowded memorial service in his honour had striking evidence of the real affection, as well as admiration, that he had commanded.

"As an instance of John Lee's wide sympathies, coupled with an innate desire to make himself acquainted with all his subordinates, I may, perhaps, mention that whilst Postmaster at Belfast he was, I understand, in the habit of exchanging a kindly word, even with the messenger boys.

"In John Lee we had a truly remarkable man, such as was by nature peculiarly well adapted to presiding at International Telegraph Conferences. Again, there cannot be many high officials who would take the infinite pains that he took in showing visitors over the Central Telegraph Office at St. Martin's-le-Grand.

"John Lee was also an admirable example of the good work that a layman can do as a Christian Churchman. Many will wish to keep him vividly in mind. His memory will always be worth cherishing as an example of everything that is good."

OBITUARY.

MR. GEORGE T. BAKER, in London, on January 10th, aged 59 years. Mr. G. T. Baker was for many years London representative of Messrs. J. H. Tucker and Co., Ltd. He first became associated with the electrical industry in the early days, with Messrs. Woodhouse and Rawson, with whom he remained for several years. He joined Messrs. J. H. Tucker and Co., Ltd., about 35 years ago, and has represented them in London ever since. He was widely known in London electrical trade circles, where his genial personality and unfailing kindliness will be sadly missed, especially among the older school of contractors. Mr. Baker, who had suffered from an internal complaint during the last three months, is survived by his widow and three sons. The funeral was at Forest Hill Cemetery on Tuesday.

The late Mr. G. T. Baker, of J. H. Tucker & Co.

MR. FRANK HARRY BASTIN, of F. H. Bastin and Son, electrical contractors, Cheltenham on December 14th.

M. LOUIS POULAINE, aged 63 years. He was vice-director of the International Telegraphic Union, Berne.

MR. DAVID FULTON, at Monte Video. He played a prominent part in the transfer of the National Telephone Co. to the Post Office.

MR. FREDERICK RICHARD EDWARDS, aged 50 years. He was in business in London Road, St. Albans, trading under the style of the Herts Electrical Co.

MR. FREDERICK TUNBRIDGE, who, among many other business activities, was associated with the Reading Radio Supplies. He was one of the best-known Freemasons in Berkshire.

MR. ABRAHAM EDWARD GODRICH, aged 64 years. He was for many years actively identified with the public life of Aston. He was a member of the District Council, and subsequently served on the Aston Town Council, being chairman of the Electricity Committee. He continued his membership of the Council until the borough was absorbed by Birmingham.

THE SOCIAL SIDE.

THE Badminton Section of the G.E.C. Social Club held their annual dance in the Lecture Room at Magnet House on December 21st, when there was a large attendance.

On January 4th, the A.T.M. (Automatic Telephone Mfg. Co.) Male Voice Choir acted as hosts to a party of over 300 of the poorest children in the Fairfield district of Liverpool. In the Strowger works canteen was a giant Christmas tree, and here a substantial meal was served, followed by an entertainment.

The sixth annual G.E.C. Junior Social was held in the Lecture Hall at Magnet House, London, on January 4th, when over 200 members of the junior staff were entertained by the directors. Mr. J. Y. Fletcher and Mr. L. C. Gamage, directors of the G.E.C., were present, and Mrs. L. C. Gamage presented prizes to the best dancers of the evening.

At the annual dinner of the Western Centre of the Institution of Electrical Engineers at Bristol, on Monday, with Mr. W. J. Bache in the chair, Mr. Frank Hodges said the Institution had now 13 000 members. It had the good fortune to be assisted by an industry which had a phenomenal growth. Lt.-Col. K. Edgcumbe, in reply, said he thought the phenomenal growth of the Institution came from the local centres.

ELECTRICAL WOMEN.

THE Electrical Association for Women (London) paid the last visit of the season on December 17th, when a party of nearly 40 members visited the new showrooms of the Battersea Electricity Department. Members were received by Mr. Thompson, the deputy engineer, in the absence of Mr. Bond, and were conducted round the showrooms by Mr. Howell.

The spring programme of the Electrical Association for Women includes a visit to Messrs. Troughton and Young's showrooms and a short lecture by Mr. A. B. Read on "Modern Decorative Lighting of Interiors," on January 23rd; a Social Sub-Committee Special "At Home" at 46, Kensington Court, London, W.8, on January 30th; a visit to the School of Cookery, 20, Soho Square, London, W.1, with a lecture demonstration on "A Five-Course Dinner" by Miss Mabel Collins, on February 7th: a visit to the Singer Sewing Machine Co., Ltd., 159, Great Portland Street, London, W.1, on February 19th; a Social Sub-Committee "At Home" at Kensington Court on March 6th; a visit to the Ideal Home Exhibition, Olympia (by invitation of the British Thomson-Houston Co., Ltd.) on March 13th, and a luncheon at the Hotel Cecil under the presidency of Mrs. Wilfrid Ashley (President), Sir John Snell and Lt.-Col. K. Edgcumbe, being amongst the speakers. The luncheon will be followed by a visit to the works of Belling and Co.

Mr. Bernard C. Holding, Editor of THE ELECTRICIAN lectured on "Electricity in the Home: the Labour Saver and Comfort Bringer" to members of the Rugby Branch of the Electrical Association for Women, at a meeting at the Percival Guildhouse, Rugby, on January 9th.

INSTITUTION OF ELECTRICAL ENGINEERS.

The following candidates passed the Associate Membership Examination of the Institution of Electrical Engineers held in November, 1928.—Whole Examination: Messrs. C. Anderson, J. F. Bagnall, P. C. Bahree, R. Baldwin, R. W. C. Byrne, K. Chand, S. N. Chowla, G. A. Cladingbowl, J. A. Croucher, T. J. Crews, J. F. Dunn, F. Edmondson, I. Elkins, W. Fegan, L. G. Folipes, E. M. B. Ghosh, F. Ingham, E. H. Jordan, P. N. Kanwar, J. B. Kilshaw, W. L. King, A. A. Komarow, S. M. Lejeune, F. W. M. Lewis, J. D. T. McEwan, B. S. Mahal, A. D. Matthews, O. J. Mayo, R. G. Millard, A. R. Page, H. Roberts, B. L. Sabherwal, H. S. Saville, P. Shearer, Iqbal Singh, G. C. Smith, J. R. P. Smith, C. Tetley, F. G. Ticehurst, E. H. Van Meeteren, A. H. Venables, H. W. G. Westlake, S. C. Whaite, A. T. Witts. (This list includes candidates who are exempt from, or who have previously passed, a part of the examination, and have now passed in the remaining subjects.) The following passed Part I only: Messrs. E. D. R. Bell, O. P. Bhasin, J. S. Boyce, A. E. Clifford, A. C. Gosain, D. S. N. Khosla, M. Matchett, W. L. Muir, M. P. Nicholson, H. C. Sahgal, Chattar Singh, B. S. Sood, and J. K. Summerfield. Passed Part II only: Messrs. W. Kidd and B. A. Munford. Success in this examination does not of itself constitute the candidate an Associate Member of the Institution. Further results relating to candidates who sat for the examination abroad will be published later.

OVERSEAS TRADE.

Exports of Electrical Goods during 1928 Exceed Imports by £11 898 866.

ELECTRICAL machinery, apparatus and materials exported from this country in December, 1928, were valued at £1 435 438, and the figure for December, 1927, was £1 471 799, so that last month showed a decrease of £36 361. For the whole of 1928 the value of exports of the same classes of goods produced in the United Kingdom was £18 333 623, compared with £18 589 092 for 1927, decrease £255 469.

Imports of electrical goods in December, 1928, were valued at £617 865, an increase of £25 740 over December, 1927, and for the whole of 1928 imports of similar goods also show an increase over the year 1927, amounting in this case to £579 574. The exports in December, 1928, exceeded the imports by £817 573, and for the whole of 1928 the excess of exports over imports was £11 898 866. Of the increase in imports during 1928, submarine telegraph or telephone cables accounted for £5 877, and telegraph and telephone instruments and apparatus for £239 388, while carbons increased by £34 302, and unenumerated electrical goods and apparatus by £178 531. Exports of motors and generators, other than railway and tramway, for 1928, increased by £91 330, submarine telegraph and telephone cables by £82 303, and unenumerated electrical goods and apparatus by £194 167. Details for December, 1928, and for the whole year are given below :—

	Month of December,		Twelve Months.

BUSINESS ITEMS.

THE business which bears the name of the late Mr. C. O. CLARK will be continued by the same staff, with Mr. M. F. Clark as principal.

OXFORD RADIO SUPPLIES, LTD., 29, Queen Street, Oxford, are giving daily demonstrations of the Fultograph.

HARWELL, LTD., announce that they have changed their address to the Sessions House, Clerkenwell Green, London, E.C.1.

Mr. W. R. AMOS, electrical and radio engineer, of Stratford-on-Avon, has removed his business to 37, Wood Street, as from December 7th.

A fire occurred at the establishment of FLEETWOOD ACCUMULATOR SERVICE (owned by Mr. J. Leadbetter) on January 9th. Fortunately the damage was not considerable.

At a meeting of the wireless and electrical engineers at Ramsgate on January 8th, it was decided to form a local branch of the WIRELESS RETAILERS' ASSOCIATION OF GREAT BRITAIN.

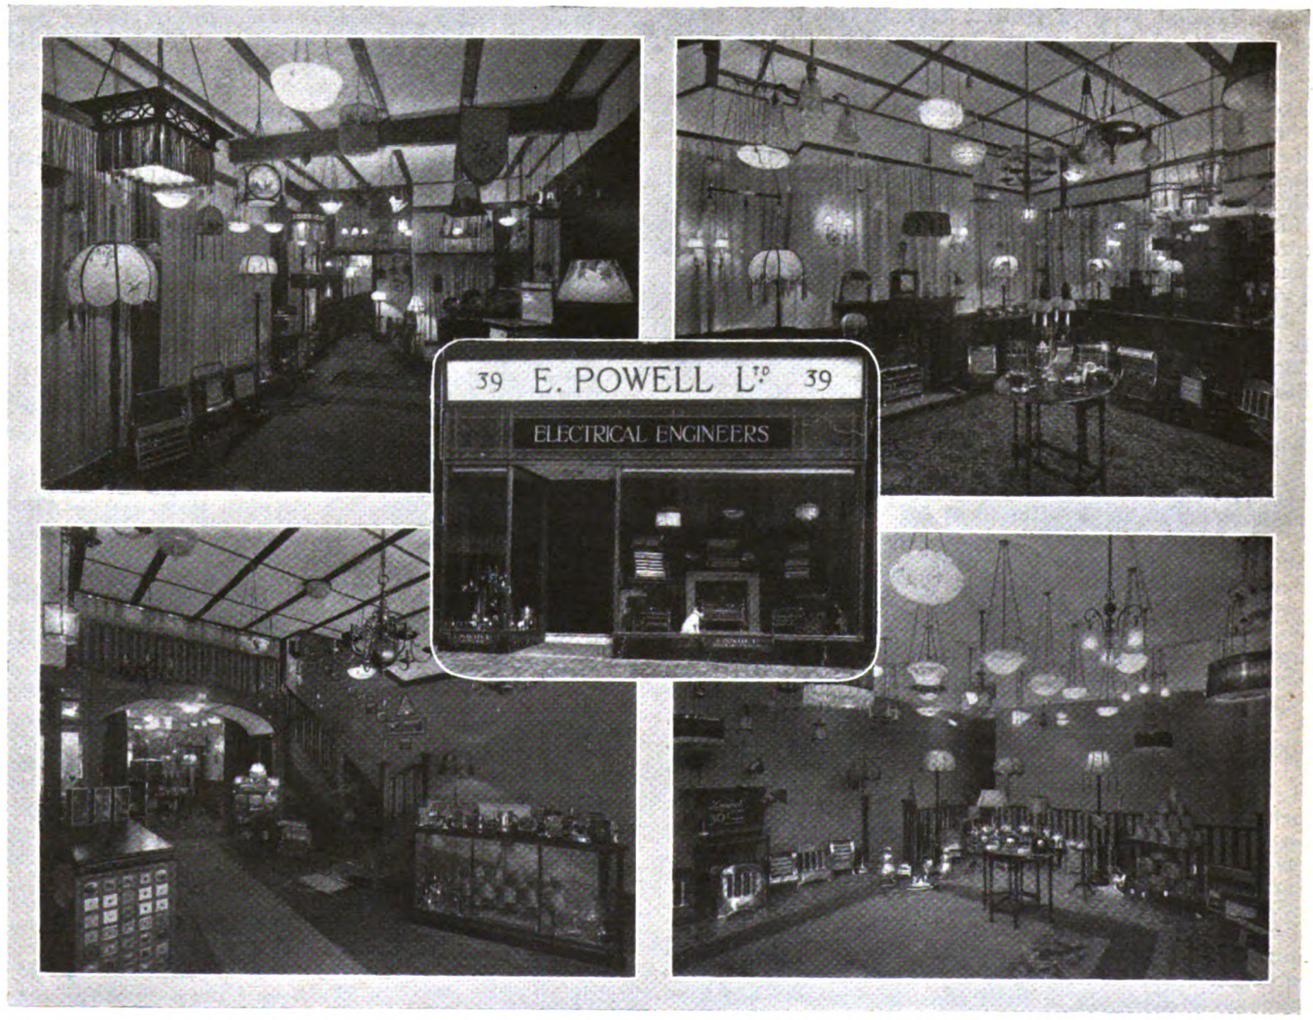
The issue of "Town and Country News," dated December 7th, contains a descriptive account of PORTER patent safety seals (7 and 9, Belfast Road, Stoke Newington, N.16) for use on electric light meters, etc.

A memorandum on the market for electrical apparatus and accessories in the Aleppo district has been received by the Department of Overseas Trade. Manufacturers desirous of receiving a copy should apply to the Department, quoting B.X. 4 962.

MR. RONALD B. BEATTIE, 1A, St. James's Street, and Hall Street, Burnley, is extending his electrical and radio business to include a department dealing with radio and other gramophone and musical instruments, having special reference to those employing electricity in any form. He invites communications from manufacturers desiring representation in Lancashire.

COMBUSTION STEAM GENERATOR, LTD., announces that the associated company, Combustion Engineering Corporation of America, has secured an order for two combustion steam generators, through Mr. W. E. S. Dyer, consulting engineer for the Philip Carey Magnesia Co. To operate at 1 800 per sq. in., these boilers, we are informed, will be the highest pressure units in regular practice in the world. The furnace volume will be 8 400 sq. ft. and each boiler will have an actual evaporation of 150 000 lb. of steam per hour with a final steam temperature of 815° F. The steam is to be used in back pressure reciprocating engines, the exhaust from which will be used for process purposes.

THE POOLEY HALL COLLIERY CO., LTD., Polesworth, near Tamworth, arranged at the Assembly Hall, Tamworth, recently, an exhibition and competition designed to stimulate interest in cooking by electricity. The company provides electricity to something like a dozen villages in the district, and there are on its books approximately 5 000 consumers, amongst whom are about 600 housewives who do their cooking by electricity. While there were on view a large number of domestic electric appliances other than cookers, the latter occupied the most prominent position. Many prizes were awarded. The most coveted of them, a silver challenge trophy presented by CREDENDA CONDUITS, LTD., Oldbury, whose Creda cookers are used throughout the Pooley Hall Colliery Co.'s area of supply, was won by Mrs. Ford, of Cope's Drive, Tamworth, who won the highest number of points. A special prize was awarded to Mrs. Wright, also of Tamworth, who in one day cooked 4 sponge sandwiches, 8 sponge rolls, 66 jam tarts, 84 lemon cheese cakes, 108 mince pies, and 160 small cakes, at an estimated cost for cooking of one shilling and ninepence. A vacuum cleaner for the cleanest electric cooker in the district was awarded to Mrs. Grant, of Dosthill; Mrs. Cowie, Tamworth, who was second, received an electric fan, and Mrs. Ford, Tamworth, who was third, was given an electric fire.



Some views of the extensive and well-equipped electrical showrooms which have been opened by Messrs. E. Powell, Ltd., electrical installation contractors, of Tunbridge Wells. Messrs. Powell have for many years maintained an electrical showroom, but it was felt that present possibilities for expansion on the domestic side demanded better display and demonstration facilities.

Digitized by Google

The WELSBACH LIGHT CO., LTD., ask us to inform any of our readers who may have seen the announcements in the Press regarding the sale of the freehold of their premises in Gray's Inn Road, that no move in the immediate future is contemplated. In due course customers will be advised individually, and also collectively through our columns, of any alteration in address which takes place.

Mr. WILLIAM BLOGG, a manufacturers' representative with offices in York Street, Sydney, and agencies in other States, desires to get into touch with British manufacturers of electrical and radio apparatus of all kinds, also with manufacturers of small refrigerating plants. He would be happy to make appointments with the principals of firms interested in extending their business in Australia in these lines. Mr. Blogg may be addressed, c/o Messrs. Barclays Bank, Tottenham Court Road, London, W.

E. POWELL, LTD., electrical installation contractors, of 39, High Street, Tunbridge Wells, have opened extensive electricity showrooms for the purpose of displaying in suitable surroundings electric light fittings of all types, together with all domestic appliances from table ware to electric fires, heaters, cleaners and floor polishers. The firm was established in 1872, and although they have had a showroom devoted exclusively to electric light fittings and appliances for some thirty years, it was felt that something on a larger scale was necessary to meet present-day demands. Some views of the entrance and of the ground floor and first floor showrooms are reproduced on page 72. It is interesting to recall that as long ago as 1884—some eleven years before the Tunbridge Wells Corporation put down the first municipal plant—Messrs. Powell had their own generating plant, as well as a portable installation which was used for local exhibitions. Electric lighting was then unknown in Tunbridge Wells, except for the private installation of the late Sir David Salomons. When Mr. W. B. Hughes addressed the Tunbridge Wells Tradesmen's Association in 1888 on the future possibilities of electric lighting, Messrs. Powell lighted the Clarendon Restaurant electrically for the lecture.

TRADE PROTECTION.

Formation of New Electrical Trade Association—Members of Committee.

A REPRESENTATIVE gathering of electrical manufacturers and factors was held recently in London, for the purpose of forming a trade protection association on similar lines to that of the Scottish Electrical Manufacturers' and Factors' Association. Mr. H. C. McMillan, secretary of the latter organisation, was present and explained the scheme in detail, and was interrogated at some length on various points in connection therewith. The meeting unanimously agreed to appoint a committee of Major Hogan, Mr. F. Hicks and Mr. C. Orgel, representatives of Messrs. Hogan and Wardrop, the Welsbach Light Co., Ltd., and Superlamps, Ltd., to prepare the draft constitution of the Association and fix the subscription. At a further meeting, the Committee's recommendations were submitted, and were adopted as follows :—

1. That an Association be formed to be called the British Electrical Trade Protection Association.
2. That the subscription be £5 5s. per annum, together with an entrance fee of £5 5s.
3. That the first 100 Members be called Founder Members, these to be admitted without payment of entrance fee.

A number of recommendations regarding the internal workings of the Association were made and adopted.

The preliminary committee, with the addition of Mr. F. W. Evans, of National Electrical Supplies Co., Ltd., was given powers to carry on the work of the Association until January 15th, when the first regular monthly meeting was held and the office bearers for the ensuing year elected.

It is understood that the response of the trade has been encouraging and a large number of applications for membership have been received.

The registered offices of the Association meantime are at 5, High Holborn, London, W.C.1, with a Scottish Branch at 13, Dundas Street, Glasgow, C.1.

At a meeting of the Association on Tuesday, the following office bearers were appointed :—*Chairman :* Major Hogan, of Messrs. Hogan and Wardrop ; *Vice-Chairman :* Mr. C. Orgell, of Super Lamps, Ltd. ; *Executive Committee :* Messrs. T. Beadle (Messrs. Beadle and Co.) A. Hunstone (Electrical Conduits), P. L. Dwyer (Dwyer and Co.), F. W. Evans (National Electrical Supplies Co.), J Godden (Godden and Co.).

LEGAL INTELLIGENCE.

Litigation Between Electrical Firms over Publication of Photographs.

IN the Chancery Division on Tuesday, Mr. Kenneth Swan moved before Mr. Justice Eve for judgment in the action of the English Electric Co., Ltd., against Crompton Parkinson, Ltd.

Mr. Trevor Watson said after what the defendants offered, the action ought not to have been brought. He opposed the plaintiffs getting costs.

Mr. Swan said the action was for infringement of copyright in three photographs of electrical machinery of plaintiffs' construction and design. Blocks or negatives of these photographs came into defendants' possession, and they used them for advertising their own goods in a large number of electrical journals. Plaintiffs considered they were entitled to an order, and they went to court, and a motion for an interlocutory injunction was moved. They intimated that they were willing to treat the motion as the trial of the action, but Mr. Watson refused to make an end of the matter; an undertaking was given in terms of the notice of motion, and the costs were reserved.

Mr. Watson said plaintiffs did not object to the offer on the footing that they wanted it taken in court. Their objection to the offer was that they wanted an apology as well, and to give it the same publicity as the defendants' advertisement. To that the plaintiffs were not entitled. Neither ought defendants to be mulcted in the costs incurred after the motion.

Mr. Justice Eve thought plaintiffs were entitled to costs of the action, including the reserved costs of the motion.

TRADE PUBLICATIONS.

Pamphlet T.A. 175, dealing with transformers, has been published by FERRANTI, LTD., Hollinwood, Lancs.

The BRITISH THOMSON HOUSTON CO., LTD., Crown House, Aldwych, W.C.2, has published leaflet L.454 relative to projector lamps.

We have received from FERRANTI, LTD., Hollinwood, Lancs., lists No. M/F 30/1 and 30 dealing with a.c. watt-hour meter type FCc.

We have received from BRITISH INSULATED CABLES, LTD., Prescot, Lancs, a circular letter relative to pre-twisted shaped conductor cables.

The BRUSH ELECTRICAL ENGINEERING CO., LTD., Falcon Works, Loughborough, has published a special leaflet dealing with liquid starters.

THE ELECTRIC HEATING CO., George Street, Croydon, has issued a new catalogue of domestic electric appliances, under the reference of No. 508.

The Vol. 8 No. 15 of "Houghton's Radio News" gives further details of the "Fultograph." Another M.P.A. sales scheme is also announced.

A catalogue of wireless receivers and components has been published by the SUN ELECTRICAL CO., LTD., 118/120, Charing Cross Road, London, W.C.2.

The WHOLESALE FITTINGS CO., LTD., 23/37, Commercial Street, London, E.1, has published list No. 233, dealing with this season's "Alto" model electric fires.

The new Mazda daylight blue headlight bulb is the subject of leaflet L.458 published by the BRITISH THOMSON-HOUSTON CO., LTD., Crown House, Aldwych, W.C.2.

Aluminium foundry practice is dealt with in a new publication of the BRITISH ALUMINIUM CO., LTD., Adelaide House, King William Street, London, E.C.4. The reference is No. 313, and the issue supplements publication No. 190.

Floodlights and floodlighting are dealt with in a new issue of the GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, W.C.2. The publication is illustrated throughout with striking examples of floodlighting, and gives details of the projectors. The reference is F. 4 822.

The current issue of the "Osram G.E.C. Bulletin" gives a detailed description of the lighting at the Piccadilly Hotel, London. Details are also given in the same issue of the 10-metre transmitting plant of Mr. E. J. Simmonds (G.20D.), together with a photograph of the station.

A description of the laying of the all-welded pipe line at the Sabie River hydro-electric power station has been published by ALLOY WELDING PROCESSES, LTD., 14/16, Church Street, Islington, N.1, in the company's bulletin No. 53. A German opinion of "A.W.P." electrodes is given in bulletin No. 56.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, when available.

CHERTSEY GUARDIANS.—Electric light installation at the institution. Particulars from the clerk, Mr. F. J. Wareham.

STAINES GUARDIANS.—Addition of 168 lighting points in the Institution, with transformer, cables and wiring, and provision of power for laundry. Also provision of 43 lights in the Girls' Home.

EDINBURGH DISTRICT BOARD OF CONTROL, January 18th.—Electric power and lighting installation at Gogarburn, Edinburgh. Specifications from Mr. Stewart Kaye, 14, Hill Street, Edinburgh.

ISLINGTON (LONDON) BOROUGH COUNCIL, January 18th.—Manufacture and supply of one 5 000 kVA Scott-connected transformer, for three-phase system, 6 600 V and 2 000/2 300 V per phase, with voltage regulator; and 375 kVA and/or 770 kVA Scott-connected transformers, for three-phase system, 6 600 V and 2 000/2 300 V per phase. Specification from the Borough Electrical Engineer, 60, Eden Grove, Holloway, N.7.

ISLINGTON (LONDON) BOROUGH COUNCIL, January 18th.—Supply of cables; electricity meters; terminal, service, network and fuse boxes; oil circuit breaker switches; electrical sundries; wires; lamps; transformers, etc., for one year. Specification from the Town Clerk.

HALIFAX CORPORATION, January 19th.—Electrical work in connection with erection of six shops. Particulars from the Borough Engineer; deposit £1 1s.

WEST RIDING EDUCATION COMMITTEE, January 19th.—Electric light installations in Norton New School and in Glass Houghton Ashton Road Council School and caretaker's house. Specification, until January 14th, from Education Department, County Hall, Wakefield.

CENTRAL ELECTRICITY BOARD, January 21st.—Supply and erection of 66 000 V switchgear in the London area, in connection with the South East England Electricity Scheme. Specification (S.E.E.-L.S.1) from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

ESSEX COUNTY AND COLCHESTER HOSPITALS COMMITTEE, January 21st.—Internal electric wiring of Brentwood Mental Hospital, with fuseboards, motors, etc. Specifications, etc., from Mr. H. H. Gepp, 66, Duke Street, Chelmsford; deposit, £5 5s. Only registered contractors are invited to tender.

NEWBURY CORPORATION, January 21st.—Direct-coupled electric motor and centrifugal pump, etc. Specification, etc., from Messrs. H. Humphries and Sons, 28, Victoria Street, Westminster, S.W.1; deposit, £1 1s.

CLITHEROE CORPORATION, January 22nd.—Electric light wiring of 12 houses in course of erection behind Chatburn Road, Clitheroe. Specifications can be seen at the office of the Borough Engineer.

GLASGOW CORPORATION, January 22nd.—Work in connection with electric lighting installations at (1) Haghill No. 1, and (2) Saracen Street, No. 1 rehousing schemes. Specifications, etc., from General Manager, Electricity Department 75, Waterloo Street, Glasgow.

MANCHESTER CORPORATION, January 22nd.—Supply of copper bands for tramway rails. Specifications from Secretary Tramways Department, 55, Piccadilly, Manchester.

Annual Contracts for Stores.

CHEADLE AND GATLEY URBAN DISTRICT COUNCIL, January 25th.—Electric lamps, meters, cable protection boards, service cables, meter boards, and ironclad cut-outs, for 12 months. Specification, etc., from the Engineer and Manager, Electricity Department, 37, High Street, Cheadle.

NEWRY URBAN DISTRICT COUNCIL, January 25th.—Supply of single and three-phase electricity meters. Specification, etc., from Mr. W. M. Cronin, town clerk, Town Hall, Newry.

GLASGOW CORPORATION, January 28th.—Electrical installation and heating installation, in connection with conversion of Family Home, St. Andrew's Street, Glasgow, for use as additional police headquarters. Specifications, etc., from the Office of Works, 64, Cochrane Street, Glasgow; deposit £3 3s.

CHICHESTER CORPORATION, January 28th.—Supply and erection of 40 kW motor-generator, with starting panel, shunt regulator, etc., for Apuldram outfall works. Further particulars from the City Engineer.

BELFAST CORPORATION, January 29th.—Installation of automatic telephones in the Infectious Diseases Hospital, Purdysburn. Specification, etc., from Mr. R. Meyer, town clerk; deposit £2 2s.

DUMFRIES AND GALLOWAY JOINT SANATORIUM BOARD, January 29th.—Electric wiring work in connection with erection of two houses for employees at Lochmaben Sanatorium. Specifications from the Clerk, County Buildings, Dumfries.

CHELTENHAM CORPORATION, January 30th.—One year's supply of electric light fittings. Tender forms from the Borough Engineer.

LIVERPOOL CORPORATION, January 31st.—Twelve months' supply of various materials, including (E.S.1) cables, compound and tapes; (E.S.2) insulated cables; (E.S.3) electricity meters; (E.S.4) cartage; (E.S.5) incandescent lamps; (E.S.6) brass and copper castings; (E.S.7) a.c. motors and starting gear; (E.S.8) stoneware troughing, etc.; (E.S.9) oils. Tender forms from City Electrical Engineer, 24, Hatton Garden, Liverpool. State number of form desired.

Overhead Transmission Line.

RIPON CORPORATION, February 1st.—Overhead 11 000 V transmission line and small quantity of e.h.t. underground cable (contract No. 2). Persons desiring to tender were to communicate their intention to Mr. W. C. C. Hawtayne, 9, Queen Street Place, London, E.C.4, before January 11th. Specifications, etc., will be issued, on or about January 18th, to persons who, after receiving notice from Mr. Hawtayne, send to the Town Clerk a deposit of £2.

HAMMERSMITH (LONDON) BOROUGH COUNCIL, February 6th.—Twelve months' supply of electric lighting sundries, insulated wires, joint boxes, meters, h.t. and l.t. paper insulated cables, etc. Forms of tender, etc., from the Borough Electrical Engineer. Stamped addressed envelope to be sent.

SHEFFIELD CORPORATION, February 14th.—Equipment for new generating station at Blackburn Meadows, Sheffield, including turbo-alternator, with condensing, evaporating and steam preheating plant (specification B.M. 67); water-tube boilers, with chimneys, superheaters, stokers (or pulverised fuel firing equipment), economisers, valves, etc. (B.M. 68); wagon tippers, conveyors and elevators (B.M. 70); cooling towers (B.M. 72); and overhead electrically and hand-operated cranes (B.M. 73). Specifications from Mr. S. E. Fedden, general manager and engineer, Electric Supply Department, Commercial Street, Sheffield; deposit £3 3s. for each.

CENTRAL ELECTRICITY BOARD, February 15th.—Supply and laying of 66 000 V cables in London area, in connection with South East England Electricity Scheme. Specification (S.E.E.-L.C.1) and form of tender from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, February 18th.—Supply and erection of 132 000 V overhead transmission lines, in connection with the North-West England and North Wales Electricity Scheme. Specification (No. N.W.E.-P.L. 1) and form of tender from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit, £2 2s.

CENTRAL ELECTRICITY BOARD, February 18th.—Supply and erection of 132 000 V overhead transmission lines, in connection with the Central England Electricity Scheme. Specification (No. C.E.-P.L. 1) and form of tender from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit, £2 2s.

CENTRAL ELECTRICITY BOARD, March 4th.—Supply and erection of 132 kV outdoor switchgear, for transforming stations, in the area covered by the North West England and North Wales Electricity Scheme. Specification (N.W.E.-P.S.1) from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, March 4th.—Supply and erection of 132 000 V transformers, in connection with the

Digitized by Google

North West England and North Wales Electricity Scheme. Specification (N.W.E.-P.T.1) from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

BULAWAYO MUNICIPALITY, January 18th.—Supply of street lighting material, transformers, h.t. and l.t. cable, h.t. kiosks and pillars, and busbar material. (Reference B.X. 4 965.)

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, January 21st.—Supply of static power transformers, for Young-Wyangala section of Burrinjuck hydro-electric development transmission lines (contract No. 235/28). (Reference B.X. 4 995.)

GRAHAMSTOWN (SOUTH AFRICA) MUNICIPALITY, January 22nd.—Supply and erection of centrifugal pumps, motors and cable (Contract B. of 1928). (Reference A.X. 7 187.)

GRAHAMSTOWN MUNICIPALITY, January 22nd.—Supply of cable, transmission lines and transformers (contract C. 1928). (Reference B.X. 4 913.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, January 22nd.—Supply of two concrete mixers, with electric motors (contract No. D.W. 67/107). (Reference A.X. 7 315.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 22nd —Supply of telephonists' telephones (Reference B.X. 4 888.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 22nd.—Telephone transmitters and associated parts (schedule C. 386). (Reference B.X. 4 889.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 22nd.—Telephone receivers and associated parts (schedule C. 387). (Reference B.X. 4 890.)

ST. GILLES, BRUSSELS, MUNICIPALITY, January 22nd.—Supply of 400 3 A, 220 V, and 1 600 5 A, 222 V, Ah meters. Details (charge 5 fr.) from Service d'Electricité, Hotel Communal, St. Gilles, Brussels.

BOMBAY, BARODA AND CENTRAL INDIA RAILWAY CO., January 23rd.—Supply of 400 kW heavy oil engine-driven generating set. Specification, etc. (20s.) from Mr. S. G. S. Young, secretary, White Mansion, Petty France, Westminster, S.W.1.

CAPE TOWN MUNICIPALITY, January 23rd.—Supply of electric cable (specification 446/1928). (Reference B.X. 4 978.)

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, January 23rd.—Supply of armoured, multiple twin telephone cable. (P. and T. 151/1 240). (Reference B.X. 5 016.)

EGYPTIAN MINISTRY OF THE INTERIOR, January 24th.—Supply and installation of electric system for Beba. (Reference B.X. 4 916.)

JOHANNESBURG MUNICIPALITY, January 24th.—Supply of 4 500 porcelain insulators (contract No. 106). (Reference B.X. 4 972.)

JOHANNESBURG MUNICIPALITY, January 24th.—Supply of weatherproof copper wire, with fireproof coatings and outer braiding, for use on overhead electric lines. (Reference B.X. 4 976.)

JOHANNESBURG MUNICIPALITY, January 24th.—Supply of electric cable (contract No. 109). (Reference B.X. 4 977.)

JOHANNESBURG MUNICIPALITY, January 24th.—Supply of oil switches (contract No. 114). (Reference B.X. 4 994.)

JOHANNESBURG MUNICIPALITY, January 24th.—Supply of steel lighting and tramway poles (contract No. 107). (Reference A.X. 7 302.)

SOUTH AFRICAN DEPARTMENT OF POSTS AND TELEGRAPHS, January 24th.—Supply of telephone switchboards (tender No. 143). (Reference B.X. 4 912.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, January 24th.—Supply of two small d.c. generating sets, running on crude oil, for Maquassi. (Reference B.X. 4 943.)

EGYPTIAN MINISTRY OF THE INTERIOR, January 27th.—Transformer kiosks, cables and accessories, in connection with extension of electricity supply from Mit-Ghamr power station. (Reference B.X. 4 893.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 29th.—Accumulator batteries and counter E.M.F. cells (schedule C. 390). (Reference B.X. 4 906.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, January 29th.—Single core, paper insulated lead covered cable. (Reference B.X. 4 954.)

WAIRARAPA (N.Z.) ELECTRIC POWER BOARD, January 29th.—Supply of 15 sets of earth leakage protection equipment (contract No. 78). (Reference B.X. 4 950.)

CHILEAN MINISTRY OF MARINE, January 30th.—Two electric travelling cranes. (Reference A.X. 7 353.)

EGYPTIAN MINISTRY OF THE INTERIOR (SECTION DES MUNICIPALITES ET COMMISSIONS LOCALES), January 31st.—Diesel engine driven generator set, d.c. rotary balancer and accessories, for Kafrel Zayat electric station. (Reference B.X. 4 931.)

A MOTOR-CYCLE, featuring Osram lamps, snapped during a recent Empire week in British Guiana to boost the sale of British-made goods.

MANAWATU-OROUA (N.Z.) ELECTRIC POWER BOARD, January 31st.—Supply of automatic re-closing 11 000 V switchgear for pole platform mounting (contract No. 57). (Reference B.X. 4 988.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, January 31st.—Supply of electrically driven locomotive turntable (tender No. 1 386). (Reference A.X. 7 253.)

VICTORIAN ELECTRICITY COMMISSION, February 4th.—Supply of 11 000 V switchgear, in connection with the Yallourn power station extensions. (Specification No. 29/5.) (Reference B.X. 4 897.)

VICTORIAN ELECTRICITY COMMISSION, February 4th.—Supply of 22 000 V switchgear and accessories, for Richmond Terminal Station. (Reference B.X. 4 901.)

VICTORIAN ELECTRICITY COMMISSION, February 4th.—Supply of 11 000 V switchgear, for installation in the Richmond Terminal Station (specification No. 29/3). (Reference B.X. 4 898.)

VICTORIAN ELECTRICITY COMMISSION, February 4th.—Supply of pillar insulators, with metal parts for use on 132 000 V outdoor circuits. (Reference B.X. 4 921.)

INDIAN STORES DEPARTMENT, NEW DELHI, February 5th.—Supply of turbo-alternator, boiler, economiser, switchgear and cables. (Reference B.X. 4 944.)

EGYPTIAN STATE RAILWAYS, February 9th.—Electrification and equipment of Heluan line, including equipment of power station, overhead transmission lines, track bonding, motor and trailer coaches, etc. Tenders to General Manager, Cairo Station.

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, February 11th.—Supply, erection and maintenance of hydro-electric generating plant, in connection with Hume reservoir hydro-electric development. (Reference B.X. 4 989.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, February 12th.—Supply of 110 kV switchgear, and controlling equipment, for Waitaki power scheme, section 3. (Reference B.X. 4 848.)

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, February 12th.—Supply of dry cells, for telephone work. (P. and T. 151/1 205.) (Reference B.X. 4 991.)

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, February 12th.—Supply of v.i.r. wire (No. P. and T. 151/1184). (Reference B.X. 4 951.)

JOHANNESBURG MUNICIPALITY, February 14th.—Supply of two single-phase transformers, each of 1 080 kVA (contract 115). (Reference B.X. 5 005.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, February 14th.—Supply of 15-ton electrically-driven portal titan crane (tender No. 1 366). (Reference A.X. 7 272.)

D

INDIA STORE DEPARTMENT, February 15th.—Supply of hydro-electric plant, comprising four 12 000 kW water-wheel driven alternator sets, auxiliaries and spares (schedule 4). Forms of tender (5s.) from the Director-General, Belvedere Road, London, S.E.1.

NEW SOUTH WALES DEPARTMENT OF PUBLIC WORKS. Extension of date.—February 18th.—Supply and erection of hydro-electric generating plant for Burrinjuck development. (Reference 4 938.)

NEW ZEALAND POSTS AND TELEGRAPHS, February 19th.—Supply of bronze wire and copper binding wire. (Reference A.X. 7 252.)

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, February 19th.—Supply of 120 000 galvanised steel spindles for insulators. (Reference B.X. 4 948.)

CAPE TOWN MUNICIPALITY, February 20th.—Pumping equipment for storm water, etc., for the electricity department (specification 445/28). (Reference A.X. 7 345.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, February 28th.—Supply and erection at Sollum of aerial ropeway, with dynamos, telephone and other equipment. Specification (10s. 6d.) from Chief Inspecting Engineer, 41, Tothill Street, London, S.W.1.

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, February 28th.—Supply of six-conductor telephone cordage. (No. P. and T. 151/1 234). (Reference B.X. 4 990.)

WHANGAREI (N.Z.) HARBOUR BOARD, February 28th.—Supply of one 15-ton electrically-operated level luffing gantry crane (contract No. 35). (Reference A.X. 7 263.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 5th.—Supply of seven single-phase 5 500 kVA transformers, for Waitaki power scheme, section 4. (Reference B.X. 4 873.)

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, March 12th.—Supply of switchboard cords (P. and T. 151/1 247). (Reference B.X. 5 017.)

CAPE TOWN MUNICIPALITY, March 15th.—Supply of metal-clad switchgear (specification 449/28). (Reference B.X. 5 004.)

VICTORIAN ELECTRICITY COMMISSION, March 18th.—Supply of 1 300 strings of suspension insulators, 600 strings of tensioning insulators, 1 300 conductor suspension clamps, 350 conductor tensioning clamps, 50 semi-anchor clamps for "V" strings of insulators, 200 semi-anchor clamps for single strings of insulators, 475 earth wire suspension clamps and 125 earth wire tensioning clamps. (Reference B.X. 4 997.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 19th.—Supply of 110 000 V transformer, for Mangahao electric power scheme (section 204). (Reference B.X. 4 952.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 19th.—Supply of 11 000 V switchgear, for Mangahao power development (section 203). (Reference B.X. 4 953.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, April 9th.—Supply of induction voltage regulators, for Lake Coleridge scheme (section 215). (Reference B.X. 5 018.)

TANGANYIKA GOVERNMENT, June 1st.—Concession for utilisation of Pangani River Falls for the development of electric power. Copies of the draft concession may be obtained from the Crown Agents for the Colonies, 4, Millbank, London, S.W.1.

STATE ELECTRICITY WORKS, MONTEVIDEO, July 8th.—Construction and equipment of 50 000 kW power station.

Tenders Accepted.

DEWSBURY CORPORATION.—Power and Lighting Cables, Ltd., cable, £532.

LONDON COUNTY COUNCIL.—Edison Swan Electric Co., Ltd., feeder panel switches.

ERITH URBAN DISTRICT COUNCIL.—H. J. Creffield, wiring the baths for electric light, £48 10s.

CANNOCK URBAN DISTRICT COUNCIL.—English Electric Co., Ltd., switchgear, £431 7s. 9d.

ADMIRALTY.—Metro-Vick Supplies, Ltd., supply of Cosmos metal filament lamps (part contract).

PAIGNTON CORPORATION.—Paignton Electric Light and Power Co., Ltd., lighting streets by electricity.

ESSEX COUNTY COUNCIL.—Chelmsford Radio Co., wireless installation at Harold Court sanatorium, £107.

REIGATE CORPORATION.—T. S. Marriage and Co., wiring small houses under hire-purchase scheme (renewal for one year).

GREAT WESTERN RAILWAY CO.—Walter Parkins and Co., electric lighting installation in offices and stores at Stafford works.

FAIRFIELD SHIPBUILDING AND ENGINEERING CO., LTD.—Parsons Oil Engine Co., supply of two 60 kW generating sets, for new C.P. liner "Empress of Japan."

OLDHAM CORPORATION.—Whitworth, Whittaker and Co., Ltd., construction of screen, pump pit and pump house for circulating water pumps at new generating station.

BRADFORD CORPORATION.—British Insulated Cables, Ltd., supply of 41 tons of copper trolley wire, £3 951 4s.; Enfield Rolling Mills, Ltd., supply of five tons of copper trolley wire, £466 13s. 4d.

WALTON-ON-THAMES URBAN DISTRICT COUNCIL.—Hackbridge Electric Construction Co., Ltd., four transformers, for sub-stations, £647; Pirelli-General Cable Works, Ltd., short lengths of cable, for sub-stations, £59.

WIMBLEDON CORPORATION.—Foster Engineering Co., two 100 kVA transformers, £158; Hackbridge Electric Construction Co., two 200 kVA transformers, £237; Babcock and Wilcox, Ltd., installation of pipework at No. 5 boiler at electricity works, £374.

STEPNEY (LONDON) BOROUGH COUNCIL.—A. Reyrolle and Co., Ltd., supply of e.h.t. switchgear £10 421. (Recommended.) Also tendered: Ferguson, Pailin, Ltd., £10 798; British Thomson-Houston Co., Ltd., £11 226; English Electric Co., Ltd., £11 510; Metropolitan-Vickers Electrical Co., Ltd., £11 933.

CHESTERFIELD CORPORATION.—British Thomson-Houston Co., Ltd., supply of e.h.t. switchgear, £203 12s. 6d.; Hewittic Electric Co., Ltd., 150 kW mercury arc rectifier equipment and transformer, for extension of railless vehicle system to New Whittington, £960; Greenwich Cable Co., Ltd., supply of cables, £1 810.

STOKE-ON-TRENT CORPORATION.—Davenport Engineering Co., Ltd., erection of cooling tower, at power station, £8 267; Joseph Booth Bros., Ltd., supply of jib for electric coal-handling crane, at power station, £150; Barnett and Soans, erection of overhead wiring and services at 64 houses on Sutton estate, Trent Vale, £184 13s. 4d.

GLASGOW CORPORATION.—A. and P. Steven, Ltd., installation of passenger and goods lifts at a building at Glasgow Cross, £1 118 15s.; British Electrical and Manufacturing Co., supply of cable, £562 10s.; Kennedy, Stark and Co., electric lighting installation, bells, and fire-alarms, at Mearnskirk Sanatorium, £1 571 10s. 7d. (All recommended.)

GLASGOW CORPORATION.—British Insulated Cables, Ltd., insulated bolts, Drake and Gorham, Ltd., reflectors (for 'bus depot); Felten and Guilleaume, v.i.r. cable; Mavor and Coulson, Ltd., supply of switchboard (for 'bus depot); Revo Electric Co., Ltd., supply of 1 000 lanterns, 29s. 9d. each; H. T. Boothroyd, Ltd., electric lighting installation at, Knights wood Hospital, £350 15s. 6d. (All recommended.)

THE NATIONAL REGISTER.

Contractors' Applications Accepted at Meeting of Executive Committee.

AT a meeting of the Executive Committee of the National Register of Electrical Installation Contractors, held at the Institution of Electrical Engineers on January 11th, twelve applications from electrical installation contractors for enrolment on the National Register were accepted. At the same meeting six applications were declined, for various reasons, and one was withdrawn.

The names and addresses of the newly registered contractors are:—Alderson, Harold, 92, Claypath, Durham City; Allenby and Stokell, 126, Vicar Lane, Leeds; Bysouth, Christopher, 31, Hitchin Street, Baldock, Herts; Cropper and Hancock, 4, Exeter Street, Woodhouse Lane, Leeds; East Sussex Wiring Co., Ltd., The Broadway, Crowborough; England, Sidney E. J., 5, Dorchester Street, Bath; Jones, E. W., and Co., Park Street, Wellington, Salop; Modern Electrical Supplies, 208A, North Street, Leeds; Taylor, Whiting and Taylor, Oakes Yard, St. Peter's Street, Derby; West Wales Electric, Ltd., 3, High Street, Criccieth, N. Wales; Wilkinson, John, and Sons (Greengates), Ltd., Parkside Works, Apperley Bridge, Bradford; Woodward, Herbert, 254, High Road, Wood Green, London, N.22.

We understand that there has already been a large demand for copies of the pamphlet, "Hidden Risks," which has been produced for sale to registered contractors at cost, for distribution to members of the public. Supplies may be obtained from the Secretary, at 1, Lincoln's Inn Fields, London, W.C.2, at £1 3s. per 1 000, or 13s. 6d. per 500 copies.

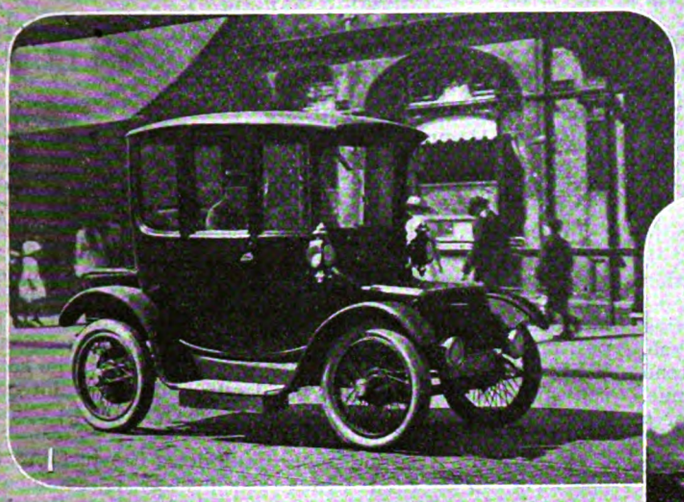
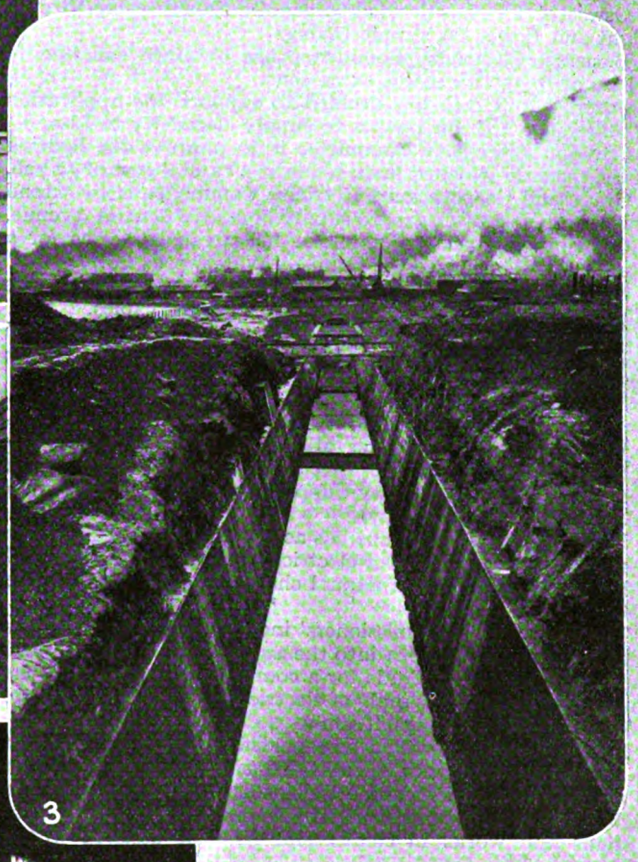
ELECTRICAL NEWS PICTURES.





(1) Our references to early electric passenger vehicles continue to arouse interest. Here is another reader's picture of an electric vehicle built during the petrol rationing period in the early days of the war ; **(2)** Some of the 813 oldest employees of British Insulated Cables, Ltd., who were presented with long service medals on the occasion of a recent entertainment given by the company. Those shown in the picture are Messrs. Arch. Lauder, superintendent of lead covering department ; Reg. P. Nash, resident electrical engineer ; J. L. Packer, manager of cables department ; and W. H. Birchell, mains engineer (left to right, seated), and Mr. A. J. Macphail, publicity manager (standing) ; **(3)** Works in connection with the making of a tunnel, 15 miles long, and 15 ft. in diameter, through Ben Nevis, through which water from Loch Treig will be carried to a power station near Fort William for the purpose of generating electrical energy for a large factory in course of erection for the British Aluminium Co. ; **(4)** Shell House, Aldwych, London, as seen one morning this week. The picture gives a good idea of the heavy day lighting load in London which is created during the dark winter days ; **(5)** A turbine house for the generation of electricity for two farms between Grassington and Kilnsey, Wharfedale, Yorkshire. It is hardly necessary to point out that it is *not* a selected station.

ELECTRICITY SUPPLY.

The Mid-East England Electricity Scheme—Nottingham's Supply to Outer Districts—Proposed East Ham Installation Department—Extension of Hammersmith Street Lighting—Birmingham Supports Registered Contractors.

SHEFFIELD Electricity Committee has authorised mains extensions at a cost of £12 560.

Oswestry T.C. has decided to acquire the Oswestry Electric Light and Power Co.'s undertaking.

Barnsley Electricity Committee has obtained sanction to a loan of £7 356 for mains extensions.

Petersfield R.D.C. has decided to support the application of Aldershot T.C. for powers to supply electricity to Liss.

Croydon Electricity Committee is to improve the lighting of the recently widened main roads at a capital cost of £2 726.

Gravesend Corporation Electricity Committee is to extend mains, at a cost of £1 350, to supply houses in Central Avenue.

Grimsby Electricity Committee has arranged terms for a supply of electricity to the Grimsby Waterworks Co.

Southwark Electricity Committee seeks sanction for loans of £4 066 for mains and meters and £2 140 for cables.

Powers for electricity supply in Alresford rural district are sought by the Hampshire Electricity Co. and the Alton Electricity Co.

Commissioners' New Scheme.

We understand that the Mid-East England Electricity Scheme, prepared by the Electricity Commissioners under Section 4 of the Electricity Supply Act, 1926, will be published to-morrow (Saturday).

Fylde Board of Guardians has accepted the offer of Preston Corporation for a supply of electricity for the Institution and offices at Kirkham at an annual charge of £250, plus 1d. per kWh.

The Electricity Commissioners' inquiry, which was to have been held on January 8th into the application of the T.C. and the local Chamber of Trade for a compulsory reduction in the charges made for the supply of electricity in Pontefract by the Yorkshire (West Ridings) Tramways Co., has been postponed.

Nottingham Corporation has decided to apply for sanction to a loan of £150 000, to be expended as required on extension of mains, transformers, and switchgear in connection with the high tension supply for outside districts, erection of substations and works in connection with the assisted wiring scheme.

It is stated that about 20 000 applications have been received by the County of London Electric Supply Co. from consumers desiring to be charged under the company's new alternative two-part tariffs, under which the charge is 1d. per kWh for all purposes, plus a quarterly charge based on the dimensions of houses, and, in the case of business premises, on the wattage installed for lighting.

With regard to the supply of electricity for Wyvenhoe, Colchester T.C. has made a revised application for a loan of £8 536, made up of purchase price of the undertaking of the Wyvenhoe Electricity Co., £2 150; cost of application for Special Order by Wyvenhoe U.D.C., £275; estimated cost of transmission line from Hythe generating station to Wyvenhoe, £4 776; mains services, etc., £1 260; and contingencies, £75.

East Ham Electricity Committee has asked the Engineer to submit a report with regard to the supply of electricity to North Woolwich. The Electricity Committee has heard a deputation from the Electrical Trades' Union urging the Council to establish an installation department, and has deferred further consideration thereof until the next meeting. The electricity department is to extend cables at a cost of £2 222.

The Commissioners have informed Stratford-on-Avon R.D.C. that the Leamington and Warwick Electrical Co. has applied for consent to the erection of overhead wires in the rural area, and, as the Commissioners are satisfied with the technical proposals, they suggest that the Council should withdraw its objection. The Council has decided to continue to object, on the ground that in a very narrow road the cables should be laid underground.

The district engineer of the Central Electricity Board has informed Glasgow Corporation of the intention of the Board to erect two steel towers for the supply of three-phase, 50 cycle electrical energy, at a pressure of 132 000 V between phases, on the route within the city from Clyde's Mill (Cambuslang) power station to Dalmarnock power station, and 59 steel towers along the route through the city from Dalmarnock power station to Port-Dundas and Yoker power stations.

In 1924 Hammersmith (London) Council entered into an agreement with the Brentford Gas Co. (now the Gas Light and Coke Co.) regarding 587 gas lamps maintained by the company in the Southern portion of the borough. The agreement was for five years, and thereafter, terminable by notice. There was a proviso in the agreement that not more than 20 per cent. of such gas lamps should be converted to electric lighting during the period of the agreement, and, as that proportion has been converted, and the electricity department is in a position to convert a further 120 during the next 12 months, it has been decided to terminate the agreement. The cost of conversion will be £9 10s. per lamp, and the maintenance charge £4 per annum, compared with the charge of £4 19s. 11d. by the gas company.

Birmingham Electric Supply Committee has just put into operation an assisted wiring scheme. It is confined to premises of a residential character, and covers installations of not less than four and not more than 15 lighting and four power points, or their equivalent. To the cost of installations will be added interest and percentages to cover supervision and maintenance during the agreement period. The consumer is required to enter into an agreement, in the case of quarterly account consumers, for repayment by way of 12 equal quarterly instalments, and in the case of prepayment consumers, by way of an addition on prices charged for current. In the latter case the consumer will pay £1 on signing the agreement and the balance by an additional 2½d. per kWh for lighting and an additional ½d. for power. The wiring will be done, at the Corporation's cost, by registered contractors, to the Department's specifications.

Birmingham Corporation discussed on January 8th a report by the Electric Supply Committee dealing with the arrangements for the change-over of the electricity supply system, in accordance with the requirements of the Central Electricity Board, from 25 cycles to the standard 50 cycles. Three sites have been selected for transforming stations for dealing with supplies from the grid. These will be the Hams Hall and Nechells stations, and a further station at a spot between Selly Oak and Northfield. It will be several months before the two large frequency changers at Nechells can be installed as a temporary measure. The outer districts will first be dealt with, and the central and more highly developed industrial areas will be changed over as the demand grows. Coun. Lewis remarked that the Board was bearing the cost of all replacements, including that of altering or replacing plant belonging to manufacturers, and he asked if workpeople who temporarily lost time owing to substitution would be compensated. Coun. Beale replied that the manufacturer obtained no compensation for actual disturbance. When the Electricity Supply Bill was before Parliament, the Government resisted the efforts made to secure some such provision. The report was approved.

Douglas and Joint Authority.

Douglas (Isle of Man) Electricity Committee has reported that the Chairman, the Town Clerk and the Borough Electrical Engineer attended a meeting of the Electricity Commissioners, at which the subject of electricity supply to the Isle of Man was discussed. The Commission asked for the decision of the Committee as to (1) whether the Corporation desired to undertake the supply and distribution over the whole island; (2) whether the Corporation would be agreeable to the formation of Joint Electricity Authority, to which Douglas would sell its generating station and plant, and from which it would buy its electricity and continue distributing in its own area; (3) whether the Corporation would be prepared to undertake the supply and distribution over the whole island, if the alternative were the taking over of their station by a Joint Electricity Authority; and (4) whether the Corporation would be prepared to sell electricity in bulk to a company or Electricity Authority for the purpose of distribution outside the Douglas area, on the terms of the second schedule of the English Electricity Act, 1926. The Committee replied that it does not desire to undertake distribution outside the Douglas area, and it answered question (2) in the negative and expressed the opinion that question (3) cannot arise. The Committee also stated that it is prepared to supply on any terms which could be considered equitable.

COMPANY NEWS.

Appreciation of Electrical Manufacturers' and Telegraph Shares—American Radio and Gramophone Amalgamation—Manx Electric Railway's Increased Receipts—Ever Ready Co.'s Bonus Share Issue—New Companies.

DURING the past week there have been considerable rises in the prices of electrical manufacturing companies' shares. Callender's 6½% preference have risen from 23s. 9d. to 25s., Crompton Parkinson 8% preference from 25s. to 25s. 7½d., English Electric ordinary from 7s. 6d. to 8s. 9d., General Electric ordinary from 55s. to 56s. 3d., Henley's ordinary from 116s. 3d. to 117s. 6d., Metropolitan-Vickers' ordinary from 30s. to 35s., and Siemens Bros. ordinary from 28s. 9d. to 30s. Telegraph securities also show improvement. There is little change in the supply and traction groups.

* TRACTION AND GENERAL INVESTMENT TRUST.—Fin. div. 10% on ord. shs., makg. 10% for year, less tax, has been declared.

EASTERN EXTENSION, AUSTRALASIA AND CHINA TELEGRAPH CO., LTD.—Int. on 4% mtge. deb. stk. for half-year to Jan. 31 will be paid on Feb. 1.

ANGLO-AMERICAN TELEGRAPH CO., LTD.—Blce. div. £1 10s. % on ord. consol. stk., less tax, blce div. £1 10s. % on pfd. stk., less tax, and 1st and fin. div. £1 10s. % on defd. stk., less tax, all payable Feb. 1.

ADELAIDE ELECTRIC SUPPLY CO., LTD.—Rev. for year to Aug. 31, 1928, £801 514, increase £36 491. Pft. £411 946, decrease £670. To gen. res. £66 737; fin. div. on ord. shs. 6%, makg. 12%. Fwd. £31 902.

Mr. S. R. Mullard, who has joined the board of Everlite, Ltd.

AMERICAN RADIO-GRAMOPHONE COMBINE.—The directors of the Radio Corporation of America and the Victor Talking Machine Corporation approved on Tuesday the terms of the proposed merger.

MANX ELECTRIC RAILWAY CO., LTD.—Gross receipts for year ended Sept. 30, £42 007, agst. £30 508. Net workg. pft. £12 515, agst. £10 867, plus £878 brt. in. Deductg. deb. int., etc., £9 754, leaves £3 641, wh. is carried fwd.

CONSOLIDATED SIGNAL CO., LTD.—Net income for year ended Sept. 30, 1928, £31 677, agst. £25 363 for previous year. Div. on pref. shs., 6% p.a., less tax at 3s. 9½d. in £, and on ord. shs., 17½%, less tax at 3s. 9½d., agst. 12½%. Fwd. £673, agst. £803 brt. in.

INTERNATIONAL PAPER AND POWER CO. (NEW YORK).—Co. offered last week to common stkhldrs. 1 500 000 shs. of class C common stk. Each two shs. and common stk will carry right to subscribe at $10 p. sh. for one sh. of new issue of class C common stk.

TATA POWER CO.—Pft. for year ended June 30, 1928, Rs. 402 647. To depreciatn. Rs. 322 500; written off prelim. exes. Rs. 75 000. Blce. fwd. Rs. 5 078. During year full capacity of power house, with hydraulic adjuncts, was made available for service, and erectn. of remaing. three generators, with their twin turbines, was completed, makg. five in all.

BARBADOS ELECTRIC SUPPLY CORPORATION, LTD.—Tradg. pft. for year to June 30, 1928, £13 936, agst. £12 835. After provisn. for London gen. exes., deb. and loan int. and res. of £1 500 for taxation, total remaining is £12 212, includg. £2 194 brt. in. To depreciatn. and renewals res. £5 000, set aside for redemptn. of debs. £1 000; to gen. res. £1 374. Div. of 5%, less tax. Fwd. £2 007.

TATA HYDRO-ELECTRIC POWER SUPPLY CO., LTD.—Net pft. for year ended June 30, 1928, Rs. 2 144 592, agst. Rs. 2 543 598, plus Rs. 331 855 brt. in. Div. on ord. shs. at rate of 8% p.a., tax free, makg. 7%, agst. 8%. Fwd., Rs. 562 224. Industrial depression and the taking over by the Tata Power Co. of its own load reduced sales of energy from 131 000 000 kWh to about 114 000 000 kWh.

HASLAM AND NEWTON, LTD.—Statutory rpt. states that number of shs. allotted for cash is 250 000 7½% £1 cum. pref. shs. and 500 000 4s. ord. shs. Allotmt. of 500 000 4s. fully paid ord. shs. has been made, in accordance with prospectus. Total recd. in respect of shs., £335 778, and bank int. recd., £307. Paymts. to Dec. 31 include purchase moneys £265 000, investmts. £15 500, prelim. exes., £23 703, underwritg. commissns. and brokerage, £13 026, and gen. exes, £124. Cash at bank and in hand, £18 423.

EVER READY CO. (GREAT BRITAIN), LTD.—An extraordinary gen. mtg. will take place on Jan. 31 to consider a resolutn. to authorise capitalisatn. of £74 000 of undivided pfts. standing to credit of gen. res. so that it shall be used for paying up 296 000 ord. shs., which shall be distributed as fully paid amongst ord. shhldrs., in proportn. of one such fully paid sh. for every five ord. shs. held. Directors announce that co. has

Digitized by Google

recently acquired substantial int. in a large mfg. business in part similar to that of the Ever Ready Co., but includg. mfre. and sale of numerous classes of goods which that co. does not at present mfre.

BRAZILIAN TRACTION, LIGHT AND POWER CO., LTD.—Directors have announced that in view of arrangemts. for purchase of ord. shs. of City Santos Improvements Co. which will involve an expenditure of approximately 14 000 000 dollars, and also in view of other essentl. cap. outlay required for expansn. of business, it has been decided to make an offer to ord. shhldrs. of additional ord. shs. of no par value on basis of one new sh. for each seven shs. held, at price of 40 dollars p.sh. This should produce approximately 31 000 000 dollars. Holders of pref. shs. may convert their hldgs. into ord. shs., in order to take advantage of right to subscribe. Qtrly. div. 50 cents p. sh. on ord. shs. is announced.

COMPANIES TO BE STRUCK OFF THE REGISTER.—The following companies will be struck off the register of joint stock companies unless cause to the contrary is shown before April 1st: Anode Wireless and Scientific Instruments, Associated Electric Traders, British Radio Sales Co., Electrolite, Holborn Radio Co., Mitchell's Electrical and Wireless, Modern Electrical Supply Co., Re-echo Electrical Mfg. Co., Swift Electrical Co., Tele-Dis Services (Founders Co.), Theatrephone Co., Uni-Directional Apparatus Co., Wireless Installations. The following will be struck off unless cause to the contrary is shown before April 4th: Coventry Wireless Supplies, Electric Lamp Regenerators, Holborn Electric Fire, Jenner Light and Power Co., Maywood Engineering and Electrical Mfg. Co., National Wire Mfg. Co., Prendergast Electrical Engineering Co., R.E.T. Construction Co., Stella Light Co., Sunbeam Light Co.

New Companies.

C. H. ROBERTS AND CO., LTD.—Cap., £2 000. To acquire business of electrical engineers, salesmen and contractors carried on by C. H. Roberts and T. R. Jackson, at 77, High Street, Broadstairs, Kent.

ALLANDS, LTD.—Cap., £2 100. Designers and manufacturers of and dealers in electrical fittings and lighting and wireless apparatus, etc. Reg. office: 7, Duke Street, Manchester Square, London, W.1.

OLIVER ELECTRICAL SUPPLIES CO., LTD.—Cap., £100. Electricians, manufacturers of and dealers in electrical apparatus and appliances, etc. Reg. office: 10, Bolt Court, Fleet Street, London, E.C.4.

LE VERRE ARTISTIQUE, LTD.—Cap., £1 000. Electrical engineers, manufacturer of and dealers in illuminated and coloured glass and electrical fittings, etc. Solicitor: W. H. Lane, 27, Chancery Lane, London, W.C.2.

BURGOYNE WIRELESS, LTD.—Cap., £6 000. To adopt agreement with E. H. Hine and to carry on business of manufacturers of and dealers in wireless sets, etc. Reg. office: 36a, York Road, King's Cross, London, N.

JERUSALEM ELECTRIC AND PUBLIC SERVICE CORPORATION, LTD.—Incorporated in Palestine. British address: 66, Queen Street, London, E.C.4, where T. K. Anderson, C.A., is authorised to accept service of process and notices on behalf of the company.

A. T. M. PENSION TRUST, LTD.—Cap., £100. To undertake and discharge office and duties of trustees of the existing pension fund for the benefit of the staff employees of Automatic Telephone Manufacturing Co., Ltd., and the International Automatic Telephone Co., Ltd. Solicitor: G. M. Magee, 10, Water Street, Liverpool.

TRE-COIL WORKS, LTD.—Cap., £300. To acquire business of electrical engineers now carried on at 5, Archer Street Works, Shaftesbury Avenue, W., by J. Dorn and R. Lurion, and the right to use the name of "Tre-Coil"; also to acquire all interest in certain inventions of said J. Dorn relating to manufacture and design of a three-coil cone speaker movement, etc.

PHOS DEVELOPMENT, LTD.—Cap., £4 050. To undertake improvement, development and exploitation of any inventions, patents and secret processes relating to television, to carry on business of importers and manufacturers of, agents for and licencees of television apparatus and electrical and wireless apparatus, etc. Reg. office: 68, Victoria Street, London, S.W.1.

W. M. SYNDICATE, LTD.—Cap., £2 500. To adopt agreement with Capt. M. Trouton for acquiring his interests relating to royalties under an agreement dated March 5th, 1928, and made between him and Wireless Music, Ltd., to carry on business of manufacturers of and dealers in wireless, and other apparatus, etc. Solicitors: Lawrence, Messer and Co., 14, Old Jewry Chambers, London, E.C.2.

A.R.L. SYNDICATE, LTD.—Cap., £3 000. To adopt agreement between A. D. de Castro and Central Trust Co., Ltd., to develop and turn to account patents for improvements to electric lamps, owned by the said A. D. de Castro, to carry on business of electricians, electrical and mechanical engineers, manufacturers, agents or vendors of electric and other lamps, electrical, radio and wireless apparatus, etc. Reg. office: 5, Broad Street Place, London, E.C,

ELECTRICAL TRADE MARKS.

The following information is prepared from the Illustrated Official Journal (Patents by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

493 888.—Class 11. Gas and electric lighting units specially made for therapeutic purposes. Tylors (J.B.4), Ltd., 134, King Street, Hammersmith, London, W.6; manufacturers. August 8th, 1928.

CONOGRAPH.—493 969. Class 8. Sound reproducing instruments. John Denis Thompson Tsalta, Mount Row, Guernsey, Channel Islands; manufacturer. August 10th, 1928.

HERCULITE.—495 206. Class 8. Direction indicators for vehicles, and electrically illuminated advertising and display signs. R. D. Hughes and Son, 46, Sidney Street, Chorlton-on-Medlock, Manchester; sign manufacturers. September 21st, 1928.

Opposition to the Registration of the following Trade Marks can be lodged up to January 26th, 1929.

VERTIGRAPH.—494 474. Class 8. Philosophical instruments, scientific instruments, and apparatus for useful purposes; instruments and apparatus for teaching. Hinz Fabrik Gesellschaft mit beschrankter Haftung (a joint stock company organised under the laws of Germany), Lankwitzerstrasse 16 to 18, Berlin-Mariendorf, Germany; manufacturers. August 27th, 1928. (To be Associated. Sect. 24.)

494 655. Class 8. Philosophical instruments, scientific instruments and apparatus for useful purposes; instruments and apparatus for teaching. Schering-Kahlbaum Aktien-Gesellschaft (a joint stock company organised under the laws of Germany), 170 and 171, Mullerstrasse, Berlin, N.39, Germany; manufacturers. August 31st, 1928. (To be Associated. Sect. 24.)

FULTOGRAPH.—495 269. Class 8. Philosophical instruments, scientific instruments, and apparatus for useful purposes; instruments and apparatus for teaching. Wireless Pictures (1928), Ltd., 11, Bishopsgate, London, E.C.2; manufacturers. September 24th, 1928.

Opposition to the Registration of the following Trade Marks can be lodged up to February 2nd, 1929.

496 887. Class 8. Philosophical instruments, scientific instruments, and apparatus for useful purposes; instruments and apparatus for teaching. Sophus Berendsen (London), Ltd., 10, Philpot Lane, London, E.C.3; metal and general merchants. November 9th, 1928.

NEOLUX.—495 659. Class 13. Chandeliers, lamp shade frames, lamp shade supports, lamp shades, lamp holders, lamp standards, reflectors, and electric lighting fittings, all being goods made of ordinary metal and not included in other classes. Louis Dernier and Hamlyn Ltd., 23, Newman Street, Oxford Street, London, W.1; manufacturers. October 4th, 1928. (By consent.)

Registration of this Trade Mark shall give no right to the exclusive use of the device of an electric lamp.

480 059. Class 13. Electric lamps (ordinary). Martin Fraenkel, Siegmundshof, 5, Berlin, Germany; merchant. May 14th, 1927.

Opposition to the Registration of the following Trade Marks can be lodged up to February 9th, 1929.

COLUMBIA.—User claimed from October 31st, 1914, in respect of arc light carbons; from March 31st, 1915, in respect of projector carbons; from September 30th, 1914, in respect of photographic carbons; from February 28th, 1915, in respect of searchlight carbons; and from November 30th, 1919, in respect of forced carbons.

DULCETTO.—494 353. Class 8. Wireless telephonic apparatus, gramophones, sound reproducing apparatus, and parts and accessories of wireless telephonic apparatus, gramophones, and sound reproducing apparatus. Dulcetto-Polyphon, Ltd., 2 and 3, Newman Street, Oxford Street, London, W.1; manufacturers. August 22nd, 1928. (To be Associated. Sect. 24.)

Rubber—Para fine, 11d.; plantation, 1st latex, 10d.

*** The metal prices are supplied by British Insulated Cables, Ltd., and the rubber prices by W. T. Henley's Telegraph Works Co., Ltd.

LEAD MARKET REPORT.

According to James Forster and Co. a dull and uninteresting lead market has been witnessed this week, prices fluctuating within narrow limits. Highest prices paid were on Monday at £22 3s. 9d. for January and £22 12s. 6d. for April, since when the tone has been slightly easier. New York price remains unchanged at 6.65 cents. Demand from consumers has been extremely quiet this week, a contrast from the activity seen the previous week, and similar conditions appear to prevail on the Continent. Supplies on the other hand, though not excessive, are quite sufficient for current needs.

Closing prices on January 11th were £22 1s. 3d. for January, £22 3s. 9d. for February, £22 6s. 3d. for March, and £22 8s. 9d. for April.

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

ELLIS, Mr. F. L., Wood Lane Electrical Works, Chapel Allerton, Leeds, electrician. £13 10s. 1d. November 15th.

GOTTLIEB, J. L. AND CO., LTD., 15, Cromer Street, Gray's Inn Road, W.C.1, wireless manufacturers. £11 16s. 6d. November 30th.

LEICESTER AND HOLT, 60, Blackburn Road, Haslingden, electrical engineers. £20 0s. 2d. December 5th.

MADDOX, Mr. G. E., 70, Rowson Street, New Brighton, radio engineer. £13 3s. 5d. November 22nd.

PEARCE, Mr. S., J., 91, High Street, Edgware, wireless agent. £13 8s. 7d. October 29th.

RAPINET, Hamilton P. Lotosca, 43, Hebdon Road, Tooting, wireless expert. £20 13s. July 6th.

RICHARDS BROS., Vale Street, Rhyl, electrical engineers. £16 11s. 5d. December 5th, and £15 12s. 1d. December 4th.

ROSE, Mr. W., 8, Sion Street, Radcliffe, wireless dealer. £19 8s. November 28th.

TROWER, Mr. J., 266, Charnwood Street, Leicester, electrical contractor. £11 2s. 4d. November 22nd.

WILLIAMS, Mr. J. S., 60, Bebington Road, New Ferry, wireless dealer. £18 1s. 10d. July 10th.

Receiverships.

ASHLAND ENGINEERS, LTD. A. R. Welchman, C.A., of 9, Old Jewry Chambers, E.C.2, was appointed Receiver and Manager on December 19th, 1928, under powers contained in debentures dated June 30th, 1927.

ATTAIX, LTD.—H. C. Merrett, of 32, Finsbury Square, E.C.2, was appointed Receiver and Manager on December 14th, under powers contained in debenture dated May 16th, 1928.

London Gazette, etc.

Bankruptcy Information.

GOVETT, Charles Kenneth, 179, Albany Road, Cardiff, trading as KENNETH GOVETT AND COMPANY, electrical contractor. Receiving order, January 5th. Debtor's petition.

Notices of Dividends.

HOLMES, Walter Godfrey, 42, Walcot Street, Bath, wireless and electrical engineer. First and final dividend 2s. 11½d. per £, payable, January 21st, Official Receiver's Office, 26, Baldwin Street, Bristol.

WOOD, Norman Hurst, 32, Highway Avenue, Thornton Heath, Surrey, lately 38, St. Charles Square, North Kensington, W.10, electrical engineer. First and final dividend, 1s. 10d. per £, payable, January 25th, Official Receiver's Office, 29, Russell Square, London, W.C.1.

Notice of Intended Dividend.

KELLY, Stanley Sherzell, 59, North Road, Durham, electrical contractor. Last day for receiving proofs, January 26th. Trustee, H. J. Armstrong, 2, Saville Place, Newcastle-upon-Tyne.

Partnerships Dissolved.

KEENE AND HARWOOD (James Alfred KEENE and George William Keene HARWOOD), electrical engineers, 68, Church Road, Barnes, S.W.13. By mutual consent as from December 31st, 1928. Debts received and paid by G. W. K. Harwood, who will continue the business under the style of G. W. K. Harwood.

MAGNUM ELECTRICAL APPLIANCES (Lawrence Arthur GOMMERSALL and Thomas Josiah LATTIMER and Frank Daniel SOARES), electrical engineers and manufacturers, and dealers in electric heating and cooking apparatus, 16, Limes Road, Croydon. By mutual consent as from December 31st, 1927, so far as concerns F. D. Soares, who retires from the firm.

Bankruptcy Proceedings.

WILLS, Thomas Treneman, 17, Britannia Place, Prince Rock, formerly 16, Turret Grove, both Plymouth, Devonshire, wireless apparatus vendor. The public examination in this matter was held recently at the Western Law Courts, Guildhall, Plymouth, when the debtor lodged a statement of affairs showing liabilities of £170, against estimated assets amounting to £21, leaving a deficiency of £149. The debtor stated that he had never had a shop of his own, but had generally worked as a journeyman painter. He commenced trading in 1927, with little money, securing work by personal recommendation. In order to secure work the debtor had had to cut prices, in one case from £34 to £23. He had kept no books of account, and stated that he had insufficient money with which to file his petition until he received a legacy of £20, £13 of which he used to commence proceedings, handing the balance to his mother, he having borrowed money from her. A formal adjournment was agreed to, subject to a balance of £1 being paid in the meantime.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

302 497 A. V. KELLER and B. F. ANCOCK. Low-voltage continuous-current motors. (14/12/27.)
302 502 D. R. DAVIES and METROPOLITAN-VICKERS ELECTRICAL CO., LTD. Electrical switchgear. (22/12/27.)
302 503 M-O VALVE CO., LTD. and J. W. RYDE. Manufacture of cathodes for electric discharge tubes. (23/12/27.)
302 507 J. E. POLLAK. (HERMSDORF-SCHOMBURG-ISOLATOREN GES.). Electrical insulators or the like. (9/1/28.)
283 502 SOC. C. SCHNEIDER ET CIE. Fuses, fuse boxes, or the like. (11/1/27.)
283 931 H. F. PORTER. Magnetic alloys. (20/1/27.)
284 716 W. LEYHAUSEN. Automatic multipolar toggle-lever electric switch. (4/2/27.)
285 020 BRITISH THOMSON-HOUSTON CO., LTD. Shielding systems for electric discharge devices. (8/2/27.)
302 522 SIEMENS BROS. AND CO., LTD. and A. E. FOSTER. Insulated electric conductors. (17/2/28.)
302 523 E. D. FELDMAN. Electric motors. (22/2/28.)
286 268 J. T. WELSH. Electrical switches. (2/3/27.)
286 650 ALLGEMEINE ELEKTRICITATS-GES. Process for the manufacture of cathodes for discharge devices. (7/3/27.)
287 458 ELEKTRO-HEIZ U. WARME GES. Manufacture of electric heating-resistances. (19/3/27.)
302 529 E. F. NORTHRUP. Apparatus for heating rods, tubes and the like by electricity. (21/3/28.)
289 475 BRITISH THOMSON-HOUSTON CO., LTD. Automatic switching systems. (28/4/27.)
302 538 I. INABA. Electric switches. (4/5/28.)
290 665 A. POUCHAIN. Zinc-lead electric accumulators. (19/5/27.)
291 011 AKT.-GES. BROWN, BOVERI ET CIE. Pressure-applying devices for two or more concentric transformer windings. (23/5/27.)
302 550 C. G. NOBBS and W. W. NOBBS. Electric heating-apparatus. (7/6/28.)
302 551 W. J. UNDERWOOD. Arrangement for the electric control of railway points or other traffic-regulating devices which are required to remain in one position until each passing train completely clears them. (11/6/28.)
294 255 INTERNATIONAL GENERAL ELECTRIC CO., INC. Elastic-fluid turbines. (21/7/27.)
294 546 BRITISH THOMSON-HOUSTON CO., LTD. Transmission of pictures. (25/7/27.)
297 113 SIEMENS-SCHUCKERTWERKE AKT.-GES. Vacuum cleaner with two impellers. (16/9/27.)
299 016 TELEFUNKEN GES. FUR DRAHTLOSE TELEGRAPHIE. Direction-finding aerials, for use on aircraft. (19/10/27.)
302 217 ASSOCIATED TELEPHONE AND TELEGRAPH CO. and J. WICKS. Automatic or semi-automatic telephone systems. (9/8/27.)
301 084 SIEMENS-SCHUCKERTWERKE AKT.-GES. Electric current-collecting brushes. (25/11/27.)
272 928 COMPAGNIE INTERNATIONALE DES FREINS AUTOMATIQUES SOC. ANON. Hydro-electric motor. (17/6/26.)
274 514 DR. S. LOEWE. Multiple thermionic valves. (19/7/26.)
302 706 CREED AND CO., LTD., and E. O. SYMONDS. Thermionic amplification of line or cable signal potentials or potentials subject to a slow rate of change. (21/7/27.)
302 622 AUTOMATIC TELEPHONE MANUFACTURING CO., LTD., and P. J. ROBINSON. Electrically-operated traffic warning signal lamps for use at road-traffic control points. (16/8/27.)
302 623 BROOKHIRST SWITCHGEAR, LTD., and J. O. KNOWLES. Electric fuses. (19/8/27.)
302 634 STANDARD TELEPHONES AND CABLES, LTD. (WESTERN ELECTRIC CO., INC.). Radio signalling systems. (19/9/27.)
277 698 W. D. FLETCHER. Generation of electric power. (17/9/26.)
302 638 P. B. HEALEY and TELEPHONE MANUFACTURING CO., LTD. Telephone circuits. (19/9/27.)
302 715 COLLISON'S PRECISION SCREW CO., LTD., and F. E. COLLISON. Electric circuits employing thermionic valves. (21/9/27.)
302 716 AUTOMATIC TELEPHONE MANUFACTURING CO., LTD., and W. O. PASSMORE. Automatic or semi-automatic telephone systems. (21/9/27.)
278 710 SIEMENS-SCHUCKERTWERKE AKT.-GES. Electric gas-purifying plant. (5/10/26.)
302,751 F. C. RUSSELL [trading as RUSSELL, NEWBERY AND CO.], and J. H. BRADBURY. Adjustable and flexible magneto and like shaft couplings. (7/10/27.)
302 754 BROOKHIRST SWITCHGEAR, LTD., and J. O. KNOWLES. Electric switches, fuses, and the like. (14/10/27.)
302 764 T. HOUGH. Electrical gramophone-pickups. (25/10/27.)
302 768 SWITCHGEAR AND COWANS, LTD., and G. H. NEEP. Electric switches and switchgear. (28/10/27.)
302 769 F. S. BLAKEY and A. WILLIAMSON. Electrical terminal plates for electric motors and the like. (28/10/27.)
302 777 B. DUNGLINSON and ELECTROFLO METERS CO., LTD. Recording-instruments. (4/11/27.)
302 784 C. M. E. TROTTER [legal representative of G. H. TROTTER (deceased)]. Electric accumulators. (16/11/27.)
302 793 A. D. RICCIA. Reflector for short Hertzian waves. (1/12/27.)
302 799 BROOKHIRST SWITCHGEAR, LTD., and G. RATTENBURY. Relays, particularly applicable to automatic regulating-apparatus for alternating-currents. (15/12/27.)
302 800 W. H. COX. Devices for discharging static electricity from machinery. (15/12/27.)
302 823 BRITISH MANNESMANN TUBE CO., LTD., and E. S. SMITH. Electric-light standards. (18/1/28.)
284 990 N.V. PHILIPS' GLOEILAMPENFABRIEKEN. Manufacture of bodies from metals having a high melting-point. (7/2/27.)
302 824 BRITISH THOMSON-HOUSTON CO., LTD., C. J. MORTON and T. H. WOODFIELD. Shock-absorbing devices. (26/1/28.)
302 838 H. ANDREWES and DUBILIER CONDENSER CO. (1925), LTD. Pick-up and amplifying devices for use with gramophones and the like. (24/2/28.)
302 840 IGRANIC ELECTRIC CO., LTD. (CUTLER-HAMMER MANUFACTURING CO.). Thermally-actuated electric cut-outs and other thermally-responsive electric elements. (29/2/28.)
286 649 F. HOLWECK. Thermionic valves. (7/3/27.)
291 003 AKT.-GES. BROWN, BOVERI ET CIE. Method of preventing back ignitions in metal-vapour rectifiers having insulated anode sheaths. (13/5/27.)
291 085 SIEMENS-SCHUCKERTWERKE AKT.-GES. Explosion-proof housing for electrical apparatus. (27/5/27.)
302 855 W. J. SCOTT. Electric stop-motion for drawing-boxes for wool, worsted, and like fibres. (4/5/28.)
290 644 ASSOCIATED TELEPHONE AND TELEGRAPH CO. Remote control of electric power substations. (11/10/26.)
291 731 BRITISH THOMSON-HOUSTON CO., LTD. Means for indicating synchronism between alternating electric voltages. (6/6/27.)
292 101 BRITISH THOMSON-HOUSTON CO., LTD. Indicating-instruments. (23/6/27.)
294 885 ASSOCIATED TELEPHONE AND TELEGRAPH CO. Telephone systems. (18/10/26.)
298 205 DR. S. LOEWE. Multiple thermionic valve. (19/7/27.)
273 320 AKT.-GES. BROWN, BOVERI ET CIE. Electric annealing-furnaces of the resistance type. (23/6/26.)

Digitized by Google

303 075 DUNLOP RUBBER CO., LTD., H. WILLSHAW, W. A. DAVIS, and H. SMITH. Electrical time-switch mechanism applicable particularly to moulding and vulcanising apparatus. (22/8/27.)
30 0337 W. S. SMITH and N. W. MCLACHLAN. Thermionic valves. (26/8/27.)
303 039 SPENCER, A. E., WALLER, P. H., AND GENERAL ENGINEERING DEVELOPMENT TRUST, LTD. Electric incandescent lamp holders. (27/8/27.)
303 190 J. R. QUAIN. Illuminated signs. (31/8/27.)
303 078 C. R. BURCH, F. E. BANCROFT, and METROPOLITAN-VICKERS ELECTRICAL CO., LTD. Vacuum distillation. (21/9/27.)
302 960 J. GROSSART. Electric cut-outs. (22/9/27.)
277 988 ASSOCIATED TELEPHONE AND TELEGRAPH CO. Telephone systems. (22/9/26.)
277 990 C. E. BENNETT. Electric current interrupters. (23/9/26.)
302 973 BRITISH THOMSON-HOUSTON CO., LTD., P. H. HARDING, and J. M. GOODALL. Protection of dynamo-electric machines. (23/9/27.)
293 681 RAINBOW LIGHT, INC. Starting and operating luminous electric discharge tubes (9/7/27.)
293 682 RAINBOW LIGHT, INC. Luminous electric discharge tubes of high candle-power. (9/7/27.)

APPLICATIONS FOR PATENTS

December 10th.

36 354 METROPOLITAN-VICKERS ELECTRICAL CO., LTD. Voltage regulators. (9/12/27, U.S.)
36 367 D. G. PETRIE and YOUNG, OSMOND AND YOUNG, LTD. Electric heating units, etc.
36 454 D. G. PETRIE and YOUNG, OSMOND AND YOUNG, LTD. Resistance units and electric heating apparatus.
36 462 O. PRESSLER. Photoelectric cells. (9/12/27, Germany.)
36 470 W. ROW. Electric dimmer switches.
36 374 D. R. SHARMAN. Automatically lighting vehicle lamps, etc.
36 467 SIEMENS AND HALSKE A.G. Telephone installations. (23/6/28, Germany.)
36 424 SUDDEUTSCHE TELEFON-APPARATE KABEL UND DRAHTWERKE A.G. Manufacture of alternating rectifiers. (10/12/27, Germany.)
36 351 C. C. G. TAYLOR. Trolley head for electric vehicles. (14/9/28.)
36 388 A. A. THORNTON (PAILLARD ET CIE). Electrical amplifiers for sound reproducing apparatus.
36 320 C. B. WALKER. Electric power systems.
36 391 WESTINGHOUSE LAMP CO. Manufacture of incandescent lamps. (9/12/27, U.S.)

December 11th.

36 605 J. P. ANNACKER. Electrical fuse bridges.
36 565 BRITISH ELECTRICAL AND ALLIED INDUSTRIES RESEARCH ASSOCIATION, P. D. MORGAN, E. B. WEDMORE and S. WHITEHEAD. Electric cables.
36 601 R. E. H. CARPENTER. Electron discharge amplifying apparatus.
36 599 E. W. CHALLANS, L. H. PETER and WESTINGHOUSE BRAKE AND SAXBY SIGNAL CO., LTD. Apparatus for electric transmission of indications.
36 524 E. S. CLUDERAY. Electric relays.
36 483 F. DUFFY. Tramcars, etc.
36 568 W. H. EGGINTON and J. LUCAS, LTD. Electrically heated cigar lighters, etc.
36 563 ELECTRAD, INC. Electrical resistors. (17/12/27, U.S.)
36 542, 36 543, 36 544 ELECTRICAL RESEARCH PRODUCTS, INC. Television systems. (6/4/27, U.S.)
36 531 GENERAL ELECTRIC CO., LTD., and E. WEINTRAUB. Mercury vapour rectifiers. (21/7/28, France.)
36 574 G. GROENEVELD. Protective switching device.
36 564 HAZELTINE CORPORATION. Wheatstone bridge filter. (20/1/28, U.S.)
36 572 L. A. LEVY and D. W. WEST. Electrical production of visible images.
36 482 L. N. LLOYD. Variable speed electrical transmission gear.
36 557 C. LORENZ AKT.-GES. Electrical transmission of pictures. (28/12/27, Germany.)
36 500 A. H. RICHARDSON. Tuning devices for wireless receiving apparatus.
36 537 F. G. L. SCOTT and A. W. SHARMAN. Apparatus for producing electrical radiation.
36 554 SIEMENS-SCHUCKERTWERKE A.G. Withdrawable oil switch for multiple busbar systems. (1/2/28, Germany.)
36 545 SIEMENS-SCHUCKERTWERKE A.G. Means for regulating flow. (12/12/27 Germany.)
36 475 H. M. SPENCER. Detector unit for wireless receiving set.
36 595 A. E. TELFORD. Transmitting and remote recording systems.
36 562 A. E. WHITE (BASTIAN MORLEY CO.). Electric heating apparatus. (10/10/27.)

December 12th.

36 725 AUTOMATIC TELEPHONE MANUFACTURING CO., LTD., R. TAYLOR and W. SAVILLE. Telephone systems.
36 726 F. A. CAIN. Transformers, etc.
36 728 E. C. DAVIES and GENERAL ELECTRIC CO., LTD. Arrangements for controlling electric motors.
36 615 H. F. DOWLER. Electrodes of batteries.
36 690 EDISON SWAN ELECTRIC CO., LTD., and L. H. SOUNDY. Thermionic valves and circuit arrangements therefor.
36 613 R. R. HOLMES. Electric light fittings.
36 688 INTERNATIONAL GENERAL ELECTRIC CO., INC. Speed controlling means for a.c. motors. (12/12/27 Germany.)
36 680 METROPOLE DEVELOPMENTS LTD., and A. SCHMIDT. Manufacture of light emitting elements for electric lamps.
36 724 METROPOLITAN-VICKERS ELECTRICAL CO., LTD. Electrical control devices. (13/12/27, U.S.)
36 738 J. NEALE. Electrostatic relay.
36 662 J. and J. V. WALKER. Electrical make and break contact.

December 13th.

36 829 C. G. M. BENNETT. Electric lamp holders.
36 752 G. B. BRAITHWAITE and J. W. RIGBY. Miners' electric lamps.
36 865 BRITISH THOMSON-HOUSTON CO., LTD. Electron discharge devices. (14/12/27, U.S.)
36 866 BRITISH THOMSON-HOUSTON CO., LTD. Photoelectric cells. (4/1/28, U.S.)
36 816 W. H. BULL and J. E. SCHEEL. Apparatus for producing high-frequency alternating currents.
36 819 ECONOMIC ELECTRIC, LTD., and C. HOLT. System of winding inductances.
36 820 ECONOMIC ELECTRIC, LTD., and C. HOLT. Connecting radio receivers.
36 821 ECONOMIC ELECTRIC, LTD., and C. HOLT. Constant amplitude oscillator.
36 856 ELEKTRIZITATS A. G. VORM, W. LAHMEYER AND CO. and RHEINISCH WESTFALISCHE SPRENGSTAFF AKT. GES. High tension insulators. (12/1/28, Germany.)
36 829 C. A. ELY. Electric lamp holders.
36 841 J. FELDMAN. Transformers, choking coils, etc.
36 793 GENERAL ELECTRIC CO., LTD., and J. W. RYDE. Electric rectifying apparatus.
36 778 D. JONES. Apparatus for galvanising metallic sheets.
36 750 W. J. LINE. Electric plugs.
36 867 LONDON ELECTRIC WIRE CO., and SMITHS, LTD., and E. L. WILDY. Transformers.
36 883 MASCHINENFABRIK OERLIKON. Electric rectifiers. (16/12/27, Switzerland.)
36 881 J. E. POLLAK (ASSOCIATED TELEPHONE AND TELEGRAPH CO.). Telephone systems.
36 870 H. J. ROUND. Means for recording sound, etc.
36 805 SIEMENS-SCHUCKERTWERKE A. G. Electric switches. (2/2/28, Germany.)
36 871 S. B. SMITH. Signal limiting, amplifying, etc., devices.
36 765 H. M. SPENCER. Low-frequency unit for wireless sets.
36 862 SPRAGUE SPECIALITIES CO. Electrical condensers. (13/12/27, U.S.)
36 861 A. E. WHITE (SPRAGUE SPECIALITIES CO.). Electrical condensers.

December 14th.

36 974, 36 975 AKT. GES. BROWN, BOVERI ET CIE. Insulators. (9/5/28, Germany.)
36 976 AKT. GES. BROWN, BOVERI ET CIE. Insulators. (20/4/28, Germany.)
37 017 AKT. GES. BROWN, BOVERI ET CIE. Strainers for overhead lines of electric railways. (31/12/27, Germany.)
36 888 BRITISH THOMSON-HOUSTON CO., LTD. Temperature responsive inductances. (13/12/27, U.S.)
36 966 BRITISH THOMSON-HOUSTON CO., LTD. Toasters. (14/12/27, U.S.)
36 970 BRITISH THOMSON-HOUSTON CO., LTD. Amplifying apparatus. (24/12/27, U.S.)
36 954 D. A. CHRISTIAN, and SIEMENS BROS AND CO., LTD. Selecting switches for automatic telephone systems.
36 905 J. A. CORRY and H. WOOLDRIDGE. Electric signs.
37 042, 37 043 S. G. S. DICKER (N. V. PHILIPS' GLOEILAMPENFABRIEKEN). Electric pick-ups.
37 053 D. R. FLETCHER. Devices for connection of electric wires, etc., to apparatus.
36 951, 36 953 E. A. FORCEVILLE, E. A. PETITHORY, and SIEMENS BROS. AND CO., LTD. Selecting switches for automatic telephone systems.
36 952 E. A. FORCEVILLE, E. A. PETITHORY, and SIEMENS BROS. AND CO., LTD. Automatic telephone selector banks and selectors.
37 054 R. K. HEARN. Electric oven heater for soldering irons.
37 052 H. M. JONES. Tubular joints and bearings for electric lamps, etc.
36 977 T. KENDALL. Sound reproducing apparatus for wireless receiving apparatus.
37 010 KERSONS MANUFACTURING CO., LTD., and C. W. PARSONS. Electric fuses.
36 895 J. F. J. MALONE. Transformers.
37 050 R. S. MILLER, and OLDHAM AND SONS, LTD. Apparatus for charging galvanic batteries, etc.
37 034 TELEFUNKEN GES. FÜR DRAHTLOSE TELEGRAPHIE. Piezo-electric devices. (17/12/27, Germany.)
37 035 TELEFUNKEN GES. FÜR DRAHTLOSE TELEGRAPHIE. Manufacture of dielectrics. (21/12/27, Germany.)
37 005 F. E. WOOLNOUGH. Radiant heat baths.

December 15th.

37 147 BRITISH THOMSON-HOUSTON CO., LTD. Radio signalling apparatus. (22/12/27 U.S.)
37 151 W. P. DIGBY and R. B. FAIRTHORNE. Cooling transformers.
37 117 O. FULTON, G. PRIECHENFRIED, and WIRELESS PICTURES (1928), LTD. Apparatus for electrical reception of pictures.
37 118 INSTITUT FÜR PHYSIKALISCHE GRUNDLAGEN DER MEDIZIN. Charging and discharging electric condensers. (17/12/27, Germany.)
37 149 A. JOFFÉ. Manufacture of electric insulations, etc. (20/12/27, Germany.)
37 132 L. N. MILLS. Electrical sheathings or casings.
37 079 V. C. J. SAMPSON. Sound amplifier for telephones, etc.
37 137 M. SORO (NÉE LAVATELLI). Electric switches.
37 128 H. A. SUTTON. Microphonic devices for wireless transmission, etc.
37 150 TELEFONAKTIEBOLAGET, L. M. ERICSSON. Generation of harmonic oscillations. (17/12/27, Germany.)

December 17th.

37 261 ALLGEMEINE ELEKTRICITATS GES. Compressed gas switch. (15/12/27 Germany.)
37 241 A. E. ANGOLD, GENERAL ELECTRIC CO., LTD. Arc lamps.
37 309 P. G. ARGUELLES. Safety device for lamp bulbs.
37 187 R. BOSCH AKT.-GES. Electric switches (17/12/27, Germany.)
37 246 BRITISH THOMSON-HOUSTON CO., LTD. Electric condensers. (21/12/27, U.S.)
37 247 BRITISH THOMSON-HOUSTON CO., LTD. Electron discharge devices. (22/12/27, U.S.)

COMING EVENTS.

Friday, January 18th.

ELECTRICAL DEVELOPMENT ASSOCIATION.—Royal Society of Arts, John Street, Adelphi, London. Conference on "Electric Heating and Cooking Developments." Speaker, Mr. C. H. Rayner. 7.30 *p.m.*

Saturday, January 19th.

ASSOCIATION OF MINING ELECTRICAL ENGINEERS (SOUTH WALES BRANCH).—South Wales Institute of Engineers, Park Place, Cardiff. Paper by Mr. F. E. Pring on "Coal Cutting Machines in Low Seams." 6 *p.m.*

Monday, January 21st.

INSTITUTION OF ELECTRICAL ENGINEERS (LONDON STUDENTS' SECTION.)—Institution of Mechanical Engineers, Storey's Gate, Westminster. Paper by Mr. H. R. Sketch on "Engineering Insurance." 7 *p.m.*

INSTITUTION OF ELECTRICAL ENGINEERS (SOUTH MIDLAND CENTRE).—University Edmund Street, Birmingham. Lecture on "Wireless," by Capt. P. P. Eckersley. 7 *p.m.*

CROYDON WIRELESS AND PHYSICAL SOCIETY.—5, Altyre Road, East Croydon. Demonstration and description of the "Construction of Moving-coil Loud Speakers." 8 *p.m.*

Tuesday, January 22nd.

ELECTRICAL CONTRACTORS' ASSOCIATION (CHESTERFIELD SUB-BRANCH).—Falcon Café. Ordinary meeting.

ELECTRICAL CONTRACTORS' ASSOCIATION.—Savoy Hotel, Strand, London. Annual Dinner. 6.30 for 7 *p.m.*

INSTITUTION OF ELECTRICAL ENGINEERS (NORTH-WESTERN CENTRE).—Engineers' Club, 17, Albert Square, Manchester. General discussion on "The Anticipation of Demand, and the Economic Selection, Provision and Layout of Plant," with introductory papers by Capt. J. M. Donaldson (Power Systems), and Mr. J. G. Hines (Telephone Systems). 7 *p.m.*

ILLUMINATING ENGINEERING SOCIETY.—Lecture Theatre of the Home Office Industrial Museum, Horseferry Road, Westminster. Paper by Dr. L. C. Martin on "Colour and its Applications." 7 *p.m.*

Wednesday, January 23rd.

ELECTRICAL ASSOCIATION FOR WOMEN.—Visit to the newly equipped showrooms of Messrs. Troughton and Young, Ltd., 143, Knightsbridge, S.W. Short lecture by Mr. A. B. Read on "Modern Decorative Lighting of Interiors."

INSTITUTION OF ELECTRICAL ENGINEERS (NORTH-WESTERN CENTRE).—Midland Hotel, Manchester. Annual Dinner. 6.45 for 7.15 *p.m.*

Thursday, January 24th.

INSTITUTION OF ELECTRICAL ENGINEERS.—Institution, Savoy Place, Victoria Embankment, London. Paper by Messrs. Johnstone Wright and C. W. Marshall on "The Construction of the Grid Transmission System in Great Britain." 6 *p.m.*

Friday, January 25th.

ENGINEERING AND SCIENTIFIC CLUB (WOLVERHAMPTON).—Debate on "Trams *versus* 'Buses." Opened by Mr. A. C. Baker and Mr. C. Owen Silvers.

INSTITUTION OF ELECTRICAL ENGINEERS (IRISH CENTRE).—Gaiety Theatre, Dublin. Faraday Lecture by Mr. Ll. B. Atkinson on "How Electricity Does Things." 4 *p.m.*

PHYSICAL SOCIETY.—Imperial College of Science, Imperial Institute Road, South Kensington. Papers by Prof. G. Vernon Boys on a "Fused Quartz Pendulum Rod for Clocks"; Mr. G. W. Sutton on "A Method for the Determination of the Equivalent Resistance of Air-Condensers at High Frequencies"; and Mr. L. Hartshorn on "The Measurement of the Anode Circuit Impedances and Mutual Conductances of Thermionic Valves." 5 *p.m.*

BIRMINGHAM ELECTRIC CLUB.—Grand Hotel, Colmore Row, Birmingham. Presidential Address. 7 *p.m.*

Overhead Lines and Rural Electricity.

OUR experiment a year ago in producing a special issue mainly devoted to overhead line transmission and distribution met with such wide and immediate approval that a considerably augmented edition was sold out within a few hours of publication. The present issue, planned on somewhat similar but even wider lines, describes and illustrates the developments made since that time, and supplies a good deal of information which should prove useful in future construction work. In addition to overhead lines this issue deals with various aspects of rural electrification which are the natural corollary of the extensive transmission and distribution schemes that are now in progress. Although it is manifestly impossible to cover every aspect of overhead line work in a single issue, every effort has been made to provide the maximum of information in the space available. The whole subject is one of such topical interest and importance that instead of forgetting all about it until the publication of our next Overhead Lines Number in January, 1930, arrangements have been made to devote space to it throughout the year, normally in the fourth issue of each month.

The Mid-East England Scheme.

STILL another electricity scheme has been submitted to the Central Board by the Commissioners, the area covered representing something like 7 545 square miles, including e East and West Ridings of Yorkshire, parts of the North Riding, Lincolnshire, Rutland and parts of Derbyshire and Nottinghamshire. The area embraces such industries as coal, iron and steel, engineering and textile, as well as large tracts of agricultural territory. The area is now served in part by 3 authorised undertakers, operating some 40 generating stations, and it is suggested that 18 of these stations be "selected" units, while 3 others be classed as "temporary" stations. The Commissioners estimate that with the scheme in operation, the maximum load of 1927–28 will be more than doubled by 1940–41, and, as shown by the details published elsewhere in this issue, the system will well link up with the S.E. England, and N.E. and N.W. England schemes, so as to form one comprehensive system. It is contemplated that the growing load will be dealt with by allocating as far as possible the base load output to the Ferrybridge, Kirkstall, Thornhill, Blackburn Meadows, and Prince of Wales stations, while stations not carrying such loads will meet the peak demands. It is interesting to note that the scheme does not make provision for any new stations, it being the opinion of the Commissioners that the present plant, installed or sanctioned, together with the contemplated extensions, is sufficient to meet the needs of the area up to the year 1940–41. Another interesting point is that, so far as the stations of authorised undertakers are concerned, there is practically no plant of non-standard frequency in the area, and in those cases where distribution is made at frequencies other than 50 cycles, such as bulk supplies from collieries, etc., alteration of such systems is not regarded by the Commissioners as essential to the scheme. In addition to the transmission lines shown on the map on page 111, there are many existing secondary lines which have been or are being constructed by the Yorkshire Electric Power Co., by the Derby and Notts Electric Power Co., and by a number of municipal undertakings, and where these do not give sufficient service it is contemplated that the Board will run further secondary lines as required.

The Financial Position.

OWING to the standard plant and high efficiency of the stations in the area served by the Mid-East England scheme, the capital expenditure is estimated as lower than that associated with the already adopted schemes. The expenditure is put down by the Commissioners as £4 616 750 up to the end of 1935–36, this sum representing £2 907 156 to be spent by the Board on transmission lines and transformer stations, and £1 709 594 by owners of selected stations on extensions. On the basis of individual development by the various undertakers, in the absence of the scheme, it is estimated that in order to make provision by 1935–36 for extensions of plant in existing stations to meet the load in that year and to allow for further growth, owners would be required to make an expenditure of £5 406 584, including the sum arranged for under the present scheme. By that year a proportion of the existing plant in many of the generating stations will, if the scheme is adopted, be available for revenue earning purposes, such plant, amounting in all to something like 80 000 kW, and representing an expenditure of about £1 360 000. Thus, allowing for the non-release of spare plant in the absence of the scheme, it appears that whereas the system of interconnection for the area under discussion could be affected by a capital expenditure up to 1935–36 of £2 907 156 under the scheme, an investment of £5 056 990 would be required under the existing system; the latter sum being made up of the preceding items of £5 406 584 for extensions under individual development, less the £1 709 594 spent under the scheme, plus £1 360 000 for spare plant released for revenue earning purposes. The publication of this

Digitized by Google

scheme and, we hope, its early adoption by the Board, is a good start for the New Year, representing as it does further contracts to be competed for, and further orders to be completed. As an indication of the magnitude of the scheme it may be understood that the main transmission system alone comprises 324 route miles of line, involving 11 transformer stations.

Salesmanship.

IT was well that Col. VIGNOLES found occasion, at last Friday's E.D.A. Conference in London, to remind an unusually large audience that the series of discussions which the E.D.A. organises during the winter season was originally established in order to encourage development of the art of salesmanship in the industry. On many recent occasions interesting subjects have been introduced under excellent sponsors, and have been discussed, at times with considerable enthusiasm, from various points of view. We have been able to listen with the requisite degrees of sympathy or admiration to the relation of the troubles or the triumphs of numerous worthy members of the industry in their own particular jobs. We have listened, stirred by memories of the past, or with half-credulous amusement, according to our age, to reminiscences of the early days of the industry and of the apparatus which it then produced. We have discussed electricity tariffs with an enthusiasm worthy of an I.M.E.A. Convention, and many other very interesting and important matters, each with requisite zest. But so far have we strayed from the original idea of "Salesmanship Conferences" that when somebody does stand up and say something about salesmanship his remarks seem somehow out of place. If we were past masters of the art this attitude would be understandable. Actually, it must regretfully be acknowledged that our sales methods in most branches of the industry are very little less haphazard than they were when the exploitation of electricity really was "in its infancy." It is pleasant, in reminiscent vein in the club, to talk of the old "sausage" radiators, reciprocating sets and such like, but as subjects for a salesmanship course of an Electrical *Development* Association they are rather lacking in inspirational point. In the past electricity and certain types of electrical apparatus have practically sold themselves. While we are fortunately far from saturation point, stronger sales resistance must be expected as time goes on and the more obvious outlets for energy and appliances are utilised. We should therefore be ready with plans to cope with the changing conditions. The sooner we get seriously to grips with the specialised business of selling the sooner will the work of our designers and manufacturers come to full maturity.

The Inferiority Complex.

ONE good feature of the last E.D.A. Conference was the bold assault made by one of the speakers upon the inferiority complex which seems to have taken hold of so many electrical people. As he rightly pointed out, the purveyors of a rival commodity can find so little to criticise in electric cookers that they can only tell people that the electrical method is so much slower than theirs. So assiduously has this point been developed that there must be many in our own industry who do not think it necessary to question the truth of this contention. What was true of the electric cooker hotplate of ten, five, or even two years ago is out of date to-day, and though finality in cooker design is hardly within measurable distance, we can at least give to those desiring it the facility of rapid cooking and water heating, in addition to all the other exclusive advantages of the electrical method. Again, too many of us accept too readily the implication that the odorous competitor is almost invariably cheaper than electricity. In scores of cases only the simplest knowledge of mathematics suffices to show that the much-vaunted advantage is either very slight or even non-existent. Years ago we may have had some excuse for deprecating comparisons of this kind, but now we have no occasion to fear the results of such tests. On the two points of speed and price we have undoubtedly lost much valuable business. We shall lose still more if we let this widespread misapprehension go unchallenged.

Contractors and Shoddy Wiring.

ANY attempt to raise the standard of electrical installation work must command the support of all who have at heart the best interests of the electrical industry and of the public. To that extent we heartily sympathise with the remarks of various speakers, including the President, at the E.C.A. annual dinner on Tuesday. We fail to appreciate, however, why, in all these speeches, no solitary reference was made to the work in this very direction which has been, and is being, done by an independent organisation which is surely well known to almost every member of the E.C.A. We refer, of course, to the National Register of Electrical Installation Contractors, which, we feel, has done more to improve electrical installation work in its short life of five years than the E.C.A. has done in twenty years. In saying this it is not our intention or desire to blame the E.C.A. for devoting most of its attention to the trade interests of its members. That, we feel, is its legitimate and main function, and the attention which the Association is now paying to the nefarious activities of the unqualified contractor is to be welcomed. It should be obvious that such interest should be complementary to, and in active co-operation with, the efforts of the National Register, which, by reason of its independence alone, is the most appropriate body to deal with such matters. By working in harmony with this organisation the E.C.A. will stand a much better chance of seeing its ideals put into practical operation. We cannot think that the absence of any reference to the excellent work of this voluntary and public-spirited body was intentional, but it is possible that some people might put that construction upon it.

Fire Designers Wanted.

THE new architectural, furnishing and other art forms which are being evolved in continental Europe, are slowly but surely being transplanted into English soil, and it is fairly safe to predict that within the next decade, so far as architecture and furnishing are concerned, some of these ideas will be incorporated in many houses in this country. On the lighting fittings side, as readers will know, vigorous steps are being taken to develop the new art which, for want of a better name, has been called architectural lighting, in a manner suited to native tastes. So far, however, we have not heard of any corresponding effort in regard to electric heating apparatus. Electric fires to-day are for the most part designed to stand in a fireplace before a chimney which is no longer necessary, and generally made to look as much as possible like the anachronistic heating devices which they replace. But in the new kind of home there will be no yawning chasm to be filled up by imitation fire grates. The heating apparatus will have to be put into housings designed to form, with the lighting, an integral part of the architectural and furnishing scheme. In a restaurant well known to most electrical men are to be seen examples of an attempt to get away from conventional electric heating forms, but there is endless scope for designers to evolve types of fire suited to take their place in the wholly modern all-electric home of the near future.

A Well-deserved Compliment.

To many who saw a complete stranger to the electrical industry take the most important position it had to offer, Sir ANDREW DUNCAN, in the two years during which he has been chairman of the Central Electricity Board, has been a figure of unusual interest. Sufficient time has passed to show quite unmistakably the wisdom of his appointment, and each further step towards the completion of the interconnected national supply network gives rise to renewed wonderment at the smooth and diplomatic way in which its myriad difficulties are overcome. Although Sir ANDREW had distinguished himself long before his alliance with th electrical community it may be presumed that the recommendation of his name for election to the Counc l of Directors of the Bank of England is, in part at least, a compliment to his work during the past two years.

OVERHEAD LINE PROGRESS.

Modifications in Regulations Assist Development—Importance of Low Capital Costs—Growing Popularity of 11 000 V for Distribution—Farm Electrification Possibilities—A Lesson from One of the Dominions.

By THEODORE RICH, M.I.E.E.

IN considering the events of the past year from the point of view of rural electrification, the modifications made in the regulations last April, although they did not go so far as some people would have liked, were in a way a recognition of the fact that the real problem of supply in agricultural districts is that of distribution costs and not power costs as such; that is to say, getting the power from the wholesale supply point, be it local power station or sub-station to the village green, and to the farmer's door. When a line is constructed to transmit thousands of kilowatts with a large prospective annual "traffic," the revenue will be ample to cover capital charges and maintenance. But where a line is constructed for rural supplies, revenue is not so ample, and capital costs must be kept down as low as possible, consistent with safety and durability.

* * *

The reduction in ice loading enables longer spans to be used, which means lower pole costs per mile, and lower annual wayleave charges. To the same end there has been quite a material increase in the use of galvanised stranded steel conductors for h.t. sub-circuit work, and in the use of compound conductors of aluminium and steel. Up to recently, spans of 200 to 300 ft. were very usual, but now 400 to 500 ft. is being adopted under favourable conditions. The use of long spans means stouter posts, and to comply with the regulations, chocks will often be necessary in bad ground. Negotiations regarding wayleaves would be facilitated if the advantages of an electricity supply could be impressed on farmers.

* * *

There is to be noted a distinct upward tendency regarding distribution at high tensions, and it is significant that a large proportion of the new work on hand is being arranged for 11 000 V. It is realised that there is but little to gain and much to lose by the adoption of 2 000 or 3 000 V, unless the average transformer unit is very small indeed, to supply scattered farms or hamlets. If, for example, a transformer of 80 to 120 kVA is installed on a 2 000 V line, money has simply to be thrown away on excessively heavy overhead conductors, whereas at 11 000 V a No. 8 copper will comfortably carry several hundred kVA. The heating load is growing rapidly in towns, and the night storage hot water heating system is also developing. In due course it may spread to the farms; the possibility provides a further reason for keeping the voltage up.

The difference in cost between a line at 3 000 V and one at 11 000 V is small, the spacing is limited by wind sway rather than by voltage, the difference in insulator costs is a small item per mile, and experience abroad shows that once a sufficient demand has sprung up, the difference in cost for fuses, aerial switches and transformers is negligible compared with the much greater capacity thereby attained.

With a higher voltage in rural areas it is possible to make a lot of extensions without bothering about line capacity at all. As the new regulations specially favour low tension lines, there is a temptation to lengthen these to outlying points, rather than to extend the h.t. line; this practice will result in l.t. voltage drop troubles should heating loads develop, although it tends to diminished transformer light load losses.

It is, of course, hardly logical to assume that a h.t. line will have a different ice loading from that of a l.t. line, and a materially different road clearance; if it were not for this a new system now being tried out in Central France would have some attraction. Under this system transformer stations are being put up with double wound transformers with an intermediate step between the h.t. feeding pressure and the 115/200 V l.t. supply. Extension line feeders are insulated for the h.t., and small transformers on 500 or 1 000 V placed in farms or outlying villages. As soon as the load is built up transformers at the normal h.t. voltage replace those at the intermediate voltage.

* * *

During the last few years remarkable progress has been made in New Zealand with regard to electricity supply to farms. This country—as large as Great Britain, but with a population of only one and a half millions—is showing what can be done in spite of apparently severe obstacles in the way of high labour costs and sparse population. Many of the New Zealand farmers enjoy the advantages of a supply of electricity, and altogether they use approximately 8 000 electrically-driven milking machines. Yet it must not be assumed that this progress has been mainly due to the existence of water power, for there, as here, the cost of the power at the terminals of the generator switchboard is only a fraction of the total costs. If such supplies can be given in New Zealand, it ought to be possible to give them here.

PROPOSED FORMULÆ FOR CONDUCTOR SPACINGS.

Important Governing Considerations—Vertical Offset *v.* Horizontal Arrangement—Choice of Conductor Material—Wind Conditions Favour Small Conductor—New Constant Values and an Example.

By WILLIAM T. TAYLOR, M.Inst.C.E., M.I.E.E., Fel.A.I.E.E.

THE most important consideration which governs the spacing of overhead electric power conductors is the necessity for preventing them from making contact or flash-over. The lightweight conductors, more particularly in the longer spans, have a relatively greater tendency for equivalent sag and sagging to swing out of the synchronism than the heavier weight conductors of equal diameter.

It is doubtful whether the vertical offset arrangement of conductors has any advantage in minimum spacing over the horizontal arrangement, due to possible uplift and slack or deformation of the catenary shape of the span from upward gusts of wind or from ice-jumps, and from swing-in of the slack to adjacent spans relatively longer.

Safest Spacing.

The safest absolute minimum horizontal spacing of conductors that can occur is where the conductors are supported from rigid insulators; where sags of conductors in the span are equal; where conductors have the least diameter for the greatest weight; where the spans are uniform and level, and are of moderate length; where spans are located so that upward gusts of winds cannot occur; and where lines are operated so that hazardous ice accumulations cannot occur.

On the other hand, the most dangerous minimum horizontal spacing of conductors is in that line located where the heaviest upward gusts of wind are prevailing; where conductors are arranged in vertical offset at the commonly understood distances apart; where conductors have the least weight for a given diameter, and are supported from suspension insulators; where the spans are long and short and not level; where conductor sags are unequal and relatively greater for the long spans; and, where heavy ice formation is allowed on conductors.

As a general rule, we need only consider the electrical factor as, say, a maximum additional length of 0.5 in. for every 1 000 V between lines, for lines operating at voltages above 22 000. Looking at the subject in a practical way, knowing that a 1 in. spacing is good enough for 10 000 V, very often this constant is ranged as we consider best for the particular formulæ employed. As the regulations fix the loading conditions for all spans, we need only consider: (*a*) choice of conductor material; (*b*) safest location and best uniformity of spans; (*c*) choice of span lengths; (*d*) choice of conductor-insulator supports—rigid or flexible; (*e*) method of dealing with heavy ice accumulation on conductors; (*f*) arrangement of conductors. The factors (*b*), (*c*) and (*d*) are, in one form or another, inter-related with (*a*). All these factors should be considered in the choice of line voltage—hence the reason for adding a flashover factor slightly greater than 1 in. per 10 000 V for the higher voltages and for lines using suspension insulators.

For a given conductivity the conductor material will have much to do with the size required for a given regulation on lines operating at voltages up to any value, but for this purpose let us say up to 66 000 V, because the copper conductor has the smallest diameter and allows of the highest annealing temperature of the conductor from arcs. Metal vapour during an air-spark shows up most intensely for aluminium, and vaporisation occurs in much less time than the most rapidly operating switch can open. Greater separation of conductors is required for the lighter weight conductor, also for the longer span with equivalent tension on conductor, and copper is the most favourable, because, among other advantages, it permits of less torsional stresses on supports and less voltage drop on the higher voltage lines for equal kW transmitted. The use of copper conductor and medium span construction and stringing tension conforming to regulations offer the best and safest line construction. Aluminium and steel-reinforced aluminium conductors are lighter in weight and larger in diameter for equivalent conductivity, and will blow about more than copper, hence are relatively more dangerous; the most dangerous movement is the upward, because of slack and the sudden vibrations and oscillations set up, and unequal stresses on supports, etc.

With a strong steady wind blowing in a transverse horizontal direction across the line, say at the regulation velocity of 50 miles per hour actual (or an equivalent velocity of 83 ft. per second) the time that elapses before the same air impulse acts on the adjacent horizontal conductor is of no practical importance because there is little or no change in the velocity or direction of the air on the conductors in such a short air space that separates them: what there is favours the copper line.

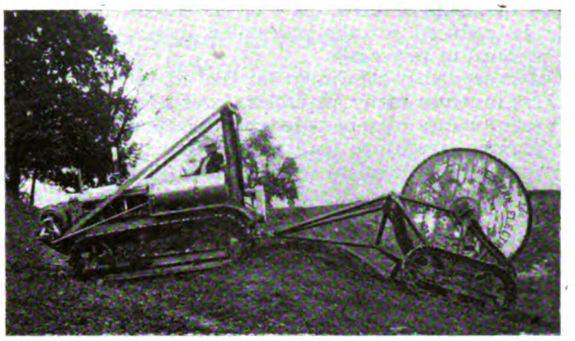
Some Irregularities.

In the horizontal and vertical spacing of conductors we have to cope with irregular and somewhat unknown upward and downward and transverse components; irregular, opposing, and unequal velocities, eddies and gusts of wind; irregular falling off of ice. The horizontal spacing of conductors involves complicated factors such as: for equal conductor weight an increase in sag requires a greater separation; for

EARTH BORING APPARATUS.

EQUIPMENT for the boring of holes for the erection of poles is shown above. To the left is seen the "Highway" earth boring machine mounted on a truck, with winch and pole derrick installed. This equipment finds extensive use in the U.S.A. The other picture illustrates a boring machine in conjunction with a tractor, with a cut-away hole showing the auger in position.

Digitized by Google



CABLE TRANSPORTING EQUIPMENT.

THE transport of cables for use in overhead line construction is sometimes no easy matter. To the left is seen a trailer for hauling cable drums, which is extensively used in America for road transport jobs. A new device to facilitate cross-country work is shown in the other picture, in which a "Holt" caterpillar draws a cable drum mounted on crawlers. We are indebted to the Highway Trailer Co. for permission to reproduce these photos and also those on page 86.

equal conductor weight an increase in sag requires a greater separation for the same or for an increase in span; for a larger diameter of conductor (not weight) the spacing should be greater for equal sag, span and loading per unit length; for less weight of conductor (same or perhaps less diameter) the spacing should be greater for equal sag and span. Apart from the variable factors covering the design, such as wind, weight, diameter, span, sag, we have to deal with irregular upward components of wind, heavier or lighter momentary weights, changing sags, unknown location conditions, uncertain pull-in to other spans. Nevertheless, the copper line is the most favoured.

Best conditions favour the relatively heavier conductor for equal diameter or the relatively more weighted span for equal sag, as well as the relatively better configuration of the ground from upward components of wind *en route*—all of which may be said to favour the copper line.

Any force or condition tending to reduce weight or tension (reducing the tension can be effected by a reduction in weight) for a given span, will require a greater minimum horizontal spacing of conductors. Any line location causing an upward turn of the wind, such as a rising hillside or hollow ground formation, which are the more common in long-span construction, will require a greater minimum spacing of conductors; the wind will have an upward component in the one case, and in the other case there is the possibility of ice falling from one-half (the sloping part) of the span, while remaining on the other half (the bottom and relatively level part) of a hillside span.

Where suspension insulators are used, the conductor slack and deformation of the catenary shape of the span may be partly drawn into the adjacent spans, thus aggravating the danger of flashover between conductors. With long spans which are often located over foothills and across hills, over gulleys and across surface depressions, the lifting of one part and/or the weighting of another part of the same span from the effects of strong winds (relatively more prevailing in such locations) require greater separation of conductors than for medium-span construction, assuming relative sags and equal conductor diameters. As relatively lower tension of conductors is often employed in such locations, still wider separation of conductors becomes necessary—the advantages again favouring copper.

Copper Favoured.

Wind conditions favour the smaller conductor, provided it is relatively heavier, such as copper. The character of the ground and height of supports, etc., favour the medium span, and tend to keep the line low and make the best use of the relatively more favourable ground surface, for which a copper line is well suited. For the higher voltage lines (132 kV) the jumping distance of line voltage is less for a line designed for maximum economy, and again favours the copper line for equal kW transmitted.

The weight of conductor is practically fixed by the choice of material and loading regulations; the diameter is fixed by the electrical requirements and choice of material; and the span length is fixed by the conditions of location, mechanical and economic factors, and the choice of conductor material. Hence, the value of sag must first be calculated when designing, and is therefore known at the start. For any given span, the safe horizontal spacing of conductors depends more on the sag than on any other single group of factors.

Extending the Formula.

Some time ago the writer proposed in his book* a formula for the spacing of conductors based on sag, swing and flash-over voltage. The sag (or tension) involves the span length, the weight and the diameter of conductor. In the main we have to deal with sag, excessive wind gusts and ground surface formations and/or obstacles causing deformation of the catenary shape along the route, flashover distance for worst weather conditions and for the highest operating (perhaps surge) voltage, and a factor for possible pull-in to adjacent span or spans when the weight and tension are thrown off. For horizontal spacing of conductors the swing is directly dependent on the weight, the sag and its difference from uniformity, span length, amount and direction of wind gusts or eddies, and ground configuration. Instead of writing minimum *horizontal* spacing of conductors as given,* we may develop it to show more detail; thus, for bare conductors:

$$S_h = y + g + k \text{ inch or feet } \textit{units}.$$

For ice-coated conductors:

$$S_h = y + d + k \text{ inch or feet } \textit{units}.$$

where:

y = For minimum swing of conductors out of synchronism.
Varying with the weight, diameter and kind of conductor material; span length; location of lines; degree of unequal sagging; flexibility of conductor supports; direction, velocity, irregularity, and length of wind gusts for one or more spans or part of a span length.

d = For deformation of the catenary shape of span or spans, due to the irregular and excessive upward wind gusts.
Varying with the height and arrangement of conductors; length of span; deviation from the regulations loading; size and kind and make-up of conductor material; excessive upward gusts of wind; ground formation *en route*, which includes hollows, hillsides and longitudinal obstacles.

g = For deformation of the catenary shape of span due to irregular ice jump (irregular falling-off of ice) from conductors.
Varying with the length and type of spans (level to steep side hills); size and kind of conductor material; arrangement of conductors; ground surface formation; prevailing excessive air gusts and their direction at certain points of span.

k = For maximum flashover (jumping distance) of voltage.
Varying with the design and kind of conductor material used. The relative equivalent kW load and loss and voltage regulation in the case of higher voltage lines, such that variations occur with the maximum operating line-voltage, the altitude, the climatic and economic conditions, and arrangement of conductors.

As the maximum possible pull-in of conductors into adjacent span or spans can rarely add to d or g, a constant for this value can be (and is) omitted.

From the above formulæ it is evident that the factor y may show a difference at the same time a deformation of the catenary shape occurs, either for ice-jump at one time, or for maximum uplift due to a vertical upward wind gust initiating the release. And, as the upward slack and deformation of the catenary shape occur, part of the conductor may be drawn

* See "Distribution of Electricity by Overhead Lines," p. 61, (Chas. Griffin and Son, London, 1928).

Digitized by Google

into adjacent spans at the same time. For any arrangement and type of insulator used, part of the values d and g can scarcely be reduced for the particular span and conditions, except perhaps in rare cases.

It is thus seen that a formula for the minimum spacing of conductors involves many variables, inter-related and uncertain. A set of values may be prepared for each constant, based on the various conditions mentioned herein. The values y, d and g are largely dependent on respective sag and sagging for the different span lengths, weights and diameters of conductors used.

The minimum *vertical* spacing of conductors also depends on the factors d and g and k. The difference between d and/or g (if any), and that between the vertical sag for maximum ice on the one, and bare conductor conditions on the other, or for bare conductors only, must be accounted for, and the maximum value chosen for design and safety.

For minimum vertical spacing of conductors we may write:

For bare conductors:

$$S_v = S + (S \pm d) + k \text{ inches or feet.}$$

For ice-coated conductors:

$$S_v = S + (S \pm g') + k \text{ inches or feet.}$$

where:

S = For difference between *vertical* sag of bare conductors and *vertical* sag of conductors covered with ice, or for bare conductors only, whichever offers the worst condition.

$d'g'$ = For maximum deformation of catenary shape of span.
Varying with conditions mentioned under d and g respectively, in formulæ S_k.

k = For maximum flashover voltage.
Varying according to the conditions mentioned under k in formulæ S_k.

It will be noted that, for minimum horizontal spacing of conductors, the writer first proposed (in his book) $S_k = y + k$; where $y = y' + g$ (for wind), and $y' + d$ (for ice-jump).

For equal span length and regulation loading, the sag for steel-cored aluminium cable is less than that of copper for the same overall diameter. But this is a poor comparison, because of the relative advantages of copper for maximum kW carrying capacity, etc. However, it is a simple and short way of showing the minimum conductor spacing, because one formula will serve for both conductor materials. As copper is heavier and has other advantages, it is safe to base both copper and steel-cored aluminium on the same spacing for the same overall diameter and regulation loading conditions.

The length of a suspension string of insulators increases with the line voltage. But so do span lengths as well as large-sized conductors. Whether long or short strings are used, the effect can be accounted for by the greater swing and pull-in of conductors as compared with pin insulators. Taken as a general rule, for the lower voltage lines the spans will be shorter, voltage surges lower and pin insulators used, so that constant values for y, d, g, and k can be decreased somewhat for the lower voltage lines.

Constants.	Values for Constants based on sag percentage of span values given in feet.	
	Pin insulators.	Suspension Insulators.
y	1·0 to 4·0	1·0 to 6·0
d	0·5 to 5·0	0·5 to 8·0
g	0·5 to 6·0	0·5 to 10·0

	Voltage.	Maximum Line-Voltage Constant values for k, in feet.
Suspension Insulators	220 000	11·0
	154 000	7·7
	132 000	6·6
	110 000	5·5
	88 000	4·4
	66 000	3·3
Pin Insulators	66 000	2·5
	33 000	1·0
	11 000	0·4

Example.—Lines traversing both level and rugged country, and the span lengths vary so that the range of sags is between 2·0 and 3·5% in the respective normal spans; medium and medium-large sized conductors are used and arranged in vertical offset with two circuits per line support.

Minimum horizontal spacing of conductors from $S_k = y + d + k$
$= y + g + k$

For a 132 kV line =	2·3 + 2·8 + 6·6 = 11·7 feet	Suspension Insulators
	2·3 + 3·5 + 6·6 = 12·5 feet	
For a 110 kV line =	2·2 + 2·8 + 5·5 = 10·5 feet	
	2·2 + 3·4 + 5·5 = 11·1	
For a 66 kV line =	2·0 + 2·7 + 3·3 = 8·0 feet	
	2·0 + 3·3 + 3·3 = 8·6 feet	
For a 66 kV line =	1·8 + 2·3 + 2·5 = 6·3 feet	Pin type Insulators
	1·8 + 2·7 + 2·5 = 7·0 feet	
For a 33 kV line =	1·6 + 2·0 + 1·0 = 4·6 feet	
	1·6 + 2·4 + 1·0 = 5·0 feet	
For a 11 kV Line =	1·0 + 1·6 + 0·4 = 3·0 feet	
	1·0 + 2·0 + 0·4 = 3·4 feet	

BRICK SUB-STATIONS.

A NUMBER of sub-stations of brickwork construction are to be seen in different parts of Great Britain, but their employment is by no means general. As a rule they are connected to the line by end bells and cable.

On the Continent, despite the extra cost, sub-stations of brick or masonry are still popular. The apparatus is under cover, it is accessible in all weathers, and part of the structure can be used as a linesman's store.

It is a usual practice to arrange section links, choking coils, and any fuses in the upper part of the building, with screened connections to the transformer below. In stations of appreciable size oil circuit-breakers are usually installed.

The attractively designed sub-station which we illustrate here is a type of station used for the final step down for a village. The high-tension leads arrive over the door, and the low tension leads can be seen on the right. The low tension lines can be controlled through the hatchway if required. Thanks are due to the Royal Swedish Water Power Board for permission to reproduce this illustration.

RURAL LINES IN NEW ZEALAND.

How the Power Boards Solved a Difficult Problem—Economical Design and Construction in Sparsely Populated Areas—Methods and Materials Employed—Costs of Different Types of Line.

By W. P. GAUVAIN, M.I.E.E., M.I.Mech.E., A.M.I.C.E.

RURAL electrification in New Zealand started on a large scale as the result of the passing of the "Electric Power Boards Act" in 1918. It is true that, prior to that date, a certain amount of country electrification had been carried out, but no definite schemes had been devised for supplying outlying areas, nor did it appear likely that public or private companies would embark on such undertakings.

It is not proposed to deal with the various clauses of this Act; it is only necessary to say that the Act enabled districts to form themselves into Power Board areas with the right to generate their own power or purchase it in bulk from the Government, and to carry out the distribution work. Power was first supplied to consumers, under this Act, in March, 1921, and the progress of the work since that date has been rapid. Distribution lines have been erected in all parts of the country and a supply given to outlying areas where, but a few years ago, it would have been considered impossible, from an economic point of view, to confer the benefits of electricity on the settlers.

The present population of New Zealand is under 1 500 000, whilst the area of the country approximates that of Great Britain. It will be realised, therefore, that the problem which confronted the Power Boards, in their endeavour to give a supply to the settlers in the back-blocks, was no small one. The security for loans raised for this distribution work is a rate, which is struck but not collected, over the areas, and in consequence every owner of property feels that he is entitled to a supply, no matter how far his land may be situated from the main distribution lines. Only by strict economy in design and construction has it been possible to supply light and power at rates which compare favourably with those in other countries, where the population per square mile is greatly in excess of that in New Zealand.

The questions of safety to the general public and to the operating staffs, and continuity of supply, have been the first consideration, and the Public Works Department has altered and added to the Regulations only after full consultation with the authorities concerned, so that every advantage is taken of the experience of engineers operating schemes in all parts of the country under varied climatic conditions.

Bulk Supplies.

In the majority of cases, power is purchased in bulk from the Government stations, at a pressure of 11 000 V, and the sizes of the areas are such that this voltage is usually sufficiently high for the main distribution work. There are certain districts, however, where distribution could not be economically carried out at this voltage from one point only, and in such cases it is customary to receive a supply from two or more points, the Government making a charge of £400 per annum over and above its standard rates, for each extra point of supply.

Fig. 1.—A pole in a village carrying two 11 000 V and one low tension circuits.

VOLTAGES.—The standard voltages for distribution work are 11 000, 6 600, 3 300, and 415/240, the frequency being 50 cycles. The tendency, as the result of experience, is to carry out the main distribution at 11 000 V, and whilst 6 600 is used in some cases—more especially where the main distribution voltage is higher than 11 000—the adoption of 3 300 V is not favoured to any great extent. The Regulations permit of the 415/240 V lines being run on the same poles as the higher voltage lines. Wherever possible this form of construction is adopted, thereby effecting large savings in capital cost.

POLES.—The majority of poles used in the construction of rural lines are of ironbark, or other Australian hardwoods. Steel and reinforced concrete poles are in use to a small extent, but the comparatively high cost of these materials militates against their general adoption for distribution work. The factor of safety allowed is two in the case of iron, steel and reinforced concrete, and four in the case of wood, calculated on the crippling load of the structure. In computing the strength of wooden poles the working stresses allowed, based on heart wood measurement, are as follows for Australian woods:—

Fig. 2.—A single circuit 11 000 V line in New Zealand in course of construction. The pole also carries a low tension circuit.

Ironbark	3 500 lb. per sq. in.
Other approved Australian hardwoods	3 000 lb. per sq. in.

The wind pressure is taken as 30 lb. per sq. ft. of plane surface, and 18 lb. per sq. ft. of diametral plane of a cylindrical surface.

In lines operating at 11 000 V, the minimum clearance between any portion of the line and ground is 20 ft. and consequently, in the majority of cases, poles having a length of 35 ft. have been adopted. This height is sufficient to allow of a double circuit 11 000 V line, with a low pressure line on a crossarm at a distance of 4 ft. below the lower 11 000 V arm. The poles are set 6 ft. in the ground. Fig. 1 shows such a pole erected in a village, and carrying two 11 000 V and one low tension circuits. On the low pressure arm are three phase wires, neutral, and street lighting wires. It will be observed that earthing guards are attached to the high tension crossarms. These consist of hardwood arms (bolted to the crossarms) attached to which are galvanised iron bars with which the lines would come in contact should they break away from the insulators. The ironwork is efficiently earthed at the base of the pole. The service crossarm will be noted at some distance below the low pressure arm.

Typical Pole Construction.

Fig. 3 is a drawing showing the pole construction. In this case it will be seen that on the low tension arm the street lighting wire has been omitted, and two high tension telephone wires take its place. This is the usual country line construction. Owing to shorter spans when passing through towns, it is customary, with the same length of low tension crossarm, to accommodate seven wires, namely, three phases, neutral, two high tension telephone wires, and street lighting wire. In country districts the pole spacing is generally 4 chains (88 yd.), but when passing through towns and villages this is reduced to 2½ chains (55 yd.).

Fig. 2 shows a single circuit 11 000 V country line in course of construction, also carrying a low tension circuit. The

Digitized by Google

pole spacing is 88 yd. It will be seen that the three high tension insulators are on the same crossarm, which is attached to the top of the pole by a galvanised iron U bolt which

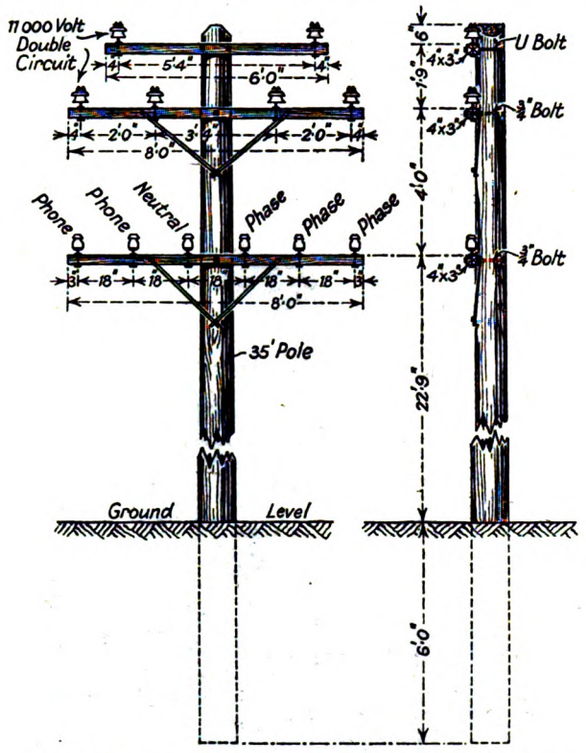

Fig. 3.—A typical New Zealand double circuit 11 000 V pole with low tension (415/240 V) and telephone circuits.

prevents any tendency for the pole top to split. The spacing of the high tension insulators is 2 ft. 8 in.; the crossarm being 6 ft. long and having a section of 4 in. by 3 in.

The sizes of the 35 ft. poles on these lines vary from 11 in. to 12 in. diam. at 6 ft. from the butt, tapering to from 6½ in.

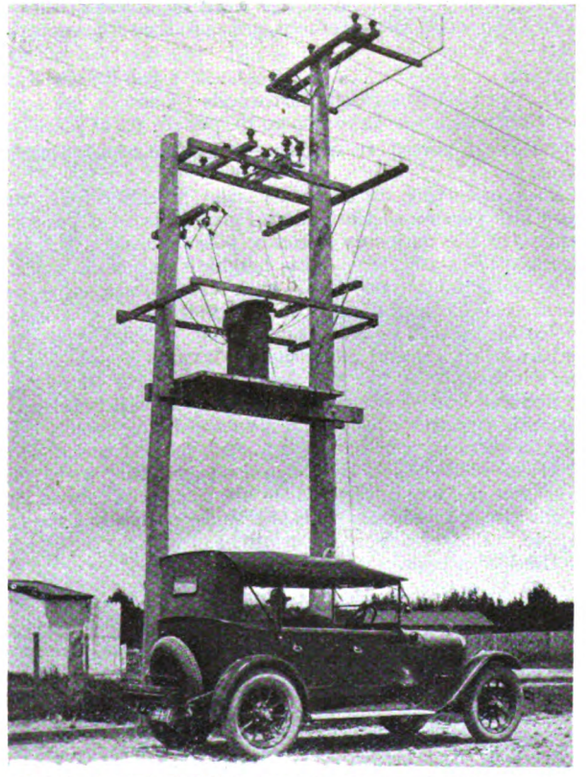

Fig. 4.—A rural sub-station. The pole arrangement provides for the subsequent installation of a larger transformer.

to 7 in. at the top. It is usual to specify the proportion of heart wood which each pole must have. Ironbark is a quick growing timber, and whilst it is very satisfactory for large poles, it is not so good for the smaller sized pole—such as are used for service lines—owing to the fact that small poles of this wood contain too great a percentage of sap. The prices of 35 ft. ironbark poles of the sizes indicated above vary from about 55s. to 60s. each. Preservatives are but rarely used on these poles as there is some doubt whether sufficient penetration can be obtained on these hardwoods, and whether the expense of such treatment is warranted.

For 6 600 and 3 300 V lines, 30 ft. poles tapering from about 10 in. diam. to 6 in. diam. are used, and cost from 42s. to 46s. landed. It is customary to use a similar type of pole for low tension distribution in town districts, but in country areas a 26 ft. pole is often adopted, whilst for service lines, poles having a height of 24 ft., and costing about 30s. each, are largely used. Crossarms are chiefly of Tasmanian tallow wood, and the standard section for main distribution is 4 in. by 3 in., the cost being about 5d. per running foot.

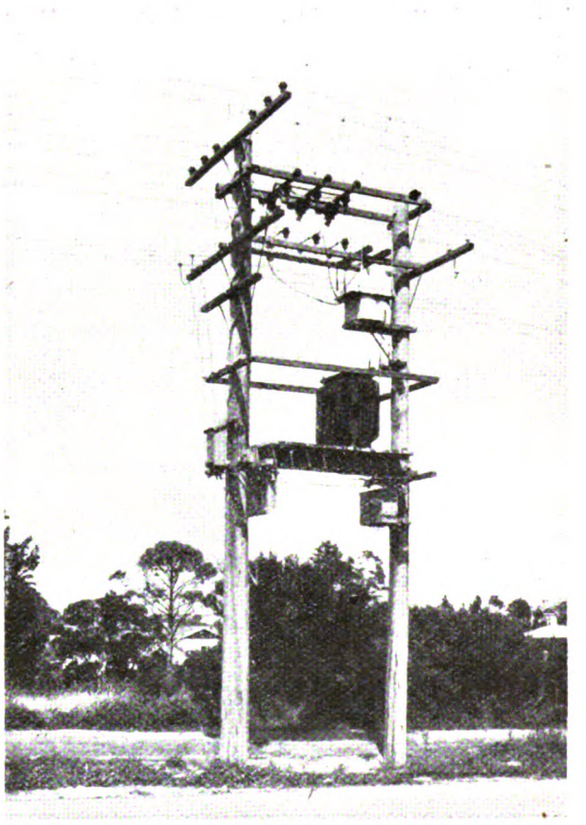

Fig. 5.—A 50 kVA village sub-station in New Zealand. Provision is made for the addition of a further 50 kVA transformer.

WIRES.—Stranded hard drawn copper is chiefly used. Galvanised iron wire and the various forms of copper-covered steel wire are in use to a small extent, usually in cases where the loading is small, and with but little chance of any increase in demand. On lines of 3 300 V and over, where copper is used, stranded wire only is allowed, and the minimum size is 7/·064. On service lines the minimum size allowed is No. 10 S.W.G., and for other low pressure lines, No. 8 S.W.G. The stress in a hard drawn copper conductor, at a minimum temperature of 20 deg. F. and a wind pressure of 18 lb. per sq. ft. of diametral plane in country areas (or 12 lb. per sq. ft. in town areas) must not exceed 25 000 lb. per sq. in. If there is a liability of the lines being subjected to ice loading they must be designed to stand a wind pressure of 8 lb. per sq. ft. of diametral plane with a radial thickness of ½ in. of ice.

All lines operating at 11 000 V and upwards must be bare. In country districts, all lines below this pressure may be bare, but when such lines pass through towns, the low pressure lines must be covered with triple braiding thoroughly impregnated with waterproof compound, whilst lines above low pressure, and up to and including 6 600 V, must be covered with vulcanised rubber of at least 600 megohm grade. It is specifically stated in the Regulations that these coverings must not be deemed to be an insulating covering for making the lines safe to handle when alive.

In perusing the Regulations it will be observed that they afford full protection to the Post and Telegraph, and Railway Departments, without harassing the Power Boards. One

Digitized by Google

side of each road is reserved for the Power Boards and the other for the Post and Telegraph Department.

Fig. 4 is an illustration of a country sub-station. The transformer is 15 kVA 11 000/10 500/10 000 to 415/240 V. On the high tension side can be seen an air break switch (made locally) and high tension fuses, whilst low tension cut-outs are attached to one of the crossarms. The poles are arranged so that a larger transformer can be installed as the load grows.

Fig. 5 shows a 50 kVA sub-station in a village, through which a double circuit 11 000 V line passes. The equipment consists of a double-throw switch (made locally) and oil switch on the high tension side. On the low tension side are fuses and measuring apparatus. The station is arranged to receive a second 50 kVA transformer when the demand warrants its installation.

In the construction of these rural lines the main aim has been to provide reliable distribution at a reasonable cost. Almost the whole of the material necessary for construction has to be imported, and the cost of labour is considerably higher than that in European countries. Even with these handicaps, and taking into consideration the sparsely populated nature of the country, the majority of the Power Boards are in a good financial condition, and are supplying electricity to the country districts at rates which cannot be considered high for rural work. The lighting rate averages about 7d. to 8d. per kWh, although a number of undertakings are giving a supply at a price considerably below these figures. Domestic power rates generally start at 3d. per kWh and go down to 1½d. or 1d. per kWh, whilst water heating is in some cases as low as ¼d. per kWh. The country industries, such as dairy factories, flax mills, etc., receive a supply at varying rates according to their load and time of running, and a number are purchasing power at under 1d. per kWh.

And, now, as to the cost of these rural lines. An 11 000 V single circuit line with 7/·083 copper wire can be constructed for from £250 to £300 per mile, depending to a great extent on the locality. A three-phase four-wire low tension line having 7/·083 phase wires and 7/·064 neutral will cost slightly less. Three-phase four-wire service lines to the farms cost from £160 to £200 per mile. The cost of lines is, however, one item only in a rural electrification scheme, and, apart from the transformers and switchgear, there are also such items as the building and equipping of offices, service depots, and showrooms. For a country scheme to be successful it is essential that efficient service be provided, and money spent on service depots, although increasing the first cost of the scheme is a good investment.

As a matter of interest, figures have been taken out of capital costs of twenty-eight of the New Zealand Power Boards operating in rural areas, and either purchasing power in bulk from the Government, or generating their own power from water. These figures show that approximately £6 000 000 has been spent; the route miles of line erected amount to 9 000 miles or say £660 per mile. It will be realised that some of these are three circuit lines, whilst a very large number will have two circuits. The figure comprises everything in the way of capital expenditure, and includes such items as the expense of the flotation of loans, interest during construction, and administration. A number of these twenty-eight Boards have not yet completed their distribution work, and therefore it is reasonable to anticipate that the cost per route mile will show a reduction as years go on. These figures of costs per route mile, taken as a whole, may be somewhat misleading, unless the particular circumstances are investigated. For example, the costs of one of the Boards per route mile was at the low figure of £333, with a revenue per route mile of £62 or 18·6%. Another Board, with £366 per route mile had a revenue of £40 or 10·9%, whilst a third had a cost per route mile of £1 030 with a revenue of £170 or 16·5%. In the last case it is obvious that much heavier construction was necessary, but the extra revenue received shows that such construction was justified. In all three cases the main schemes have been completed, but a large number of extensions still remain to be carried out.

The latest figures as to the actual mileage of overhead distribution lines in use in New Zealand are not available, but the route mileage of these lines may be taken as approximately 18 000 miles.

INFLUENCE OF ATMOSPHERIC POLLUTION ON PERFORMANCE OF LINE INSULATORS.

A Special Investigation of Troubles Experienced in Britain—Performance of Fouled Insulators—Action of Coal Smoke—The Wind Factor—Points in Insulator Design.

By B. L. GOODLET and J. B. MITFORD.

In certain regions of the world during damp or foggy weather transmission engineers experience considerable annoyance due to the arcing over of insulators on their lines. The extent of the trouble is indicated by the increasing tendency for insulator specifications to contain a fog or mist test. The details of this test are, however, generally left to the imagination, the standard phraseology being that the test shall be made in an "approved manner."

The peculiar climate of our island renders the matter one of considerable importance to British engineers, and, in view of the general lack of information on the subject, even in technical circles, some results of an investigation by the Metropolitan-Vickers Electrical Co. may not be without interest.

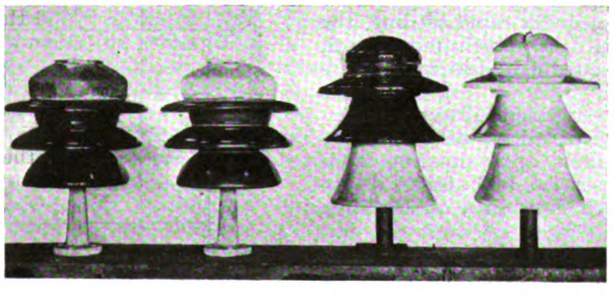

Fig. 1.—Four insulators of the same rated voltage, on which a coal smoke film was built up in a fume chamber.

Operating experience indicates unmistakably that trouble of this kind occurs only in districts where a considerable amount of solid matter in a finely divided state is in suspension in the atmosphere. This "impurity," which, according to circumstances may consist of smoke and soot particles, minute salt crystals, dust from roads and quarries or the product of various industries such as chemical works, blast furnaces or cement kilns, is gradually deposited on to the insulators, forming a film over their surface. In the majority of cases the impurity is of a hygroscopic nature; in every case the spongy and porous structure of the film facilitates the condensation of moisture during damp weather. The consequent increase in surface conductivity leads to a redistribution of stress which may in turn give rise to damaging surface discharges, and—finally, arc overs.

Although apparent only during damp weather, the "fog" trouble, therefore, is primarily due to the presence of a surface film of dirt; if no such film is present the damp alone will have little effect.

As surface films are completely ignored in the various National Insulator Specifications it is not to be expected that the standard tests will enable the performance of an insulator with regard to fouling to be predetermined. Indeed, it must be admitted that our present testing procedure is altogether a little illogical. In service the insulator is seldom clean, the most severe electrical stresses are the impulsive disturbances due to lightning, and the atmospheric conditions vary over a wide range. In the laboratory, insulators are tested after careful cleaning, seldom with impulsive voltages, and under atmospheric conditions which vary only very slightly. The realisation of these facts lead the Metropolitan-Vickers Co. to undertake an extensive investigation into the performance of fouled insulators under various electrical and atmospheric conditions. The results given in this article have been selected mainly to illustrate the phenomena in the case of the 33 and 44 kV systems most prevalent in Britain at the present date.

Digitized by Google

In any attempt to reproduce service conditions in the laboratory, the first essential is to obtain very precise ideas of the phenomena, the effects of which it is desired to study. The investigation accordingly commenced with the examination of operating records and meteorological data. It was

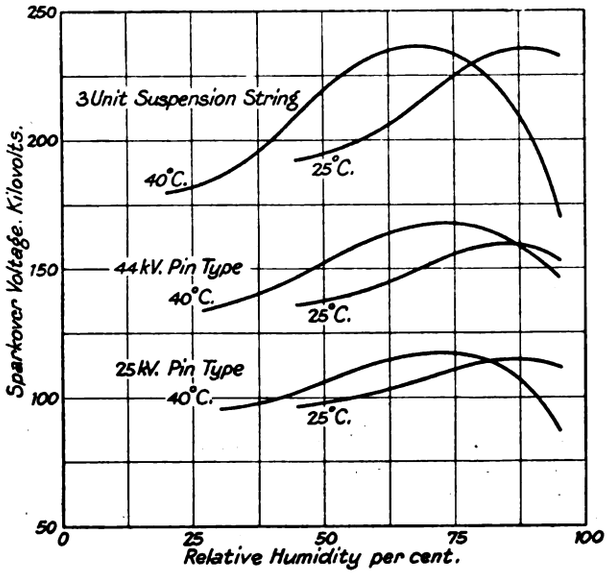

Fig. 2.—Variation of sparkover voltage with humidity and temperature —clean insulators.

found that the majority of insulator troubles of this nature occur on lines running fairly close to the sea shore, the deposit consisting of minute salt crystals formed from the evaporation of sea spray in a dry wind, and carried inland. Meteorological data indicates that such salt crystals are one of the main constituents of the permanent impurity of the atmosphere.

Trouble due to this cause has been experienced on lines as much as thirty miles from the sea coast, although the intensity of the deposit usually diminishes rapidly as the distance from the coast increases.

The second most prevalent source of trouble seems to be fouling by coal smoke. While the reduction in discharge and sparking voltages due to this impurity is admittedly less than in the case of salt, yet the number of lines (at any rate in England) working at some point in a smoke polluted atmosphere, must be very great. As an example of the magnitude of the reduction experienced, we may quote the case of an insulator installed in an industrial district of Manchester, but not in a particularly foul situation. In six months the accumulated desposit was sufficient to reduce its "dry sparkover voltage" (at 70% humidity) from 166 kV to 97 kV, i.e., to 58% of its value when first installed.

In addition to salt and coal smoke, troubles have also been experienced due to ashes from metallurgical works, cement dust, fumes from chemical works, etc., but, owing to the larger size of the particles and consequent rapid settling, the distribution of such impurities is very much more local, and they are, therefore, of correspondingly less importance to the industry as a whole.

The experimental side of the investigation falls very naturally into two distinct parts. First of all we have to study methods of building up surface films approximating sufficiently closely to those formed in service, and also to devise some method of characterising such films in a quantitative manner.

Secondly, we have to investigate the performance of insulators so prepared, under various atmospheric and electrical conditions.

Formation of the Surface Deposits.

The formation of a satisfactory surface deposit is not at all the simple matter which first thoughts might lead one to expect. Such films can only be properly built up by placing the insulator in an atmosphere in which the required impurity is held in suspension, and allowing the deposit to form by precipitation.

In the formation process the size of the particles of the disperse phase, the concentration, the stability and other properties of the aerosol, all play an important part. In particular, the size of the particles requires consideration. A particle suspended in the atmosphere close to the insulator will be acted on by four sets of forces, viz. :—

1. The gravitational attraction varying as the density and cube of the diameter of the particle.
2. The frictional resistance offered by the air to the motion of the particle, varying as its diameter and velocity.*
3. The wind forces varying as the diameter.
4. Electrical forces due to (*a*) the action of the field on the particle, (*b*) ionic bombardment, the magnitude of which depend very little upon the size of the particle.

According to the size of the particles one or other of these sets of forces will predominate and govern the formation of the film. In particular, the electrical forces require most careful consideration.

It is here necessary clearly to distinguish between the phenomena occurring when the insulator is working respectively below and above its discharge voltage. In the first case the forces are merely electrostatic and of comparatively small magnitude; the tendency is for dirt to accumulate on surfaces over which the normal component of the intensity is high. In the second case the forces are much greater, and are due mainly to the electric wind. Electrostatic precipitation as a method of removing impurities from the air is, of course, well known. It is not, however, generally appreciated that this phenomenon occurs equally well wherever an electrical discharge is present.

Conditions During Film Formation.

In the case of insulators, the atmospheric dirt is precipitated on the dielectric surfaces adjacent to the discharge, and, in conjunction with the nitrous products of the latter, forms an extremely stable and adhesive deposit. The necessity for considering the electrical conditions during the formation of the film will be apparent from Fig. 1, which shows four insulators of the same rated voltage on which a coal smoke film was built up at the same time in the same fume chamber. Numbering from left to right, the only difference in the conditions was that insulators 1 and 3 had their rated voltage impressed on them during the formation of the film, while numbers 2 and 4 were left disconnected. It should be noted that insulators 1 and 2 have a brown and not a white glaze.

Another most important factor in the formation of the film is the presence or absence of a side wind. In the latter case the deposit will be distributed uniformly over the insulator and mainly on the upper surfaces of the rain sheds. In the former case, the deposit will be heavier on the side facing the air current, and a considerable amount of matter will be carried under the rain sheds, quite apart from any electrical effects tending to this end.

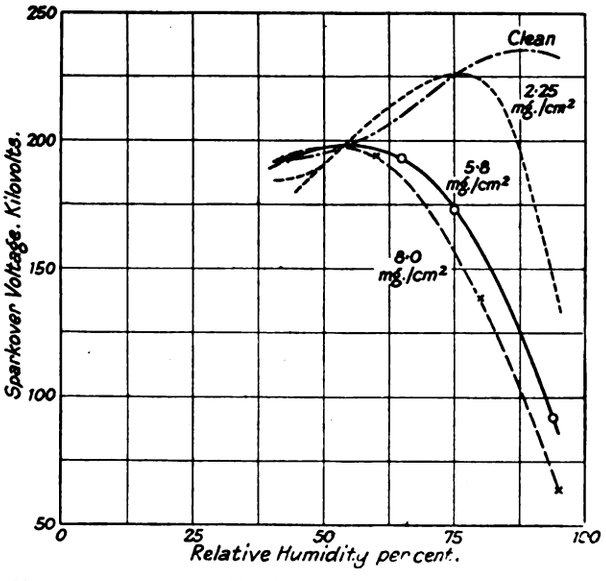

Fig. 3.—Sparkover voltage of 3-unit suspension chain as function of relative humidity and severity of salt deposit. (Temperature 25 deg. C. Barometer 755–767 m.m.)

As the majority of engineers will be interested rather in the results of the investigation than in the experimental methods adopted, the procedure employed in building up the various deposits will not be discussed in detail. It may be noted that the investigations were carried out in a large fume

* The particles in the majority of practical cases are too large to exhibit the Brownian movement; indeed, they are frequently much larger than the mean free spaces of the gas, and consequently follow Stokes law.

Digitized by Google

chamber, the atmospheric conditions in the interior of which could be strictly controlled. In building up the deposit the insulators were mounted in this chamber, and the required suspensoid introduced into the atmosphere by a process appropriate to the impurities in question. Salt fog, for example, can be produced by spraying an aqueous solution of sodium chloride through a high velocity air stream; salt haze is best formed by a spray evaporation process similar to that employed in the preparation of dried milk.

Industrial smoke can be obtained by the combustion of the appropriate grade of fuel, with slight admixtures of other ingredients; the composition of the deposit from a given grade of fuel is, however, liable to vary considerably. This uncertainty may be due partly to variations in the quality of the coal itself, but is mainly dependent upon the degree to which combustion is carried out; with imperfect combustion the size of the particles will be much increased, the deposits will be correspondingly heavier, and the tar content greater. The reports of the Advisory Committee on Atmospheric Pollution were of great assistance in suggesting the composition of deposit to be aimed at.

Comparison of Deposits.

A point which necessitates particular consideration is the time in which the deposits are formed. In service, the building up of a surface film is usually a matter of months, and, sometimes, years. In the laboratory, such periods cannot be employed, and the process has to be accelerated by increasing the concentration of impurity in the atmosphere, so that the required deposit is built up in at most a few days. The question may well be asked if deposits formed in such a manner are comparable in behaviour with those formed by natural processes.

As far as can be seen at present, the distribution of a deposit over the insulator does not depend very greatly upon the concentration of the aerosol from which it was formed; the stability and adhesion of artificial deposits is, however, undoubtedly inferior.

It is, of course, most desirable to have some numerical index of the severity of the deposit which can be correlated with the electrical performance of the insulator. Unfortunately, it is by no means easy to devise a quantitative method of characterising the deposit that will satisfy even the most modest requirements. The electrical performance of the insulator depends upon the peculiarities of the distribution of the film over its surface; the mean thickness of the deposit is connected only remotely with some of the phenomena observed, and even the mean thickness of the film can only be determined with considerable difficulty.

Surface resistance measurements provide no solution of the difficulty, the results being hopelessly erratic, and the only feasible method seems to be the characterisation, not of the deposit itself, but of the aerosol from which it is built up.

The important physical properties of an aerosol are the number and size of the particles of the disperse phase, and its life or stability.

The particles of interest to us in the present connection are too large to exhibit the Brownian motion; their size may accordingly be calculated by Stokes equation from observation of their mean rate of settling in still air under the influence of gravity. Their number in a unit volume can be determined by means of the Aitken dust counter or similar apparatus. These methods of examination, however, find their main application in work connected with the standardisation of the aerosol itself; they are not sufficiently rapid to provide a continuous control on conditions in the fume chamber during the formation of a deposit. Once the spraying and combustion processes are standardised, conditions in the fume chamber can be controlled fairly well by observing the total obscuring power of the fog and the weight of deposit formed in a given time on small exploring plates inserted in the chamber. More refined methods of measurement are, however, being investigated.

* * *

The experimental procedure best calculated to exhibit the effect of surface deposits on the performance of an insulator is to observe the discharge and sparkover voltages as a function of the relative humidity of the air. Curves connecting these variables are first obtained for the clean insulator, and the procedure repeated with surface deposits of gradually increasing thickness until this factor ceases to have a noticeable influence on the results.

The dispersion of the observations in such tests is always quite considerable, and in order to obtain even moderate consistency, tests have to be made simultaneously on a number of identical insulators.

The procedure adopted by the writers was to place the insulators in the fume chamber, build up the deposit and carry out the electrical tests without any further handling whatsoever. With all the precautions taken, however, the magnitude of the dispersion was seldom less than ±5%, while at the higher humidities deviations of as much as ±15% were sometimes observed.

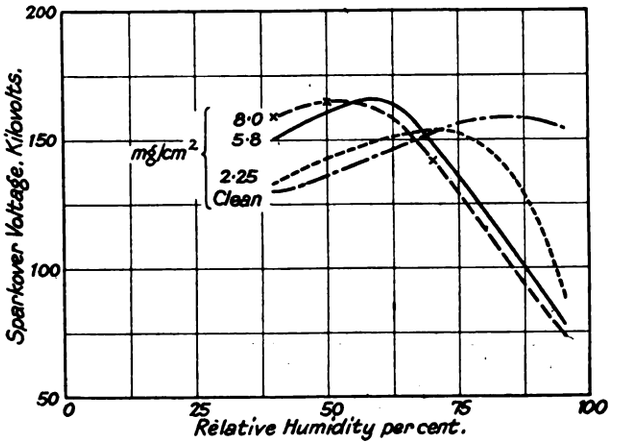

Fig. 4. Sparkover voltage of 44kV pin type insulator as function of relative humidity and severity of salt deposit. (Temp. 25 deg. C., Barometer 756 mm.)

A source of error requiring particular mention is the influence of the time of exposure of a fouled insulator to the humid atmosphere. The sparkover voltage usually continues to decrease for a considerable time after the atmospheric conditions have been stabilised, and due allowance for this fact has to be made.

The curves of Fig. 2 show the sparkover voltage of three different sizes of insulator in the clean condition as a function of the relative humidity and temperature of the air. It will be noticed that with increasing humidity the sparkover voltage first increases, then attains a maximum, and, finally, begins to fall. The reasons for this peculiar shape of the curve are not known with certainty. It may be noted, however, that the sparkover voltage increases with the humidity also in the needle gap, and, in fact, in any spark gap in which a bush discharge precedes sparkover.

Reason for Phenomena.

The reason for this phenomenon is probably associated with the decreased mobility of ions in moist air. The falling portion of the curve is possibly due to the formation of a surface film of moisture by adsorption.

If this suggestion is correct it might be expected that with a surface deposit the falling portion of the curve would start at a lower relative humidity than in the case of the clean insulator, in consequence of the rougher surface of the deposit and the decreased vapour pressure when the substance of the latter is hygroscopic. It will later be seen that this prediction is, in fact, realised. One conclusion which may be drawn from these curves is that the humidity has a much greater influence than the temperature on the sparkover voltage, and the usual assumption that the sparkover voltage varies inversely as the absolute temperature is liable to be misleading.

In Fig. 3 curves are given showing the influence of various intensities of salt deposit on the power frequency sparkover voltage of a three-unit chain of cap and pin type insulators. such as is frequently used on 33 kV lines. The relative intensity of the deposit is expressed by the weight (mg/cm²) of precipitate collected on the exploring plates mentioned above during the period the deposit was being formed. If we assume the nominal dry sparkover voltage of the insulator to be that measured at 25deg. C., and 70 % relative humidity, it will be seen that the combined action of a heavy salt film and damp atmosphere is capable of reducing the actual sparkover voltage to less than 30% of its nominal value.

In Fig. 4 similar curves are given for a pin type insulator of flow line design nominally rated at 44 kV. The general behaviour of this insulator is much the same as that of the suspension chain shown previously, but the absolute magnitude of the reduction is considerably less.

That the use of insulators with a long leakage path is not necessarily a cure for the trouble will be apparent from

Digitized by Google

Fig. 5, which shows the results obtained on two pin type insulators of the same nominal rating, but different design. Curve A refers to an insulator having a leakage path of 32 in., while Curve B was obtained on an insulator with a leakage path of only 23 in. It will be seen that in this particular

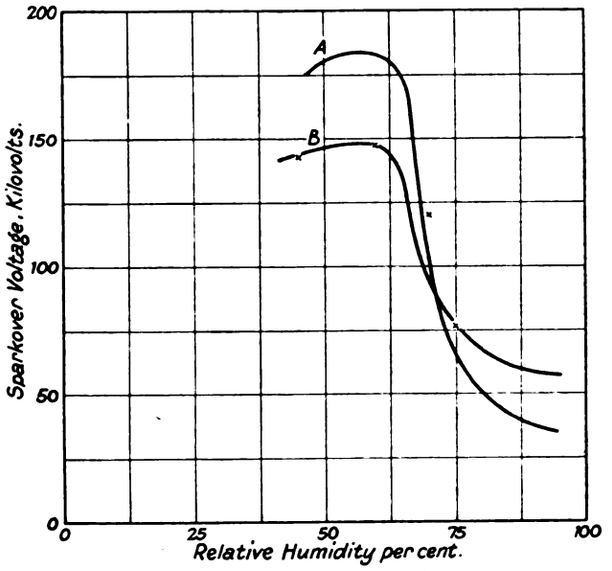

Fig. 5. Variation of sparkover voltage with humidity salt-coated insulators. (7mg/cm². Barometer 755mm.)

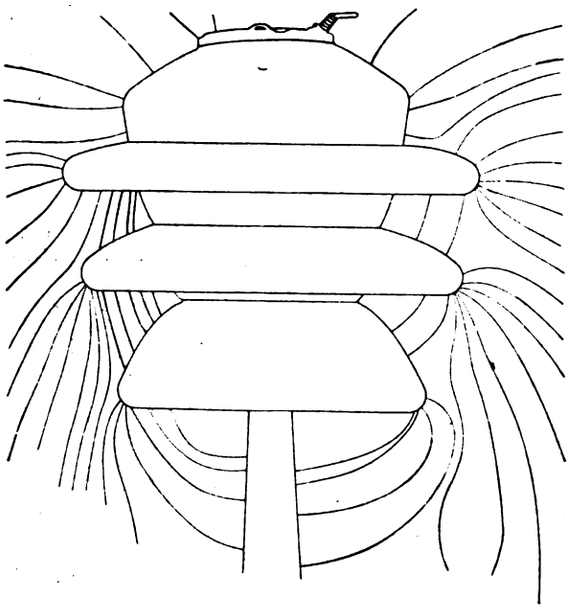
case the insulator with the longest leakage path gives much the poorest performance.

The magnitude of the reduction due to smoke deposits is in general less than that caused by salt, but is still quite sufficient to cause serious annoyance.

Fig. 7 shows some results obtained with the same insulators that furnished the data for Figs. 3 and 4.

The phenomena observed with substances, other than salt and soot, are qualitatively very similar, and need not be discussed in detail here. It may be noted, however, that of all impurities those of a metallic nature, such as fumes from metallurgical works, seem to have the most deleterious effect. Cement dust, however, is also extremely harmful, the sparkover voltage being frequently reduced to 10% or 15% of its nominal value.

It should be noted that the performance of an insulator in the fouled condition cannot be characterised solely on the basis of its sparkover voltage. Usually luminous discharges



CLEAN. **Fig. 6.** FOULED.

are present at very much lower voltages, and, with certain types of insulator, at the higher humidities these discharges assume the form of partial arcs between the sheds, developing considerable heat and noise, but without causing complete arc over. The action of such discharges, if prolonged, is very damaging to the surface and glaze of the insulator, and the useful life of the latter will be considerably reduced.

A point of considerable interest is the fact that the sparkover voltage of a fouled insulator is frequently lower in an atmosphere of 95% relative humidity than in actual rain. This somewhat unexpected effect is particularly noticeable where the surface film is easily soluble, and not of a particularly adhesive nature. In a humid atmosphere the surface film is moistened fairly uniformly. In rain, however, the wetting process is a gradual one ; the upper surfaces of the rain sheds will be streaming in a very few seconds, but a considerable time may elapse before the vertical and under surfaces attain a stable condition. The result is that a considerable portion of the deposit on exposed surfaces gets washed away before the protected surfaces are moistened to any great extent.

Whether such washing would occur to any degree with the more adhesive deposits obtained in actual service may be doubted ; the effect is not apparent, even in the laboratory, with deposits of a greasy and adhesive nature such as are formed from smoke.

It is now necessary to consider how the evil effects of damp and surface deposits can be minimised in service. Since one of the most apparent effects of a surface deposit is a greatly decreased leakage resistance, the solution most generally adopted is to instal insulators having an especially long leakage path, or, in the case of suspension insulators, to add additional units to the chain. This solution is simple, obvious, and has certainly cured the trouble in a good many cases.

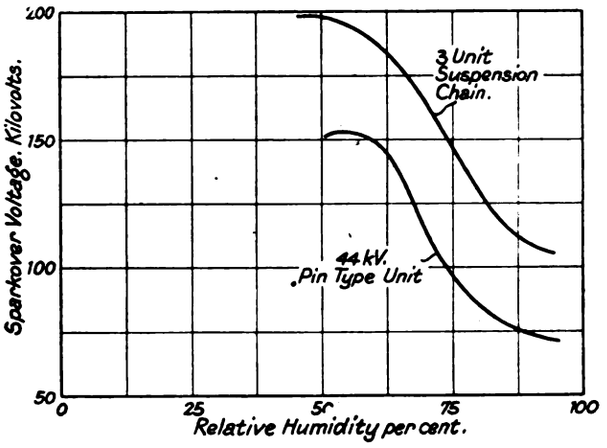


Fig. 7. Sparkover voltage of smoke-fouled insulators as function of relative humidity. (Temp. 25 deg. C., Barometer 769 mm. Average deposit 1·1 mg/cm².)

In the majority of systems, however, fouling troubles occur only in some one particular locality. Installing long leakage path insulators in this locality alone is rather liable to upset the general balance of the system insulation as a whole, since such insulators usually have also a considerably longer arcing path than the normal units. As the impulse and high frequency sparkover voltages are unaltered by rain or fouling, the result will be that the lightning strength of this part of the system will be considerably above the average. This result may be avoided by the use of arcing horns, which are very valuable means of controlling the arc over voltage in various parts of a system.

The sparking voltage of two properly designed arcing horns depends comparatively little upon the atmospheric conditions. Its variation with humidity is not negligible, but is no greater than that of the insulator protected ; a maximum value is usually attained at about 95% relative humidity, in other words, under fog conditions. Rain, however, has very little effect, the decrease being seldom greater than 5%. We may, in fact, regard a horn shunted insulator as a combination of two spark gaps in parallel, one of which is affected by the atmospheric condition, while the other is not. As we wish the arc to pass always between the horns we have to so dimension the insulator that its arc over voltage under the most adverse conditions still exceeds that of the protective horn gap.

The fouling trouble has given rise to a considerable amount of thought among insulator designers, and there are at present on the market several designs for which especially good performance in damp and polluted atmospheres is claimed. The majority of these designs depend for their effectiveness

Digitized by Google

upon the presence of a long and protected leakage line obtained by the use of deep vertical surfaces. In the case of suspension units, the shape of the insulator is reminiscent of a bell; with pin types the leakage path is obtained by several deep vertical ridges on the under sides of the rain sheds. Many of these insulators are quite effective in service, although largely the result of empirical design. A rational criterion on which the probable performance of an insulator in the foul condition may be estimated is provided by the following consideration.

If a moist deposit is formed on the surface of a dielectric under stress, then the tangential component of intensity along that surface tends to vanish to an extent dependent upon the conductivity of the surface film, and in the limit an equi-potential surface is established.

The minimum disturbance of the original field form will, therefore, occur with an insulator where the deposits accumulate mainly on surfaces which are equi-potential surfaces, also in the clean condition.

Fig. 6 shows the field forms determined by experiment on the pin type insulator of Fig. 4, in the clean, and in the foul and damp condition. The vanishing of the tangential component of the intensity is here well illustrated, the majority of the lines of force cutting the fouled surfaces strictly at right angles.

While the above principle is undoubtedly correct, it by no means follows that the ideal so presented is attainable in practice. When the mobility of the particles in suspension is high, and prevailing winds not especially marked, a good deal can undoubtedly be done by designing the insulator so that the electrical forces will themselves tend to precipitate the suspensoid on to surfaces where it will do little harm. Whether any such principles are capable of extended application can, however, only be shown by practical experience.

ACCESSORIES FOR H.T. LINES.

Isolating Links—Aerial Switches—Combined Links and Fuses—Earthing and Earth Plates.

AMONG the accessories useful for overhead line work are isolation links, aerial switches, fuses and isolated aerial oil circuit breakers. At one time horn lightning and other h.t. dischargers were very largely used, but of recent years, in many cases, they have proved to be more bother than they are worth; the surges set up when they operate sometimes causing more disturbance than the shock due to atmospheric disturbance. Where a transformer is of small capacity it is quite practicable, after cutting off the load on the low tension side, to break the transformer current by means of simple isolating links. Fig. 2 shows a set of links on a concrete post line in France. Each link has a ring at the swinging end of the blade, which can be operated by means of a long insulated pole with a hook at the end.

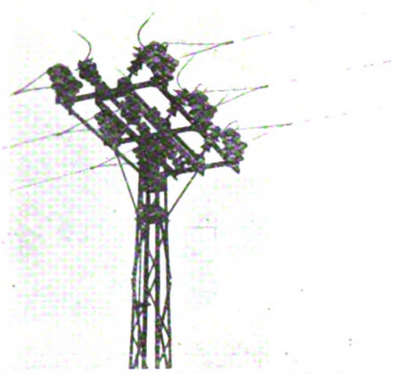

Fig. 1.—An aerial switch of a type which is popular in France.

It is well known that on a heavy short-circuit there is a tendency for a circuit to attempt to enlarge itself, and this may cause a link to open. Some makers therefore fix latch locks to the knife blades. The vertical pattern is in some favour as it can be arranged in the leads coming down to a transformer.

Owing to the difficulty of manipulating a very long insulated hook rod in the wind or rain, especially at night, and to the danger that one of the links might be left alive when repairs are being done, aerial switches have been popular among overhead line engineers. By means of crossbars and linkage, the three blades can be made to open simultaneously, and by means of a quadrant and padlock the switch can be locked in an open or shut position. With the aid of arcing horns quite an appreciable load can be broken.

A type of aerial switch introduced into French Alpine water power districts before the war by Messrs. Maljournal et Bourron of Lyons (now Messrs. Grammont of Paris), can be seen in Fig. 1. It has two sets of movable horns which separate, the movement being very rapid; the horns are faced with anti-arc metal, and the contact is made at the base of the horns. This type can be seen in many parts of France to-day, and many switches made nowadays with rocking contacts on insulators contain features traceable to this type of switch, which has stood the test of time.

Fig. 9 (p. 97) shows an aerial switch made by Ferguson Pailin; Fig. 8 an outdoor sub-station in North Wales at 33 000 V with switchgear made by the same firm. In this case flexible leads supported by hinged arms make connection to the knife blades; an interesting feature of this sub-station is the use of an ammeter directly in the h.t. circuit placed out of reach. It is strange that this simple arrangement is not more often used. Fig. 5 (p. 96) is an aerial switch combined with horn fuses made by Messrs. Johnson and Phillips. As will be seen the switch blades are fitted with horn arcing tips.

Fig. 7 is a switching point on an 8 000 V line at Shoreham. This is arranged with a cable end box and bells, inclined tubular fuses, a bracket guard to earth a conductor should it break, and aerial switches at the top. As will be seen, the terminal insulators are of the suspension type; this gear controls a transformer placed on the ground.

Fig. 6 is an aerial switch on an 11 000 V line in North Wales. This switch is placed one pole away from the fuses and transformer that it controls, an arrangement that is becoming increasingly popular at home and abroad. The usual procedure before approaching the h.t. fuses or transformer is to open the l.t. circuit, break the h.t. circuit at the aerial switch, and then the final span is quite dead and safe to work on. The installations shown in Figs. 6 and 7 were made by Crompton-Parkinson, Ltd.

The horn type aerial switch is usually used to break circuit at low loads. It is often used abroad for undertakings such as small brickworks which buy power at high tension; when such consumers shut down, the h.t. side of the transformer can be cut off and the light load losses on the transformers avoided.

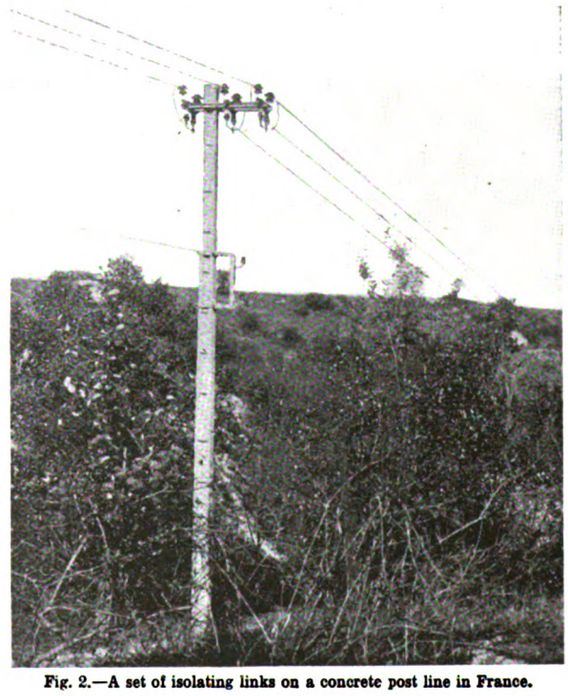

Fig. 2.—A set of isolating links on a concrete post line in France.

E

In urban districts, with ample opportunities of revenue per mile of line, oil switches are, of course, mainly used, especially in connection with underground cables. Where, however, it is of importance to cut down the capital cost to a minimum consistent with safety and durability, as in the case of lines in many rural areas, fuses are indicated in many cases. They have been used for some time abroad, and are becoming more popular at home with the extension of rural electrification.

A favourite type of fuse for many years was a porcelain tube with a silver wire as fuse, the silver being used to diminish oxidation. Recently, to prevent difficulty from the porcelain tube bursting in the case of a very violent short circuit, the greater capacity of modern power stations behind a blow tending to make it more violent, even when toned down by intermediate transformers and reactive aerial lines, bakelite tubes have been used, in some cases with a cap at one end to direct the arc out at the other.

The horn type fuse has been established for a number of years, the blow out being not merely the result of the draught of air due to the heating, but also to the magnetic effect which tends to push the circuit outwards.

Fig. 3 is a type of combined link and fuse developed before the war by Messrs. Maljournal and Bourron, of Lyons, now handled by their successors, Messrs. Grammont, of Paris, and still a favourite appliance, often used for 15 000 V. The fuse is arranged between two terminals supported on insulators on a hinged base, held up into position between the main link contacts, which are also on insulators, by means of a latch with a looped handle. The fuse can either be connected directly between the terminals or wound round a strip of celluloid, with the idea that when the fuse blows the celluloid will ignite, and the fact that it has blown shown from below. As can be seen, arcing horns are fitted.

The advantage of this type is that it acts at the same time as a disconnecting link with safety latch, and is re-fused from below while the fuse contacts are dead. In one area in the North of France, where very sticky fogs are experienced, it is sometimes found that when a fuse breaks gently after a gradual warming up, the heat of the break has not been sufficient to blow the damp celluloid, and trials have been made with a gunpowder cartridge to give a similar result. Some linesmen say they can tell from the ground when a fuse has blown, even if the wire is small.

It is of importance in the case of links, link fuses and aerial switches to take side-strain off the contact terminals, and in most of our illustrations, showing the accessories in place, separate anchoring terminals have been provided.

Fig. 4 is a horn fuse developed by Messrs. Johnson and Phillips. The fuse is carried by a holder made in two halves connected by an insulator, the fuse contacts having bases in the form of conical bells; the horned fuse holder can be lifted off the fixed contacts by means of an insulated rod operated from the ground.

At home on high tension lines, either an earthing conductor or earth plates are used to minimise danger from a broken

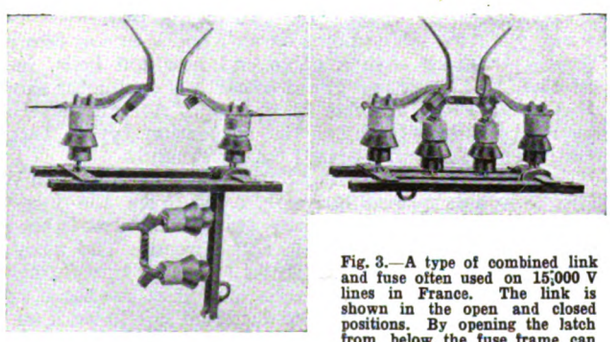

Fig. 3.—A type of combined link and fuse often used on 15,000 V lines in France. The link is shown in the open and closed positions. By opening the latch from below, the fuse frame can be dropped down clear of the h.t. contacts, and a fuse replaced from below in safety.

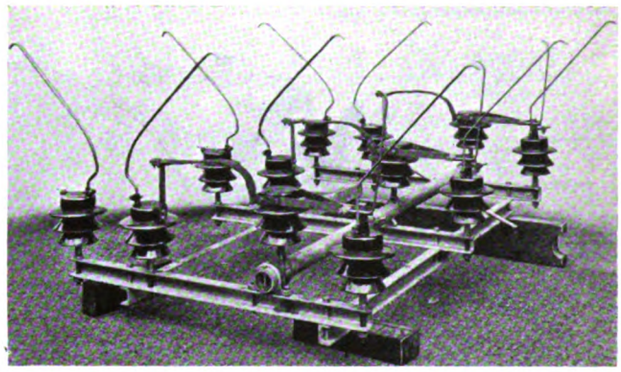

Fig. 5.—A "J. & P." aerial switch combined with horn fuses. The fuse wire is fastened to the base of the horns, and the inner insulators of the switch on the right open round the tubular hinge.

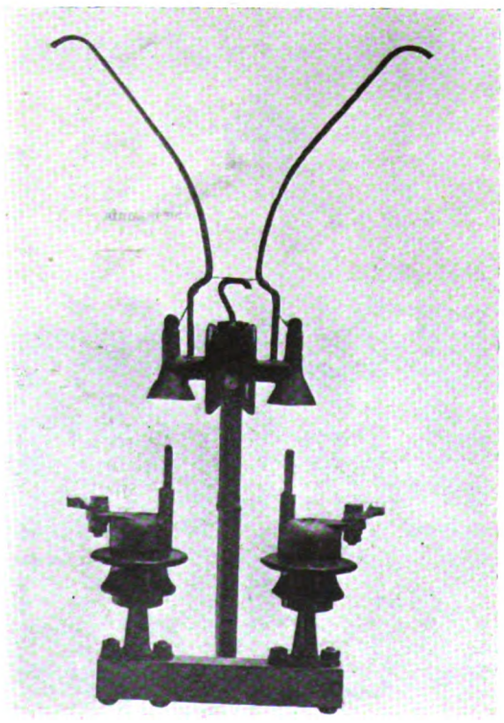

Fig. 4.—A type of horn fuse developed by Messrs. Johnson and Phillips.

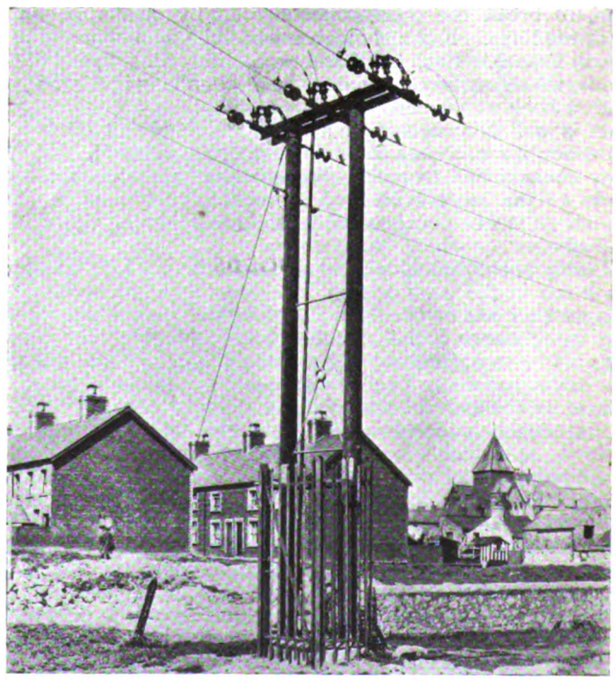

Fig. 6—An aerial switch employed on an 11 000 V line in North Wales.

Digitized by Google

conductor or leakage. The Regulations dated April, 1928, recommend the placing of the earth wire below the others, so that if a conductor falls contact may be made and safety devices operated. There is one objection, and that is that from the point of view of lightning protection the earth wire is best above the main conductors.

For the support of earth wires the Electrical Transmission Company makes a hanging clip. The same undertaking makes a cast iron earthing plate 3 ft. by 2 ft., the earth lead being bound and sweated to a copper bond expanded at each end into holes in the plate. A box is formed by ribs in the top of the plate, and when the earth connection is sweated the box is filled with compound, and covered with a board. Some engineers use an earthing arrangement made with galvanised steel plate which can be placed round the butt of the pole and tightened up by means of flanges and bolts.

From the point of view of safety the more connections there are from an earth wire to earth the better, as the longer the run the greater the drop in voltage along the earth wire itself in the case of a leakage.

In countries where no earthing conductor is insisted on, some accidents have occurred at aerial switch points and other places where accessories are installed through the metal work becoming alive. Where no earth wires are used and good earths are difficult to arrange, insulated platforms are being adopted from which aerial switches can be operated.

Perforated copper tubes and perforated galvanised pipes are much used in the U.S.A. as earth plates. It should not be forgotten that when a bad leak to earth takes place there may be a rapid fall of potential on the ground itself round the leakage point, which may give rise to dangerous voltages at a foot pace interval, even if no conductors are touched at all.

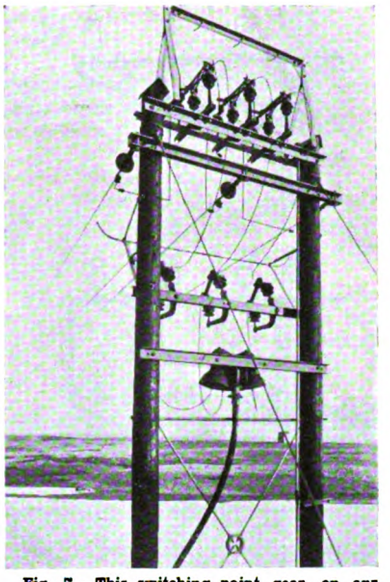

Fig. 7.—This switching point gear on anr 8 000 V line at Shoreham controls a transformer placed on the ground. By opening the horn switch at the top with the aid of gear below, the tubular fuses can be made dead for replacement purposes. The transformer is connected through a short length of cable.

LOW TENSION LINES.

Some Necessary Precautions—Angle Poles and Strain Insulators—Types of House Brackets for L.T. Work.

OWING to the use of 220 to 250 V to neutral with three-phase currents, materially greater precautions must be taken at home than in countries where 110–125 V is customary. The 1928 regulations allow of a minimum height of 19 ft. across a roadway, 17 ft. in other places, and 15 ft. at points inaccessible to vehicles. This means a material reduction in pole heights, and the Electricity Commissioners are also prepared to consider arrangements for the support of low tension mains on the same posts as high tension; the latter are placed at the top with ample clearance so that the low tension can be got at without danger. The new regulations which enable an earthed neutral when placed below other conductors to act as a guard have led to a reduction of the "top hamper" of low tension lines, making them materially safer for linesmen to get at.

It is somewhat of a paradox that, per mile, low tension lines are so often dearer than high tension lines, the reason being that owing to the very much greater amperage per kilowatt the amount of copper in the former is usually high. Where a l.t. line runs along a roadway with houses every few yards, owing to the requirements for taking off services it does not usually pay to have spans as long as those which are possible for mechanical reasons.

The use of outdoor aerials for wireless reception has introduced a new source of danger. It would certainly be an advantage from the point of view of neatness if they could be forbidden in towns. At any rate, their presence makes it objectionable in some cases to put up bare conductors under the eaves of houses; where ownership of blocks of houses or arrangements permit, the supply of a row of houses by means of insulated genuinely weatherproof conductors, such as "Maconite," is desirable from the point of view of safety, and the reduction of the number of tapping points tends to make the overhead work neater.

Fig. 2 (p. 98) shows a l.t. line with three copper conductors, 0·05 sq. in section, with two 0·0145 sq. in. conductors as a

Digitized by Google

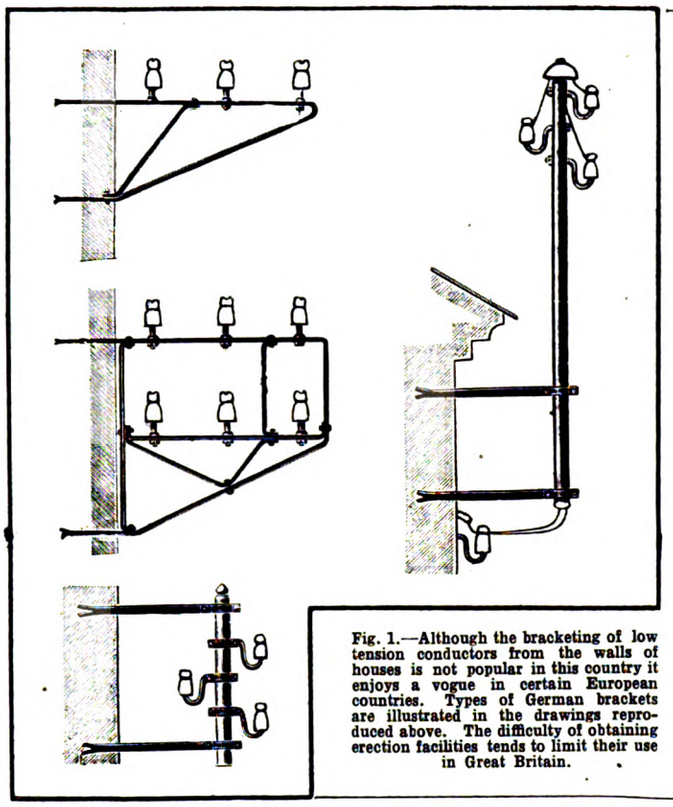

Fig. 1.—Although the bracketing of low tension conductors from the walls of houses is not popular in this country it enjoys a vogue in certain European countries. Types of German brackets are illustrated in the drawings reproduced above. The difficulty of obtaining erection facilities tends to limit their use in Great Britain.

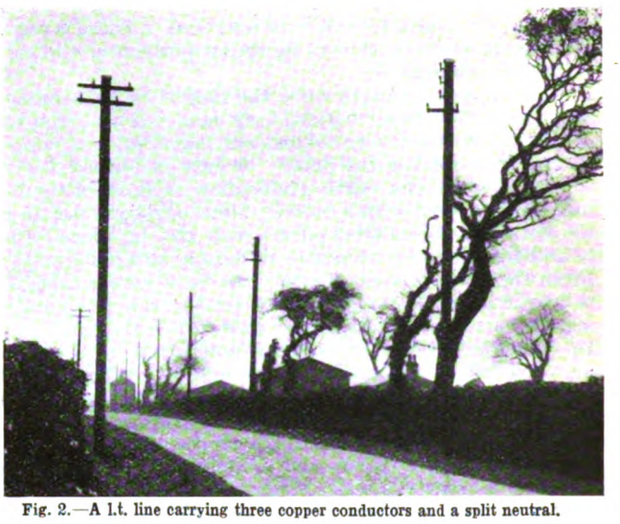

Fig. 2.—A l.t. line carrying three copper conductors and a split neutral.

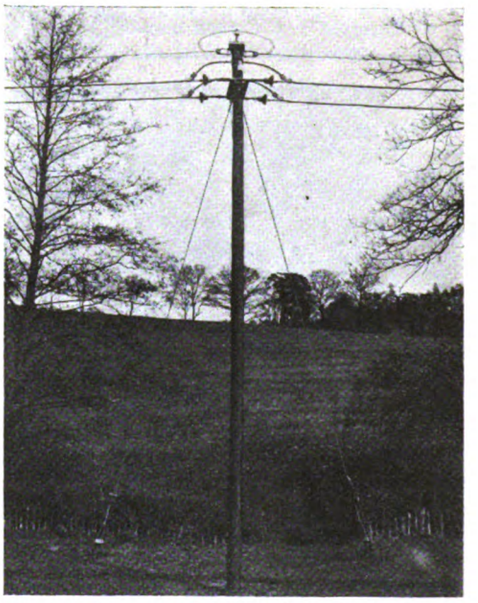

Fig. 3.—Angle pole on l.t. line fitted with strain insulators.

split neutral. A Post Office line is at the opposite side of the road. Fig. 3 is an angle pole on a low tension d.c. line, with 0·5 sq. in. conductors at 480 V for power, and a neutral of 0·05 sq. in. It will be noticed that strain insulators are fitted to this pole.

The spans are 165 ft. maximum and 150 ft. normal. Owing to the very heavy conductor a strong construction has to be used. The two above lines were constructed by Messrs. Johnson and Phillips.

In many towns and villages on the Continent it is very usual to bracket low tension conductors off the walls of houses. In some countries the law gives facilities for so doing, but in some places in England the cost of negotiating for any such arrangements has proved to be more than the facilities are worth to the electricity supply undertaking. The use of 115 V to earth naturally makes it safer to use such a construction. Fig. 1 shows various types of house brackets for l.t. work made by Messrs. Hannemann, of Duren, Germany.

RURAL ELECTRIFICATION IN WESTERN LORRAINE.

Some Interesting Statistics on Recent Developments of Village Supplies—Methods for Encouraging Fuller Utilisation.

MONS. R. PICAUD and Mons. R. Gilliard, inspector-general and chief engineer respectively of the French Department of Rural Engineers, have published some statistical notes on rural electrification in the departments of Meuse, Menthe-et-Mosell and Vosges, published by J. L. Paton, of Troyes.

The particulars relate to 24 rural associations of communes with 554 communes (villages) associated, each having an average of 8·65 sq. km. (3·3 sq. miles). The average density of population is 57 per sq. mile, and the average length of h.t. line per commune 3 005 yds. and l.t. 1 278 yds., so that the villages are fairly closely grouped.

There is an average of 1·1 transformer posts per village, the average capacity being 11·9 kVA per transformer; each station supplies 175 inhabitants. Each village averages 47 consumers, or nearly 1 in 4 of the population.

In the areas examined there were 25 830 consumers. The average capacity in motive power per motor is 2·08 kW; 8·7 motors per village; 31% of the capacity is lighting and 69% power. The capacity in lighting plus power installed per village is 27 kW.

In 1927 the consumption was 4 390 kWh per village and 94 kWh per consumer. The sale price varied between 1·40 and 2·05 frs. (2·8 and 4·1d.) for lighting, and 1·1 to 1·35 frs. (2·2 to 2·7d.) for power. For each 1 000 inhabitants there are 12·4 miles of combined h.t. and l.t. line and 5·75 transformer posts.

The average utilisation factor of the transformers installed is 320 hours per year; the best is 500 hours, and the worst 132 hours. Efforts are being made among agricultural consumers to encourage a successive time table utilisation of the farm motors to improve this factor.

It might be noted that if in the part of France concerned, 230 V had been used instead of 115 V, it would doubtless have been possible to reduce the number of transformers and increase the capacity, but not quite in inverse proportion to the numbers, owing to the improved diversity factor.

Owing to the developments which are taking place at home, the statistics given are distinctly interesting. For the carrying out of village electricity supplies the French Government puts up money on easy terms, the schemes being prepared or supervised by officers of the department of Rural Engineers, to which department thanks are due for the particulars given.

RURAL ELECTRIFICATION AND ITS PRACTICAL POLITICS.

Development of the National "Grid" and the Sequel—Problem of Supplying Outlying Small Towns and Villages—Experience in Sweden and the Netherlands—The Lincolnshire Area Scheme.

By ALFRED EKSTROEM, D.Sc. M.I.E.E.

PUBLIC services such as electricity for light and power, gas (and later electricity) for cooking and heating, coupled with convenience of running water, have during many years been considered as privileges for the inhabitants of the cities and bigger towns. They are also among the important reasons for the increasing movement of the population from the countryside to the cities.

The energy and enterprise displayed by the electrical engineering profession in bringing the electric power production and distribution in the cities and towns of Great Britain up to its present very high standard, deserves "honorable mention." The power-stations of the larger British cities, by the incorporation of modern labour and fuel saving devices, have been developed in a really astonishing manner. In fact, to such an extent as to compare approximately with the cost of energy transmitted from the average hydro-electric plants in Sweden.

The growing use of electricity for light and power has given rise to many difficulties in the design of the distribution system, but cable engineers have risen to the need, and have been able to overcome the most difficult problems arising from the demand for higher tensions for the underground transmission mains.

The bigger the population of the city or town, and the wealthier its inhabitants, the faster is the increasing consumption of electricity, and also the easier for an enterprising local electricity supply undertaking to procure the necessary capital for a highly efficient plant.

Rural Supply as By-Product.

It might be considered quite natural that under these conditions the electrification of the smaller towns, and especially the country-side, was of little interest for electricity supply engineers. It was a problem which was only occasionally tackled, when a transmission-line for a town or some large industry happened to pass, and the costs of the tapping were reasonable; i.e., such a rural supply was only treated as a by-product. Even to-day, the idea of the majority of English electricity supply engineers seems to be that electrification of the country-side can only be carried out where it is economically justified through the supply *en route* to larger towns and industries.

The remarkable qualities which electricity possesses, not only as a comfortable and efficient source of light, as well as

Fig. 1.—Winch Controlling hoisting tackle for barns. Energy is supplied by a 5 h.p. motor.

for domestic and other power applications, but also for more specialised heating and cooking purposes have, however, made an electricity supply an essential social utility of pre-eminent importance for modern conditions of life, even in the country. Hence, with the development of electric power transmission at high voltages, the problem of providing the population of the country-side with all the facilities which electricity affords in the daily life of the city has grown acute.

Rural electrification has accordingly passed the stage of being occasionally considered for a very few convenient situations, to a problem which must be faced for very much larger districts, and ultimately, in its last stage, as a supply to the nation as a whole.

In this respect, the National Grid System of the Central Electricity Board now under development in Great Britain, will, if successfully carried out, be of pioneer importance in the history of electric power supply all over the world.

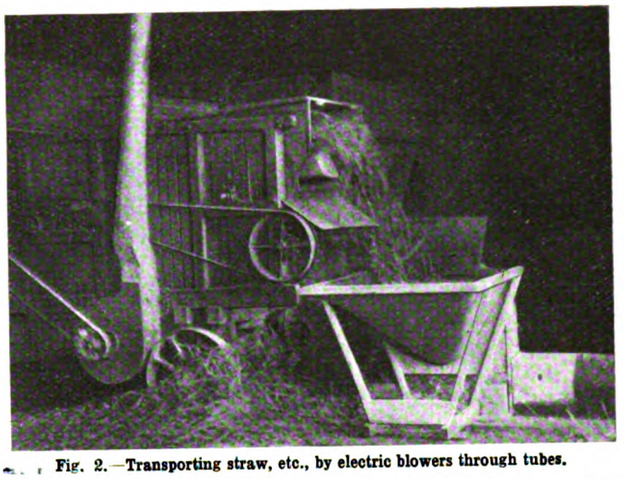

Fig. 2.—Transporting straw, etc., by electric blowers through tubes.

But the sequel of this great idea, the electrification of the country districts, leaves many problems which require solution, and must be solved. If this matter could be taken into consideration for a certain district as a whole, for example, a county complete with all its cities, towns, villages, hamlets and farms, it would be relatively a simple one. The difficulty is, however, that generally, several of the larger communities in the area already have their own distribution system. Even if the Central Electricity Board successively, as I suppose is the intention, should build out an intermediate transmission system of say 33 000 V which could serve as a bulk supply grid for all these existing undertakings, the question of the further development is by no means easily settled.

District Supply Undertakings.

How are other existing smaller towns and villages which are not yet electrified to be supplied with power? Apparently the Electricity (Supply) Act of 1926 does not make any provision for their needs in so far as a distribution system is concerned.

Shall this 33 000 V system of the Central Electricity Board be extended and brought to practically every small village, which will then buy its necessary power from the Board and carry out its own little administration for local distribution, or shall special district electricity supply undertakings be formed to buy in bulk from the National Grid at the 33 000 V, and take over the responsibility of distributing energy to the inhabitants of the unelectrified towns and villages in certain larger areas.

It will doubtless be of interest to state that the first mentioned system of distribution was adopted by the Swedish Central Electricity Board for the whole of Central Sweden, and unfortunately, it has been far from successful. I have from the beginning been an outspoken opponent of this method. One very important reason for the failure of their system is that an electricity supply undertaking necessitates a more highly qualified management than such a small unit can economically support.

The practice in the Netherlands is an excellent example of the advantages to be gained by co-operation over large areas. Practically all the small municipal organisations which originally had their own management, have, during recent years, been amalgamated into large undertakings, supplying power to all the inhabitants of a province (a Dutch province is of about the same average size as an English county). Even

Digitized by Google

towns up to 40 000 inhabitants have preferred to give up their own distribution organisation, and have joined in with the larger provincial undertakings.

However, assuming such larger provincial or county undertakings could be established in England, the question might still be raised whether they really would become sound commercial propositions, or whether they would more or less rely upon State or municipal aid. No doubt it must be considered a matter for State or municipal aid if the electrification is to be carried out on the same principles as in large towns, and so that every remote cottage in the country can be in the position of buying electricity at its door.

As I have lately thoroughly studied the possibilities of the electrification of one county in England*—Lincolnshire,

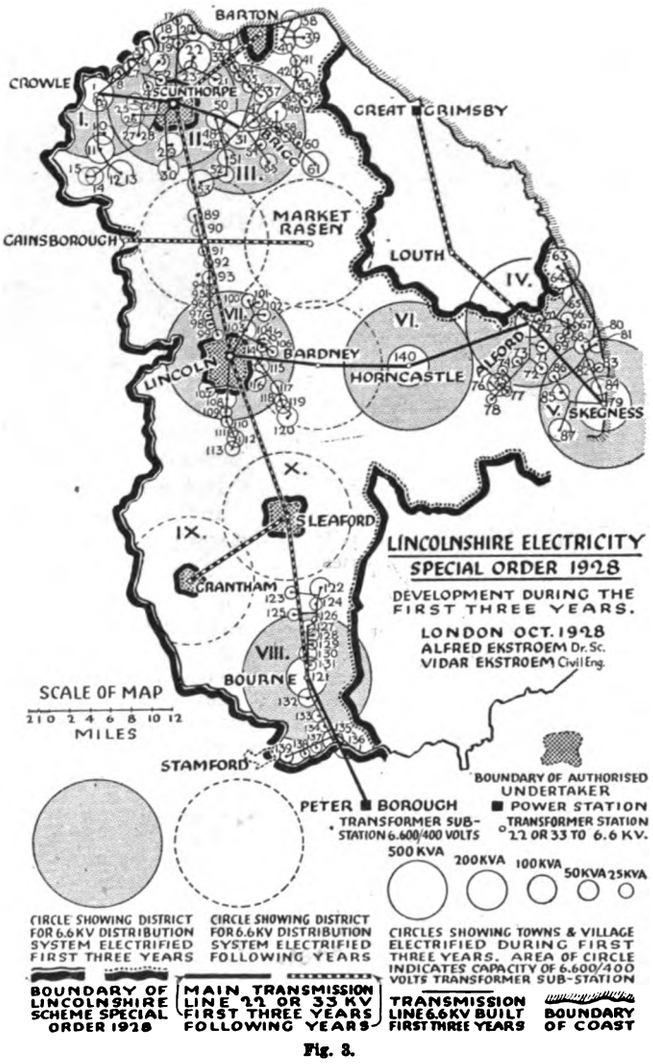

Fig. 3.

in connection with the Special Order applied for by Mr. R. Borlase Matthews—it may be of interest to know how this scheme works out as regards these alternative methods.

Lincolnshire Distribution System.

The map (Fig. 3) shows the proposed distribution system that has been decided upon for the portion of the oounty that it is proposed to electrify during the first three years.

From the municipal electricity works at Peterborough, Lincoln, Grimsby, and from the waste heat stations of the Scunthorpe Steel Works, it is proposed to build 33 kV lines to Bourne, Bardney, Horncastle, Alford, Skegness, Brigg and Crowle, and eventually to Sleaford, Grantham, Gainsborough, Market Rasen and Barton. From each of these towns a 6.6 kV distribution system will radiate, whereby all consumers living within a radius of six miles can be connected up. In each village one or more 6 600/400 V transformer stations will be erected for the purpose of supplying the inhabitants at 400/230 V. The intermediate pressure of 6 600 V has been selected as, due to the results of recent experience, it can be installed and operated at very little more cost than a 1 500 or 3 300 V system, though over a larger radius.

It is proposed to carry out the whole transmission system with overhead lines, though as an engineering proposition when the current density justifies it, underground mains will be laid in the centre of the larger towns.

To begin with, the power supply will be obtained from the above-mentioned central electricity stations. In the second year of supply, the whole system will probably be connected to the grid of the Central Electricity Board.

As to the reliability of overhead line service, it may be of interest to state that in the Eastern district of Central Sweden (the rural area around Stockholm) about twice as large as the Lincolnshire area, the *total hours of interruptions averaged per consumer and per annum* during the last five years have been as follows :

	1923	1924	1925	1926	1927
Hours ..	13.1	11.7	15.5	8.9	7.2

I presume that everybody will admit that a supply with an interruption—with tendency to decrease—of an average of 10 hours totally per annum per consumer is a reasonably reliable service under rural conditions.

Electrified Inhabitants.

In the Lincolnshire area it has been found an economical proposition to construct the distribution system in such a manner that in most urban and rural districts 80% to 90% of all the inhabitants can be supplied with electricity.

In fact, in this respect Lincolnshire is very favourably situated. The reason for this is the very peculiar configuration of the villages, in that almost all the inhabitants within the urban and rural districts live very closely together, generally within a radius of 600 yards from a central point, while their farming lands surround each village. This especially favourable circumstance is, no doubt, a result from that time when the Scandinavian vikings made their raids upon this country and forced the inhabitants to herd together so as more easily to defend themselves against these invaders.

In fact, in another part of the county of Lincolnshire (Holland), which evidently was put into cultivation at a later period—as it was largely unrecovered marsh land in the early days—the configuration is quite different. The dwellings of the farmers are there generally placed in the middle of their fields. Electrification prospects in such an area are evidently considerably less favourable.

It is proposed within the first three years to offer a supply to 50% of all persons living within the area of the Lincolnshire Electricity Special Order.

The capital necessary for the transmission system and the consumers' equipment to supply about 60% of all the inhabitants within the whole area is calculated at about one and a half million pounds sterling.

As this area is 3% of the total rural area in the whole of Great Britain, the great importance of rural electrification—systematically carried out—in Great Britain is readily seen, not only for its rural population, but also for the electrical industry as a whole.

Advantages of Rural Electrification.

Reference has already been made to the valuable qualities of electricity in the home for light, cooking and heating purposes, or what is now generally called domestic uses. As to electric light, I will only point out the increased demand for abundant light, and the importance of a suitable arrangement of switches, so that, in passing from one room to another, the room which is being entered can be conveniently illuminated before the lamps in the room that is being vacated are extinguished.

Even if it is acknowledged that finality has not been arrived at in the matter of constructing cheap and reliable devices for cooking and water heating for the average family, it may not be considered too optimistic to say that it is only a question of a relatively short time before this is achieved. The tariffs already quoted for these purposes in many places in England are such as to secure a wide development of this use, thus giving the house in the country the possibility of the same, or rather higher, comfort than that which electricity offers to the urban inhabitants.

As to the very important convenience to the country home to always have running water at its disposal, the modern electric house service water pump has already reached such a high degree of perfection and the demand of electrical energy for its use is so negligible, that wherever electricity is available this device will very soon be generally adopted.

* See THE ELECTRICIAN, Vol. CI, p. 658, for a brief account of the Inquiry held by the Electricity Commissioners at Lincoln.

Digitized by Google

As to the heating of rooms a consumption for more exceptional use can only be assumed, as a general use for this purpose will necessitate such a low energy price as it might not at present be considered possible to attain.

What electricity means to the average farmer is seldom really understood. The convenience of good lighting as well as running water, as mentioned for the home, is undoubtedly still more important for stable and barn. There are, however, other applications of electricity here, which perhaps are even more valuable, if they are properly applied.

Electric Milking Machines.

As the most important I do not hesitate to specify the use of electric milking machines. I have eight years' experience of this application on my own farm near Stockholm, where every day about 80 cows have been milked regularly in this way with *only* the very best results; and I may mention that in Sweden at present more than 5 000 farmers are using milking machines.

The importance of the internal transport problem and the important task of the electric motor in this connection has become more and more obvious. Systematic labour-saving electro-mechanical transport devices are therefore a very vital question.

This is illustrated on page 99. The whole load of hay or corn, as it arrives from the field, is rapidly raised in one lift from the cart or wagon by an electric elevator, after which, by means of a small trolley running on a rail under the ridge of the roof, operated by a simple switch it is unloaded at the desired spot in the barn or loft. (See Fig. 1.)

If the corn has been stored in the barn for the winter, it must eventually be carried back from its place of storage to the thrashing-machine. By fitting a claw fork to the elevator, it will then be easy enough to raise about half a wagon load at a time and convey it out of the barn direct to the feeding platform of the thrashing machine.

In fact, these transporting arrangements have led to quite new principles in the design and construction of stables and barns of a very interesting nature, which cannot, however, be discussed here for lack of space.

Electric exhaustion has of late years found an interesting use in connection with thrashing work. For many years, exhaustion has been used for transporting the chaff by blowing it from the thrashing machine through tubes several hundred yards long to the storage rooms.

It has also been found practical to transport straw from which the corn has just been thrashed, direct from the thrashing machine in tubes of a length of a couple of hundred yards or so, either to the straw-rick or to the loft, where it is to be stored. (See Fig. 2.)

Of recent years at Ahlby Farm, near Stockholm, the grain has, simultaneously with the other work of thrashing, been conveyed direct from the thrashing machine by means of an exhaustion and injector device through a 60 yards' long pipe-line right up to the fourth floor of the granary.

It has been stated by a very eminent British agriculturist that the drainage problem is one of the most important things that the farmer has to solve to-day. Now one very important application of rural electrification is the possibility of obtaining an efficient and cheap drainage of waterlogged pasture and arable land. This is readily accomplished by means of electrically driven pumps, preferably of the automatic type. It will readily be appreciated that by these means a considerable capital expenditure can be saved, that would otherwise have to be sunk in the construction of deep ditches and channels —which are necessary if the ordinary fall of the water has to be allowed for. It is a very simple matter to elevate water the few feet required when electric pumps are available. It is true that where drainage works are on a larger scale, steam engines and oil engines have been employed. The labour of attendance, however, generally kills the steam and oil engines, apart from their initial greater capital cost.

In the area of the South Swedish Electric Power Co. there are five districts, each containing some hundreds of acres, which have now been drained for a considerable number of years with the greatest success. Each station is equipped with an electric pump of 25 to 50 H.P. capacity. Current is supplied, between midnight and 6 a.m., at ⅛d. per kWh. When other methods of pumping were employed, it was not an economic success as it is at present.

For the county of Lincolnshire, where large areas have been reclaimed from the sea, more particularly in Holland and Axholme, electric pumping will be of the utmost interest.

Handicrafts and Small Industries.

The advantages, both from a social and an economic point of view, of industrial activity in the country—perhaps particularly of small industries and handicraft—are perfectly clear. We have numerous examples in the south of Sweden of small workmen in the country, for instance, smiths, wood carvers, etc., who, after having at first introduced a small electric motor connected to the rural supply system, have now extended their handicraft to prosperous factories employing a considerable staff of helpers. Generally speaking, there is every reason to believe that cheap power would give an invaluable impetus to the development of industrial enterprise in country districts.

DEVELOPMENT OF GLASS INSULATORS FOR TRANSMISSION SCHEMES.

Some Advantages of Glass for Electrical Purposes—Examination Under Polarised Light—Possible New Uses—The Proper Sealing Method.

By NORMAN E. NORTH.

NOTWITHSTANDING the exceptional advantages of glass as an insulating material, it is only during the last thirty years that it has been extensively used in connection with the transmission of electric power. This, however, may be explained by the fact that glass insulators require shapes, weights and thicknesses which could not be manufactured in the then state of the art.

Although glass insulators were at first slow in taking favour with the electrical industry, and particularly the electricity supply undertakings, it is now being appreciated that glass, with its many advantages, represents the most modern practice, and in view of the very favourable reports from users, it is now being used very extensively in various parts of the world, in connection with the distribution of electrical energy over large areas.

For telegraph and telephone lines it is used practically exclusively in continental Europe. The Governments of Canada, U.S.A., and Mexico have also adopted glass insulators, and in Spain, notwithstanding the fact that the lines were to be supported by porcelain insulators, they are being replaced by those manufactured of glass. Glass insulators are used in all the French Colonies, with their varied climates, and the other countries of Europe, and the British and Dutch Colonies are reporting favourably on their use.

Glass, being a material obtained by the complete fusion of its elements, is homogeneously perfect, a state which no porcelain can attain. It is thus not necessary to submit it to porosity tests.

Its transparency enables one to perceive the minutest defects in the mass, and to eliminate all pieces susceptible of causing trouble in service. Special apparatus only applicable to transparent material is used to disclose internal stresses which may have taken place in manufacture, thus avoiding the placing in service of pieces susceptible to cracking.

As is well known, porcelain is very susceptible to these internal stresses, and being opaque, it is materially impossible to discover them. X-ray apparatus has been tried in Germany for porcelain, but its action is very limited, and only applicable to actual internal cracks; and, of course, cannot be used for the detection of internal stresses.

To a large extent porcelain, which may be full of pin holes and other defects, depends on its glaze for its insulating qualities; moreover, the re-distribution of moisture by endosmose may be a factor of importance, as investigated by S. Evershed in 1914. Endosmose is the motion of films of water along the walls of an insulator, due to the water being electro-positive to practically all solid insulating materials, and being, therefore, drawn through the pores of the solid towards their electro-negative ends. The alignment of threads of moisture has the effect of partially short circuiting the dielectric.

As the flashover values for most porcelain insulators depend almost entirely on their glaze, and as this glaze depends on

Digitized by Google

the manufacturer's skill, the risk of failure may be considerable. In the case of glass insulators this risk is entirely eliminated, as no surface treatment is required and little effect is caused by chipping or other damage in transit or during erection.

Glass has an electrical resistance approaching infinity, and it has a mechanical resistance better than porcelain; its consistency is assured by vigorous chemical control and the rate of melting by the most efficient modern pyrometric apparatus.

Glass is the only solid electrical insulating material used which is isotropic. It is, therefore, the only insulating substance used for electrical application which transmits light, heat and electricity equally in all directions, a factor which is most important in every case in which the material is continuously submitted to the influence of a dielectric field.

Glass acts in relation to the lines of force as an ideally homogeneous body, and this is an advantage, the importance of which will be fully appreciated by engineers engaged in this field.

In a solid isotropic body, temper, lamination or a difference in the chemical composition effects simultaneously the transmission of light, heat and electricity. In other words, temper, lamination or alteration in chemical homogenity are susceptible to make an isotropic body lose its essential qualities by producing irregularities in the transmission of light, heat and electricity.

Thus, in an isotropic body, all the physical properties are altered simultaneously, and proved alteration of any one of them will indicate clearly and surely the alteration of all the others.

The electrical conductivity measurements (however intensive one may make them) are long and tedious, and the percentage of errors with which in ordinary industrial practice they are inevitably effected, deprives them of all practical utility.

It is the same with the measurement of calorific conductivity for industrial uses, and no real or trustworthy indications can be obtained for commercial purposes.

But these are not the greatest advantages of glass over all other insulating materials. It has already been mentioned earlier how another of its physical properties, namely, its transparency, still further enhances this advantage, and thereby places glass in a class of its own.

Polarised Light Test.

Now let us recall to mind the work of the celebrated physicist, Faraday. In 1845 he discovered the fact that, as soon as glass under the influence of an exterior agent suffered the slightest alteration of its physical properties, under an examination under polarised light it immediately showed the phenomenon of double refraction.

It is the application of this most important discovery which has made possible the immense progress which has taken place in the last twenty-five years in the electro-technical glass industry.

The examination of every piece of glass under polarised light indicated instantaneously and with an extraordinary sensibility, the state of the molecular equilibrium of the piece under examination.

Glass, naturally, has already the great advantage of being an isotropic transparent body, and thereby ensures the rapid and sure means of verifying after manufacture that these vital qualities have not been altered in the slightest degree, thus affording proof of its suitability to stand up to service conditions.

Generally glass is the only body used in electrotechnology which has the two united qualities referred to above, although, to be thoroughly impartial, it ought to be mentioned that, in a much lesser degree, celluloid possesses somewhat similar characteristics.

The delicate question of re-baking has been the object of very special improvements, and this operation, upon which depends the very existence of the finished insulator, is watched over by pyrometers. The piece when once re-baked is submitted to an examination in polarised light, which enables every part showing the least defect to be discarded.

This method, which is of an incomparable sensitiveness, is only applicable to transparent bodies, and its application constitutes one of the most important superiorities of the glass insulator.

There is no necessity for the usual immersion test for proving he freedom from inherent internal stresses of glass insulators. Although this test is indicated in the B.E.S.A. Specifications, because no satisfactory alternative has yet been found, it, nevertheless, is generally admitted as not satisfactory, because this test often causes damage which cannot be observed by the naked eye, and only materialises into a fault when the insulators are put into service.

The general testing of glass insulators after completion of the manufacturing process is very comprehensive, and almost invariably includes standard dry flashover; rain at different degrees, and magnitude; and various methods of mechanical testing.

To the engineer-designer the application of glass insulators will suggest many interesting possibilities. One might suggest, as an example, the utilisation of their transparency for oil filled terminal bushings, thus dispensing with the usual glass gauge which is integral with the bushing and placed at what is, both electrically and mechanically, the weakest point.

Again, in the case of compound-filled apparatus, this transparency can be utilised to indicate the state of the compound when actually in service.

The following notes are intended as a guide to those using or assembling insulators, and should be carefully followed if satisfactory results are to be expected.

The Sealing Medium.

Sulphur should be absolutely barred. The makers will not guarantee any insulators which have been sealed with this substance. It should be the same with all cement that is liable to swell.

Contrary to general impression, the sealing of insulators with pure Portland cement is not advised. This substance has already caused considerable inconvenience to those who have used it for fixing insulators (glass or porcelain) on to their iron work.

The co-efficient of expansion of cement is much higher than that of glass. Under the influence of heat during summer, actions are produced which might cause the breaking up or loosening of the insulator.

Sealing by utilising plaster of Paris mixed with powdered glue is the most satisfactory method known. Care must be taken to obtain good plaster for moulding. The melting is done in a double saucepan with carpenter's glue exactly similar to that used by joiners. It is dissolved in water, before being used as a mixture, in the proportion of one tablespoon of the powdered glue to one quart of water.

It is not advisable to mix more than 10 lb. of plaster at a time, otherwise it will very probably become hard during use. This hardening process begins about forty minutes after mixing. The mixing of the plaster can be done in any kind of receptacle, provided that the inside is uniform and smooth.

First of all, pour out the required quantity of thin watered glue, then add the plaster gradually so as to obtain a mortar having the consistency of a soft paste.

The sealer then takes in his hands a sufficient quantity to fill half the cavity of the insulator in which the sealing is being effected. This quantity naturally varies according to the size of the insulator. Afterwards he rolls this mortar into a ball, either between his hands or on the table in front of him, and places it inside the insulator, which has previously been fixed in a suitable support.

This done, the workman pushes the pin right to the bottom of the insulator. He keeps the latter in position with one hand, whilst, with the other, he heaps together the plaster and presses it round the ironwork by means of a specially bent round wire tool.

This tool may easily be made from a long piece of brass wire having a ring at one end, and turned into a semi-circle at the other end. The hook thus formed is then bent at right angles to the stem.

When the sealing operation is completed, the insulator should be placed on a drying board, where it should be left for about an hour in order to give the plaster time to set. At the end of this time the pieces may be baked, but care must be taken. At the end of a day or two they may be put into position.

The method of mixing, which has been described above, is excellent for the fixing of iron work, but it should not be employed if it is a question of joining the different pieces (skirts) of the insulator.

It should further be noted that, until such time as the sealed parts are perfectly hard and dry, there would be considerable danger in exposing them to a temperature below zero.

TRANSFORMER STATIONS AND THEIR APPARATUS.

Current Practice Reviewed—Alternative Arrangements of Apparatus—Wood Pole, Steel Structural and Kiosk Type Stations.

By THEODORE RICH, A.M.I.E.E.

THE supply of electricity over extensive rural areas from overhead lines has led to the development of special arrangements and apparatus for those points at which the current is stepped down. Across the Atlantic, a system of 2 200 V high tension, 60 periods, with lamps about 115 V was developed at the end of the last century. Single phase transformers hooked on to cross arms with plug fuses were largely used. The combination of a low primary and low secondary voltage tended towards the limitation of the higher voltage distribution radius, and the multiplication of intermediate voltage distribution points resulted in excessive light load losses through the large number of small transformers required.

At home, until comparatively recently, overhead line supplies were, to a material extent, limited to areas in which there was an appreciable amount of industrial load, so that the " traffic " could often bear the capital charges required by expensive apparatus.

On the Continent, as in America, it was realised that the apparatus used to supply rural areas must be of the simplest and cheapest character possible consistent with safety; section links and porcelain tubular fuses being used largely in France and Italy at transformer stations.

At first, a large amount of work was done at 3 000 V; the pressure crept up, and now a great deal of village supply work is done at 10 000 to 15 000 V, the greater capacity and elasticity of the higher group of voltages very much more than covering the small increased cost in transformers and accessories.

In Great Britain, development has been taking place on somewhat similar lines. Voltages have been rising, and simple accessories have been coming more into vogue, and makers of appliances are realising that it is capital outlay and not wholesale current costs that tends to limit progress. There is some danger that supplies from colossal power stations over expensive grid lines may lead to a demand by the Central Board for the installation of expensive protective apparatus, not merely at the grid tapping stations, but also at final step-down points. Although the presence of a large primary driving force must have some effect, where intermediate lines are also overhead, there is material protection through line reactance, and that of transformers.

Some people have been heard to say that a great deal of the rural distribution work abroad is carried out by cross country h.t. lines solidly linked in at both ends; but this is comparatively rarely the case. The tree system is still very usual, and the existence of a line on a map between two feeding points does not necessarily mean the feeding of a line from both ends simultaneously to the same intermediate points. As a rule, such lines are sectionalised by isolating links or aerial switches to suit operating conditions. Directly one starts feeding a line from both ends, differential relays, elaborate switchgear, with operators at least within call, and so on, have to be considered, and costs begin to pile up. The use of 220/250 V to earth instead of 110–125 V, as employed in many countries, naturally widens the areas of supply from any given step-down point, and it makes for larger transformers which, in turn tend to justify more expensive apparatus; the larger radius usually means a better diversity factor, and a reduction in light load losses.

In the U.S.A., owing to a parentage of the single-phase system, and the cramping influence of the two big trusts, single-phase

Digitized by Google

transformers were largely used, to a great extent in open delta or delta on the three-phase side, the existence of three-phase transformers being practically ignored for many years for commercial reasons. On the Continent, the first long distance experimental transmission from Lauffen to Frankfort, was made with three-core, three-phase transformers, and, apart from single-phase lines, three-phase transformers are the rule, there being many transformers of about 10 kVA on 15 000 V, 50 period lines.

At home, Continental practice has been followed in the use of three-phase transformers, mainly of the core type, the shell type never having been really popular outside America. In order to bring out the neutral point for lighting, a star winding on the l.t. side is usual, a delta on the h.t. side of the step-down transformer being more desirable from the point of view of higher harmonics than a star.

Choice of Types.

When a transformer is attached to an overhead line, the latter must have an anchor terminal or fixed through point at about 20 ft. from the ground, and connection must then be made to the transformer windings, either through end bells and a length of cable, which, according to some authorities, provides a certain measure of protection against lightning and other surges, through outdoor type pass-through

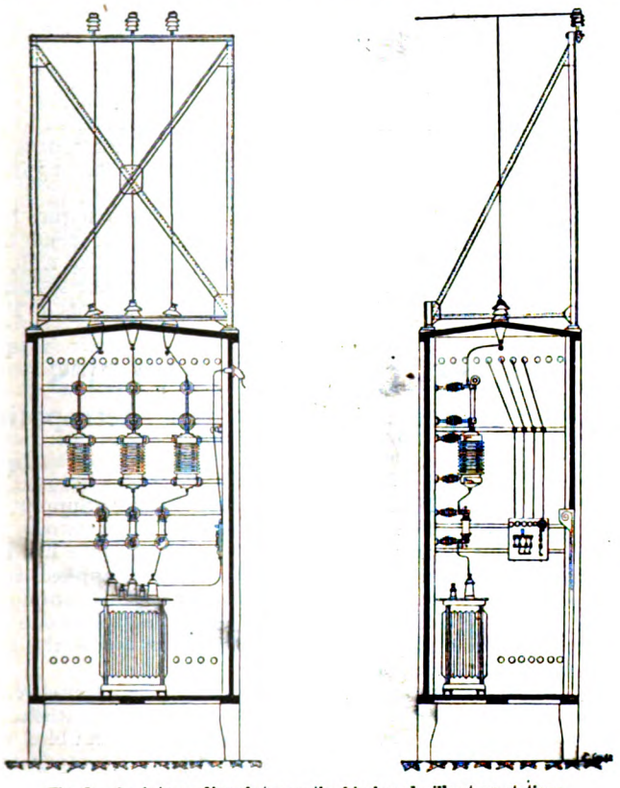

Fig. 9.—An intermediary between the kiosk and pillar type stations.

insulators on the cover of the transformer tank, or by means of individual leads passing through side glands, any protective apparatus being placed between the line and transformer terminals.

There are several ways in which the apparatus at a step-down point can be arranged :—

(I.) The transformer can be supported on posts or on an angle-steel structure well out of reach of the public, with the transformer tank either in the open or inside a protecting cabin of some kind.

(II.) The transformer can be placed on or near the ground : (*a*) In a fenced enclosure with metal-clad apparatus and three-core cable connections to the overhead line, or with the h.t. connections on the top of the transformer tank specially guarded with grid work ; (*b*) in a low brick, masonry, concrete or composite building, the connections being brought down from above by means of an armoured cable or a vertical protective trunk of some kind ; (*c*) in a kiosk of metal or concrete, usually with cable connections ; (*d*) in a cabin, with a chimney-like structure above it, which acts as an anchor terminal for the incoming h.t. and outgoing l.t. mains ; (*e*) an enclosed structure of brickwork, masonry, or concrete, tall enough for the h.t. line to be looped in direct through a side or end wall.

In America, owing to the difficulty of getting bricklayers in country districts, and to the influence of the old 2 200 V system, outdoor sub-stations are the rule ; some of them look very untidy, although great improvements are now being made in this respect.

On the Continent, however, permanent structures are very largely used as step-down points.

In England, as all forms of building work are exceedingly expensive, transformers on wood posts are very fashionable.

In America it is the usual practice to hook transformers on to the cross arms of stout poles, and to connect up to 2 200 or 4 000 V h.t. mains by means of fuses, frequently of the plug type. Stout wood posts are comparatively easy to get in that country, and at such a low pressure, simple outlet bushings with insulated tails looped up to the h.t. line are sufficient.

Outside America — except in Japan, which has followed American practice — the hook supported transformer has never been very popular ; distribution voltages have been higher, stout timber expensive, therefore the tendency has been to use a more solid support. So the practice has grown up of using two poles—in some Dominions areas three—with wood or steel cross bearers, often on a sort of platform between the posts. The high tension apparatus is placed, in many cases, above the platform level at a height convenient for the incoming conductors, the loops into the transformer being placed at the back, so as to be more out of reach of anyone standing on the platform. Owing to the larger normal distributing radius, and the fact that thinly populated areas have hardly been touched at home, larger transformers are placed on elevated platforms at home than abroad, where in some places those elevated do not exceed 10 to 15 kVA.

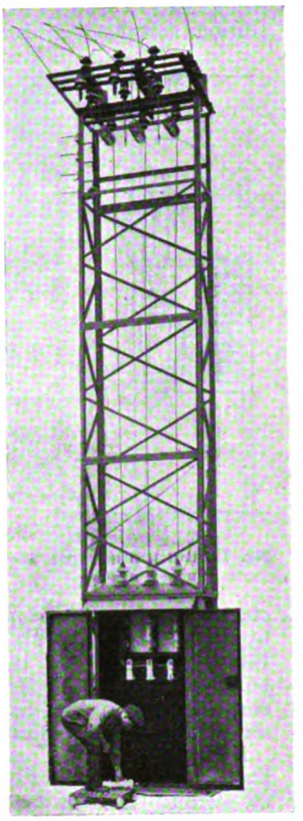

Fig. 10.—A construction in which the transformer is placed in a steel chamber inside an angle-iron structure.

By using angle or channel cross-bars for the support of apparatus a convenient point becomes available, on to which to hang the tackle for raising the transformer into place. With a pole type transformer the ground space is small, but it is awkward if anything does go wrong in bad weather. Twin-pole stations have been used to a material extent in New Zealand, France, Scandinavia, Switzerland, Germany, and have been used recently in North Wales and elsewhere.

Fig. 7 (page 104) shows a transformer station at the anchor terminal of an 11 000 V line. Connection is made above through a vertical horn-break switch and tubular fuses and porcelain end bells on the back of the transformer. The

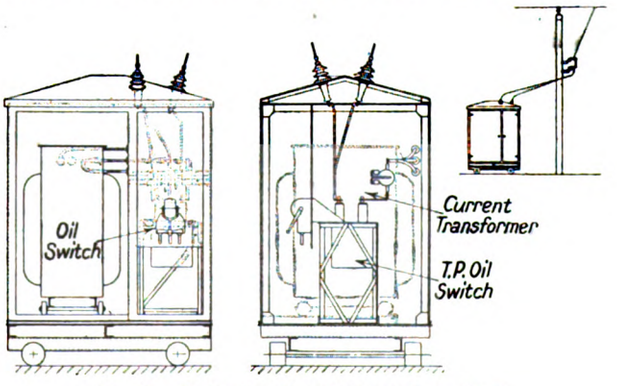

Fig. 11.—The l.t. side of a portable transformer kiosk.

four overhead l.t. leads are for 230/400 V. This station was equipped by Messrs. Johnson and Phillips.

A modified wood pole type station is to be seen in Fig. 12. The transformer in this case is protected by an oil-filled

Digitized by Google

safety switch fuse, the down coming h.t. leads to the transformer cover on the sub-platform being shielded by a netting. This is a design of the English Electric Co.

In order to make a support of more permanent character than can be done with wood poles, armoured concrete is being used somewhat extensively abroad. Fig. 1 shows a station suitable for heavy transformers designed by the Société Parisienne pour L'Industrie de Chemins de Fer. It is fitted with surge dischargers and switch fuses operated from the ground level. A ring of spikes is placed round each post to deter the adventurous small boy.

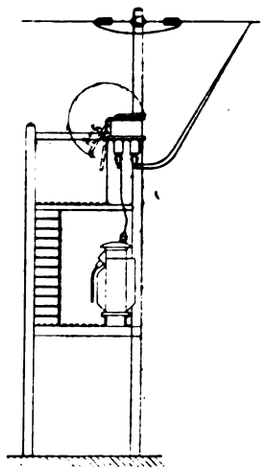

Fig. 12.—A modified wood pole type station.

When transformers are large, one arrangement is to make up a platform between two lattice steel posts. Fig. 2 shows such a station connected to a 33 000 V line used to supply the town of Lydney and also a farm; as will be seen it is a tapping off a through line at an angle. The h.t. line is tapped above. It passes through the horn break switch on the left, and then to the fuses on the right with vertical pass-through type inlet insulators on the transformer. This station was equipped by Messrs. Ferranti, Ltd.

On the Continent a type of station has been developed with the transformer supported by an angle structure taking up but a small ground space. Fig. 8 is a station in the South of France arranged with a horn switch, kicking coils and porcelain fuses, the same structure carrying a bracket for street lighting; this was constructed by Messrs. Merlin and Guérin, of Grenoble,

Fig. 3 is a station on a very small base. A substantial platform with hand rail and manhole is provided. The l.t. switchgear is in the steel cupboard below; it contains a four-pole switch with fuses, meter and earthing device.

One arrangement which has its advantages is to place the transformer in a little metal cabin above the ground and provide a platform on each side, one side for the h.t. and the other for the l.t. Fig 6 shows one of these cabins during erection. These two stations were designed by Messrs. Grammont, of Paris.

The Kiosk Type Station.

Where the potential load justifies the expense, the kiosk type of sub-station is very convenient. The leads are brought down from the overhead line in cable and led into the kiosk, which can contain links, and an oil switch. Fig. 4 shows a steel kiosk by Johnson and Phillips for 11 000 V. The station in question has two sets of h.t. terminals with change-over links. The switchgear compartment is fitted with an inner door filled in with expanded metal. Fig. 5 is the transformer. The bottom angle iron can be removed to allow the transformer to be wheeled in and out. The space is sufficient for a transformer of 150 kVA. Figs. B. and C (page 103) show a somewhat similar kiosk made by Messrs. Ferguson, Pailin, Ltd.

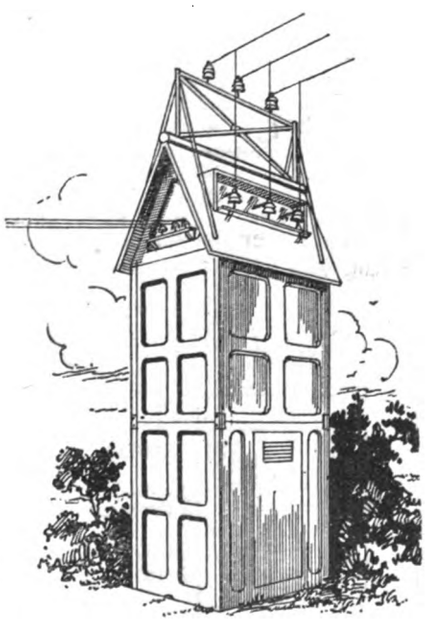

Fig. 13.—A construction of pre-cast concrete slabs.

Due very largely to the fact that in early days the three-phase system was in the hands of undertakings controlled from abroad, it is only of recent years that contractors, cement makers, quarry owners and brickmakers at home have begun to realise the extraordinary elasticity of three-phase current for the purpose of supplying power at short notice with the aid of light h.t. conductors, and therefore it was only recently that electrical manufacturers were called upon to supply h.t. appliances suitable for such work. Fig. A (page 103) shows a portable transformer kiosk used for brickmaking and similar work, designed by the English Electric Co., suitable for driving large motors. It is arranged for a 100 kVA transformer and oil circuit breaker. The l.t. side of a kiosk of very similar type is shown in Fig. 11. This type of portable station is made by the English Electric Co.

An interesting form of station which might be termed an intermediary between a kiosk and a pillar station can be seen in Fig. 9, of a type developed by Messrs. Soulé, of Bagnères-de-Bigorre, in the Pyrenees. It is built up of light armoured concrete slabs with angle iron corner pieces. The station shown has Ledoux shunted self-induction coils, a roller shutter is arranged in front, and the floor is kept well up so that the transformer can be easily got out of a lorry. They have been arranged also with aerial disconnecting switch interlocked with the shutter, so that access cannot be obtained while the transformer is alive. The smallest size of this general type is made about 5 ft. square inside and in larger sizes they are used for pressures up to 30 000 V.

Fig. 13 is a station built up like a telephone kiosk out of pre-cast concrete slabs. It is made by the Société de Fabrication d'Appareils en Ciment Armé, of Angers.

A type of station that has some vogue abroad is one in which the transformer is placed in a steel chamber inside a tall angle iron structure, which reaches to a height sufficient to take in the h.t. mains and let out those of l.t. at a sufficient height from the ground. The h.t. leads are guarded by boxing in the framework with netting. Fig. 10 shows one of these, 23 ft. 6 in. high, with a base 4 ft. 3 in., by 2 ft. 3 in., the structure being made up of 2·4 by 2·4 angles. The cabin is independent of the frame, so that the latter can take the strain of a double pull at the top, without any tendency to throw stresses on the cabin itself. This type is made by Messrs. Grammont, of Paris.

PROTECTIVE DEVICES.

Recent Experiences on North Metropolitan Co.'s Network.

By "OUTSIDE SUPERINTENDENT."

THE North Metropolitan Electric Power Supply Co. operate an extensive 33 kV overhead line network, and during the past year considerable useful experience has been gained in relation to the protective circuits applied to it. Pilot wire discriminative protective devices are employed, and the pilot cable consists of multi-cored telephone and protective circuits on a catenary suspension below the main transmission conductors.

The system originally installed was of the opposed e.m.f. type with bias restraint, which was not completely satisfactory on feeders above five miles in length. The troubles were mainly due to insufficient pilot wire capacity compensation in the protective circuit, and induced voltages in the pilot cables by earth faults. This type of system has since been superseded by one of the circulating current variety, and, up to the present, it has given satisfaction for the few months that it has been in service. It is an improvement upon the closed core opposed e.m.f. type as it avoids saturation of the current transformers, and possesses efficient means of pilot wire capacity compensation.

It has also been proved that pilot wire systems should not be earthed, otherwise instability will result, due to the induced voltages and unbalanced capacity effects. Experience has also shown that the insulation resistance of the pilot cables and protective circuits must be carefully watched to prevent them becoming earthed, for reasons mentioned above.

The problem of induced voltages, especially with overhead line systems, requires investigation, mainly to avoid the pilot and telephone circuits being subjected to excessive pressures. The pilot lead and screens in the overhead portion of the network carry considerable earth return currents, and the pilot wires in consequence are subjected to induced voltage rises.

Fault conditions on overhead lines are in almost every case initially to earth, but they are frequently accompanied by a concurrent fault on another phase at some point of the network. These conditions are probably aggravated by methods of earthing, and with an extended network multiple earthing

Digitized by Google

seems to be essential, in any case to avoid a portion of the network being isolated from an earthed point.

During the gales on November 19th last, a large quantity of straw blew across one line, causing a phase to phase fault. This condition operated the overload protection at another point in the network, which was set with an inverse time lag varying from 4 seconds down to 1 second.

The section on which the straw had accumulated was protected by a pilot wire discriminating system of the circulating current type, which, however, did not operate. The apparent explanation is that the straw formed a high resistance fault, which did not pass sufficient current to operate the pilot wire relays, which required 300–500 A to operate.

High phase fault settings are objectionable, especially in outlying districts remote from the generating point. The probability of high resistance faults and the operation of the overload devices before the discriminating devices endangers continuity of supply.

BIRD GUARDING.

Some Methods for Eliminating Interruptions.

IT is strange that in the British Isles we seem to have more trouble than most other countries with regard to short circuits due to birds. It may be that in democratic France, where gun licences cost so much less than with us, sportsmen of sorts go about and blaze at all and sundry on the wing. It may be that our game preservation tends to encourage the multiplication of birds, and indirectly enables nightingales to send their warbles over the wireless. Possibly the native birds are as slow as some other bipeds at home at learning about what is not good for them. We do not have the problems that beset some engineers in the tropics when they find an industrious pelican starting to make a nest on the top of a steel lattice post; but all the same, in no country in the world has the bird problem brought so many devices and methods into being. There is some evidence that in the same way that horses cease to shy at motor-cars and dogs "gang warily" across the road, even brother crow is beginning to realise that a high tension line is not the most desirable perch on which to feed a fledgling.

In one way it seems illogical to provide a sort of "comfy" armchair for a bird in the form of a cross-arm, and then put on it the equivalent of a piece of barbed wire in the form of a spiked insulator to keep him away.

The greatest difficulty lies at the line support, although in

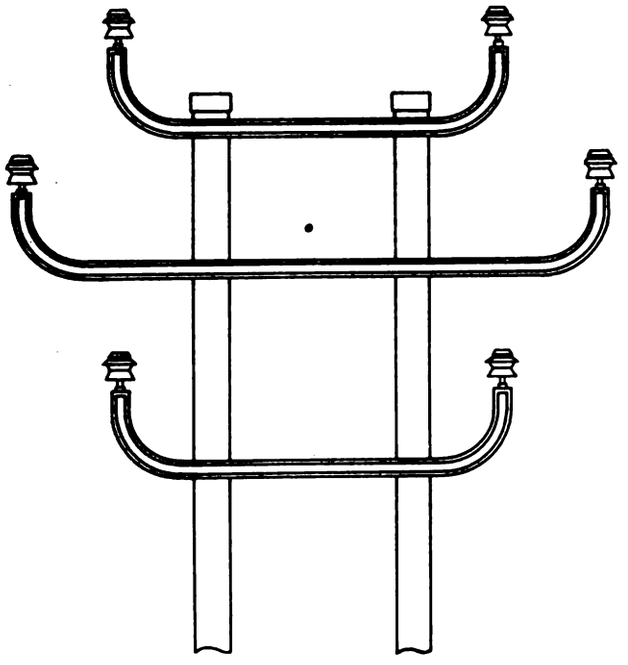

Fig. 1.—A type of support specially made to eliminate bird troubles.

some cases extra spacing and special arrangements of double circuits have been adopted to minimise trouble between the posts.

One device is to arrange the insulator brackets in such a way that no attractive seat is provided; another to put an insulating sleeve over a short length of the conductor with a cap over the insulator top; a third is to put an insulating sleeve over the metal cross-arm; and a fourth to make the cross-arm itself of insulating material.

Birds like a comparatively level place when they sit down

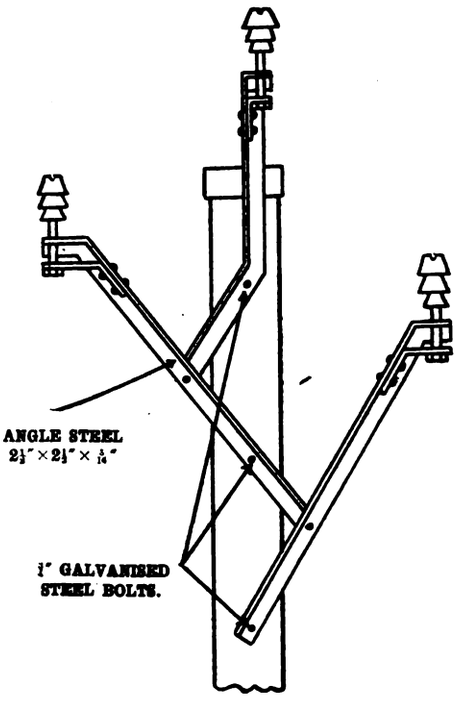

Fig. 2.—A modified herring-bone system which does not prove attractive to birds.

upon their haunches, so that if the supporting arm is at a steep angle until well clear, they will cogitate on mundane affairs elsewhere.

Fig. 1 shows an arrangement of two circuits, the brackets being of channel steel. The arrangement was of a design used by Messrs. Johnson and Phillips for a Scotch colliery company for 22 000 V, with 300 ft. spans. Fig. 2 is a modified herring-bone system of supports which affords no enticement for birds. This is being used for 11 000 V around Basingstoke by Mr. Swarbrick, and in the North Metropolitan Co.'s area.

Regarding the second arrangement, the Key Conduit Co. has had on the market for some time a simple guard composed of a split tube of insulating fibre which can be put on to the arm inside the insulator pin. Bakelised wood is now being tried out on the Continent for cross-arms.

SETTING POLES WITH DYNAMITE.

Details of an Unusual Method Developed by Florida Power Co.

DYNAMITE seems an unusual and a somewhat alarming agent for use in the erection of pole lines, but the following account of a method developed by the Florida Power and Light Co., after experience in building over 1 000 miles of wood pole transmission lines shows that the explosive method has its uses.

It is pointed out at the outset that, though the method is applicable to conditions ranging from nearly dry soil to wet, swampy land, some practice is required before the attainment of encouraging results, particularly if long, heavy poles are used.

For pole sites on swamp land a 1½ in. pipe is worked into the ground by employing a ½ in. rod for a plunger inside the pipe. With this agitation at the point of piercing, the pipe is easily pushed downward by the weight of two men applied on "Stilson" wrenches at opposite sides of the pipe. The pipe is forced to a depth representing the depth desired to set the pole, the plunger rod removed, and several sticks of dynamite dropped into the pipe and pushed to the bottom.

Sometimes when there seems to be danger of the pipe clogging with earth when driven, a blasting point is used.

Digitized by Google

This is nothing more than an 8 in. length of 1½ in. pipe flattened out wedge shape on one end and coupled to the drill pipe, thereby allowing the pipe to be driven with mauls. In this case after the dynamite had been inserted, the drill pipe may be unscrewed from the blasting point. It is evident that with this scheme a new point is required for each shot. The drill pipe is lifted out while the charge is held in position by a stick or wooden rod, and is ready for the pole, which is set directly over the dynamite.

When the blast occurs, the pole quivers and hesitates a moment, then slides into a hollow cylinder formed in the ground by the force of the expanding explosive gases.

The weight of the pole at the instant of fire tends to prevent an upward thrust, and what little ground disturbance takes place is seen around the pole. There is no sharp report, but rather a dull thud. As the pole slides into place, gases from the shot leak out between the soil and the circumference of the pole. This pressure would indicate that the confined gases tend to retain the pocket walls awaiting the pole.

No advice can be given as to quantity of dynamite to be used. This is something to be worked out by each individual foreman. With practice a man can make a close estimate of required powder for a certain depth under certain soil conditions. Variations in depths and soil conditions make dynamite requirements vary from three to twenty sticks.

A great upheaval of soil about the pole indicates an overcharge. Likewise, when a pole neither punctures the earth's surface nor goes to the required depth, an insufficient amount of dynamite has been used. To correct a "jam" the drill pipe must be worked at an angle to a point under the butt of the half set pole, and a fresh charge inserted. When exploded this will, as a rule, send the pole to the required depth.

MECHANICAL · CONSTRUCTION.

Fig. 1.

A BRACKET construction made up of galvanised strip, braced from below, with guards by Crompton-Parkinson, is shown in Fig. 1. It is used in North Wales.

A type of insulator steel spindle and saddle used for round-top wooden cross-arms by the Ohio Brass Co. is shown in Fig. 2.

Various arrangements of conductors are to be seen in Fig. 3. Figs a, b, c and d show triangular arrangements which are convenient for balancing purposes. Figs. a and b are convenient from the points of view of minimum pole heights. Fig. b is a herring-bone pattern, which is getting popular in America. Fig. c is a cheap swan-neck bracket used in France and Germany. Fig. d has a support for an earth wire above the other conductors. Fig. e is an unbalanced arrangement sometimes used for roadside lines abroad, the insulators being easily visible to a linesman on patrol.

SUSPENSION INSULATORS FOR H.T. TRANSMISSION LINES.

Overcoming Difficulties Due to Expansion of Cement—The "Spring Ring" Insulator—Increasing Tensile Strength—Employment of Steatite—New Insulators for Special Purposes.

By C. S. GARLAND, A.R.C.S., B.Sc., M.I.Chem.E.

WHILE the old pin-type insulator was satisfactory up to 40 000 or 50 000 V, at higher tensions the size of the insulator itself became unwieldy, and a margin of safety had to be accepted which was not regarded as sufficient protection at these higher voltages.

These difficulties gave rise to the development of the suspension insulator, the first of which was made in America by Hewlett about the year 1907. This type of insulator is still used to a limited extent in America, and to some extent also in England. As a consequence of its difficulty of manufacture, the insulator was costly, and, unless made with very great care, unreliable, and for these reasons the Hewlett has been gradually replaced by the cap and pin insulator.

The cap and pin insulator offers the great advantages, electrically and mechanically, that it is symmetrical, it has a long creepage distance between the two metallic parts, and offers a quick and easy method of assembling the units together, while at the same time allowing them a sufficient freedom of movement in relation to one another under working conditions. The circular symmetrical form also makes for simplicity and certainty in the methods of manufacture, and while maintaining a high puncture voltage, it has been found

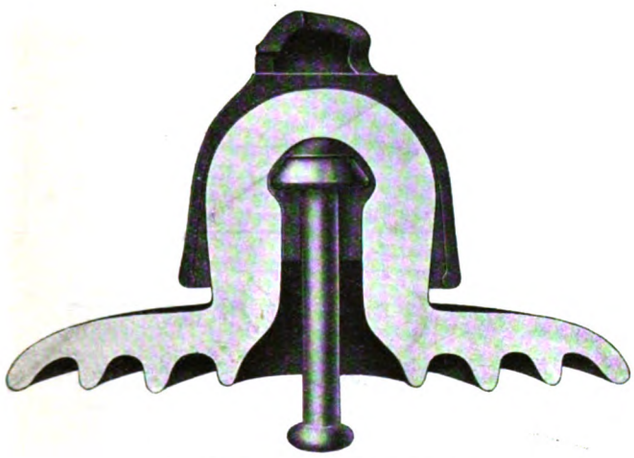

Fig. 1.—"V" ring insulator.

possible to increase the mechanical strength of the insulator and of its fittings, to an almost unlimited extent, so that, at present, insulators of this type with an ultimate breaking strength of 20 tons are regular articles of manufacture.

The caps are made of cast steel or malleable iron, and are cemented on to the head of the insulator by Portland cement. The unavoidable expansion of the cement used in this position is taken up by the elasticity of the cap, and holds the porcelain head of the insulator under ever-increasing compression, so that the longer the life of the insulator the more strongly is its cap held fixed to the porcelain body.

In the early insulators cement was also used for fastening the pin into the hollow head of the insulator, but in this position the expansion of the Portland cement is a very objectionable feature, as it acts in a direction entirely opposite to that between the cap and the outside of the insulator, and tends to burst the insulator.

The inevitable expansion of the cement, as the subtle chemical changes take place over several years, has a disruptive effect on the insulator, and many records of the failure of high tension transmission lines can be traced to the setting up, in the course of from one to five years, of fine cracks in the porcelain by this expansion, forming ultimately a leakage path for the current, and puncture of the insulator.

It is undeniable that satisfactory cemented insulators have been manufactured, and have lasted for several years, but the nature of this material made it impossible to guarantee that reliability which the importance of the service rendered by the high power lines demanded, and there was created an urgent demand for some means of fixing the pin, which would be certain and secure, and would not depend upon the skill and care with which the cement was selected, mixed and applied.

The first successful effort to overcome these difficulties was the very ingenious ball-headed insulator produced by Mr.

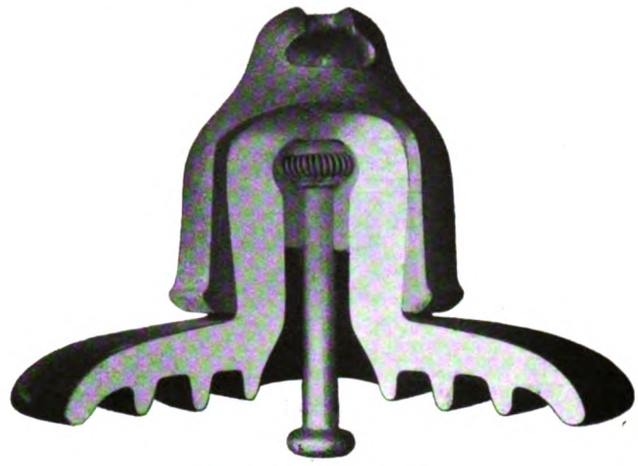

Fig. 2.—Spring ring insulator.

Scheid of the Hermsdorf-Schomburg Co., in which an already fired porcelain sphere, from which a sector had been cut and through which a hole the size of the pin had been bored at right angles to the flat surface thus created, was placed in the hollow head of the insulator before firing. The size of the sphere and the size of the hollow head were so calculated that when the insulator was fired there was just freedom for the sphere to be rotated in the hollow spherical space. For assembly, the flat surface was brought to the bottom position, when a nut and washer were placed upon it, and these then rotated with the sphere to the top of the hollow space. The pin, which carried a screw thread, was then passed through the hole in the sphere and screwed into the nut. The small spaces between the sphere and the pin, and the sphere and the insulator, were then filled with a lead alloy.

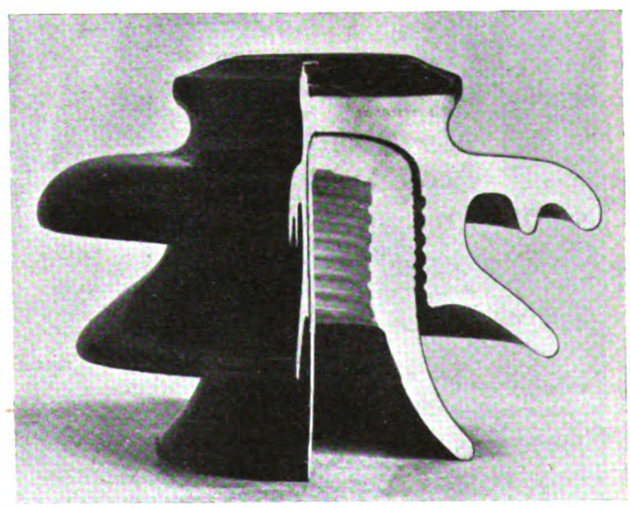

Fig. 3.—A "Motor" insulator, cut away to show construction.

This type was superseded by a method of fixing the pin by which a copper ring was put with the pin into the cavity in the insulator head, which was made slightly conical in form, and the copper ring then pressed out by means of a hydraulic press to a "V" shape, from which the insulator (Fig. 1) takes its name, so that the pin and ring could no longer be drawn out from the insulator. This converted the tensile stress of the pin into a pressure stress in the porcelain.

Digitized by Google

On account of its greater ease of manufacture and consequent lower cost, this was preferred to the ball top insulator, particularly as it gave higher mechanical and electro-mechanical strengths, and some millions of these insulators are in use on the Continent.

The latest development in this direction is the so-called spring ring insulator (Fig. 2) which secures a still higher

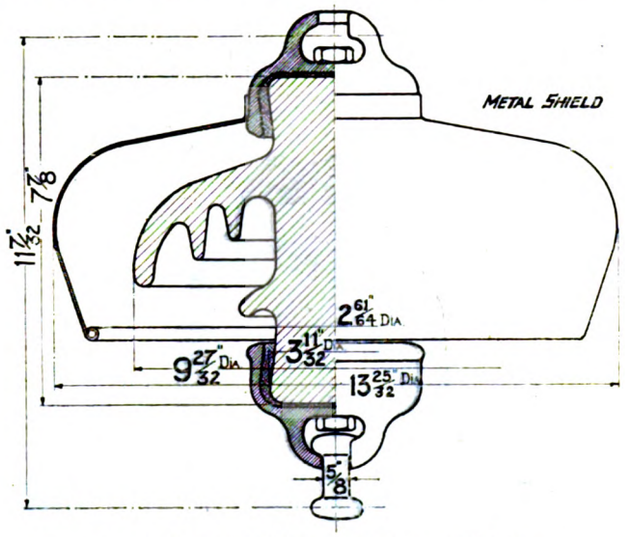

Fig. 4.—A metal shielded insulator for use in Palestine.

mechanical strength and more uniform distribution of pressure over the space in the insulator. A flexible spiral spring, made of strong steel wire of high tensile strength, is forced into the spherical space at the head of the insulator after the pin. The spring ring is able to contract in order to pass the narrow neck of the hollow in the insulator, but after expansion into the upper chamber it can no longer be withdrawn. The spring is secured in place by means of a serrated collar and special pin, and, in order to protect the assembly from the weather,

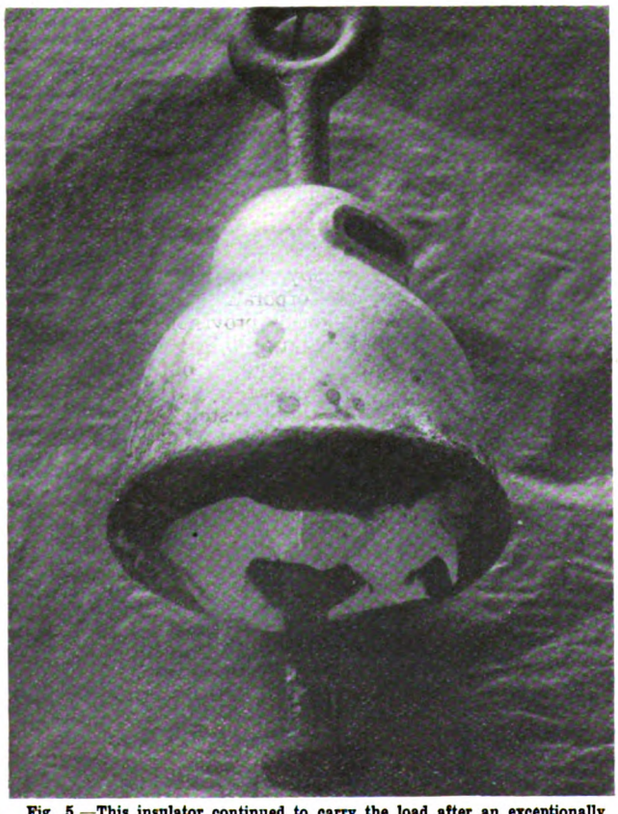

Fig. 5.—This insulator continued to carry the load after an exceptionally heavy lightning stroke.

and further to prevent any relative movement, the space is filled with a special lead alloy. This lead alloy does not increase to any substantial extent the mechanical strength of the insulator, but it does assist in the even distribution of the pressure over the porcelain surface. The construction is such that the line cannot fall unless the whole of the porcelain inside the cap is broken away, a contingency which cannot occur in service. Fig. 5 shows an insulator which, after an exceptionally heavy lightning stroke, continued to carry the load until a convenient opportunity for replacement was available.

This method of fixing the pin has admitted of the manufacture of insulators of a very much higher mechanical strength than had been hitherto possible, and has promoted economy in high tension transmission, by giving a sufficient mechanical strength to admit of the use of single strings only for the many tension points which are necessary when lines have to be carried over a thickly populated country, and where, hitherto, double or even treble parallel strings of suspension insulators have been required. The unit seen in Fig. 6, which is the standard for 220 kV transmission lines, has a mechanical strength of 18 to 20 tons.

In parallel with this development of the now standard cap and pin insulator, the basis of the successful use of which was the employment of porcelain in compression, an extensive series of researches was carried out, with the object of so increasing the tensile strength of the porcelain body itself as to admit of its being used in tension, so that much greater thicknesses of porcelain could be imposed between the metal parts of the insulator units. In the course of this it was discovered that certain qualities of Steatite, which is a naturally occurring

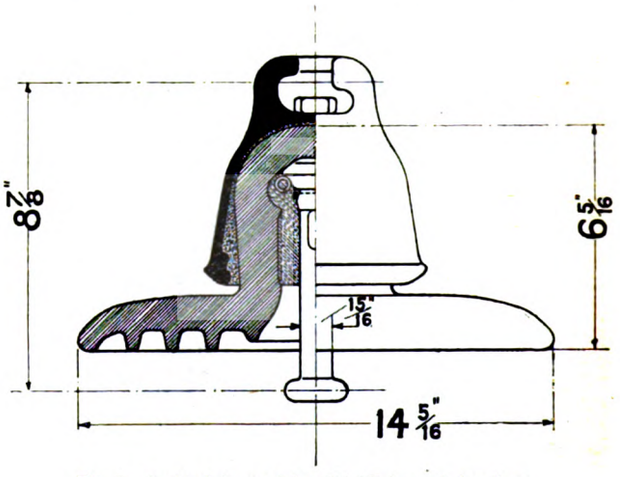

Fig. 6.—An insulator used for 220 kV transmission lines.

magnesium silicate, have electrical resistance properties equal to those of porcelain, and very much higher tensile and bending strengths. The use of this material has rendered possible the production of an insulator which is absolutely puncture-proof under all known voltages, the so-called "Motor" insulator (Fig. 3) named after the company which produced it. This consists of a solid body of Steatite which can carry one or more weather protecting shields, having a long creepage surface, and the tensile strength of which is so great that it can be safely used for wide river crossings in the form shown, the standard method of attachment being by a cap of the same type at both ends of the insulator. These caps are then lined together with ball headed pins in the usual way. Such insulators, owing to their difficulty of manufacture and their construction in a material which is much more expensive than porcelain, only come into consideration in normal high tension transmission lines under exceptional circumstances. Their flashover values are so high that one double shedded insulator will take the place of several normal cap and pin insulators, and the smaller sizes are being extensively used for the electrification of railways in all parts of the world. In these circumstances, where the insulators are much nearer to the ground, their resistance to fracture by stone throwing or shooting is of merit. In a series of tests these "Steatite" insulators were shown to be undamaged when steel bullets from a large bore revolver were fired at them point blank.

An interesting development of insulators for special purposes is shown in Fig. 4 of a metal shielded insulator which has been produced for use in Palestine from Haifa to Jaffa near the shores of the Red Sea, where considerable trouble was anticipated from the combination of salt spray and drying winds. The complete metal shield over the standard "Motor" insulator shown gives full protection against the incrustation of salt on the surface of the insulator itself and avoids the necessity for frequent cleaning.

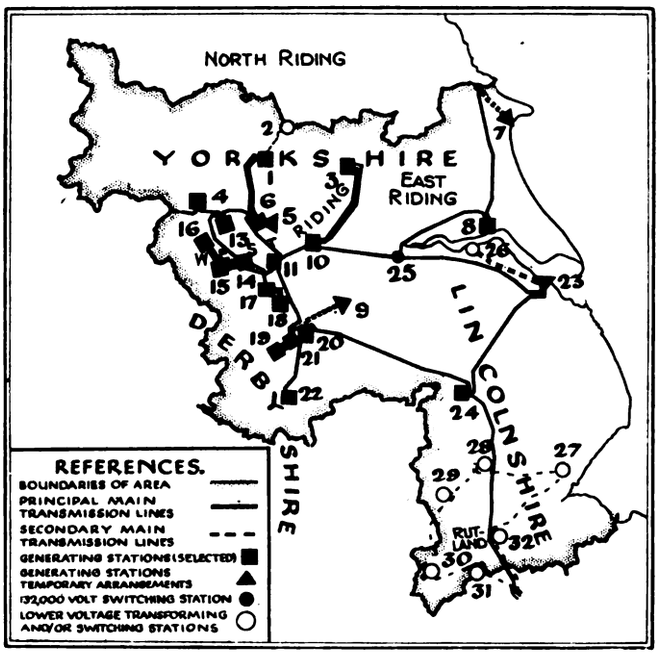
MID-EAST ENGLAND ELECTRICITY SCHEME.

Details of Scheme for Area Embracing Coal, Iron and Steel Industries—Seventy-three Authorised Undertakers Involved—Eighteen Stations Out of Forty to be "Selected."

PARTICULARS of the Mid-East England Electricity Scheme have been submitted to the Central Electricity Board by the Electricity Commissioners, and it is estimated that the scheme if adopted will improve the maximum load in the area from 372 381 kW in 1927-28 to 933 000 kW by the end of 1940-41, or 2·48 times. The area of the scheme is about 7 545 square miles in extent and embraces the whole or part of the area of supply of 73 authorised undertakers, as shown in the accompanying map. The cost of the scheme as estimated by the Commissioners is £2 907 156 in the case of the Central Board, in addition to an expenditure by undertakers of about £1 709 594 on extensions of certain existing stations. It is further estimated that the full advantage of the scheme can be secured with the saving of about £2 149 834 on the capital expenditure (up to the year 1935-36), as compared with the same expenditure that would be necessary if the present system were continued.



Illustrating the Mid-East England Electricity Scheme, the "selected stations" being (1) Harrogate, (3) Foss Islands, (4) Keighley, (6) Kirkstall, (8) Hull, (10) Ferrybridge (11) Wakefield, (13) Valley Road, (14) Thornhill, (15) Huddersfield, (16) Halifax, (17) Barugh, (18) Barnsley, (19) Blackburn Meadows, (20) Prince of Wales, (21) Neepsend, (22) Chesterfield, and (24) Lincoln. The "temporary arrangements," switching and transformer stations, main and secondary transmission lines are indicated, the numbers representing: (2) Boroughbridge, (5) Leeds, (7) Bridlington, (9) Doncaster, (23) Grimsby, (25) Reedness, (26) Barton-upon-Humber, (27) Boston, (28) Sleaford, (29) Grantham, (30) Oakham (31) Peterborough, (32) Stamford.

The Commissioners have determined that 18 stations out of the 40 public generating stations now in operation or under construction in the area shall be selected stations, the names of these being Barnsley (Barnsley Corporation); Barugh, Ferrybridge, Thornhill (Yorkshire Electric Power Co.); Blackburn Meadows, Neepsend (Sheffield Corporation); Chesterfield (Chesterfield Corporation); Foss Islands (York Corporation); Halifax (Halifax Corporation); Harrogate (Harrogate Corporation); Huddersfield (Huddersfield Corporation); Hull (Kingston-upon-Hull Corporation); Keighley (Keighley Corporation); Kirkstall (Leeds Corporation); Lincoln (Lincoln Corporation); Prince of Wales (Rotherham Corporation); Valley Road (Bradford Corporation); and Wakefield (Wakefield Corporation). Certain extensions and alterations will be made to these stations as follows: Blackburn Meadows an additional 25 000 kW of 3-phase 50-cycle generating and equivalent boiler plant for operation by 1935-36, and a further 25 000 kW of 3-phase 50-cycle generating and equivalent boiler plant for operation by 1936-37. In the case of Ferrybridge an addition of 50 000 kW of 3-phase 50-cycle generating and equivalent boiler plant will be made for operation by 1935-36, and a further addition of 50 000 kW of 3-phase 50-cycle generating and equivalent boiler plant for operation by 1938-39. Kirkstall will receive an addition of 50 000 kW of 3-phase 50-cycle generating and equivalent boiler plant for operation by 1937-38, with a further addition of 50 000 kW of similar plant for operation by 1939-40. The Prince of Wales station will take an additional 32 000 kW of 3-phase 50-cycle generating and equivalent boiler plant for operation by 1937-38, and a further addition of 50 000 kW for operation by 1940-41. An addition of 50 000 kW of 3-phase 50-cycle generating and equivalent boiler plant for operation by 1938-39 will be made in the case of Thornhill.

The routes to be taken by the 132 000 V lines are shown in the accompanying map and each line will be capable of transmitting not less than 50 000 kW. The routes to be taken by other lines for operation at voltages between phases not yet determined are also given.

In connection with these lines, transforming stations are to be provided for the purposes of supply to or from the undermentioned places, each such station to comprise transformers having in aggregate a rating in kVA of not less than that specified unless otherwise determined: Barnsley (15 000), Blackburn Meadows (100 000), Chesterfield (10 000), Ferrybridge (120 000), Foss Islands (30 000), Grimsby (20 000), Halifax (15 000), Harrogate (20 000), Huddersfield (15 000), Hull (30 000), Keighley (30 000), Kirkstall (80 000), Lincoln (10 000), Rotherham (Prince of Wales) (60 000), Thornhill (90 000), Valley Road (60 000), Wakefield (20 000). For interconnection between the systems of the Board and those of authorised undertakers, overhead lines for operation at 33 000 V between phases will also be provided, the routes to be followed being shown on the map. In this case also transformer stations are to be provided for the purposes of supply to or from the following places, each such station to comprise transformers having in aggregate a rating in kVA of not less than that specified unless otherwise determined: Barton-on-Humber (600), Boroughbridge (400), Boston (4 000), Bourne (400), Bridlington (4 000), Doncaster (10 000), Grantham (2 000), Oakham (300), Peterborough (8 000), Rotherham (Prince of Wales) (10 000), Sleaford (600), Stamford (1 000).

Those stations falling under the description of "temporary arrangements" are also indicated in the accompanying map.

It is contemplated by the Commissioners that the growing load will be dealt with by allocating so far as possible the base load output to the Ferrybridge, Kirkstall, Thornhill, Blackburn Meadows and Prince of Wales stations, while the scheme also provides for the working of three other stations under temporary arrangements between the Board and the owners, these being the stations at Doncaster, Grimsby, and the Whitehall Road station belonging to Leeds Corporation. It will be noted that the scheme does not make any provision for new selected stations, neither is any generating plant of non-standard frequency in the area. It is pointed out, however, that since in some cases supplies are distributed at a non-standard frequency the alteration of these systems is not essential to the scheme and no financial estimates have been provided in this connection.

It is estimated that by the end of the financial year 1935-36 the capital expended under the scheme, and by the owners of selected stations on construction and extension will be £4 616 750, of which, as explained in the opening paragraph, £2 907 156 will be spent by the Board on transmission lines and transforming stations (including capitalised interest), and £1 709 594 by owners of selected stations on extensions. On the basis of individual development, it is stated, a capital expenditure of £5 406 584 would have been necessary by 1935-36.

By that year a proportion of the existing spare plant in the several generating stations will have been released for revenue-earning purposes, such released plant amounting in all to about 80 000 kW., and representing an actual expenditure of about £1 360 000. These figures thus show how the Commissioners have arrived at their economic conclusions.

Additional advantages will also accrue by reason of reductions in the cost of generation and savings in capital expenditure, which otherwise would have been necessarily incurred on secondary transmission lines by the individual undertakers concerned.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

"Showroom Radio Demonstrations."

[To the Editor.]

Sir,—The subject of "Showroom Radio Demonstrations" is one of great importance, for probably there is no greater source of harm to the prestige of radio in the world of music than the horrible noises which sometimes pour forth from the doors of cycle-cum-radio dealers.

One cannot help feeling, however, that the circuit suggested by "A Radio Engineer" is far from the ideal for the purpose of supplying "plenty of volume to overcome traffic noise," combined with faithful reproduction, from a moving coil or high-class cone type of speaker.

To begin with, the half-megohm coupling resistance following the first valve is shunted by a condenser, the impedance of which at 5 000 cycles is only about 10 000 Ω. The amplification due to a typical high μ value at that frequency would thus be only about one-tenth of its nominal value, rising to about three-quarters of the full value at the lowest musical frequencies.

Assuming that some form of volume control on the second valve has been omitted for the sake of simplicity, or that detuning is to be relied upon (for otherwise the second high μ valve must be hopelessly overrun by signals of sufficient strength to make the first valve efficient as an anode-bend detector), we have the output of the last valve fed through a condenser of 0·01 microfarad capacity, which will offer an impedance, in series with the speaker, of nearly half a megohm at the lowest frequencies.

Finally, the output from a valve of from 4 000 to 6 000 Ω impedance, biassed presumably with about —9 V on the grid, is hardly calculated to overcome traffic noise.

More suitable values for some of the components would be: C.2, 0·0001 mfd.; C.8, 1·0 mfd.; R1 and R2, 0·25 mΩ; V.3, 2 000 Ω impedance; and 20 Henries would be ample inductance for the output choke.—

I am, etc.,

C. E. Field.

Harrow,
January 18th.

[The circuit suggested by "A Radio Engineer" is obviously one which will give more than the average degree of purity, a condition which is brought about by working each valve at the correct point on its characteristic well below its full efficiency with respect to volume. The views of other readers will be welcomed.—Ed.]

"Fallacies of Load-Factor."

[To the Editor.]

Sir,—I quite agree with Mr. Edward V. Clark that supply engineers in this country think a great deal too much about load-factor, but what astonishes me is that Mr. Clark himself concludes his article with a blessing on bulk supply with a load-factor tariff! Why not sell bulk supply as bulk on a flat rate, or graded for quantity, or by time controlled-meters?

In his observations on company and municipal practice, Mr. Clark does not appear to be aware of the large and growing custom of selling electricity on the rateable value tariff, which has nothing whatever to do with load-factor. This tariff was devised by a municipal engineer and is more extensively used by municipalities than companies.

Experience shows that this form of tariff produces sound financial results, and the explanation appears to be partly on account of improved load-factor, which is left to take care of itself, but more probably due to the increased consumption per consumer, which reduces the consumers' charge per kWh sold, and the charges per mile of distributing main per kWh sold. If the peak load is increased, the new kW of plant is obtained at a lower rate, owing to larger plant, which also tends to improve the fuel consumption.

It is becoming more and more apparent that the factor of size in consumption, per consumer, tends to a more rapid decrease in the cost of supply than the small increase in load-factor that efforts in this direction are likely to produce.

I agree with Mr. Clark that proposals to supply hot water on a large scale are not worth the candle, and I think that it will be found that most municipal engineers prefer to use a coke stove for this purpose for their own personal requirements.

The question of load-factor has been discussed in greater detail in a series of articles and correspondence under the heading of "Electricity Supply and the Consumer" in issues of The Electrician dated February 26th, 1926, April 16th, 1926, October 22nd, 1926, August 19th, 1927, November 11th, 1927, and April 6th and 13th, 1928.—I am, etc.,

J. Rutherford Blaikie.

29, Stanley Street, Bedford.
January 21st.

[A further interesting letter on this subject is unavoidably held over.—Ed.]

Contractors and Registration.

[To The Editor.]

Sir,—Study of the position with regard to the registration of contractors, and the suggestions which have been made in various quarters that immediate attempts should be made to secure compulsory registration, leads the writer to agree with most of the remarks under "Current Topics" in your January 18th issue. The chief difficulty in the way of suggesting the right solution of the problem seems to lie in the divergence of views as to the approximate total number of reputable electrical contractors, i.e., those who could satisfy the Registration Board of their suitability for enrolment on the National Register.

It has been suggested that the number of contractors satisfying these requirements, and who have not yet been registered is much smaller than some estimates allow. Personally, I think 5 000 is an outside figure for registerable contractors in this country. If this figure is anywhere near correct, it should only take another year or so to get them all entered on the voluntary National Register. This done, it would be a comparatively simple matter to press for compulsory registration.—I am, etc.,

"A Northern Contractor."

January 19th.

AN ELECTRICAL CARNIVAL.

Details of Important Social Function to be held in Newcastle—Novel Competitions and Prizes.

As a point of local interest an electrical carnival is being promoted in Newcastle under the auspices of the Electrical Development Association and the Electrical Association for Women. The carnival will be held in the Oxford Galleries, New Bridge Street, Newcastle-upon-Tyne, on February 7th, and the guests will be received by the Lord Mayor and Lady Mayoress. The function promises to be one of the best electrical efforts that has ever been promoted in the country, and it is interesting to note that practically every firm manufacturing electrical apparatus have together very generously provided a large selection of prizes. These will be awarded for treasure hunts, treasure dances, balloon dances and other novel competitions. The surplus moneys from the carnival will be given to the Hospitality Fund of the Electrical Association for Women to entertain the delegates at their Conference at the North East Coast Exhibition. The chairman of the dance committee is Mr. W. F. T. Pinkney, and tickets are 5s. each.

NEWS IN BRIEF.

All-Electric Houses for Clydebank—Secretary Wanted by the I.M.E.A.—The Prince of Wales and the B.I.F.—The A.S.E.E. Annual Dinner—The Royal Institution and Faraday—London Local Group of the E.P.E.A. to Hold Dance.

DUNDEE T.C. is to oppose the Grampian Electricity Supply Order.

Clydebank T.C. is to erect, on a site at Park Hall, 346 all-electric houses.

Applications are invited for the position of electrical engineer to New Mills U.D.C.

A shift charge engineer is wanted for Worcester Corporation's Hylton Road station.

An installation assistant and an assistant meter tester are wanted by Coventry Corporation.

It was announced at a recent meeting of Preston T.C. that the fourth generating set at Ribble power station had been completed.

Gainsborough U.D.C. is about to erect, as an experiment, six electrically lighted one-storey houses on the Burn Street housing site.

Reading Corporation tramway employees have subscribed £5 1s. to the Mayor of Reading's fund for relieving distress in mining areas.

At a meeting of the Royal Institution on January 31st, Sir Wm. Bragg will give the first of three lectures on the early history of X-rays.

Bermondsey (London) Electricity Committee has agreed to wire new flats under the L.C.C. housing scheme in Hankey Place, on condition that the buildings are not piped for gas lighting.

The E.D.A. will be showing a cinema film entitled "Rural Electrification" at the Plaza Theatre, London, on January 28th. The film is of their own production and prizes are offered for a new title.

The Incorporated Municipal Electrical Association invites by February 4th applications for the position of secretary (male) to the Association. The commencing salary will be £700 per annum.

A contract, amounting to about £5 500, for the concrete foundations for a sub-station at Port Dundas, Glasgow, and also a similar contract, estimated at £5 000, for the Motherwell sub-station, have been placed by the Central Electricity Board.

South Shields Housing Committee, having been asked by tenants in Prince Edward Road, to consent to a supply of gas for cooking purposes, the Borough Electrical Engineer has been asked to submit a quotation for the installation of electric cookers in the houses.

The interest taken by the Prince of Wales in the British Industries Fair is shown by the fact that the first public dinner which he will attend since the illness of the King will be the banquet at the Mansion House on February 18th, the opening day of the Fair.

Preston Watch Committee recommends the erection of four automatic electric traffic signals. These will be 9 ft. in height, equipped with three vertical coloured lights denoting "stop," "caution" and "go," and each light will be lettered with its signal word as a precaution against mistakes by colour-blind drivers.

The N.W. Students' Section of the I.E.E. has arranged a visit to the works of the Allied Newspapers, Ltd., to-morrow, Saturday. On January 29th, Mr. D. J. Watkins will read a paper, entitled "Electric Locomotives." A dance will be held on February 9th, in the University Women's Union, Manchester.

The annual dinner of the Association of Supervising Electrical Engineers, will be held at the Hotel Cecil, London, on February 23rd. Mr. S. B. Donkin, will preside, and will be supported by, among others, Sir Brodie Henderson, Lt.-Col. K. Edgcumbe, Sir Wm. Noble, Messrs. T. P. Wilmshurst, Frank Hodges, G. Scott-Ram, G. Heys-Jones, Roger T. Smith, A. H. Dykes, F. Gill, J. S. Highfield, W. E. Highfield, A. M. Sillar, and A. P. Trotter.

Bristol Electricity Committee reports that it is desirable to appoint the preliminary staff for the Portishead generating station, which will be rated as a class "H" station under the salary scale approved by the National Joint Board for the Electricity Supply Industry. The Committee recommends that it be authorised to appoint a station superintendent at a salary of £672 3s. 2d. per annum and a boiler-house superintendent at a salary of £511 5s. 8d. per annum.

Coxhoe (co. Durham) P.C. is arranging for the electric lighting of the roads at Quarrington Hill.

An electrical engineer is required by the Government of Nyassaland, for the Public Works Department.

Seaham Harbour U.D.C. has received sanction to a loan of £3 000 in connection with the assisted wiring scheme.

The next A.M.I.E.E. examination will be held on May 29th, 30th and 31st, 1929. Entry forms must be completed and returned by April 1st.

The Business Efficiency Exhibition, whereat a number of electricity items are to be seen, opened at the White City, London, on Wednesday.

The Royal Institution has called a meeting for February 5th to set afoot preparations to celebrate in 1931 the centenary of the discoveries of Faraday.

Direct communication in both directions between Singapore and London was established on January 7th by the Eastern Telegraph Co., eliminating relaying stations.

The Electricity Department of Shanghai Municipality requires a system control engineer, two assistant charge engineers and two distribution engineering assistants.

Mr. Wm. M. Morgan read a paper on electric arc welding, at a meeting of the Glasgow and West of Scotland Association of Foremen Engineers and Draughtsmen, on January 16th.

Burnley Workhouse Committee recommends that, subject to sanction by the Ministry of Health, two wireless receiving sets and accessories be purchased at a cost not exceeding £85.

The London Local Group of the E.P.E.A. has arranged a dinner and dance to be held at the New Prince's Galleries, Piccadilly, W.1, on March 16th. This constitutes the first social function of the group.

A new tramway pole lighting system has been approved by Lytham St. Annes Council. The existing type of lamp will be gradually changed over to arc lamps, the cost being spread over a period of years.

Mr. H. de A. Donisthorpe, of the General Electric Co., Ltd., lectured on "Radio Progress and Valve Applications," and demonstrated uses of the photo-electric cell, at the Grammar School, Jesmond, Newcastle-on-Tyne, last week.

The Midland Electrical Engineers Ball, held at the Grand Hotel, Birmingham, on November 16th last, resulted in a sum of seventy-five guineas being handed over to the Benevolent Fund of the I.E.E. for the second year in succession.

It is reported that a new motor invented by a Swedish engineer, Mr. W. H. Uggle, and constructed by Luth and Rosens Elektricka Aktiebolag, consumes less power than other motors and renders possible smoother weaving and higher production per working unit.

The Brazilian Traction Light and Power Co. has been informed that the Brazilian Federal Supreme Court upholds the validity of the Rio de Janeiro telephone concession, which was disputed by the predecessors of the present municipal administration.

The annual meeting of the Iron and Steel Institute will be held on May 2nd and 3rd, at the Institution of Civil Engineers, when Prof. H. Louis will assume the office of President. The annual dinner will be held on May 2nd at the Connaught Rooms, Queen Street, W.C.2.

In order to extend its scope the title of "Electro-Farming" has been changed to "Rural Electrification and Electro-Farming." The change is attributed to the fact that "it seems that for the next few years rural electrification, which in reality includes a still wider field, will be a matter of greatest importance."

A special course of five lectures on electrical sub-stations is being held on Tuesday evenings as from January 22nd at the School of Engineering and Navigation, High Street, Poplar, London, E.14. The lectures are to be delivered by Mr. H. Brazil and the subjects covered include: Why sub-stations are necessary; numbers and position of sub-stations; protective devices for e.h.t. circuits; types of converting plant; rotary converters; motor converters; motor generators; storage batteries, their use in the future; boosters; automatic regulators; traction sub-stations; rotating plant versus mercury arc rectifiers; noise and its prevention; continuity of supply; suggestions for the best means of maintaining.

Digitized by Google

PERSONAL.

THE North Western Branch of the Institution of Mechanical Engineers has elected Mr. H. L. Guy as chairman for the year. Mr. Guy, who was trained at the Cardiff University College, has been for some years chief engineer of the mechanical department of the Metropolitan-Vickers Electrical Co., Ltd. He has been responsible for many important developments in steam turbine practice, including the design of some of the largest and most efficient units which have been built in this country. For his last paper, "The Economic Value of Increased Steam Pressures," presented to the Institution in November, 1926, he was awarded the Hawksley Gold Medal. This medal is the premier award in the gift of the Institution and is given only for original work of outstanding merit. Considerable interest is therefore attached to a paper Mr. Guy is to present before a meeting of the Institution in Manchester on January 31st on the subject of "Some Tendencies in Turbine Design." It is also of interest to note that the programme of the Summer Convention of the Institution, which is to be held in Manchester, is to include a visit to the Metropolitan-Vickers works.

Mr. H. L. Guy who has been elected chairman of the N.W. branch of the Institution of Mechanical Engineers.

Sir Basil Blackett and Sir Andrew Duncan have been recommended to fill vacancies on the Court of the Bank of England.

Mr. V. W. Dale underwent a successful operation on January 16th, and is, we understand, making satisfactory but necessarily slow progress.

The appointment of Mr. Wm. Forbes as manager of Cardiff tramways at a salary of £1 150 per annum has been confirmed by the City Council.

Ald. E. Huntsman, deputy Lord Mayor of Nottingham, has been reappointed chairman of the East Midland Joint Industrial Council (District No. 7) for the Electricity Supply Industry.

The appointment of Mr. F. A. Fitzpayne as transport manager in succession to Mr. R. Stuart Pilcher, who goes to Manchester, was confirmed by Edinburgh Town Council on January 17th.

Mr. J. Aldworth, who has retired from the managership of Nottingham Corporation tramways, after 30 years' service in that capacity, has been presented with a gold hunter watch by the traffic and depot staffs.

The marriage of Mr. Edward Victor Newberry, of the test department at the Rugby works of the British Thomson-Houston Co., Ltd., and Miss Hilda Beatrice Over, was solemnised last week at the Rugby Parish Church.

Mr. Frank Buckley, general manager of the Corporation Tramways at Bury, Lancs, has been appointed general manager and engineer of the city of Norwich tramways. He takes up his new duties at the end of February.

Mr. R. Stuart Pilcher, transport manager to Edinburgh Corporation, was entertained at luncheon on January 15th by members and officials of Edinburgh Corporation, and presented with a gold watch and electric standard and table lamps, as a memento of his 10 years' service in Edinburgh.

We understand that Capt. P. Dunsheath, who has for the past nine years had charge of the research laboratories of W. T. Henley's Telegraph Works Co. Ltd. has been appointed research and technical manager at the company's head office in Holborn. The control of the laboratories at Gravesend is being taken over by Mr. W. C. Barry.

It is announced that with the object of still further centralising the executive and direction of the British Columbia Power Corporation, which controls the British Columbia Electric Railway Co., the president, Mr. George Kidd, has become chairman of the Board of Directors, and Mr. W. G. Murrin, the general manager, president. Mr. Kidd, who will remain in Vancouver in order to keep in touch with the power development plans at Bridge River, joined the British Columbia Electric Railway Co. in London 21 years ago, and went to Vancouver four years later as comptroller. Mr. Murrin left the London United Tramways 15 years ago to join the railway company.

THE SOCIAL SIDE.

UP to and including December 15th, the B.T.H. (London) Rugby Football Club had, out of 13 matches played, won 4, drawn 2, lost 7, the average being 65 points for and 136 against. The figures for the Siemens Club were, 9 games played, 4 won, none drawn, 5 lost, the average being 136 points for and 98 against.

Last month the staff of J. Dyson and Co., Ltd., electrical wholesalers, Bradford, held a dance at Sherwood House, when between 80 and 90 people were present. Numerous prizes were given for various dances, the music for which was provided by Arthur Jackson's Vauxhall Band. Mr. Harry Moss carried out the duties of M.C.

On January 19th, the annual staff dinner of Francis Polden and Co., Ltd., of 56, Cannon Street, London E.C.4, was held at Anderton's Hotel, followed by a concert by the "Merrie Villagers." The toast of "The Chairman and Company" was introduced by Mr. W. T. Buswell, to which Mr. Polden replied. Mr. James Oswald welcomed the ladies, to which Mr. Tucker, the Hoover representative with the company, replied. Mr. Polden proposed "The Staff," and Mr. Lamport and Mr. Gover responded.

An enjoyable time was spent by members of the Birmingham Electric Supply Department, their wives, children, and friends, on the occasion last month of their annual pantomime at the Temperance Hall, Birmingham. The performance was given by children of employees, who gave a clever interpretation of "Sinbad the Sailor." The Lord Mayor and Mr. E. J. Jennings, secretary of the Department, attend. The play was written by Mr. G. H. Luke, the producers were Messrs. R. New and F. J. Tivey, and the orchestra was conducted by Mr. J. Aspin.

The first annual dinner of the Elliott Long Service Association was held on January 11th, at the Green Man Hotel, Bromley Road, Catford, at the invitation of the directors of Messrs. Elliott Brothers (London), Ltd. Forty-one out of forty-eight members were present, illness being responsible for the absentees. The members of the E.L.S.A. share 1 589 years service between them, ranging from 54 to 25, which latter is the number entitling to membership. Keen disappointment was felt with regard to the absence of the president, Mr. W. O. Smith (chairman of the company), owing to illness. He holds the record for years of service, viz., 54 years, and should have occupied the chair. The vice-president, Mr. G. T. Cooper, with 50 years service, however, suitably performed that office.

On the invitation of Mr. and Mrs. Robson, the employees of Messrs. Robson and Coleman, their wives and partners, were entertained to a whist drive, supper and dance at the Minories Assembly Rooms, Newcastle, on January 18th, when about 100 were present. There were numerous prizes, including two season tickets for the N.E. Coast Exhibition. During the evening Mr. Turpin presented Mr. and Mrs. K. Smith with a timepiece and set of vases on the occasion of their marriage. Mr. Robson announced that one of the apprentices, D. Waite, had succeeded in obtaining the grant given by the Electrical Contractors' Association for an apprentice in the electrical contracting industry receiving the highest number of marks in the six Northern Counties for the London City and Guilds Examination in electric installation work. Music was supplied throughout the evening by Mr. J. P. Anderson's orchestra.

Obituary.

MR HERBERT R. WYATT, on January 1st. He was in business as an electrician at Liverpool.

MR. ALEXANDER TAYLOR. He was 13, years ago appointed assistant lighting superintendent at Calcutta, and in 1921 was promoted to the position of lighting superintendent.

MRr W. A. LYON, wireless manufacturer, Blackpool, at the age of 33. He served in the Royal Navy during the war, and his death is attributed in some degree to the hardships of the service.

MR. J. M. GORHAM, aged 73 years. He was a director of Drake and Gorham, Ltd., his association with the company dating from 1886. He retired from active interest in the business many years ago.

MR. F. HARDING, aged 71 years. He retired a short time ago from the position of manager of the Derby Corporation tramways after having been connected with that undertaking for 48 years.

BUSINESS ITEMS.

WE are advised that the electrical department of BROWN BROTHERS, LTD., is now open.

Stirling Town Council has appointed GRAHAM AND MORTON, LTD., as electricians for the ensuing year.

We are advised by Mr. LIONEL CALISCH that his address is now 107, Avenue Louis Lepoutre, Brussels.

RICHARD B. ISLE AND CO., electrical engineers, have opened premises at 22, Priory Place, Doncaster.

Mr. L. E. HEMBER, electrical engineer, has opened new showroom premises at 4, Pepper Street, Lymm, Cheshire.

Mr. C. H. MORRIS, radio engineer, of 16, Tontine Street, Folkestone, has opened additional premises at 140, Foord Road.

G. E. WALLIS AND SONS, LTD., electrical engineers, have opened new showrooms at Bateman's Buildings, High Street, Ashford, Kent.

HOWLETT AND SONS, electrical engineers, of Windsor, are carrying out the electrical installation at the Windsor Hospital.

Mr. J. Raine announces that he will carry on the business of WILLIAM RAINE AND SON, electrical wiring contractors, etc., at 18, Houndgate, Darlington.

Copies of a confidential report upon the electric light and power services to Chile may be obtained from the Department of Overseas Trade upon quoting reference B.X. 4853.

It has been decided to instal Marconiphone amplifiers in Norwich Cathedral. These will be similar to the installations already in use at Canterbury, York, St. Martins-in-the-Fields and elsewhere.

Mr. F. W. Coomber, electrical and radio engineer, of The Tything, Worcester, has taken his son into partnership, and the business will be carried on under the style of F. W. COOMBER AND SON.

An agent and wholesaler in Brussels is desirous of representing British manufacturers of electrical domestic and other appliances. Further particulars from the Department of Overseas Trade, reference No. 425.

Mr. F. G. Southworth, who has for nearly three years been with Mr. W. R. Brown, electrical engineer, 18, Mill Street, Macclesfield, has been appointed manager of the showrooms of G. J. SCRAGG AND CO., LTD., electrical engineers and contractors, Abergele, near Rhyl.

The Union des Centrales Electriques du Hainaut has placed an order for the manufacture, laying and jointing of 88 miles of 30 000 V "H" type armoured cable with the A.C.E.C. (Ateliers de Constructions Electriques de Charleroi). This is the largest contract so far placed in Belgium for "H" type cable, amounting as it does to approximately £115 000.

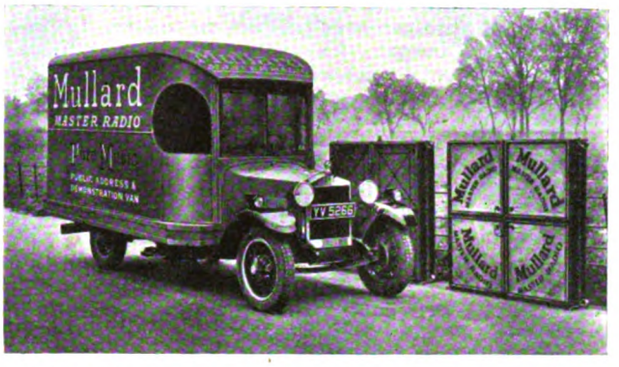
V. G. MIDDLETON AND CO., LTD., of 9, Carteret Street, London, S.W.1, announces that in order to strengthen the connection between that company and W. J. Furse and Co., Ltd., of Nottingham the name of the former has been changed to W. J. FURSE AND CO. (LONDON), LTD. Mr. F. W. Marshall will continue to act as managing director and the office and engineering staffs remain unaltered. Attention is drawn to the facilities now offered by the use of offices in Nottingham, Manchester, Derby and Bristol.

For some time past PHILIPS LAMPS, LTD., have marketed a range of commercial and industrial electric light fittings, and although up to the present the range has been limited, it has met with considerable success. As a consequence it has been decided to manufacture a comprehensive range suitable for all commercial and industrial purposes. Foremost amongst the new fittings will be a number of diffusing units to be known by the trade name of "Phililite." More detailed particulars and illustrations of the new fittings will be published shortly.

J. H. HOLMES AND CO., of Portland Road, Newcastle, announce that the firm is now reconstructed under conditions that involve no break with the traditions of the past. The style of the company is now J. H. HOLMES AND CO., LTD., and the directors are Messrs. W. Hall, N. D. Newall, and Sir Arthur N. L. Wood, with Mr. R. Robinson as manager. Accompanying this information were two leaflets describing and illustrating "Holmes-Clatworthy" duplex motor equipments for newspaper presses and "Castle" electro-plating motor generators respectively.

The Mint Authorities at Calcutta recently decided to change over from their own power house and take supply from the Calcutta Electric Supply Corporation. To effect this conversion, the GENERAL ELECTRIC CO., LTD., has installed substation plant consisting of h.t. truck cubicles, transformers, rotary converters and d.c. slate switchboard with interconnecting cable work. It is interesting to note that in 1906 upwards of 1 000 kW of generating plant, in addition to motors for the complete electrification of the Mint, were supplied by the General Electric Co.

A contract recently obtained by the GENERAL ELECTRIC CO. (INDIA), LTD., was in connection with the public water supply at Benares and covered plant and apparatus controlling the supply of unpurified Ganges water from the Bhadaini pumping station, to the filtering station at Bhelupura, and for the supply of filtered water from Bhelupura to the city. The electrical plant at Bhadaini consists of two h.t. vertical spindle slip-ring motors of a total output of about 700 B.H.P., and that at Bhelupura comprises four h.t. slipring motors with horizontal shafts and having an aggregate output of 1 100 B.H.P. The plant is complete with starting and control equipment, cables and all accessories.



The latest addition to the fleet of demonstration vans of the Mullard Wireless Service Co., Ltd.

The ENGLISH ELECTRIC CO., LTD., has received orders from the Bradford Corporation Tramways for 11 complete single-deck four-wheel electric trolley omnibuses, and 6 complete double-deck top covered six-wheel electric trolley omnibuses. The single-deck vehicles will each have a seating capacity for 34 passengers and will be equipped with a 60 H.P. motor, and the double-deck vehicles will each have a seating capacity for 56 passengers and will be equipped with two special 40 H.P. motors. Both types of vehicle will be equipped with the company's standard foot-operated controller and rheostatic braking. The English Electric Co. has previously received orders for 16 electric trolley vehicles from this Corporation.

A striking innovation in political campaigning methods was inaugurated yesterday (Thursday), when by a series of speech relays carried out by the MARCONIPHONE CO., LTD., for the Conservative Party, the Prime Minister was able to speak at the City Hall, Newcastle-on-Tyne, his words also being heard by meetings at Berwick, South Shields, Stockton, West Hartlepool and Whitley Bay. On February 22nd Mr. Neville Chamberlain, M.P., will speak simultaneously to audiences at Swindon, Trowbridge, Abingdon and Chippenham, while on February 27th the Prime Minister will speak at Manchester, to Darwen, Macclesfield, Preston, Rochdale, Stockport, and Warrington; on March 21st he will be heard at Leicester (in person), Derby, Grantham, Mansfield, Nottingham, Northampton and Retford.

THE "BLUE BOOK."

New Edition to be Published next week.

NEXT week the forty-second issue of the ELECTRICAL TRADES' DIRECTORY will be published. It will be a sumptuous production, and a valuable storehouse of information for all associated with the industry. The "Blue Book" is the only publication that contains a complete alphabetical directory of the electrical industry and this has been very carefully revised. The whole edition has undergone that thorough revision for which this publication has earned such a reputation. A notable feature of the 1929 issue is the inclusion of a complete list of electrical contractors for England and Scotland. The price of the directory is as usual 25s. and postage 1s. extra (inland), and 2s. abroad. Orders should be sent to the publishers without delay, Messrs. Ernest Benn, Ltd., 154, Fleet Street, London, E.C.4.

ELECTRICAL CONTRACTORS' DINNER.

Col. Wilfrid Ashley's Scheme for Testing Demand in a Rural Area—Suggestions for Ensuring Good Electrical Installation Work—An Appeal to the Electricity Commissioners —Demand for Compulsory Wiring Code.

THERE was an attendance of nearly 300 members and guests at the annual dinner of the Electrical Contractors' Association, held at the Savoy Hotel, London, on Tuesday. Mr. W. H. Walton (the President) was in the chair, and was supported by Col. Wilfrid Ashley, Lt.-Col. K. Edgcumbe, Mr. T. P. Wilmshurst, Mr. Frank Hodges, Col. R. K. Morcom, Mr. C. W. Sully, Mr. Ll. B. Atkinson, Mr. A. Nichols Moore, Sir John Gatti, Mr. A. C. Cramb, Mr. D. N. Dunlop, Col. W. A. Vignoles, and many other well known personalities in the industry.

Proposing "The Allied Associations and Honorary Officials," Col. ASHLEY said the E.C.A. was a prosperous section of the most deservedly prosperous industry in the country. In the last seven years the output of electricity had been practically doubled, and it went on increasing at the rate of approximately 20 per cent. each year. Its progress was such that not even the motor car industry could equal it. In 1927, for the first time, we took the foremost place as exporters of electrical machinery and apparatus, beating for the first time both the U.S.A. and Germany, which before the war were far ahead of us in this field. In congratulating the Central Electricity Board on the progress it had made during the past two years, Col. Ashley said that the developments for which that body had been responsible would undoubtedly place the electrical industry on a firmer footing than it would have enjoyed if the Electricity Act had not been passed. It was anticipated by the Weir Report that in consequence of the 1926 Act a saving of £44 500 000 would accrue to electricity consumers by 1940. If, as he believed, this proved to be correct, he could claim that there was virtue in some Acts of Parliament, or at least those with which the Ministry of Transport had to do.

Work of the Central Board.

In the two years of its existence the Central Board had gone about its work in a very tactful manner and overcome obstacles in a surprisingly easy way. The Electricity Commissioners had prepared, and the Board had accepted, four great area schemes which represented a very considerable advance towards the completion of their task, covering, as they did, some 64 per cent. of the population of this country. Already the Board had placed contracts for about £3 250 000 for electrical apparatus, transmission lines, etc. The E.C.A. could do, and was doing, a great deal to help forward this great industry, particularly in the harmonious relations which they maintained with the Trade Union side.

He understood that one of the main objects of the Association was to ensure to the public installation work of good quality. In his view they should not only do good work but should receive a good return for it—absurdly low prices and good work did not go together. Members of the public were safe from the possibility of accidental shocks and other untoward events if they employed reliable installation contractors.

With regard to rural electrification, Col. Ashley said he hoped for results from a committee which the Electricity Commissioners had appointed to carry further the work done by the Committee on Rural Electrification. He also hoped that at no distant date it would be possible to develop it in such a way that a body which was interested could offer a supply to everyone in a certain area, providing the wiring and apparatus on the hire or hire-purchase systems. He was very anxious to do this in order to test the desire of the rural population for electricity.

Mr. W. H. WALTON, in reply, said it was becoming increasingly necessary to raise the standard of electrical safety in this country, and the only way to achieve this was to work unceasingly to secure the use of better electrical materials and better workmanship in the homes and business premises of the nation.

Certain of their manufacturing friends seemed to find it difficult to stand together in mutual support of perfectly legitimate trade ends. Others, again, seemed to hesitate to prepare clear-cut trading policies, or to adhere to them when so defined. It was the settled policy of the E.C.A. to promote fair trading conditions among its own members and to demand them, in reasonable terms, from all other sections of the industry.

Emphasising the responsibility of the trade to give to the public a high standard of electrical workmanship, Mr. Walton declared that he was definitely not satisfied with the quality of much of the electrical work going into the homes of the people at the present time.

The increasing public contact with electrical equipment had synchronised with increased supply pressures in many areas, and with a torrent of cheap, mass-produced wiring material, accessories and equipment. Electricity was perfectly safe under proper control, but it was an easy matter to-day to find installations and equipment that were dangerously unsafe to place in the hands of the people. It was no part of the policy of the E.C.A. to turn installation workers into a close corporation. They desired to keep no competent man out of the business, but they did say that some definite qualification or experience should be required from those undertaking this vitally important work.

If this could not be achieved the next best thing was to adopt some reasonable code of wiring regulations to which all electrical workers might be required, under penalty, to adhere. Some such control was one of the urgent needs of the moment which the industry could not ignore. He submitted that a duty had been imposed on the higher electrical authorities to investigate the question with a view to safeguarding the user.

In other directions, Mr. Walton said, the relations existing between the Association and electricity supply engineers all over the country continued to develop on the most friendly lines. More than one central station engineer had been moved to wonder whether installation work, after all, represented the care-free gold mine which he pictured in his dreams.

It was gratifying to note that more and more supply authorities had entered into agreement with E.C.A. members for the execution of "assisted" wiring work at contract rates, and in many parts of the country these businesslike agreements were in force and giving satisfaction to all parties concerned.

Mr. T. E. ALGER, referring to some of the shoddy work that was being put into British homes, recalled the statement that the electrical contractor was the last link in the electrical chain. He hoped the Electricity Commissioners would realise the weakness of some of the links in the chain they were forging. He also hoped that the Commissioners would seek powers to enforce minimum regulations which would ensure safety to the user wherever he might be.

Col. K. EDGCUMBE, who, with Mr. T. P. Wilmshurst and Mr. Frank Hodges, responded to the toast of "The Guests," said he was glad to see the definite move to ensure sound electrical installations, for though it was easy to wire a house after a fashion, it was difficult to see that good work was done.

The Electrical Contractors' Association was held in high regard by the Institution of Electrical Engineers, a regard in which he had a personal share. Theirs was the only section of the industry that was in direct touch with the general public. It was all very well to produce a "cheap and abundant supply," but all their work would be of no avail if the public did not use their product.

He hoped that Col. Ashley would be able to do something with a view to ensuring that good wiring was a *sine qua non*.

Mr. T. P. WILMSHURST said that in 30 years' experience as a supply engineer he had seen far too much of the type of "contractor" whose chief qualifications were a glib tongue and a pair of pliers.

Too Big for Politics.

Mr. FRANK HODGES thought the only praise due to the Government was for having lived while electricity had developed by itself. Actually, the 1926 Act had its birth in another party which he refrained from naming. He desired to see the electrical industry as far removed from politics as possible. It was too big for politics.

The toast of "Our Chairman" was proposed by Mr. WALTER RIGGS, and briefly acknowledged by Mr. WALTON.

A selection from silhouette portraits specially cut during the evening by Baron Scotford is given on page 117, and a photograph taken at the beginning of the dinner is reproduced on page 121.

E.C.A. DINNER SILHOUETTES.

THESE silhouettes, specially cut for THE ELECTRICIAN during the E.C.A. annual dinner on Tuesday, portray several well-known Association people in a slightly different "light." Some of the profiles are readily recognisable, but no prizes are offered to successful solutionists. (For report of speeches and flashlight photograph of the diners see pages 116 and 121).

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, when available.

AYLESBURY CORPORATION.—Manufacture and supply of 11 000 V switchgear. Full particulars from Mr. W. A. Turnbull, borough electrical engineer.

CHEADLE AND GATLEY URBAN DISTRICT COUNCIL, January 25th.—Electric lamps, meters, cable protection boards, service cables, meter boards, and ironclad cut-outs, for 12 months. Specification, etc., from the Engineer and Manager, Electricity Department, 37, High Street, Cheadle.

NEWRY URBAN DISTRICT COUNCIL, January 25th.—Supply of single and three-phase electricity meters. Specification, etc., from Mr. W. M. Cronin, town clerk, Town Hall, Newry.

CHICHESTER CORPORATION, January 28th.—Supply and erection of 40 kW motor-generator, with starting panel, shunt regulator, etc., for Apuldram outfall works. Further particulars from the City Engineer.

Electrical Equipment of Municipal Houses.

DENNY CORPORATION, January 28th.—Electrical and other works in connection with erection of 28 houses. Schedules of quantities, etc., from Messrs. J. Strang and Wilson, architects, Falkirk.

GLASGOW CORPORATION, January 28th.—Electrical installation and heating installation, in connection with conversion of Family Home, St. Andrew's Street, Glasgow, for use as additional police headquarters. Specifications, etc., from the Office of Works, 64, Cochrane Street, Glasgow; deposit, £3 3s.

GLASGOW EDUCATION AUTHORITY, January 28th.—Electric lighting and electric heating installation in temporary annexe at St. Roch's School, Garngad Road, Glasgow. Specifications, etc., from Education Offices (Property Department), 129, Bath Street, Glasgow; deposit £1 1s.

ABERDEEN CORPORATION, January 29th.—Supply of 12 tramcars, with trucks and electrical equipments. Specifications from the Tramways Manager, 2, Marischal Street, Aberdeen.

BASINGSTOKE CORPORATION, January 29th.—Supply and erection of heavy oil engine, direct coupled to 800 kW, three-phase, 50 period alternator. Specifications, etc., from Mr. F. Swarbrick, borough electrical engineer; deposit £1 1s.

BELFAST CORPORATION, January 29th.—Installation of automatic telephones in the infectious Diseases Hospital, Purdysburn. Specification, etc., from Mr. R. Meyer, town clerk; deposit, £2 2s.

DUMFRIES AND GALLOWAY JOINT SANATORIUM BOARD, January 29th.—Electric wiring work, in connection with erection of two houses for employees at Lochmaben Sanatorium. Specifications from the Clerk, County Buildings, Dumfries.

CHELTENHAM CORPORATION, January 30th.—One year's supply of electric light fittings. Tender forms from the Borough Engineer.

EDINBURGH CORPORATION, January 30th.—Supply and erection of traffic lamps at various points in the city. Further particulars from the City Architect, City Chambers, Edinburgh.

LIVERPOOL CORPORATION, January 31st.—Twelve months' supply of various materials, including (E.S.1) cables, compound, and tapes; (E.S.2) insulated cables; (E.S.3) electricity meters; (E.S.4) cartage: (E.S.5) incandescent lamps; (E.S.6) brass and copper castings; (E.S.7) a.c. motors and starting gear; (E.S.8) stoneware troughing, etc.; (E.S.9) oils. Tender forms from City Electrical Engineer, 24, Hatton Garden, Liverpool. State number of form desired.

RAMSGATE CORPORATION, January 31st.—Re-wiring stage electric lighting installation, at Royal Victoria Pavilion. Particulars from the borough engineer, Mr. T. G. Taylor, 16, Albion Place, Ramsgate.

CHEADLE AND GATLEY URBAN DISTRICT COUNCIL, February 1st.—High tension overhead line (contract 45); and outdoor type transformers (contract 56). Specifications from Mr. R. W. Willis, 37, High Street, Cheadle, Cheshire; deposit £1 1s. for each contract.

OTLEY URBAN DISTRICT COUNCIL, February 1st.—Electricians' work in connection with erection of 40 houses on Westbourne housing estate. Specifications can be seen and quantities obtained on application to the Council's Surveyor; deposit £1 1s.

RIPON CORPORATION, February 1st.—Overhead 11 000 V transmission line and small quantity of e.h.t. underground cable (contract No. 2). Persons desiring to tender were to communicate their intention to Mr. W. C. C. Hawtayne, 9, Queen Street Place, London, E.C.4, before January 11th. Specifications, etc., were to be issued, about January 18th, to persons who, after receiving notice from Mr. Hawtayne, sent to the Town Clerk a deposit of £2.

COUNTY ARMAGH EDUCATION COMMITTEE, February 2nd.—Electric lighting installation in Lurgan New Technical School. Specifications can be seen at the office of Mr. J. St. J. Phillips, 16, Donegall Square South, Belfast, or the Education Office, Armagh.

AMPTHILL GUARDIANS, February 4th.—Electric heating installation, in the board room at the institution. Particulars from the surveyor, Mr. Leonard Foster, Flitwick, Bedford.

EASTBOURNE CORPORATION, February 4th.—Automatic electrically-operated pumping plant. Specifications from the Borough Engineer; deposit £1 1s.

HALIFAX CORPORATION, February 4th.—Wiring 64 houses at Moor End Road for electric light. Particulars from the borough engineer, Mr. A. C. Tipple, Crossley Street, Halifax; deposit £2 2s.

LONDON COUNTY COUNCIL, February 4th.—Manufacture, and supply at East Greenwich power station, of h.t. and l.t. cables, concrete core re-actors, control battery, etc. Specification from General Manager, L.C.C. Tramways, 23, Belvedere Road, S.E.1; deposit £2.

LONDON COUNTY COUNCIL, February 4th.—Wiring and fittings for electric lighting, heating and cooking in one block of dwellings, consisting of some 86 tenements and administrative quarters, on Ossulston Estate, St. Pancras (about 999 wiring points). Specification, etc., from Chief Engineer, Old County Hall, Spring Gardens, S.W.1; deposit £1.

HOLBORN (LONDON) BOROUGH COUNCIL, February 5th.—Twelve months' supply of electric lamps, etc. Specification, etc., from Mr. J. E. Parr, borough surveyor, or Mr. L. Walford, town clerk, Town Hall, High Holborn, W.C.1.

HAMMERSMITH (LONDON) BOROUGH COUNCIL, February 6th.—Twelve months' supply of electric lighting sundries, insulated wires, joint boxes, meters, h.t. and l.t. paper insulated cables, etc. Forms of tender, etc., from the Borough Electrical Engineer. Stamped addressed envelope to be sent.

PORTSMOUTH CORPORATION, February 6th.—Twelve months' supply of stores and materials to the tramways department, including insulating materials, lamps, and motor windings (section Q), overhead line materials (section R), etc. Specification and form of tender from Mr. B. Hall, general manager and engineer.

Plant for Sheffield Power Station.

SHEFFIELD CORPORATION, February 14th.—Equipment for new generating station at Blackburn Meadows, Sheffield, including turbo-alternator, with condensing, evaporating and steam preheating plant (specification B.M. 67); water-tube boilers, with chimneys, superheaters, stokers (or pulverised fuel firing equipment), economisers, valves, etc. (B.M. 68); wagon tippers, conveyors and elevators (B.M. 70); cooling towers (B.M. 72); and overhead electrically and hand-operated cranes (B.M. 73). Specifications from Mr. S. E. Fedden, general manager and engineer, Electric Supply Department, Commercial Street, Sheffield; deposit, £3 3s. for each.

CENTRAL ELECTRICITY BOARD, February 15th.—Supply and laying of 66 000 V cables in London area, in connection with South East England Electricity Scheme. Specification (S.E.E.-L.C.1) and form of tender from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit, £2 2s.

CENTRAL ELECTRICITY BOARD, February 18th.—Supply and erection of 132 000 V overhead transmission lines, in connection with the North-West England and North Wales Electricity Scheme. Specification (No. N.W.E.-P.L. 1) and form of tender from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit, £2 2s.

Digitized by Google

CENTRAL ELECTRICITY BOARD, February 18th.—Supply and erection of 132 000 V overhead transmission lines, in connection with the Central England Electricity Scheme. Specification (No. C.E.-P.L. 1) and form of tender from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit, £2 2s.

CENTRAL ELECTRICITY BOARD, March 4th.—Supply and erection of 132 kV outdoor switchgear, for transforming stations, in the area covered by the North West England and North Wales Electricity Scheme. Specification (N.W.E.-P.S.1) from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit, £2 2s.

CENTRAL ELECTRICITY BOARD, March 4th.—Supply and erection of 132 000 V transformers in connection with the North West England and North Wales Electricity Scheme. Specification (N.W.E.-P.T.1) from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit, £2 2s.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

EGYPTIAN MINISTRY OF THE INTERIOR, January 27th.—Transformer kiosks, cables and accessories, in connection with extension of electricity supply from Mit-Ghamr power station. (Reference B.X. 4 893.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, January 29th.—Accumulator batteries and counter E.M.F. cells (schedule C. 390). (Reference B.X. 4 906.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, January 29th.—Single core, paper insulated, lead covered cable. (Reference B.X. 4 954.)

WAIRARAPA (N.Z.) ELECTRIC POWER BOARD, January 29th.—Supply of 15 sets of earth leakage protection equipment (contract No. 78). (Reference B.X. 4 950.)

CHILEAN MINISTRY OF MARINE, January 30th.—Two electric travelling cranes. (Reference A.X. 7 353.)

EGYPTIAN MINISTRY OF THE INTERIOR (SECTION DES MUNICIPALITES ET COMMISSIONS LOCALES), January 31st.—Diesel engine-driven generator set, d.c. rotary balancer and accessories, for Kafrel Zayat electric station. (Reference B.X. 4 931.)

MANAWATU-OROUA (N.Z.) ELECTRIC POWER BOARD, January 31st.—Supply of automatic re-closing 11 000 V switchgear, for pole platform mounting (contract No. 57). (Reference B.X. 4 988.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, January 31st.—Supply of electrically driven locomotive turntable (tender No. 1 386). (Reference A.X. 7 253.)

VICTORIAN ELECTRICITY COMMISSION, February 4th.—Supply of 22 000 V switchgear and accessories, for Richmond Terminal Station. (Reference B.X. 4 901.)

VICTORIAN ELECTRICITY COMMISSION, February 4th.—Supply of 11 000 V switchgear, for installation in the Richmond Terminal Station (specification No. 29/3). (Reference B.X. 4 898.)

VICTORIAN ELECTRICITY COMMISSION, February 4th.—Supply of 11 000 V switchgear, in connection with the Yallourn power station extensions. (Specification No. 29/5.) (Reference B.X. 4 897.)

VICTORIAN RAILWAY COMMISSION, February 6th.—Supply of a.c. line relays (contract 42 491). (Reference B.X. 5 042.)

GHENT MUNICIPALITY, February 11th.—Supply of 16 electric portal cranes. (Reference A.X. 7 398.)

LOUGH DERG, PETTIGO, CO. DONEGAL, February 14th.—Supply and erection of two heavy oil engine-driven, continuous current, 10 kW, 220/250 V generating sets (section I); storage battery, on nickel-iron-alkaline system (section II); and d.c. switchboard (section III), for the Venerable Dean Keown. Specifications for each section from Messrs. MacEntee and O'Kelly, 23, Upper O'Connell Street, Dublin; deposit £2 2s.

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, February 26th.—Supply of induction coils and registers, for telephone work (schedule C. 394). (Reference B.X. 5 031.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 19th.—Supply of 110 000 V transformer, for Mangahao electric power scheme (section 204). (Reference B.X. 4 952.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 19th.—Supply of 11 000 V switchgear, for Mangahao power development (section 203). (Reference B.X. 4 953.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, March 26th.—Supply of telephones and dials (schedule C. 401). (Reference B.X. 5 023.)

EGYPTIAN MINISTRY OF THE INTERIOR, March 27th.—Supply and installation of electric lighting system for the town of Fashn. (Reference B.X. 5 037.)

VICTORIAN ELECTRICITY COMMISSION, April 8th.—Galvanised steel transmission line towers (specification 29/13). (Reference A.X. 7 401.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, April 9th.—Supply of induction voltage regulators, for Lake Coleridge scheme (section 215). (Reference B.X. 5 018.)

VICTORIAN ELECTRICITY COMMISSION, April 29th.—Steam turbo-generators (section 1), condensing plant, including circulating water pumps (section 2); and evaporating, de-aerating and feed heating plant, including boiler feed pumps (section 3). Specification, etc., from the Agent-General for Victoria, Victoria House, Strand, London, W.C.; deposit £3 3s.

TANGANYIKA GOVERNMENT, June 1st.—Concession for utilisation of Pangani River Falls for the development of electric power. Copies of the draft concession may be obtained from the Crown Agents for the Colonies, 4, Millbank, London, S.W.1.

STATE ELECTRICITY WORKS, MONTEVIDEO, July 8th.—Construction and equipment of 50 000 kW power station.

Tenders Accepted.

ADMIRALTY.—Siemens Electric Lamps and Supplies, Ltd., large quantities of Siemens vacuum and gasfilled lamps, for ship and dockyard use.

COLCHESTER CORPORATION.—W. T. Henley's Telegraph Works Co., Ltd., e.h.t. transmission line between the electricity works and the Wivenhoe sub-station, £3 778 16s. 2d. (lowest tender).

AUSTRALIAN POSTMASTER-GENERAL'S DEPARTMENT.—British General Electric Co., Ltd., installation in Sydney and Melbourne of apparatus for telegraphic transmission of pictures.

BRADFORD CORPORATION.—English Electric Co., Ltd., supply of 11 single-deck and six double-deck railless electric trolley vehicles, and spare parts, £28 279 8s. (Recommended.)

GENERAL POST OFFICE.—British Insulated Cables, Ltd., 21 miles of telephone cable between Blackpool and Preston, and 16 miles of cable to link Douglas, Castletown and Port Erin with new submarine cable between Fleetwood and Douglas.

CENTRAL ELECTRICITY BOARD.—Ferranti, Ltd., and Fuller Electrical and Manufacturing Co., Ltd., construction of 132 000 V transformers required in the area of the South East England Scheme. The contracts amount to approximately £400 000.

IRISH FREE STATE ELECTRICITY SUPPLY BOARD.—Metropolitan-Vickers Electrical Co., Ltd., supply of switchgear required in connection with the Shannon power scheme. It is stated that tenders at lower prices were received for switchgear of Continental manufacture.

SALFORD CORPORATION.—Metropolitan-Vickers Electrical Co., Ltd., protective switchgear at Agecroft power station, £305; and supply of two 1 500 kVA transformers at Agecroft power station, £1 528; General Electric Co., Ltd., supply of 1 000 kVA step-down transformer at Agecroft power station, £474. (All recommended.)

LONDON POWER CO., LTD.—Babcock and Wilcox, Ltd., six Babcock "C.T.M." water tube boilers, each capable of evaporating 250 000 lb. of water per hour under normal conditions and having maximum continuous rating of 318 000 lbs. per hour, with economisers, superheaters, air preheaters, etc., for new Battersea power station. The plant is to be constructed for a working pressure of 600 lb. per sq. in.

ST. PANCRAS (LONDON) BOROUGH COUNCIL.—Hackbridge Electric Construction Co., Ltd., supply of two 750 kW three-phase transformers, £649. (Recommended.) Also tendered: Johnson and Phillips, Ltd., £672; British Thomson-Houston Co., Ltd., £691; English Electric Co., Ltd., £696; Bruce Peebles and Co., Ltd., £705; Ferranti, Ltd., £710; General Electric Co., Ltd., £721; British Electric Transformer Co., Ltd., £738; Metropolitan-Vickers Electrical Co., Ltd., £794; C. A. Parsons and Co., Ltd., £798; Brush Electrical Engineering Co., Ltd., £804; Foster Engineering Co., Ltd., £818.

ELECTRICITY SUPPLY.

Additional Plant for Carlisle—Transfer of Dalkeith Undertaking—Loan for Birkenhead Extensions—Electricity Supersedes Gas for Salford Street Lighting—Supply Wanted for Wellington, Somerset—Irish Electricity Board to Supply Mallow.

THE Holderness Trust proposes to carry out an electrification scheme in Driffield rural district.

Dumfries T.C. has decided to instal additional plant at the electricity works, at a cost of £16 000.

Uttoxeter U.D.C. has arranged to obtain a bulk supply from the Burton-on-Trent Corporation works.

Stockton-on-Tees T.C. has received sanction to a loan of £10 000 for prospective expenditure for mains and services.

Grimsby T.C. is applying to the Electricity Commissioners for permission to supply electricity to the borough of Louth.

Carlisle Corporation has received consent to the installation of a 15 000 kW turbo-alternator with three 30 000 lb. boilers, and auxiliaries.

The Ministry of Transport has sanctioned the erection of overhead mains at Hanslope by the Northampton Electric Light and Power Co.

Chesterfield Electricity Committee has obtained sanction to borrow £4 700 for the extension of the overhead equipment to New Whittington.

Haywards Heath and District Electric Supply Co., Ltd., is to erect an overhead extra high pressure line between Hassocks and Haywards Heath.

Plymouth Electricity Committee has sanctioned the extension of cable to a number of streets, the total cost involved being over £4 000.

Bradford electricity department is to erect and equip a transformer chamber in Beacon Road, at an estimated cost of £4 842, including mains.

Dalkeith T.C. has decided to sell its electricity undertaking to the Lothians Power Co., Ltd. The undertaking was purchased by the Council three years ago.

Aldershot T.C. has received sanction to a loan of £8 800 in connection with the supply of electricity to the Aldershot Park housing scheme, and North Town.

Birkenhead Electricity Committee has obtained sanction to borrow £30 000 for mains and services in Birkenhead, and £25 000 for mains and services under the Wirral scheme.

Torquay Electricity Committee seeks sanction for a further floating loan of £13 000 required, during the next twelve months, for the new mains and services throughout the area.

Middleton T.C. has decided to lay a h.t. cable to a special sub-station, to supply electricity to 70 new houses on the Mainway, Middleton Junction, at an estimated cost of £3 470.

The West Riding County Council has agreed to take a supply of electricity for the receiving home at Crookhill Hall, Conisborough, from the Doncaster Collieries Association, for power and heating.

The Kent Electric Power Co. has informed Sittingbourne U.D.C. that, under its existing statutory powers, it has been decided to provide a supply of electricity for the town and Milton Regis.

Chester Electricity Committee recommends that application be made to the Electricity Commissioners for an Order permitting the Corporation to supply electricity to premises in the parishes of Eddisbury and Delamere.

Salford Lighting Committee recommends that the Council give authority for substituting electricity for gas lighting on all principal roads. The light will be trebled and the increased cost is estimated at £1 700 per annum.

The supply of electricity at Eaglesham was switched on by Mr. Thomas Wallace on January 11th. The installation was carried out under the superintendence of Mr. Johnstone, engineer to the Clyde Valley Electrical Power Co.

Wellington (Somerset) U.D.C. has asked the Electricity Commissioners for information on the present position with regard to electric lighting for the town, and as to the possibility of the Council themselves undertaking the supply.

An inquiry has been held by Mr. John Bates, engineering inspector to the Northern Ireland Ministry of Home Affairs, into the application by Omagh Rural District Council for urban powers to enable it to supply electricity to the town of Fintona.

Bicester U.D.C. has received from the Commissioners an intimation that the application of the West of England Electricity Co., Ltd., for a Special Order has been refused, and the application of the Wessex Electricity Co. has been granted.

The London and Home Counties Joint Electricity Authority has called a conference of the local authorities within the area of the Twickenham and Teddington Electric Supply Co. to carry on negotiations for the purchase of the company's undertaking.

The Irish Free State Electricity Supply Board has informed Mallow U.D.C. that the Board proposes to supply electricity in the town, the distribution to be by means of overhead lines on wood poles. The Council has asked that iron poles be substituted.

Application is being made by Liverpool Electric Power and Lighting Committee for sanction to borrow £300 000 for prospective expenditure on electric mains.—The Council has decided to extend the electricity supply area so as to include the Sefton and Whiston rural districts.

Gravesend Electricity Committee is about to put in hand a.c. cables between Pelham Arms kiosk and El Teb, along Old Road West, £2 165; from Pelham Arms kiosk along Dover Road, a distance of 650 yards, £1 080; and through Dashwood Road to Meadow Road, in Cross Lane West, £450.

The Electricity Commissioners are to hold an inquiry on February 12th into the application of the Cleveland and Durham County Electric Power Co., for the revocation of the Order permitting Darlington Corporation to supply electricity to certain premises in the parish of Haughton-le-Skerne.

Aberdeen Corporation has approved an agreement with the Aberdeen District Committee of the County Council regarding the public lighting of the Mannofield special lighting district. The agreement is for four years, 22 lamps are to be erected, and the charge per 50 c.p. lamp is to be £1 11s. 6d. per lamp per annum.

Droxford R.D.C. has received from the West Hampshire Electricity Co. an intimation that the company proposes to apply for an Order to distribute electricity in an area including Droxford rural district, except the parish of Hambledon, and that it is proposed to obtain a supply in bulk from Southampton Corporation.

In consequence of objections to the erection of overhead transmission lines through Whinlatter Pass, in the Lake District, a conference has been arranged to take place at Carlisle on January 28th between local representatives of the Council for the Preservation of Rural England and officers of the Central Electricity Board.

Bradford Electricity Committee proposes to construct and equip a district transformer chamber in Roundhill Street, Manchester Road, at an estimated cost, including mains, etc., of £3 764.—The Baths Committee has authorised the chairman, the deputy chairman, Coun. Ellis and the baths superintendent to obtain full information with regard to electric heating and to report.

The Parliamentary Bills Committee of Dundee T.C. has decided to oppose the Provisional Order which has been presented by the Grampian Electricity Supply Co. for additional powers. To ensure that the Grampian undertaking cannot come into Dundee without the consent of the Town Council, the Committee wishes to secure a repetition of the protective clause, which was included in the 1924 Order.

It is reported that a project for drying the mud of the river Emscher, a tributary of the Rhine, and using it as fuel for the generation of electricity, is to be carried out, that an agreement for the delivery of 100 000 tons of such fuel by the Emscher Association to the Rheinisch Westfalische Elektricitätswerke has been signed, and that this quantity of fuel is expected to enable about 100 000 000 kWh of electricity to be generated.

Mr. W. Weekes, borough electrical engineer of Shoreditch (London) reports that the present demand on the power station (about 12 800 kW) is rapidly approaching the total capacity of the existing high pressure boiler plant, and that no time should be lost in making application for sanction to install a new boiler of at least 100 000 lb. per hour evaporative capacity. The cost of extensions of the boiler house and the provision of a boiler of the size required, with auxiliary plant and apparatus, is estimated at £27 000. The Electricity Committee recommends application to the Electricity Commissioners for the necessary sanction.

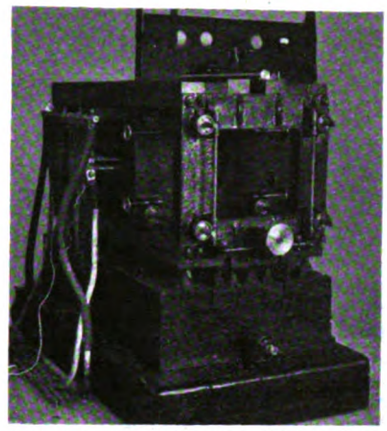
ELECTRICAL NEWS OF THE WEEK IN PICTURES.

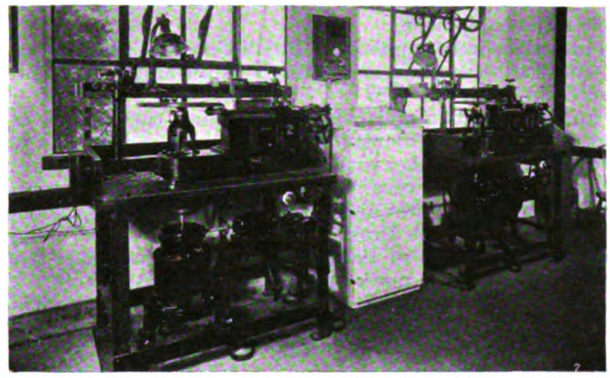
This picture of the operating theatre of a modern hospital shows the important part played by electric lighting in successful surgical operations. The use of reflectors for this work is becoming more and more general.



A large electro-magnet which was recently constructed at the National Research Laboratories at Bellevin. It was mainly subscribed for by readers of "Le Matin" in response to an appeal.

An electrical boot cleaner in Berlin. The customer sits on a high stool with his feet resting on a rail, while a revolving brush worked by a motor under the chair of the attendant does the work.

In view of the Business Efficiency Exhibition now open at the White City, London, this picture, also from Berlin, is of special interest, in that it shows a bank of electrically-connected typewriters being worked by one operator, who thus produces a number of "original" copies of the same letter by depressing the keys of one machine.



The recording room at a "talking" film studio. The machines are electrically driven, and are fitted with vacuum suction devices for collecting the wax dust as the impressions are made. The machines are fed from the studio where the scene is being photographed, through microphones, amplifiers and filter circuits, so that perfect synchronisation is obtained.

Members of the Electrical Contractors' Association and their friends at the Annual Dinner, which was held on Tuesday, at the Savoy Hotel, London. During the proceedings silhouettes of some of the personalities present were made by THE ELECTRICIAN, and these together with a report of the speeches are given on pages 116 and 117. There was an attendance of nearly 300, among whom were Col. Wilfrid Ashley (Minister of Transport), Mr. T. P. Wilmshurst (Electricity Commission), Sir John Brooke and Mr. Frank Hodges (Central Electricity Board) and Lt.-Col. K. Edgcumbe (President, I.E.E.).

INDIAN SCHEMES.

Overhead Lines in Duplicate as Precaution Against Interruption of Supply.

MESSRS. Braithwaite and Co., the structural steel engineers of West Bromwich, recently decided to carry out extensive electrical conversion schemes at both their Bombay and Calcutta works. The original power station at Muland, Bombay, consisted of three Belliss and Morcom reciprocating engine sets driving Crompton generators of a total output of 600 kW and now three G.E.C. rotary converters of a total output of 750 kW have been installed in their place. A three-phase, 50 cycle, 22 000 V supply is taken from the Tata Hydro-Electric Power Co. by means of duplicate, but independent overhead lines; these lines are duplicated in order to ensure continuity of supply should a serious fault develop on one set of lines. Each line is protected by electrolitic lightning arrestor gear of the aluminium cone type and controlled by a 100 A, 22 000 V oil-immersed circuit breaker having a rupturing capacity of 250 000 kVa and incorporating the usual three-phase overload and no-volt. protection. The lines are paralleled on to common busbars by means of these switches. Normally only one line is in service and the arrangement enables the supply lines to be changed over without interruption of service. Three similar oil circuit breakers for controlling the three rotaries are connected to these common busbars.

All e.h.t. work is carried out in bare copper rod supported on 22 000 V porcelain insulators, and the whole is screened off by steel lattice work. Three 22 000/370 V transformers (two 330 kVA and one 165 kVA) are located in a lean-to building and supply current to three tap starting roller bearing rotary converters running at 1 500 r.p.m. The rotaries are of standard construction, and three G.E.C. rotary control panels complete the equipment.

All l.t. cables were supplied by Pirelli-General Cable Works, Ltd., and these were laid in keyfibre conduit and the conduit concreted in solid.

A further installation is at present being carried out at Messrs. Braithwaite's Calcutta works, and this consists of 2 kW rotary converters together with transformers and the attendant switchgear. In this case power is taken at three-phase, 50 cycle, 6 600 V from the Calcutta Electric Supply Corporation.

When the Maharajah Protap Bahadur Deo of Mayurbhanj State, in the province of Behar and Orissa, ascended to the "gadi," he decided to mark his accession by instructing the General Electric Co. (India), Ltd., to carry out the electrification of Baripada. The scheme entailed the erection of a power station installation consisting of a 70 kW oil engine-driven generating plant, in addition to pumping sets, and over eleven miles of overhead line work.

TRADE CALENDARS, ETC.

WE have received from the COUNTY OF LONDON ELECTRIC SUPPLY CO., LTD., a telephone card illustrated by a figure symbolic of electric energy. In the foreground is shown a power station with transmission lines emanating therefrom.

A very pleasing calendar has been received from Mr. Christopher Wade, of RICHARD WADE, SONS AND CO., LTD., of Hull. The illustration shows a charming girl dressed in green, looking into the mirror of her vanity bag. The calendar may be said to be both ornamental and useful.

This year's calendar of S. G. BROWN, LTD., Western Avenue, London, W.3, is entitled, "The 'Peke' of Perfection" and consists of a wood cut-out of loud speaker, the base of which is straddled by a Pekinese dog. The product is tastefully coloured and makes both a novel and pleasing ornament.

BRITISH BROWN-BOVERI, LTD., London, has sent us a calendar illustrated by an aerial view of Baden (Switzerland) and the Brown-Boveri works, and views of various electric mountain railways in Switzerland. A picture of the Tourtemagne outdoor sub-station of the Illsee-Turtmaun, Oberems is included, together with a view of the storage lake for the Lungern power station.

We have received from Mr. J. E. DODSWORTH, a copy of "The Engineer's Diary," obtainable from stationers and bookstalls, at popular prices. This is the eighth year of publication, and, the issue as usual, contains much information of value to the engineer, varying from absolute zeros to tables for weights and measures. The diary is of convenient pocket size, leather backed and contains a foreword by Sir Robert A. Hadfield.

HEATING ENGINEERS.

Economic Application of Electricity to Low Temperature and Heating Purposes.

IT was mainly the excessive cost of electricity supply that stood in the way of its general adoption for low temperature heating purposes, said Mr. Geo. Wilkinson, in a paper before the Institution of Heating and Ventilating Engineers, in which he described an economic application of electricity for heating purposes by means of a "change-circuit." Hot water systems on the central heating plan, with coke and oil fired boilers, combined with cast iron radiators or wall panels, would doubtless continue for an indefinite time as good practice in many large buildings used for business or other purposes, especially when organised and run under a common administration. This type of installation would, he hoped, gradually wean the British public from their weakness for the open coal fire. Again, gas fires and gas radiators (when ventilated) had a domain of their own, while for short-period heating the ordinary electric fire or radiator possessed features of safety, convenience and economy. After dealing with cost of supply and modern practical economies, Mr. Wilkinson said that from Government returns and assuming an increase in load factor from 25% to 75% it was clear that during the year 1927-8 there were available for heating purposes the total of 19 855 701 260 kWh at ¼ penny. This amount was being increased every day with the growth of the constant voltage supplies. Energy in the form of electricity instead of hard fuel had the advantage in that it could be delivered at any point where heat was required. Each floor, and if nçcessary, each radiator or panel might have its separate storage cylinder which would absorb the constantly varying amount of energy received from the "change-circuits" thus forming a heat reserve to be drawn upon at such times and rates as required to maintain uniform temperature under all weather variations. The absence of combustion and the products of combustion enabled these cylinders to be placed in positions where any radiation loss was usefully employed and the whole system lent itself readily to convenient applications not obtainable with any other form of heating.

TRADE PUBLICATIONS.

THE ELECTRIC HEATING CO., George Street, Croydon, has issued a new catalogue for domestic electric appliances, under the reference No. 508.

A questionnaire in the form of a postcard has been received from HERBERT MORRIS, LTD., Loughborough, dealing with the company's conveyors, and inviting further information from potential clients so that a representative may call.

The BENJAMIN ELECTRIC, LTD., Brantwood Works, Tariff Road, London, N.17, has sent us a special booklet explaining the Benjamin lighting service. The issue is well illustrated and gives full particulars of both the company's service and the advantages gained from good lighting.

Bulletin No. 54, published by ALLOY WELDING PROCESSES, LTD., 14/16, Church Street, London, N.1, gives applications of electric arc welding to the repair and maintenance of machinery on board ship. The company's Bulletin No. 57 deals with a new electric dynamo for welding purposes.

We have received from HOBDAY BROTHERS, LTD., 21/27, Great Eastern Street, London, E.C.2, a supplementary catalogue to the main radio publication No. 70. The purpose of this supplement is to include the outstanding features of the 1928 Radio Exhibition and wireless picture receivers. There is also incorporated a special chart to direct telephone callers to the department required.

L. G. HAWKINS AND CO., LTD., 30/35, Drury Lane, W.C.2, have issued a number of pages for inclusion in their general catalogue. These include descriptions of the electric washer and wringer, No. E. 1 250; "Blazer" electric fires; "Peter the Seer," which prevents windows being affected by atmospheric changes; and the "All over" electric hair clipper. A special leaflet dealing with the "Vio Ray" artificial sunlight apparatus has also been published.

A publication has been received from BRITISH INSULATED CABLES, LTD., Prescot, Lancs., which points out that during the past fifteen years they have manufactured, laid and jointed over 1 000 miles of trunk telephone cable, with conductors ranging from 10 lb. to 300 lb. per mile, for the British Post Office. The publication also gives in detail the mileage and date of the various balanced trunk cable contracts which they have carried out.

COMPANY NEWS.

Quiet Market in Electrical Securities—Capital Issue for Austrian Electrical Works—Westinghouse Brake and Saxby Signal Company's Increased Profit and Dividend—Directors' Reports and Dividends—New Companies Registered.

CHANGES in prices of electrical securities have not been large or numerous during the past week. Yorkshire Electric Power ordinary have risen 1s. 6d. to 36s. 6d., while Charing Cross Electric ordinary have dropped 6d., and County of London Electric Supply ordinary 1s. In the traction section Central London 4% debentures have recovered one point, and stand at 81, and London Electric Railway 4% preference has risen from 73½ to 75. Among the manufacturing descriptions, British Insulated Cables ordinary have put on ½, the quotation being 91s. 3d.

SINGAPORE TRACTION CO., LTD.—Div. of 5% on 7% cum. pref. shs. is recommended.

DELHI ELECTRIC SUPPLY AND TRACTION CO., LTD.—Intm. div. of 4%, less tax, payable Jan. 31.

SOUTH EASTERN POWER AND LIGHT CO.—Qrtrly. div. of 25 cents p. sh. on common stk. is announced.

THE home of "Black Cat" cigarettes, Messrs. Carreras' new building at Mornington Crescent, London, N.W., illuminated by G.E.C. floodlight projectors and Osram lamps.

PENN-OHIO EDISON CO.—Regular qrtrly. divs. have been declared on 7% prior pref., $6 pfd. stk. and common stk.

CONSUMERS' POWER CO.—Divs. of $1·25 on $5 pfd. stk, $1·50 on 6% pfd. stk, $1·65 on 6·6% pfd. stk, and $1·75 on 7% pfd. stk. are announced.

SCHLUCHSCEWERKE ELECTRIC CO., FREIBURG, SWITZERLAND.—This co. is about to issue a 6% loan of £1 450 000, of which £420 000 will be offered in Holland at 97%.

TENNESSEE ELECTRIC POWER CO.—Regular qrtrly. divs. h. bn. declared on 5%, 6%, 7%, and 7·2% qrtrly. 1st pfd. stk. and regular monthly divs. on 6% and 7·2% monthly 1st pfd. stk.

ALDERSHOT GAS, WATER AND DISTRICT LIGHTING CO.—Messrs. A. and W. Richards offered for sale by tender last week £110 000 4% pref. stk. of this co. at a minimum price of 70.

MONTREAL LIGHT, HEAT AND POWER CONSOLIDATED.—Div. on common shs. for qrtr. ended Dec. 1 of 60 cents p. sh., compared with 50 cents for corresponding qrtr. of last year, is now payable.

SOUTHERN CANADA POWER CO.—Output in year ended Sept. 30, 1928, 138 160 340 kWh, agst. 125 452 960. Gross earngs. of co. and subsidiary cos. £1 809 566, agst. £1 534 280. Net pft. £855 073, agst. £627 742.

ALLGEMEINE ELEKTRIZITATS GES.—Div. of 8% for the year 1928 (same as previous year) has been declared. Turnover for year was 500 000 000 marks, and orders in hand are estimated at 385 000 000. marks.

EINSTEIN'S ELECTRO CHEMICAL PROCESS, LTD.—The issue of 250 000 8% participatg. pref. shs. of £1 each and 250 000 4s. ord. shs. for which subscriptions were invited last week, was over-subscribed, and the list closed on Jan. 17.

COMMONWEALTH POWER CORPORATION.—Earngs. for year ended Nov. 30, 1928, $58 066 062, agst. $52 837 951. Amt. available for divs. $16 015 874. Qrtrly. divs. of 1½% on 6% pfd. stk. and 75 cents p. sh. on common shs., payable Feb. 1.

WESTERN UNION TELEGRAPH CO., INC.—Gross revs. for 1928, $139 244 596, agst. $134 460 816 for 1927. Deductg. total exes, $120 261 522, agst. $115 846 032, leaves $189 83 074, agst. $18 614 784, and after deductn. of int. on bonded debt, net income is $15 373 669, agst. $15 030 453.

COMPANY REGISTRATIONS IN 1928.—Statistics compiled by Messrs. Jordan and Sons, Ltd., company registration agents, Chancery Lane, London, show that the total number of public and private companies registered in this country in 1928 was 9 012, with total cap. £220 506 126. Electricity, gas and water companies registered numbered 268, with total cap. £4 452 621.

AUSTRIAN POWER DEVELOPMENT.—Underwritg. took place on Tuesday of an issue of £2 000 000 6% sterling bonds to bearer of the Vorarlberger-Illwerke Aktiengesellschaft. The issue price has been fixed at 92%, giving a yield of £6 12s. 4d. per cent. Discount is to be allowed at 3% p.a. on paymts. in full. The lists were opened yesterday (Thursday). The co. proposes to erect two electric power stations to use the water power of the river Ell.

S. SMITH AND SONS (MOTOR ACCESSORIES), LTD.—In accordance with capital increase and rearrangmt. sanctioned at recent mtg., 50 000 new pfd. ord. shs. of £1 and 280 000 dfd. ord. shs. of 1s. (ranking for full year's div. for year beginng. Aug. 5, 1928, *pari passu* with existg. pfd. and dfd. ord. shs. respectively) are offered to existg. pfd. and dfd. ord. shhldrs. respectively in proportn. of one new sh. for every three shs. held. Pfd. ord. shs. are issued at 30s. p. sh., and dfd. ord. shs. at 3s. p. sh. In each case right of renunciation is given, and letters of right may be split (once only) up to Feb. 4.

Company Meetings.

HASLAM AND NEWTON, LTD.—Mr. J. H. Lord, presiding at the statutory meeting on January 15th, said the shares allotted for cash should have brought in £350 000, and they were now only £24 7s. 6d. short of that amount. The cash balance, about £33 000, and the investments, £15 500, brought them to a little in excess of the estimated amount of working capital mentioned in the prospectus, namely, £46 500. The investments were of a temporary nature, and would be realised before long. The Haslam side of the business had just entered into a contract for a period of years to supply a minimum of 100 complete refrigerator units weekly, on a fixed and satisfactory profit basis. Newton Bros. profits had exceeded the estimate made at the time of the issue. The works were busy, and profitably employed. Like all electrical engineers engaged on specialities, they looked forward to increasing turnover with satisfactory profits. Newton Bros., who had long been associated largely with British Government contracts, had secured a German Government contract for extra high tension direct current generator equipment, in which they specialised. There were certain further developments on the electrical side under consideration, but it would be unwise to refer to them more particularly at the moment, as no definite decision had yet been taken. Ford and Weston, Ltd., the subsidiary company referred to in the auditors' certificate in the prospectus, was a well-established and substantial building business in Derby. The work in hand was sufficient to occupy the energies of the company for some time to come.

WESTINGHOUSE BRAKE AND SAXBY SIGNAL CO., LTD.—Lord Southborough, presiding at the recent annual meeting, said the net profit for the year under review was £144 822, against £107 117. Their profits had benefited by the redemption of the first mortgage debentures, and in lieu of these they had now an arrangement with their bankers, who provided them with moneys required in connection with the business. Sales for the year showed a substantial increase, and the dividends from their associated companies were maintained. At the general meeting last year suggestions were made that the board should consider the question of presenting "a consolidated balance-sheet." The board were of the opinion that it was not wise, or opportune, to proceed with the project under the conditions which governed the constitutions of the company and its so-called subsidiaries. It was inadvisable for commercial reasons to disclose particulars of the accounts or profits of those companies in which the company was interested. The profits available, including £7 582 brought forward, amounted to £152 464. They had transferred £7 000 to depreciation reserve accounts for special displacements, and had transferred £20 000 to general reserve, making it £80 000. They recommended the payment of a dividend of 10%, less tax, against 8% last year, which would leave a balance of £13 227 to be carried forward. They, like other industries, were subject to the keenest competition. He believed that such good fortune as they had enjoyed sprang from the wise policy of their managing director in continually analysing methods of production for the purpose of adopting new and more scientific methods. The net figure of £172 839 at which plant and machinery appeared in their balance-sheet, represented only a few thousand pounds more than their actual expenditure on replacing, improving, and increasing their plant and machinery during the last six years. With regard to the question of the payment of an interim dividend, the board, for what they thought good and sufficient reasons, decided against it at the moment. They would reconsider the question next July.

New Companies.

ROTAPEX ELECTRIC CO., LTD.—Cap., £100. Electricians, engineers, etc. Reg. office: 62, Berners Street, London, W.1.

E. BARLOW (METAL WORKERS), LTD.—Cap., £1 000. Mechanical and electrical engineers, etc. Solicitors: Brett and Co., 24, Kennedy Street, Manchester.

WIRELESS SLOT MACHINES, LTD.—Cap., £100. Manufacturers of wireless, telegraphic and telephonic machines, etc. Reg. office: 3, London Wall Buildings, London, E.C.2.

HAYWARD AND SHEPHERD, LTD.—Cap., £500. Electricians, dealers in electrical appliances, etc. Solicitor: Ethel M. Dolbey, 29b, Holland Park Gardens, London, W.14.

PYE (CAMBRIDGE), LTD.—Cap., £100. Manufacturers of and dealers in wireless sets and apparatus, electrical appliances, radio engineers, etc. Solicitors: Bartlett and Gluckstein, 199, Piccadilly, London, W.1.

H.2.O VALVE, LTD.—Cap., £500. To adopt agreement with J. Bland for acquisition of his interest in patent No. 31 434/26, completed specification dated June 11th, 1928, and to carry on the business of electrical engineers, etc. Reg. office: 101, Dale Street, Liverpool.

STOTTS WIRE-COVERING MACHINES, LTD.—Cap., £2 000. To adopt agreement with Lottie Stott and N. Stott, to develop and turn to account business of inventor and producer of wire-covering machines carried on by said Lottie Stott at Sorrel Bank Works, Pendleton, Manchester, and to carry on business of manufacturers of and dealers in wire and materials for the insulation of wires or other electrical conductors, etc. Reg. office: 323, Bolton Road, Irlams-o' th'-Height, near Manchester.

ELECTRICAL TRADE MARKS.

This list has been specially compiled for us from official sources by GEE AND CO., Patents and Trade Mark Agents, 51 and 54, Chancery Lane, London, W.C. 2, from whom further information may be obtained.

B480 993. Class 4. Lighting carbons for electrical purposes, namely, projector carbons, arc light carbons, photographic carbons, forced carbons and searchlight carbons. National Carbon Co., Inc. (a corporation organised under the laws of the State of New York), 30, East Forty-second Street, City, County and State of New York, United States of America; manufacturers. May 25th, 1927. Address for service in the United Kingdom is, c/o Marks and Clerk, 57 and 58, Lincoln's Inn Fields, London, W.C.2.

SILENTNITE

496 853. Class 8. Component parts of wireless telephonic apparatus. John Wilson, 32, St. James' Road, Church, near Accrington, Lancashire; engineer. November 9th, 1928.

T.R.E.

496 891. Class 8. Wireless telephonic instruments and apparatus included in Class 8. James Dorn, 91, Charlotte Street, London, W.1; manufacturers. November 9th, 1928.

Registration of this Trade Mark shall give no right to the exclusive use of the letters "T. R. E."

Opposition to the registration of the following trade marks can be lodged up to February 9th.

488 993. Class 11. Electrical apparatus for aspiropulsative massage for surgical or curative purposes. Oreste Sinanide, 53, Sloan Street, London, S.W.1; medical practitioner. February 29th, 1928. (By Consent.)

Raifixa

BETA.—496 093. Class 13. Electric lamps (ordinary). John Wilson Naylor, 15, Whiteley Wood Road, Sheffield; manufacturer. October 18th, 1928.

TESA.—496 903. Class 8. Pocket lamp batteries and high tension batteries. PLAZA.—496 904. Class 8. Pocket lamp batteries and high tension batteries. E. H. Malsner and Co., Ltd., 4, Attneave Street, London, W.C.1; merchants. November 10th, 1928.

496 665. Class 13. Electric lamp fittings of ordinary metal. Harry Frederick Grinstead, trading as H. F. Grinstead, 1, Hills Place, Oxford Street, London, W.1; merchant. November 5th, 1928.

SPEEDIX.—496 247. Class 50. Fluid tight packings, jointings in the nature of packings and electrical insulating substances of asbestos, mica, resin, oils and bitumen. Dick's Asbestos Co., Ltd., Cory Buildings, 117, Fenchurch Street, London, E.C.3; manufacturers. October 23rd, 1928.

Opposition to the registration of the following trade marks can be lodged up to February 16th.

LISSEN.—493 682. Class 8. Wireless telephonic and telegraphic apparatus and parts thereof. Lissen, Ltd., Lissenium Works, Friars Lane, Richmond, Surrey; Manufacturers. July 28th, 1928. (To be Associated. Sect. 24.) Advertised before acceptance, the applicants alleging distinctiveness.

ELECTRAMONIC (sign).—492 387. Class 8. Gramophones and wireless telephonic instruments. The Electramonic Co., Ltd., Bear Gardens, Park Street, Southwark, London, S.E.1; manufacturers. June 14th, 1928. (To be Associated, Sect. 24.)

GIVRITE.—493 934. Class 8. Electrical resistances; high tension voltage cut-outs, rheostats and similar apparatus. Société Anonyme le Carbone, 37 and 42, Rue de Paris, Gennevilliers; manufacturers. August 9th, 1928. (Date claimed under International Convention, April 20th, 1928.)

AVONTONE.—497 105. Class 8. Sound reproducing instruments. Johnson and Co., 62, Wellington Road, St. Paul's, Bristol; cabinet makers. November 15th, 1928.

LEAD MARKET REPORT.

Whereas the lead market opened last week with an easier tone, James Forster and Co. state that by Tuesday prices were down to £21 15s. for January and £22 for April. Owing to the arrival of the Burma lead recently declared, the contango narrowed again to 3s. 9d. per ton against 8s. 9d. earlier in the month.

Closing prices on January 18th were £22 for January, £22 1s. 3d. for February, £22 2s. 6d. for March, and £22 3s. 9d. for April, 1s. 3d. to 5s. per ton lower on the week.

Revolutionary Improvement in Switchgear

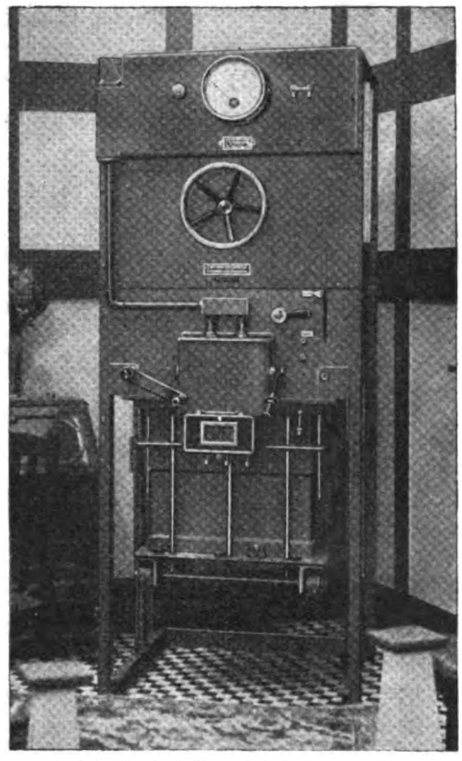
THE EVOLUTION OF A GREAT ACHIEVEMENT

As the first practical expression of the *Whitehead Principle of Isolation*, the cubicle shown here will occupy a position of great historical importance as the pioneer that led the way to a New Era in Switchgear.

THE first published description of the *Whitehead Principle of Isolation* appeared in May, 1928, to be followed by other articles and correspondence which disclosed the great interest taken in this notable advance in switchgear design.

A perusal of the recent issues of the technical Press will reveal that this ingenious invention has already influenced designers in the production of new types of switchgear.

But the essence of the *Whitehead Principle*, which is exclusive to S. & C. Switchgear, is to abolish the necessity for a movable circuit breaker in order to isolate the switchgear from the line. In present-day draw-out and drop-down gear the circuit breaker with all its components is suspended, and this unwieldy mass has to be moved (and correctly aligned again) when the switchgear is to be isolated for inspection or repair, a great complication merely to connect and disconnect six ½-inch or 1-inch plugs and sockets.



S. & C. Vertical Shrouded Switchgear Unit.
Cardiff Exhibition, November, 1928.

The *Whitehead Isolating Carriage* permits of the use of a normally fixed simple circuit breaker instead of the usual movable complicated circuit breaker. But British conservatism is difficult to move from accepted practice and present-day switchgear design cannot easily be dislodged from the trench where it is dug in.

Even S. & C. designers, at the outset, could not entirely break away from stereotyped forms, as will be seen from the illustration herewith of the first cubicle to be made embodying in a practical manner the *Whitehead Principle*.

This cubicle, however, was successful in demonstrating that the *Whitehead* innovation was of real practical value, fulfilling the claims for simplicity, compactness, complete protection, easy and accurate operation with the elimination of alignment troubles. But it also served to show the direction for further developments so that the great benefits of the *Whitehead Principle* would be utilised to the full.

The next step in the Evolution of S. & C. Vertical Shrouded Switchgear will be discussed in a succeeding advertisement.

COMMERCIAL INFORMATION.

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

BULLEN, A. G., AND CO., 79, West Walls, Carlisle, electrical engineers. £10 15s. 3d. November 13th.

FERGUSON, Archibald, 141, Slater Street, Warrington, manufacturer and electrical contractor. £22 16s. December 1st.

GARD, Mr. W., Bank Street, Coleford, electrical engineer. £18 6s. 1d. November 26th.

HARRIS (A. AND B.), LTD., 47, Victoria Street, S.W., electrical engineers. £11 4s. 9d. December 13th.

HONNORATY, Lawrence Reginald, Ryecroft, Wiggan Lane, Sheepridge, electrical agent. £13 10s. 7d. December 6th.

MACLEAN, Hector, 79A, High Street, Stockton-on-Tees, wireless dealer. £15 10s. 10d. November 27th.

MUTIMER, Charles William, 288, Upper Richmond Road, East Sheen, dealer in wireless. £27 4s. 1d. September 26th.

NEW WILSON ELECTRICAL MANUFACTURING CO., LTD., 65/66, Basinghall Street, E.C., electrical engineers. £20 6s. 1d. December 14th.

Mortgages.

[NOTE.—*The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—allowed by the date of the Summary, but such total may have been reduced.*]

ANTI-VIBRATION ELECTRIC LAMP CO., LTD., London, E.C.—Registered January 2nd, series of £3 000 debentures (of which £2 000 is already registered), together with bonus of 2 % on £1 000, present issue £500 and bonus; general charge. *——. December 14th, 1927.

BARNETT (C.), LTD., London, E., wireless accessory dealers.—Registered December 29th, series of £1 000 debentures, present issue £500; general charge.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

MOHAWK RADIO, LTD., wireless dealers, 252, Fratton Road, Portsmouth. The statutory meeting of the creditors of the above was held last week at the offices of the Society of Incorporated Accountants, 50, Gresham Street, E.C. Mr. A. A. Reeves, I.A., of 2, Tyrrel Street, Bradford, the liquidator of the company, occupied the chair. The statement of affairs submitted showed ranking liabilities of £2,270, of which £813 was due to the trade and the balance to cash creditors. In addition, there was a fully secured creditor for £13, holding security valued at £50. The assets consisted of stock and trade marks £480, estimated to realise £230; book debts £39, expected to produce £35; furniture, fixtures and fittings, £59, valued at £50; plant in workshop £75, estimated to realise £60; and surplus from fully secured creditor, £37; making a total of £412. After allowing £20 for preferential claims, the net assets were £392, or a deficiency of £1 828. The estate showed approximately 3s. 6d. in the £. The liquidator stated that the principal cash creditor was Mr. T. O. Peet, who had advanced the company sums totalling £742, whilst Mrs. Peet had lent £300. The Mohawk Service and Fitting Station, Ltd., were also creditors for £356. The issued capital of the company was £800, all of which was fully paid.

The liquidator reported that the business was commenced in December, 1926, as the Mohawk Radio Co. During the half-year to June, 1927, the turnover was £936, with a gross profit at the rate of 45 per cent., and there was a net profit of £106. The company was registered on December 10th, 1927, but it took over the business as from June of that year. The consideration payable to the vendor in respect of the plant and stock transferred to the company was £797, and nothing was paid for the goodwill. During the year to June, 1928, the sales were £1 882, but the gross profit was only at the rate of 11%, and after allowing for all the expenses there was a net loss of £973. Since June of last year, the sales had only been £740, with a gross loss of £421 and a net loss of £1 270. No definite resolution was passed, but the opinion was expressed that the voluntary liquidation of the company should be continued with Mr. Reeves as liquidator.

London Gazette, etc.

Company Winding Up Voluntarily.

NEWTON BROTHERS (DERBY), LTD.—By special resolution, December 31st, confirmed January 15th. H. C. Waddington, of Greenhalgh, Sharp and Co., Trafalgar House, Waterloo Place, Pall Mall, London, S.W.1, incorporated accountant, appointed as liquidator.

Winding-up Petition.

COUNTY ELECTRICAL AND WIRELESS STORES, LTD. A petition for winding-up has been presented by County Electrical and Wireless Stores Ltd., Garrick Yard, St. Martin's Lane, London; and is to be heard at Royal Courts of Justice, Strand, London, on January 28th.

Bankruptcy Information.

BUCKLEY, Harry, 23, Asylum Road, Old Kent Road, S.E.15, electrician. Receiving order, January 15th. Creditor's petition. First meeting, January 28th, 12 noon, and public examination, February 20th, 11 a.m., Bankruptcy Buildings, Carey Street, London, W.C.2.

LAWRENCE, Henry Frederick, 43, Canterbury Road, Margate, Kent, electrical engineer. Receiving order, January 16th. Debtor's petition.

ROYSENTUL, Jacques, 45, Woodbury Grove, Finsbury Park, London, electrical engineer. Receiving order, January 17th. Creditor's petition. First meeting, January 30th, 12.30 p.m., and public examination, February 26th, 11 a.m., Bankruptcy Buildings, Carey Street, London, W.C.2.

Notice of Dividend.

HAMMOND, William Alexander, 31, Middle Street South, Great Driffield, Yorks, wireless dealer. First and final dividend, 10s. 8d. per £, payable January 25th, Official Receiver's office, 37, Scale Lane, Hull.

Notice of Intended Dividend.

JONES, Edward Denis, Royal Sportsman Hotel, Portmadoc, Carnarvon, electrical engineer. Last day for receiving proofs, February 2nd. Trustee, I. D. Hooson, St. Peter's Churchyard, The Cross, Chester, Official Receiver.

Partnerships Dissolved.

NELSON AND FLEET (John Henry NELSON and Sydney FLEET), electrical engineers, 38, Fylde Street, Preston, by mutual consent as from January 11th, 1929. Debts received and paid by S. Fleet, who will continue the business in his own name, at 38, Fylde Street, Preston. J. H. Nelson will continue the business under his own name, at 36, Ribble Bank Street, Preston.

SIMPSON BAKER AND CO. (Charles Montague SIMPSON and Arthur Campbell BAKER), electrical suppliers, 2 to 5, Nelson Street, and 32, Newman Street, Marylebone, London, by mutual consent as from December 31st, 1928. Debts received and paid by Simpson Baker and Co., Ltd., which company was incorporated on December 27th, 1928, and will continue the business at the same addresses.

Bankruptcy Proceedings.

MARCHANT, Charles Henry, 42, Ashdown Road, lately 9, South Street, Tarringboth, Worthing, Sussex, electrical engineer. The public examination of this debtor was held on January 16th, at the Court House, Church Street, Brighton. The debtor presented a statement of affairs showing liabilities of £887, against assets of £39, and he stated that he entered into a partnership with another in July, 1926. Each provided £60 capital, the debtor borrowing his share from his father. The business was a failure and the partnership was dissolved in 1927. The partners divided the stock between them, each receiving about £10 worth, and the partner took over the liabilities, amounting to about £5. In June of 1927 the debtor entered into an agreement with another, commencing as wireless and electrical engineers and dealers. Their joint capital was £60, of which the debtor provided two-fifths and his partner the balance. This business was not successful, and the partnership was dissolved in May, 1928, since which time the debtor had continued on his own account, but he had to discontinue after two months' time. He stated that he had removed £150 worth of stock to a store room, intending to return it to his creditors who supplied it, but it was sold by the High Bailiff. The examination was adjourned for closing.

WILSHAW, George Marshall, and SHARPE, George, trading as WILSHAW AND SHARPE, 320, Padiham Road, Burnley, Lancashire, electrical dealers. The public examination herein was held on January 15th at the County Court House, Bankhouse Street, Burnley. According to the statement of affairs returned by the debtors there were liabilities amounting to £763 and a deficiency of £516. Debtors attributed their failure to lack of capital and experimental work in wireless eliminators and loud speakers, which had not proved successful. They stated that they started business in April, 1925, with a capital of about £86, the conditions being that they should share the profits and losses equally. The business was fairly successful until March, 1928, but then the takings had fallen considerably. They stated they were aware of their position in July, 1928. The examination was adjourned.

HACKBRIDGE
THERMAL RELAY

THE large number of enquiries we have received for these instruments would indicate that their application is not limited to Transformer Service.

They can be used wherever a critical temperature (between 50 and 120 degrees C.) is required to operate an auxiliary or external circuit, and our Research Dept. is prepared to advise and to carry out tests in any particular case.

Engineers are cordially invited to submit problems involving such conditions, and may accept our assurance of co-operation.

THE HACKBRIDGE ELECTRIC CONSTRUCTION COMPANY LTD

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

293 683 RAINBOW LIGHT, INC. Argon-mercury discharge tubes. (9/7/27.)
303 082 H. J. ROUND. Thermionic valves. (23/9/27.)
302 976 RADIO INSTRUMENTS, LTD. AND G. W. HALE. Transformers for high-frequency electric circuits. (23/9/27.)
302 979 L. H. PETER and WESTINGHOUSE BRAKE AND SAXBY SIGNAL CO., LTD. Track-signalling systems for railways and the like. (24/9/27.)
303 040 BRITISH THOMSON-HOUSTON CO., LTD., and H. C. HASTINGS. Control of electrically-operated switches. (26/9/27.)
278 014 S. T. GASKIN. Reception and recording of electrical signals over cables or the like. (27/9/26.)
303 085 J. HOFMANN. Electromagnetic devices operated by alternating or oscillatory currents. (26/9/27.)
303 047 A. REYROLLE AND CO., LTD., and H. C. ATKINS. Balanced electric protective systems. (27/9/27.)
303 048 BRITISH THOMSON-HOUSTON CO., LTD., and H. DREGHORN. Electric motors. (27/9/27.)
303 051 A. REYROLLE AND CO., LTD., J. MIRREY, and A. ALLAN. Electric circuit-breakers or switches. (27/9/27.)
303 086 S. G. S. DICKER (ASSOCIATED TELEPHONE AND TELEGRAPH CO.). Automatic or semi-automatic telephone systems. (27/9/27.)
279 058 ASSOCIATED TELEPHONE AND TELEGRAPH CO. Telephone systems. (18/10/26.)
303 090 A. REYROLLE AND CO., LTD., R. H. BRIERLY, YORKSHIRE SWITCHGEAR AND ENGINEERING CO., LTD., W. H. ISHERWOOD, and R. T. NORTON. Electric fusible cut-outs. (28/9/27.)
303 195 ENGLISH ELECTRIC CO., LTD., A. M. POOLEY, and A. A. HEATH. Means for interlocking doors or lids of chambers or boxes applicable for enclosing electric switchgear and other apparatus. (29/9/27.)
278 746 ASSOCIATED TELEPHONE AND TELEGRAPH CO. Remote-control of electric-power sub-stations. (11/10/26.)
303 221 BRITISH THOMSON-HOUSTON CO., LTD., J. G. WELLINGS, and C. G. MAYO. Electric protective arrangements. (8/10/27.)
303 222 A. IMBERY. Electric furnaces for heat treatment and forging. (10/10/27.)
303 224 J. NEALE. Means for effectively actuating light-sensitive cells during mist or white fog. (12/10/27.)
303 225 J. BATHGATE. Electric junction-box and switch. (14/10/27.)
303 242 W. H. ILLINGWORTH and B. BELL. Electric circuit-breakers. (4/11/27.)
303 247 SIEMENS ELECTRIC LAMPS AND SUPPLIES, LTD., and R. SIVYER. Shade-supporting arrangements for electric lamps. (15/11/27.)
289 762 VEREINIGTE GLUHLAMPEN UND ELEKTRICITATS AKT.-GES. Process for the manufacture of cathodes for electric discharge tubes. (30/4/27.)
303 253 ELECTRICAL IMPROVEMENTS, LTD., and H. B. POYNDER. Thermo-electrically-operated devices for the protection of rotary machines. (29/11/27.)
303 259 F. SMITH. Methods of and apparatus for starting squirrel-cage motors. (2/12/27.)
282 741 BRITISH THOMSON-HOUSTON CO., LTD. Electric furnaces. (29/12/26.)
303 267 RELAY AUTOMATIC TELEPHONE CO., LTD., B. B. JOHNSON, and T. M. INMAN. Junction working between exchanges in telephone systems comprising automatic exchanges. (30/12/27.)
303 301 K. ARMIN. Electric cooking or heating appliance with time-switch device. (12/3/28.)
303 053 A. E. SPENCER, P. H. WALLER, and GENERAL ENGINEERING DEVELOPMENT TRUST, LTD. Electric lighting system. (27/8/27.)
303 312 H. COVILL and R. SUFFLING. Safety device for overhead contact-arms, as applied to tramcars, rail-less electric cars, and the like. (30/3/28.)
303 317 A. E. WHITE (T. R. PALMER). Electric-battery containers. (16/4/28.)
303 320 G. W. JOHNSON (NAAMLOOZE VENNOOTSCHAP W. SMIT EN CO.'S TRANSFORMATORENFABRIEK). Electrical transformers. (23/4/28.)
292 993 BRITISH THOMSON-HOUSTON CO., LTD. Electric signal and control systems. (29/6/27.)
299 762 FELTEN AND GUILLEAUME CARLSWERK AKT.-GES. Submarine cables. (31/10/27.)
294 931 J. E. G. LAHOUSSE. Insulating-material for electric condensers and the like. (1/8/27.)
293 456 BRITISH THOMSON-HOUSTON CO., LTD. Glass-forming machines. (8/7/27.)
303 079 C. R. BURCH, F. E. BANCROFT, and METROPOLITAN-VICKERS ELECTRICAL CO., LTD. Vacuum distillation. (21/9/27.)

Application for Patents.

December 17th.

37 248 BRITISH THOMSON-HOUSTON CO., LTD. Alternating current motors. (22/12/27, U.S.)
37 256 C. CHILOWSKY and A. KOULIKOFF. Measurement of distances by electro-magnetic waves. (15/12/27, France.)
37 193 G. P. COOPER, J. W. HINCHLEY, and J. W. THOMPSON. Bleaching molasses by electrolytic treatment.
37 242 E. H. CROFT and GENERAL ELECTRIC CO., LTD. Motor control systems.
37 250 S. G. S. DICKER (N. V. PHILIPS' GLOEILAMPENFABRIEKEN.) Directing sound.
37 229 J. S. ERICSSON. Electric lighting systems for motor vehicles.
37 264 C. FRENCH. Electric horns.
37 265 C. FRENCH. Loud speakers.
37 642 GENERAL ELECTRIC CO., LTD. Arc lamps.
37 277 IDEAL WERKE AKT.-GES. FUR DRAHTLOSE TELEGRAPHIE. Thermionic tube circuits. (2/7/28, Germany.)
37 245 INTERNATIONAL GENERAL ELECTRIC CO., INC. Dynamo-electric machines. (21/12/27, Germany.)
37 177 W. H. H. MASSY. Television, etc., apparatus.
37 235 F. A. ROBINSON. Holder for thermionic valves.
37 204 R. SCHMITZ. Electric furnaces. (16/12/27, Germany.)

December 18th.

37 327 J. E. ALLAN. Motor control.
37 317 G. A. BIRCH and F. A. MULLEY. Electric light for gramophones.
37 421 BRITISH THOMSON-HOUSTON CO., LTD. Electric switches. (22/12/27, U.S.)
37 422 BRITISH THOMSON-HOUSTON CO., LTD. Furnaces.
37 381, 37 382 A. E. CHAPMAN and J. VIELLE. Electric discharge tubes.
37 315 T. COATES. Electric signal indicator for motor vehicles.
37 428 T. LANDI. Vapour lamps. (23/1/28, France.)
37 373 W. MACKIE AND CO., LTD., and J. ROOK. Dynamo-electric machines.
37 414 MASCHINENFABRIK OERLIKON. Arrangement for converting electric current. (23/12/27, Switzerland.)
37 337 F. MOUSLEY. Mouthpieces for telephones, etc.
37 318 C. PRESSLAND. Adaptor for testing wireless valve sets.
37 438 A. M. TAYLOR. Electrical power transmission.

December 19th.

37 352, 37 353 ASSOCIATED TELEPHONE AND TELEGRAPH CO. Telephone instruments. (20/12/27, Belgium.)
37 534 AUTOMATIC TELEPHONE MANUFACTURING CO., LTD., and T. BLASHILL. Electromagnetic relays.
37 544, 37 557 CLAUDE NEON LIGHTS, INC. Electric discharge tubes. (19/12/27, U.S.)
37 459 S. O. COWPER-COLES. Recording and transmitting sound waves.
37 460 S. O. COWPER-COLES. Electrodeposition of metals.
37 443 J. GRAINGER. Portable wireless receiver sets.
37 580 K. A. HAWLEY. Conductor clamps. (23/12/27, U.S.)
37 475, 37 476 J. H. HEWITT. Operating mechanism for electric condensers, etc.
37 582 E. J. LEVER (TRIX), LTD., and D. A. LYONS. Portable wireless receiving sets.
37 472 W. MCGEE AND SON, LTD., and G. S. YOUNG. Cooling arrangements of dynamo-electric machines.
37 540 G. MAIN. Incandescent electric lamps. (23/12/27, France.)
37 467 METROPOLITAN-VICKERS ELECTRICAL CO., LTD., and E. Y ROBINSON. Vacuum electric tube devices.
37 543 METROPOLITAN-VICKERS ELECTRICAL CO., LTD. Vacuum distillation.
37 576 MULLARD RADIO VALVE CO., LTD., and P. W. S. VALENTINE. Microphones.
37 441 G. H. NEEP and SWITCHGEAR AND COWANS, LTD. Electrical switchgear.
37 561, 37 562 Y. OKAMOTO. Printing telegraphs.
37 539 RECORD ELECTRICAL CO., LTD., and J. W. RECORD. Means for retarding action of electrical apparatus.
37 489 REES MACE MANUFACTURING CO., LTD., and K.S.S. SPENCER. Loud speakers.
37 490 REES MACE MANUFACTURING CO., LTD., and K.S.S. SPENCER. Radio receiving sets.
37 491 REES MACE MANUFACTURING CO., LTD., and K.S.S. SPENCER. Radio circuits.
37 235 F. A. ROBINSON. Holder for thermionic valves.
37 503 J. ROBINSON. Electrical systems for transmission of pictures, etc.
37 586 F. S. S. WATES. Electrical batteries.
37 587 F. S. S. WATES. Electric battery connectors, etc.

December 20th.

37 639 H. F. ANNS. Shades for electric lamps.
37 719 J. H. BAKER and T. S. SKILLMAN. Telephone systems.
37 618 BRITISH INSULATED CABLES LTD., and J. N. CRESSWELL. Sealing devices for electric cables, etc.
37 702 BRITISH THOMSON-HOUSTON CO., LTD. Synchronous inductor frequency changers. (24/12/27, U.S.)
37 703 BRITISH THOMSON-HOUSTON CO., LTD. Governing mechanisms for turbine-driven sets. (24/12/27, U.S.)
37 602 H. F. CARR. Obtaining electrical supply for wireless receivers.
37 694 H. C. CHANNON, H. J. GARNETT, and W. S. SMITH. Manufacture of continuously loaded conductors.
37 695 H. C. CHANNON, J. N. DEAN, and H. J. GARNETT. Submarine cables, etc.
37 680 O. FULTON. Electric reception of pictures, etc.
37 643 GENERAL ELECTRIC CO., LTD., and C. H. NUNN. Changing of transformers.
37 644 GENERAL ELECTRIC CO., LTD., and R. J. KAULA. Electric coupling elements.
37 608 H. HILTON. Electric insulators.

COMING EVENTS.

Friday, January 25th (To-day).

ENGINEERING AND SCIENTIFIC CLUB (WOLVERHAMPTON).—Debate on "Trams *versus* 'Buses." Opened by Mr. A. C. Baker and Mr. C. Owen Silvers.

INSTITUTION OF ELECTRICAL ENGINEERS (IRISH CENTRE).—Gaiety Theatre, Dublin. Faraday Lecture by Mr. Ll. B. Atkinson on "How Electricity Does Things." 4 *p.m.*

PHYSICAL SOCIETY.—Imperial College of Science, Imperial Institute Road, South Kensington. Papers by Prof. G. Vernon Boys on a "Fused Quartz Pendulum Rod for Clocks"; Mr. G. W. Sutton on "A Method for the Determination of the Equivalent Resistance of Air-Condensers at High Frequencies"; and Mr. L. Hartshorn on "The Measurement of the Anode Circuit Impedances and Mutual Conductances of Thermionic Valves." 5 *p.m.*

BIRMINGHAM ELECTRIC CLUB.—Grand Hotel, Colmore Row, Birmingham. Presidential Address. 7 *p.m.*

Monday, January 28th.

ELECTRICAL CONTRACTORS' ASSOCIATION (EALING SUB-BRANCH).—Ordinary meeting.

INSTITUTION OF ELECTRICAL ENGINEERS (WESTERN CENTRE).—Bristol. Faraday Lecture by Mr. Ll. B. Atkinson on "How Electricity Does Things."

INSTITUTION OF ELECTRICAL ENGINEERS.—Institution, Savoy Place, Victoria Embankment, London. Informal meeting. Discussion on "Mains Testing." (Opened by Mr. F. C. Raphael.) 7 *p.m.*

INSTITUTION OF ELECTRICAL ENGINEERS (NORTH-EASTERN CENTRE).—Armstrong College, Newcastle-on-Tyne. Paper by Mr. J. L. Carr on "Recent Developments in Electricity Meters, with particular reference to those for special purposes." 7 *p.m.*

ROYAL SOCIETY OF ARTS.—John Street, Adelphi, London. Cantor Lecture (II) by Dr. C. H. Lander on "The Treatment of Coal." 8 *p.m.*

Tuesday, January 29th.

INSTITUTION OF ELECTRICAL ENGINEERS (TEES-SIDE SUB-CENTRE).—Grand Hotel, Middlesbrough. Annual Dinner.

ELECTRICAL CONTRACTORS' ASSOCIATION (BIRMINGHAM BRANCH).—Ordinary meeting.

INSTITUTION OF ENGINEERING INSPECTION,—Royal Society of Arts, John Street, Adelphi, London. Paper by Mr. B. P. Dudding on "Errors in Testing Bulk Supply by Random Selection." 5.30 *p.m.*

INSTITUTION OF ELECTRICAL ENGINEERS (NORTH MIDLAND CENTRE).—Hotel Metropole, King Street, Leeds. Paper by Messrs. Johnstone Wright and C. W. Marshall on "The Construction of the Grid Transmission System in Great Britain." 7 *p.m.*

SCHOOL OF ENGINEERING AND NAVIGATION.—High Street, Poplar. Lecture II (Course of five lectures) by Mr. H. Brazil, on "Electrical Sub-Stations." 7 *p.m.*

INSTITUTION OF ELECTRICAL ENGINEERS (SCOTTISH CENTRE).—North British Station Hotel, Edinburgh. Informal meeting. Paper by Mr. E. Seddon on "Recent Extensions to Portobello Power Station." 7 *p.m.*

ELECTRICAL ASSOCIATION FOR WOMEN.—E.L.M.A. Lighting Service Bureau, 15, Savoy Street, Strand, London. Lecture by Mr. F. W. Purse on "How Electricity is Generated." 7 *p.m.*

Wednesday, January 30th.

ELECTRICAL ASSOCIATION FOR WOMEN.—46, Kensington Court, London. Socia Sub-Committee special "At Home." 3 *p.m.*

ELECTRICAL CONTRACTORS' ASSOCIATION (BELFAST BRANCH).—5, Bedford Street. Ordinary meeting. 3.30 *p.m.*

ELECTRICAL ASSOCIATION FOR WOMEN (MANCHESTER BRANCH.)—Lighting Service Bureau, 4, Fountain Street. Lecture by Mr. A. P. M. Fleming on "Milestones in the Progress of Electricity." 7.30 *p.m.*

ROYAL SOCIETY OF ARTS.—John Street, Adelphi, London. Paper by Mr. G. Fletcher on "The Shannon Scheme and Its Economic Consequences." 8 *p.m.*

Thursday, January 31st.

ROYAL INSTITUTION OF GREAT BRITAIN.—21, Albemarle Street, London. Lecture by Sir William Bragg on "The Early Evolution of X-Rays." 5.15 *p.m.*

INSTITUTE OF PATENTEES.—Caxton Hall, Westminster. Lecture by Mr. W. J. Dow on "Inventors, Their Failings and Troubles." 8 *p.m.*

Friday, February 1st.

INSTITUTION OF ELECTRICAL ENGINEERS (METER AND INSTRUMENT SECTION).—Institution, Savoy Place, Victoria Embankment, London. Paper by Mr. J. L. Carr on "Recent Developments in Electricity Meters, with particular reference to those for special purposes." 7 *p.m.*

Current Topics.

Anticipating Demand.

SINCE attention was drawn, in two recent I.E.E. papers and in a note in these columns, to the importance of economics in engineering—in other words, the economical application of science to engineering problems—signs have not been lacking of a concentration of interest on this fundamentally important matter, which augurs well for the progressive development of the industry. Expansion, particularly of electricity supply plant and networks, has for so long proceeded for the most part on casual lines, with "rule-of-thumb" as the only approximate guide, that it is at first a little difficult to conceive that there can be a more economical way of achieving comparable results. Take, as a broad hypothetical example, an engineer faced with the need to erect a new generating station. He knows of a site which is cheap so far as the land is concerned, and he knows that ample water supplies and railway sidings are in close proximity. It would seem that this was obviously the right spot. But—and there is usually a "but" in these schemes—the portion of the supply area in which intense activity prevails in the erection of new factories and dwellings is situated several miles from the proposed station, and further consideration suggests that future development will continue in the direction of the supply authority's boundary. It may well be that the cost of taking a supply to this outlying portion of the area may be so great as to counterbalance any expected economies envisaged in the original station site, and the possibility of using the same water at a different place, and so extending the existing, or utilising alternative connections with the railway system may be worthy of consideration. Even here, however, little is to be gained by looking at initial cost; the present value of all the annual charges (i.e., interest on capital, maintenance and depreciation) spread over the years of potential use is the only reliable measure, and when such studies take every factor into consideration, and include every possible alternative, it is no difficult matter to arrive at an economically sound conclusion. The basic principle appears so ridiculously simple that it might be wondered why anybody should waste time on efforts to elucidate the obvious. Examination of a concrete example soon shows, however, that an arrangement which judgment considers to be best is frequently not so good when viewed from the strictly economic standpoint. The methods devised by the Post Office for developing telephone areas on economic lines, as explained by Capt. J. G. HINES in his recent I.E.E. paper, are worthy of careful study, and it is interesting to note from an article on a later page of this issue that very similar methods are being used in Sweden for the planning of electricity supply in new districts.

The Dazzle Problem.

IT is difficult to understand why the problem of avoiding glare for motorists' headlights has not yet been tackled in a proper co-ordinated manner. Of swivelling devices, and methods based on the partial obscuration of the light emission of lamps used in headlights, there are literally scores upon the market, and a new development for which remarkable claims are made will shortly make its commercial début. But even if we assume the existence of a perfect motor-car headlight, and, further, that it is quickly adopted by public-spirited road users, this well-intentioned minority will still be at the mercy of the glare fiends, though with the important difference that they will be unable to take retaliatory steps against approaching offenders. As so many safety requirements in the road transport field have been compulsorily imposed after the elapse of a suitable period of notice, it should be perfectly easy for official notice to be given requiring the adoption within a period of, say, six months, of some anti-dazzle headlight of approved pattern. The possibility of giving undue preference to any particular type of appliance would be avoided by the establishment of a "permitted" list similar to that which operates in connection with electric safety lamps for use in mines.

The British Industries Fair.

FROM the advance information we are receiving from day to day, we gather from those firms who are showing in the Electrical Section of the British Industries Fair, at Castle Bromwich, that the exhibits are practically ready for dispatching to the stands. Further, though there are still two weeks to pass before the opening of the Fair, the enthusiasm of the exhibitors is such that the arrangements for showing the various equipments are already decided upon. Those members of the industry who have visited the Fair in previous years—and who has not?—will this year find the stands at Castle Bromwich to be in alignment from end to end as well as from side to side,

Digitized by Google

thus permitting direct approach to any particular stand from any position. This arrangement has dispensed with the classified buildings of "A," "B" and "C," and allows of each aisle being lettered and divided into "group" stand numbers, each group number being sub-divided. Another interesting point is that the Electrical Section this year occupies nearly twenty-five per cent. of the whole exhibition. It may also be of interest to those who intend visiting the Fair that there will be a continuous passenger service of petrol-driven cars running the entire distance of the south side of the Fair. The utility of the innovation is unquestioned, but it would have been excellent electrical propaganda to have employed a few electric battery driven vehicles for this purpose. Perhaps it is not even now too late for the change to be made.

Pulverised Fuel Developments.

ANNOUNCEMENTS made by and about the new company which has been formed, with Sir ROBERT HORNE as chairman, to exploit and develop a promising system of burning pulverised fuel for steam raising purposes, serve to renew interest in a perennially controversial subject amongst power-station engineers. The employment of pulverised fuel installations in British central stations has certainly been increasing, but not at anything like the rate that some early enthusiasts predicted. The number and importance of the new stations opened last year in which coal and chain grate stokers were still preferred suggests that a by no means insignificant school of thought in the power-station world is still awaiting the further development of pulverised fuel operation which the formation of this new company may not unreasonably be expected to presage.

The Brown-Lektophone Case.

THE judgment in favour of S. G. BROWN, LTD., in the loudspeaker patent litigation which has been proceeding in the Law Courts for some weeks, will doubtless create something approaching a stir in the radio manufacturing industry. Details of the findings of Mr. JUSTICE TOMLIN are given elsewhere in this issue, and a point of interest outside the legal aspect of the case is found in the fact that in his Lordship's opinion Mr. M. C. HOPKINS confined his specification to instruments which produced vibration by the movement of a stylus over a record. In view of the year of the granting of this patent, namely 1914, we are once again reminded of the apparent close association between the gramophone and radio industries, as opposed to the anticipated competition when broadcasting started in 1922–23, in both America and this country. Since then we have seen increased sales in gramophones as a result of radio; many expensive gramophone-radio combination sets have been put on the market; and the majority of the better-class gramophones incorporate moving-coil loud speakers. The latest development along these lines is the merger between the RADIO CORPORATION OF AMERICA and the VICTOR TALKING MACHINE CO., possibly the two biggest organisations in America in their own classes. Both the radio and gramophone industries may now be regarded as of electrical interest, for the two together will, in the words of Mr. DAVID SARNOFF, give better service to a single art—electrical entertainment.

Marine Electrical Progress.

IT will be apparent to those who have followed the recent developments in electric ship propulsion that after a period of stagnation this important application of electricity on board ship is now showing very distinct signs of liveliness. For auxiliary purposes electricity has very naturally come to be regarded as the standard power producer for most types of modern vessel, and it is gratifying to find that British electrical firms are securing much useful business in this field. The revival of interest in electric propulsion dates from the decision of the P. & O. Line to adopt the turbo-electric drive for the new 19 500 tons "Viceroy of India," shortly to be placed in commission. Still more noteworthy, and of particular interest from the engineering point of view, is the confirmation of the forecast, made in our issue of November 16th last, that the new 60 000 tons White Star liner "Super-Olympic," now on the stocks at Belfast and destined to be the world's largest ship, will be a Diesel-electric ship. Consideration of her mammoth proportions and the type of propulsive machinery to be adopted clearly indicates that in many ways the new vessel will be designed on lines very different from anything that has been done before. Developing something approaching 180 000 S.H.P., she will require to have a large number—probably twenty—Diesel engines. This will mean a 4-shaft arrangement, with a power distribution of 45 000 H.P. per shaft, and splitting this up between, say, six motors per shaft, each motor will be required to develop 7 500 H.P. The Diesel engines are to be arranged on two levels, and this novel layout will entail entirely new designs for many of the features which have been more or less standardised on existing ships. It is hoped later to deal with some of the interesting new problems that will arise in the construction of the "Super-Olympic," but for the moment it is important that the electrical industry should realise that this great ship will rivet the attention of the world on electric propulsion, and will directly influence emulative building. Already there are strong rumours abroad that the Cunard Line will not long delay the ordering of an electric ship of large proportions.

Cabling to Singapore.

RECENT developments in wireless telegraphy have so fired the public interest that cable telegraphy has come to be regarded by the man-in-the-street as an antiquated and obsolescent means of communication. A timely corrective is contained in the announcement of a test carried out on Monday at the London offices of the Eastern Extension Co., of the efficiency of the new direct cable service to Singapore, which makes it possible to send messages a distance of 10 521 miles in 1·2 sec. It is not so long since a message to Singapore took approximately ten hours, and even in recent years half an hour was considered good. Under the new arrangements the message is automatically relayed through eleven other stations, including Gibraltar, Malta, Alexandria, Suez, Port Sudan, Aden, Colombo, and far-distant Penang.

Colour and Its Applications.

THE paper read by Dr. L. C. MARTIN at the last meeting of the Illuminating Engineering Society, dealt mainly with the scientific principles underlying the application of coloured light, and a number of delightful experiments, executed by Mr. C. F. SMITH with the aid of the "mutochrome" apparatus, illustrated the phenomena of colour-harmonies, colour-contrasts, spatial induction, etc. The discussion turned to a great extent on applications of artificial daylight—both in the form desirable for accurate colour-matching and in the modified type of unit for general use. Dr. MARTIN pointed out—what many people are apt to overlook—how great a part the peculiarities of the eye play in the matching of colours. Results may depend very largely on the degree of luminosity and the region of the retina used. For this reason the demands for accuracy of reproduction of "normal daylight" made by dyers and others are apt to be excessive. In any case, extreme accuracy can only be attained when we have decided on our standard of "white light." The provisional standard mentioned by Dr. MARTIN—based on the use of an electric incandescent lamp, under standard conditions, and equipped with a blue solution-filter—seems to be a practical device, and it was interesting to hear that the framing of a standard specification for artificial daylight units is now considered feasible. We gather that there is still some doubt regarding the explanation of the alleged better visual conditions obtained with a modified form of artificial daylight as compared with uncorrected light. There does seem some justification for the belief that this hue is more restful. However, as several speakers pointed out, this form of unit cannot become really popular if the psychological effect is considered "cold."

ANTICIPATION OF ELECTRICAL LOAD IN RESIDENTIAL AREAS.*

Forecasting Future Load in Terms of Time and Expansion—Studies in a Large Area—Important Economic Factors—Distribution Problems.

By ALFRED EKSTROEM, D.Sc., M.I.E.E.

IT is interesting to note that in England practically the same methods are utilised for developing a fresh telephone area as are used in Sweden for projecting an electricity supply for new districts. I have lately had the opportunity of seeing how much all work of this description in England is facilitated by the existing excellent 25 in. Ordnance Survey maps. Capt. J. M. Donaldson in his paper read before the I.E.E. last month dealt with a very important matter for an electricity supply undertaking, viz., the forecasting of the future electrical load in terms of time and expansion, and also the necessity for a flexible distribution system.

As regards flexibility, I fully agree with his recommendation of an intermediate pressure of 3 300 V, although there may be cases where an increase to 6 600 V might be preferable; at the same time the pressure of 11 000 V might also be economically increased up to 22 000 or 33 000 V.

Capt. Donaldson made a survey of several existing plants in suburban and rural areas and showed a maximum demand at main transforming centres per consumer of 0·578 kW as an average for domestic and power load. If we consider only the domestic part of the load this figure will be reduced to between 0·3 and 0·5 kW. In such a case it can easily be shown what number of units can be supplied to the consumer.

The price per unit of the energy supplied being of fundamental importance, it might be opportune also to quote some figures from a scheme for a large area in England which I have lately had an opportunity of studying thoroughly.

Light and Sundry Domestic Appliances.

The average maximum load per consumer was here taken at 0·5 kW at main transforming centres.

If we assume a load factor of about 17% (1 500 hours utilisation of the maximum demand) it is possible to transmit 0·5 kW × 1 500 hrs. = 750 kWh annually to each consumer.

The first cost for complete distribution plant in this case from the "grid" to the switchgear of the consumer amounted to £22 per consumer requiring a maximum demand of 0·5 kW. The resulting energy price charged at the consumer's terminals, according to his consumption in the instances given below are based on the assumption that a bulk supply is received from the national 33 000 V network at a cost of £3 10s. per kW + 0·23d. per kWh.

With this energy we could heat about 10 gallons of water per day from 50 to 185° F., on the assumption of a thermal storage system with an efficiency of 70%. For a family of 6 persons this amounts to 1½ gallon per person per day, which should well meet the requirements of the average kitchen and scullery.

By introducing automatic thermal storage tanks on the consumers' premises in combination with a suitable control system by the electricity supply undertaking, we would thus be able to give a considerably increased supply with the same distribution plant. Moreover, this increase of about 250% in transmitted energy can be supplied at a very low price. Excluding the necessary "change-circuit" system equipment, there are no increased costs for the distribution plant. The peak load of the power station also is not increased. It might therefore be quite reasonable in this case to sell this energy at a price not exceeding ½d. per kWh.

Cooking.

If we also wish to supply electric cooking on a large scale it is necessary considerably to increase the distribution plant originally designed for the above-mentioned maximum load of 0·5 kW per consumer. Indeed, it must be constructed so as to enable a transmission of an *additional* 1 kW per consumer. Experience has shown that for electric cooking a load factor of about 25% (2 000 hours) is attained.

For an additional maximum demand of 1 kWh per consumer we can thus transmit 1 kW × 2 000 hrs. = 2 000 kWh annually per consumer.

For cooking one generally assumes 1 kWh per person per day. These 2 000 kWh will therefore be sufficient for a family of 6 persons (6 kWh × 360 days = 2 160 kWh).

In the above-mentioned example the increase of the original plant so as to enable an additional maximum demand of 1 kW necessitated an additional cost of £15 per consumer. This resulted in a price of about 1d. per kWh to the consumer, allowing sufficient interest and sinking fund for the additional in vested capital, as well as providing for upkeep, management and energy supplied from the National grid.

In fact, as the peak loads of cooking and lighting, etc., are not quite simultaneous a certain diversity factor will arise, reducing the above-mentioned necessary additional maximum demand of 1 kWh, which will improve the economical result in favour of cooking.

It is obvious that at the same time an increase of the hot water supply is rendered possible by thermal storage arrangements up to twice that stated in the first instance, which will be sufficient for covering the consumption of energy for sinks, lavatory basins and baths at a price not exceeding ½d. per kWh.

By taking into account also the load factor of the industrial demand, obviously the amount of current available for the hot-water supply can also be increased.

TABLE.

Consumer's average consumption in units (kWh) per annum	200	250	300	400	500	600	750
Consumption per person per annum in units (kWh) (1 consumer = 6 persons)	33	42	50*	67	83	100	125
Load factor at main transforming centre in %	13·9	13·9	15·0	15·0	16·2	16·2	17·4
Equivalent hours use at maximum demand	1200	1200	1300	1300	1400	1400	1500
Consumer's part of maximum load at main transforming centre in kW	0·17	0·21	0·23	0·31	0·36	0·43	0·5
At £3/10/0 + 25 % losses	£0/15/6	0/19/4	1/1/5	1/8/7	1/13/2	1/19/9	2/6/6
Consumed units (kWh) at 0·23d. + 25% losses	£0/5/1	0/6/4	0/7/8	0/10/3	0/12/9	0/15/4	0/19/2
Cost for distribution: Interest 8% on invested capital at £22; Sinking Fund 3% ditto; Management, etc., 5% ditto; Total, 16% ditto	£3/10/5	3/10/5	3/10/5	3/10/5	3/10/5	3/10/5	3/10/5
Total cost per consumer	£4/11/0	4/16/1	4/19/6	5/9/3	5/16/4	6/5/8	6/16/0
Consumer's total cost per consumed unit (kWh) in pence	5·5	4·6	4·0	3·3	2·8	2·5	2·2

* Corresponding to an abundant consumption of light only.

The quantity of possible supply in this table is sufficient for a domestic load, including lighting, ironing, vacuum cleaning, and small electrical devices, though it is *not* sufficient for water-heating, cooking and room heating. Moreover, the resulting prices per unit are very moderate for this class of consumption.

Water-Heating.

By increasing the load factor we could, however, dispose of a considerably higher quantity of energy. If we assume an increase of the load factor of 46% (4 000 hours' use) we could transmit an additional quantity of 0·5 kW × 4 000 hrs. = 2 000 kWh annually to each consumer.

Electric Heating of Rooms.

Electric heating of rooms which are used occasionally, or for more specialised purposes which will not increase the peak load of lighting, etc., and cooking make a very desirable con-

* Including points raised in a contribution to the discussion on a paper read by Capt. J. M. Donaldson before the I.E.E. on January 10th, 1929.

Digitized by Google

sumption. I may mention the use of radiant heaters in offices and sitting rooms for heating during spring and autumn, in bathrooms for heating just before taking a bath, in bedrooms which in England usually have no permanent heating arrangements, for keeping the persons warm while dressing or undressing, or for warming the bed before going to bed, or for drying the underwear.

In all these cases a remunerative and useful electricity supply of quite exceptional dimensions is possible, favoured by England's mild island-climate and by English habits and hygiene. A charge for electricity for this purpose of up to 1d. per kWh might also be quite reasonable as long as no, or only a slight, increase in plant is called for.

The continuous heating of a house—as in the all-electric house—is a more complicated problem, as this introduces the peak load factor.

During the coldest days in the winter the electrical energy required for this purpose is very considerable, the assumed capacity of the distribution plant (about 1½ kW per consumer) being entirely taken up with domestic use other than room heating. The autumn and spring demand is less, while the summer demand is practically zero. The resulting load factor will be at the very maximum 10% (1 000 hours' use).

A diversity between permanent heating of this kind on the one hand and lighting, etc., and cooking on the other, cannot here be assumed, as many times during the cold season the peak load of these two kinds of consumption must undoubtedly coincide. In this case the heating must therefore of necessity pay its full share of the costs of the increase of the necessary distribution plant as well as of the peak load.

It is, however, obvious that already the costs of energy for a bulk supply from the national grid (assumed at £3 10s. + 0·23d. per kWh) will result in a price of more than 1d. per kWh excluding the costs for increase in the capacity of the distribution plant.

The alternative methods for an economical supply of this kind must therefore be :—

(*a*) Either that another adequate load should arise during the warmer seasons (i.e., refrigeration) which could pay the cost for the transmission plant (interest, sinking fund, management and upkeep) as well as one part of the standing energy cost (£3 10s.) of the bulk supply.

(*b*) Or that thermal storage arrangements should be carried out so that a considerable part of this load could be changed over to the off-peak time.

Conclusions.

From the foregoing comments it will be seen :—

(1) That a suitably dimensioned distribution plant is of fundamental importance for the development of an electricity supply undertaking, as well as for the price for which energy can be supplied.

(2) That a suitable " change-circuit " system may be exceedingly valuable for a domestic hot-water supply. The price of energy for this purpose ought not to exceed ½d. per kWh.

(3) That cooking on a large scale necessitates a considerable increase of the distribution plant over and above that which is generally employed. The additional costs for such an increase, if suitably carried out, will, however, often give a profitable supply at a price of 1d. per kWh, which price might generally be attractive enough to secure this class of consumption.

(4) That a supply of electrical energy for heating of rooms for more occasional or specialised purposes has in England quite exceptionally favourable possibilities to a price up to 1d per kWh, while the permanent electric heating of rooms (i.e the all-electric house) seems to be a question requiring close investigation.

BOOK REVIEWS.

Electric Lines and Nets. By Dr. A. E. KENNELLY. 2nd Edition. (London : McGraw-Hill Publishing Co.) Pp. viii + 426. 25s. net.

Dr. Kennelly has developed in his new book, which is an expansion of his former treatise on artificial electric lines, the application of hyperbolic functions to general network theory, and demonstrates their application to both real and artificial lines. His treatment of network theory is comprehensive, consistent and self-contained. To the mathematically inclined student, more particularly of communication than power transmission engineering, it should make a special appeal and prove a source of inspiration.

The use of hyperbolic functions in long line theory as developed by Dr. Kennelly is now an established part of any advanced electrical engineering curriculum, but it seems a little unfortunate that in extending the method to problems which can be treated by other easily understood methods Dr. Kennelly has not indicated what is to be gained from such extension.

For example, it is difficult to see any advantage in converting the sections of a power network, including the lumped impedances of connected apparatus, each to its particular line angle when it is desired to estimate the performance of the network. In spite of the elegance of Dr. Kennelly's method, the power engineer will probably still prefer to use the vector equations developed from the four terminal impedance theory of La Cour as being more direct and obvious in application.

Although the book purports to include the line theory of polyphase systems it could hardly be put forward as a text book on such matters, since unbalanced polyphase conditions are not treated. Suitable analysis has been developed for this purpose for some years, and a text book statement of it would be very acceptable to power engineers.

The treatment artificial lines receive in the book is again carried out from the communication engineer's standpoint alone and no mention is made of the recent developments in artificial lines for the solution of power network problems.

One can only repeat, that as the application of a particular type of analysis to long line theory the book is an excellent piece of work, but the reader must not think that there are not other aspects of the problem and other equally powerful methods of treatment.

Dr. Kennelly has his own views on terminology and can be excused inventing terms to cover his particular method, but at times he becomes a little wearisome. There seems little need, for instance, to coin the term " cyps " for cycles per second, all the more so as he himself more frequently uses the symbol ~. C. DANNATT.

Handbook of the Procedure and Evidence in Arbitrations. By W. T. CRESSWELL. (London : The Institute of Arbitrators, Inc.) Pp. xvii + 167. 6s. net.

The author has succeeded in producing a good and accurate summary of the law and practice relating to arbitrations at a price which should place it within the reach of everyone interested in the subject. Litigation is now so expensive, and is sometimes so unsatisfactory in its results, that it is not surprising that arbitration is being resorted to in an increasing degree. The technical formalities and the delays involved in legal procedure are making parties loath to commence actions, and in addition it is well known that many disputes, especially those involving the taking of accounts, or where much technical evidence has to be sifted, are more expeditiously and cheaply decided by skilled arbitrators than by a judge and jury, or by a judge alone. The skilled arbitrator is able to assess the value of expert evidence more readily and more accurately than ordinary legal tribunals. It must be remembered that parties can now select their own method of settling disputes, and an experienced arbitrator is usually the best person to decide cases in which much evidence of a technical or commercial character has to be given.

An arbitrator, however skilled he may be on the subject matter of a dispute between parties, must obey the judicial rules laid down for his guidance, and he must also be acquainted with the rules of evidence, etc. Otherwise his award may be liable to be attacked and to be set aside, or to be referred back to him for further consideration. The pitfalls are fairly numerous, and there are even irregularities which may be committed by the most experienced arbitrator, but a perusal of Mr. Cresswell's work should be of great assistance to arbitrators in steering clear of trouble in arbitration proceedings. Mr. Cresswell covers everything required, from the agreement to submit to arbitration to the making and publishing of the award and its form. It is not only arbitrators who will derive assistance from this work, but engineers, architects and business men who may occasionally be interested in settling disputes by arbitration should also find it very helpful.

In future editions of the work we should like to see the appendices giving the text of the Arbitration Act, 1889, and relevant extracts from the Administration of Justice Act, 1920, and from the Supreme Court of Judicature (Consolidation) Act, 1925, as well as certain standard forms or precedents printed in larger type. The number of forms included should also be increased, and in the index of decided cases references should also be given to all the reports in which the cases are reported.

AN INTERESTING TEST ON A D.C. 3-WIRE SYSTEM.

Combined Lighting Supply at 120 V and Power at 240 V—Arrangement Effects Considerable Reduction in Losses in Neutral Wire and on Entire System.

By VERNON W. PALEN.

RECENTLY I made a test run on a d.c. 3-wire system which netted what was to me some very interesting information.

Such an arrangement makes 120 V available for lighting and 240 V for power, and combines the two, thereby eliminating one wire, and considerably reducing the losses in the neutral wire and on the system as a whole.

There are several ways by which such a system may be derived. One of the first used schemes was to connect two 120 V generators in series as shown in Fig. 1.

With a 240 V generator as the source of energy and a battery of storage cells connected across its terminals with a tap off the midpoint of the battery (see Fig. 2), we have another method of obtaining such a system.

To-day, the generally adopted method of deriving the 3-wire system is by use of a 240 V generator supply with two identical 120 V generators (direct connected through their shafts) connected in series across the line, as in Fig. 3.

A motor-generator set when thus used is sometimes called a compensator. This name originated from the fact that such an arrangement automatically compensates for any difference in the load on the 120 V circuits.

When the load becomes unbalanced on the system, the machine across the lightly loaded side operates as a motor, while the machine across the heavily loaded side operates as a generator.

For simplicity, in Fig. 3, only the armatures are shown in the circuit. In Fig. 4, however, the fields are shown properly "cross-connected" and the various points where current and voltage readings were taken are indicated.

Characteristics of System.

Table I gives a tabulation of all the readings made during the test on this system, and includes conditions ranging from a perfect balance to extreme unbalance. Thus, by a study of the readings obtained, the characteristics of the system may be observed and conclusions may be drawn.

In Figs. 5, 7 and 8 are illustrated particular sets of readings with the magnitude and direction of current indicated at each point.

Since the path of current through a motor's windings is from positive to negative, and in a generator's windings from negative to positive, the direction of current in each case indicates which machine is the motor and which the generator.

An examination of Fig. 5 shows that the machine (A_2) across the lightly loaded side is operating as a motor, while the machine (A_1) across the heavily loaded side is running as a generator. Thus the motor adds load to the lightly loaded side, and the generator helps to supply current to the heavily loaded side. In Fig. 7 the above conditions are reversed, and we see the machine (A_1) operating as a motor and machine (A_2) operating as a generator.

Valuable Economies.

It is in this manner that the load on the two sides of the system is kept balanced, and from experience, the motor-generator set thus used pays for itself through the saving in losses.

Take, for instance, the case shown in Fig. 7. If a four-wire 120-240 V system were used, the losses for unit distance (D) would amount to :—

$(6)^2$ (2d.) + $(16)^2$ (2d.) = 584d. The losses with the scheme in Fig. 8 amount to :—

$(6)^2$d. + $(16)^2$d. + $(10)^2$d = 392d.

TABLE I.

13·5	8	16	+8	13·5	0·58	0·62	238	123	115
13	6	16	+10	13	0·57	0·63	238	125	113
9·5	0	16	+16	9·5	0·55	0·65	238	129	109

Neglecting the slight losses of the motor-generator set, the difference in losses between the 4-wire and 3-wire systems in this case is 192d, or a saving of 33 per cent. Besides the saving in losses, there is a saving in copper of at least 25 per cent., since one wire is entirely omitted, and since in most cases the neutral wire can be reduced in cross-section.

In Fig. 6, is shown a water analogy of Fig. 5 which may help to illustrate just what happens in the electrical circuit. In this case we deal with turbines and pumps instead of motors and generators, but the water flow through the various pipes

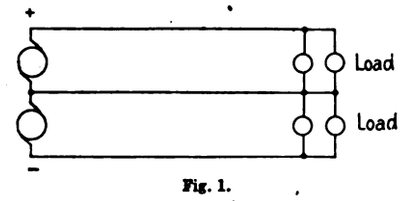

Fig. 1.

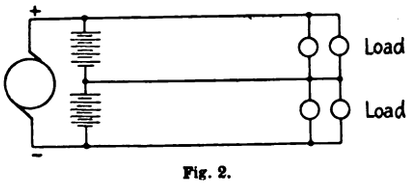

Fig. 2.

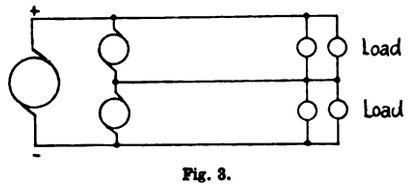

Fig. 3.

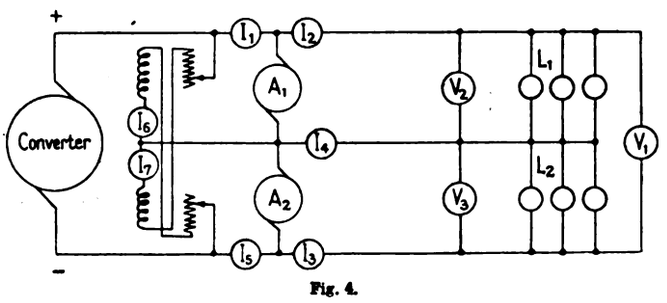

Fig. 4.

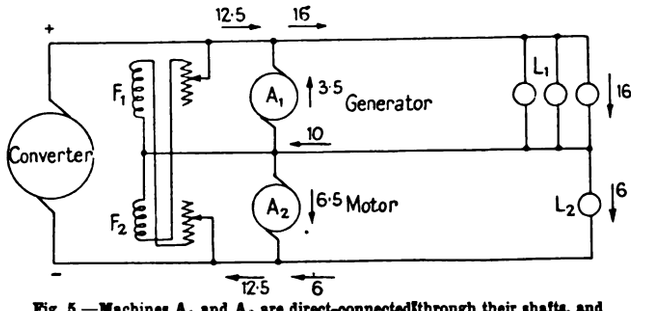

Fig. 5.—Machines A_1 and A_2 are direct-connected through their shafts, and either is capable of operating as motor or generator.

Digitized by Google

is perfectly analogous to the flow of electricity in the wires, and the load conditions determine which machine operates as a turbine and which as a pump.

There are several ways in which the fields of the compensator set may be connected. It has been found least satisfactory to connect them directly across their own armatures, as shown in Fig. 7. Since the greatest voltage drop will occur across

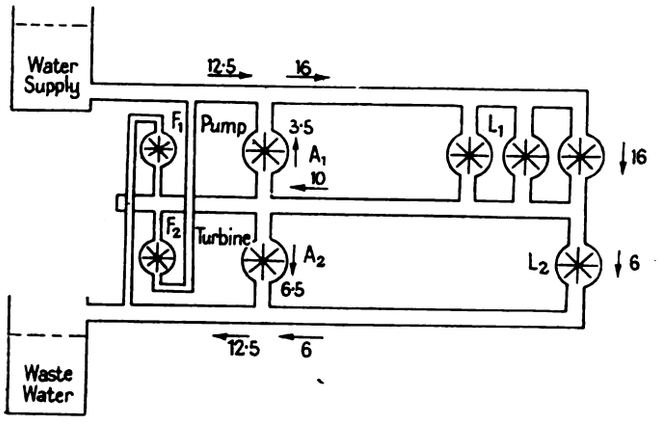

Fig. 6.—Machines A_1 and A_2 are direct-connected through their shafts, and either is capable of operating as turbine or pump.

the terminals of the more heavily loaded machine the field excitation will be reduced proportionately, and since a decrease in excitation means a further decrease in voltage, conditions will tend to become worse.

If, however, the fields are cross-connected as in Fig. 8, the voltage drop across the heavily-loaded side will decrease the excitation (and, therefore, the voltage) of the lightly

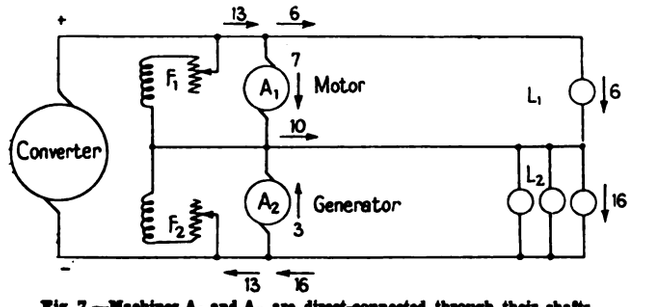

Fig. 7.—Machines A_1 and A_2 are direct-connected through their shafts, and either is capable of operation as motor or generator. Fields are straight-connected across their own armatures.

loaded side. This action tends to maintain a voltage balance between the two sides of the system, or, in other words, tends to maintain the neutral wire as its proper potential.

An examination of the data in Table I will disclose the fact that the values of field current are not constant. This, of course, is due to the variation of voltage on the two sides of the system. So, for instance, when the voltage V_2 dropped, the field current I_7 also dropped. The variation of field current and voltage are very much less than would result if the fields were " straight connected " as in Fig. 7.

Since we are primarily concerned with what takes place in the armature and load circuits, the field current values

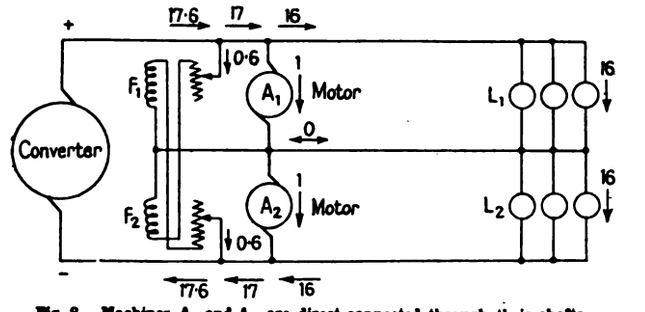

Fig. 8.—Machines A_1 and A_2 are direct-connected through their shafts, and either is capable of operating as motor or generator. Fields are cross-connected to improve voltage balance.

have purposely been omitted from Figs. 5 and 7, since they would only complicate matters and add unnecessary confusion.

An examination of Figs. 5, 7, and 8 will lead to the conclusion that " the greater the load unbalance, the greater the neutral current." Further, " the greater the neutral current, the greater the armature current."

It is, therefore, necessary to have the armatures sufficiently large to carry the maximum neutral current that will flow. With a well-balanced system a relatively small compensator set will handle the situation.

In computing the power consumption in the various parts of the circuit shown in Fig. 4, we may use the following formulæ :—

Power received from the supply :—
$$V_1I_1 + V_2I_7 + V_3I_6$$
Power consumed by the load =
$$V_2I_2 + V_3I_3$$
Power consumed by the compensator set =
$$V_1I_1 + V_2I_7 + V_3I_6 - V_2I_2 - V_3I_3$$

Taking the third set of readings (Table I) as an example :—

Power received from the supply =
(238) (15·5) + (118) (0·595) + (120) (0·602) = 3 832 W.

Power consumed by the load =
(118) (16) + (120) (12) = 3 334 W.

Power consumed by the compensator set =
(238) (15·5) + (118) (0·595) + (120) (0·602) − (118) (16) − (120) (12) = 498 W.

I.E.E. MANCHESTER DINNER.

An Interesting Early Employment of Cotton-Covered Wire Recalled.

A SINGULARLY successful and enjoyable annual dinner was held at the Midland Hotel, Manchester, on January 23rd, by the North Western Centre of the Institution of Electrical Engineers, and over 250 guests and members were present. The chair was occupied by Mr. Harcourt Williams.

In proposing the toast "The Cities and Trade of Manchester and Salford," Major-General Sir PHILIP A. M. NASH said that the trades carried on there were of a varied nature, ranging from dolls' eyes to cloth, barbed wire to steam rollers, and chemicals to artificial stone. He had heard that many years ago Messrs. W. T. Glover and Co. used to cover wire with cotton for ladies' crinolines, and this had grown into the less romantic occupation of making electric cables. The two cities were an important centre of engineering and textiles. It was worthy of note that Manchester had produced such important men as Faraday and Whitworth, and they were proud to have Dr. Ferranti, another outstanding figure, in their midst. The first Edison dynamo was made in Manchester by Mather and Platt in 1883.

Responding, the Lord Mayor of Manchester, Lt.-Col. G. WESTCOTT, said he strongly approved of the regional system of electricity supply. The question of efficiency was one of great importance. Time was when there were many incompetent people in the electrical industry, and there were still a few left. It was one of the objects of the Institution to make it more and more efficient. He recently asked a pupil engineer at the Stewart Street power station what his ambitions were, and whether he was going to push Mr. Lamb out of his job. The prompt reply was " Oh, I hope I shan't stop at that." Twenty-five years ago electricity was in its infancy, and in his opinion it was still in its infancy. The members of the industry had enormous opportunities before them, and it was the duty of the Institution to see that they were fully exploited. Manchester was second to none from an electrical point of view, and this was due to the brains of such men as Dr. Ferranti.

The toast of " The Institution " was proposed by Mr. DOUGLAS MILLER, High Master of Manchester Grammar School, who said that, though his knowledge of the industry was small, it required no inside knowledge to appreciate electricity. He only knew of two critics of electricity, the late R. L. Stevenson, who had a love for the picturesque method of lighting gas lamps, and the gas engineer.

In response, Lt.-Col. K. EDGCUMBE said that the local Centres were really the backbone of the Institution, and other institutions were following their example and forming local centres with happy results. He had often wondered why Lancashire was so precocious, and why " Lancashire thought to-day what London thought to-morrow." It was, however, recently discovered that when the Angles entered this country, the acute Angles settled in Lancashire and the obtuse Angles settled in the other parts of the country.

NUISANCE AND DAMAGE CAUSED BY ELECTRICITY SUPPLIERS.

Some Interesting Considerations Arising from a Recent Legal Case.

By W ERIC JACKSON, LL.B., Barrister-at-Law.

THE case of Farnworth *v.* The City of Manchester, which came before Mr. Justice Talbot at Manchester last July, and has recently occupied the attention of the Court of Appeal, raised some very interesting points for statutory undertakers and is well worth the closest study, although many of the points were not of very general application. The case well illustrates, however, the complexity of Private Bill legislation, and how, in spite of the efforts to codify the law by means of various general statutes, a consistent and uniform system of law seems well-nigh impossible to attain.

The Manchester Corporation originally obtained powers in 1890, under the Act of 1882, to supply electricity in various districts around Manchester. In 1899, as is well known, the Electric Lighting Clauses Act was passed, defining the clauses and conditions which were to attach to every Private Bill which in future should be granted for the supply of electricity.

In 1914, the Corporation obtained powers to erect a super-generating station. This station, when erected, proved to be a source of nuisance to surrounding occupiers by reason of the fumes created at the station.

Now the Clauses Act of 1899 says that every undertaker shall be liable for nuisance, but the Act of 1882 says nothing as to this. At any rate, the Provisional Order which gave the Manchester Corporation power to supply said nothing about liability for nuisance. Hence, up to 1914, the Corporation could not be sued for any nuisance caused by their supplying electricity, if such nuisance was a necessary and inevitable consequence of their exercising their statutory powers.

But in 1914 they obtained another statutory power, namely, the power to erect the super station. The question was, therefore, whether the clauses of the Act of 1899 (which made undertakers liable for nuisance) applied to the powers of 1914. The Act of 1899 applied to powers to *supply*, whereas the Act of 1914 was not, in the opinion of Mr. Justice Talbot, an Act authorising supply. It was merely an Act to authorise the building of a station. According to his opinion, therefore, the Clauses Act did not apply to the 1914 Act, and therefore the Corporation could not be sued for nuisance, since Parliament had, in authorising the building of a station that might cause nuisance, impliedly authorised its commission.

The Undertakers' Duty.

The principle of law still remains, that undertakers who are still supplying under the old Act of 1882, and Orders made under it, are not liable for nuisance unless in their own particular Order or Act, the liability for nuisance is expressly preserved. This does not mean that the undertaker can go out of his way to commit a nuisance and remain immune from legal action. But any nuisance caused by the ordinary and reasonable user of his statutory powers will not incur any responsibility in damages to persons who complain. But if the user is quite unreasonable and not at all necessary, then to that excessive extent he will be held liable for any trouble he may cause.

There is still, therefore, a duty upon undertakers to utilise reasonably up-to-date methods of generating and of smoke consumption, even though their powers were conferred before 1899. And after 1899, if any undertaker obtains powers to *supply*, then he will most certainly become liable for nuisance in the same way as any ordinary factory owner who has not statutory powers.

The usual sources of claim for nuisance are noise and smoke fumes. The cases generally fall into two classes, namely, those nuisances which cause injury to property, and those which only interfere with the enjoyment of property. Heat and fumes causing injury to goods or plant are in the former class, and noise and smell are in the second class.

The general principle of law is that a man can do what he likes with his own property so long as he does no harm to anyone else. No question of malice or negligence arises, so long as some actual material interference is caused, but material interference with the enjoyment of property is essential to a successful claim. To build a factory in a residential area would not be a nuisance merely because it lowered the tone and amenities of the neighbourhood.

Where, however, actual damage is caused to adjoining property the owners are entitled to damages even though the district is one which is devoted to offensive trades, or where such trades are to be expected. But where the complaint is only on the ground of interference with the adjoining owner's enjoyment of his property, without any actual damage, then the condition of the surrounding district will be taken into account.

As Lord Westbury once said in a famous case: "If a man lives in a street where there are numerous shops, and a shop is opened next door, he has no ground of complaint because, to him individually, there may arise much *discomfort* from the trade carried on in that shop . . . but where the result of that trade is a material *injury to property* then arises a very different consideration."

A "First Comer" Point.

Provided that the Court holds that a nuisance exists, it is ordinarily no defence for the tradesman to say that he was there first, and that the complaining party knew there was a nuisance and came to live near it. The reason for this is that if once an offensive trade became established, it would be impossible for the surrounding property to be used for anything but a similar business. The result would be that the district would be perpetually restricted to a particular use.

Accordingly, in a case where a confectioner had for several years used a pestle and mortar in his kitchen in Wigmore Street, London, W., and then a doctor in Wimpole Street near by built a consulting room in his back garden against the confectioner's kitchen, and the noise from the kitchen was a nuisance to the consulting room, it was held that although the doctor installed himself next to the nuisance, the confectioner was just as much in the wrong, and was ordered by the Court to remove or discontinue using the pestle and mortar.

The right to carry on a nuisance may, however, be acquired by a grant from the landlord of the adjoining property which is affected, or it may be acquired by twenty years' uninterrupted user. It is, however, not always easy to prove the latter; for it is difficult to show by evidence that the nuisance was, twenty years ago, the same as it is to-day.

On the whole, then, electricity undertakers are in this position. If their premises are in an industrial district and no physical damage is caused, no claim can be made. If it is not an industrial area, they may be open to claims for interfering with the amenities of the district, as well as for injury to property. At any moment a new occupier may come into the district and claim damages. All this is, of course, subject to what has been said above as to exemption by Statute. If the Statute or Order does not reserve the liability for nuisance, or if the undertaking is being carried on under powers conferred under the Act of 1882, then no responsibility either for physical injury or interference of enjoyment will rest upon them, provided that the nuisance caused is an ordinary consequence of the reasonable exercise of their Parliamentary powers.

In the Farnworth *v.* Manchester case the fact of nuisance was fully admitted by the undertakers. The sulphur fumes from the station could be clearly seen to devastate the crops on the ground over which they passed. Among other contentions the plaintiff said that the undertakers had not used reasonable means to conduct away the fumes by using a sufficiently high chimney. The Judge, however, on the evidence, found (and the point is therefore not open to appeal) that the suppliers had done all that they reasonably could to evade committing a nuisance. Had the Judge found otherwise, the case would have had quite a different result; for even though the Corporation may have statutory exemption from claims for nuisance, there is still cast upon all undertakers the duty of keeping their offending activities within bounds. A statutory exemption does not allow an electricity supply undertaker to do whatever he likes; it only permits him to carry out in a proper manner the powers given him. If, in so doing, he causes injury to others, then there is no more to be said, except perhaps to commiserate with the unfortunate owner adjoining whose property is damaged without any redress.

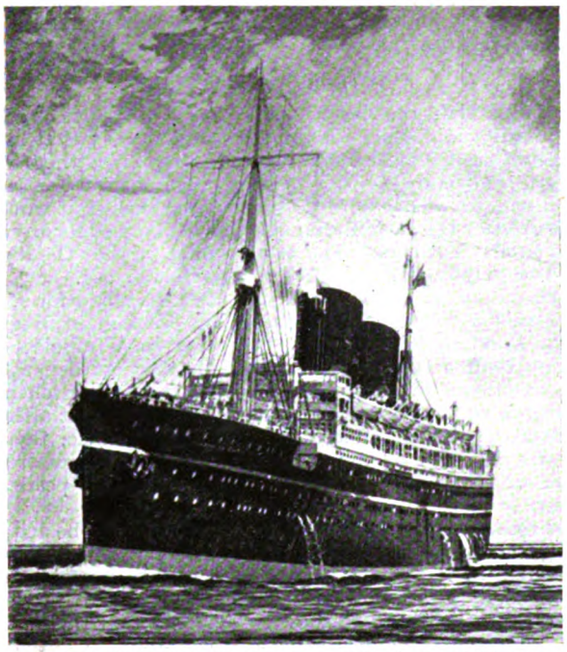
MARINE ELECTRICITY.

The Possibilities of Electric Ferries for Liverpool Considered in the Light of the Great Manœuvring Powers of Marine Electricity—Cost of Electric Ships Compared with Steamers—Electricity as a Fuel Saver.

By A. C. HARDY, B.Sc., A.M.I.M.E. (Author of "Motorshipping," "Merchant Ship Types," etc.)

IT is announced that Liverpool Corporation is shortly to order some new ferries for the busy passenger and freight services across the Mersey. Liverpool is the only port in Great Britain where ferry services are at all active and comparable with those in operation in some of the big American cities—New York, Philadelphia, and San Francisco. All these big American cities are in effect "dual" cities—New York–Brooklyn–Jersey City, Philadelphia–Camden, San Francisco–Oakland, for example. Each part in these "dualities" is separated by water. Liverpool is similarly



The triumph of the electric ship is exemplified in the 19 500 tons "Viceroy of India," the new turbo-electric P. & O. liner, shortly to make her maiden voyage. She is one of the biggest electric ships at present in commission.

separated from Birkenhead, and the Mersey ferries are as familiar and as necessary as the tramways.

It will be interesting to see whether the claims of electricity for propulsion have been, or are being, considered for these new orders. There is a great deal to recommend it—from a point of view of manœuvrability and control. No one can pretend that a reciprocating prime mover—such as a steam engine is—can manœuvre rapidly and with quick changes of rotation as efficiently as a rotary prime mover such as the marine electric motor actually is. The flexibility of pilot house control for such ships, too, is a point which cannot be overlooked.

If only on the grounds of similarity of dimensions and characteristics, it is worth while comparing a New York all-electric ferry built for carrying automobile traffic across the Hudson and a vehicular ferry operating across the Mersey. This latter is a steam driven vessel. The dimensions are comparable as below :—

Type	Route	L	B	D	Power	Speed	Remarks
Auto Ferry	New York	155	37	14·25	580	13 m.p.h.	All-electric
Luggage	Mersey	150	50	15·6	1 200	11 kts.	Steam : side loading.

Manœuvrability for Small Ships

Except in beam, the two are dimensionally very much the same. In each case, the beam recorded is the extreme beam, or beam over guards, and has comparatively little effect upon the propulsive efficiency of the hull proper. As a matter of fact, the New York ferry has a somewhat higher turn of speed than the Liverpool vessel, although her power is much less. The Liverpool ferry in deck plan view is something like an elongated horizontal section through a tub. She is a side loading vessel, moreover, and it is questionable whether this type is as efficient as the American double-ended type with a bridge house at each end. Here, with the pilot perched well up forward, are the ideal conditions for pilot house control.

Manufacturers interested in marine electricity would be well advised to lose no opportunity to place the claims of this type of propulsion prominently before those responsible for the ordering of the new vessels. It would be decidedly worth while for the industry as a whole if even one electrical contract were placed—even at a "give-away" price. The demonstrational value of such a vessel would be enormous because of the superior manœuvring qualities of the electric vessel compared with her steam sisters. After all, they are not dropping all-steam propulsion on the ferries in American waters in favour of electric propulsion merely because of the good salesmanship of the big electrical companies. In New York and San Francisco harbours, they have probably had more practical experience with ferryboat operation for heavy passenger and vehicular traffic than anywhere else in the world.

Floating Tramcars.

Ferryboats are the tramcars of big rivers and estuaries. Surely no one to-day would abandon the flexibility of control that electricity can give for this purpose in favour of a control which would postulate that the drives should give manœuvring signals to a blind man inside the body of the vehicle somewhere. And yet that is what control on the steam-driven ferry is in effect to-day.

The pilot rings a bell; the engineer on watch answers him and . . . executes the order. And this, when as many as one order every 51 sec. is given and executed on some harbour craft. With pilot house control of an electric motor the whole thing is done quickly, quietly, and automatically without any intermediary agency. The present system is merely an obsolescent application of ocean-going practice to cases where it does not apply.

It is to small harbour craft of ferryboat type that electricity is so particularly applicable on grounds of manœvrability alone. Here is a general case of application in fact. Each and every ocean-going electric ship is an entirely special case, the reasons for or against electric propulsion being dependent (1) upon auxiliary and (2) upon service requirements. This has been discussed in previous articles at some length, but is here referred to again, in connection with the latest electric ship contracts for two 20-knot turbo-electric liners for the Ward Lines New York–Havana service.

In brief, these ships are not ships to which electric propulsion shows any big advantage over other types of propulsion, because the auxiliary load, by reason of service conditions, is not a high one, and because it is not a fluctuating one. Considerations of compactness of total machinery space might have had some influence on the owners in their choice, but even here much that is gained with compact turbo-generators is lost to boiler and oil firing space.

American shipbuilding has recently received a much-needed stimulus by legislation in the form of mail and building subsidies and with it has come a kind of fashion, out of all proportion to service considerations, for electrically-propelled liners.

Leaving aside, for the moment, the question of suitability, the characteristics of the new Ward liners are of definite academic interest. The American General Electric Co.'s electric propelling motors of 16 000 S.H.P. will give a speed of about 20 knots to a hull 508 ft. in length overall by 69 ft. 8 in. beam, and having a cargo capacity of 4 155 tons. A total of 377 passengers in first cabin, and 90 tourist third passengers, will be provided for. The vessel will be of twin screw type—8 000 S.H.P. per shaft—and are expected to make the run from New York to Havana in 60 hours, the distance being some 1 166 miles. On the northward run with the Gulf Stream, that friend alike of navigators, historians, geographers, and comedians, the time may even be cut below this, and a speed of 22 knots may be attained.

Details of a technical nature, as to the exact layout of the machinery are meagre, but six Babcock and Wilcox boilers will supply steam to the turbo-generators. The stokehold will be divided, it is announced, into two watertight sections, but no information is available as to whether the bulkhead

Digitized by Google

division will be transverse or fore and aft. The contract for the construction has been awarded to the Newport News Shipbuilding and Dry Dock Co., a company already widely experienced in the construction of electric ships by the big electric liners it has built for the International Mercantile Marine Co.'s New York–San Francisco service. The contract price was £870 000 per ship, and figures are available of the bids which were submitted by other shipyards. These form a useful indication of the cost of electric ships in America. Unfortunately, similar figures are very seldom available in this country.

These figures tabulated below also enable an interesting comparison to be made of the times taken to build the ships in various yards, and of the difference in price between turbines of direct drive, and turbo-electric type. It is a noticeable reflection upon the American marine Diesel industry that no quotation was made either for direct Diesel or for Diesel-electric propulsion.

It is difficult to calculate, of course, just how the prices of electric ships, compared with turbine ships, have been regulated by the necessity of attracting work to the shipyards. Presumably, too, the prices quoted are for ships complete with propelling equipment. Judged by European standards, the prices are high, but it must be remembered that the work is being largely financed by Governmental aid.

One fact definitely emerges, however; the cost of the electric ship is not, in proportion to the total cost, so very high above that of the direct turbine ship—in the case of the successful bidder, only some £20 000. In another case, the difference was wiped out, the quotation for either steam or electric ship being exactly the same. Here again, assuming the prices to be for the complete ship, it is possible that the electrical companies, with their keen appreciation of future markets, have probably helped to arrange this. For, once the shipowner realises that he can get an electric ship for very little greater capital outlay than that necessary for a ship of ordinary type, it comes at once within the realms of practical economics and politics.

Marine electrical engineers will unquestionably find the above table useful as a guide to the price of this type of ship. Shipowners will be interested to see, proportionately, of course, for European labour conditions, what the all-electric ship will cost them. It would seem that it is not the expensive proposition we are sometimes led to believe it to be.

COSTS OF STEAM AND ELECTRIC SHIPS COMPARED: TWO 16 000 H.P. MAIL AND PASSENGER LINERS.

Shipyard.	Price per Ship: Turbine. 1 Ship	Turbine. 2 Ships.	Price per Ship: Electric. 1 Ship.	Electric. 2 Ships	Remarks.

Economy of Electric Self-Unloading Ship

I have allowed a vein of criticism to run through the above remarks on this latest electric ship order—because the ships are engaged on a service upon which the root reasons for electric propulsion are not applicable. Special requirements of service, other things being equal, should determine the fitting or non-fitting of electric propulsion. The Great Lakes of North America provide some interesting special cases for application of the all-electric ship in the giant self unloading freighters which carry ore and grain from Fort William, Port Arthur, Duluth Superior, and the upper lake ports to the lower lake ports on lake Erie, carrying back coal cargoes in return.

Some of these lake ports are little more than dumps with no unloading apparatus. Because speed of cargo handling is a *sine qua non* in great lakes ship economics it has been found practical to fit many large vessels with self unloading apparatus—endless belts on booms and in trunkways operated by some form of prime mover.

The auxiliary load in such cases is high. In one particular self-unloading vessel of 3 750 tons deadweight capacity, the belt conveyors are driven through gearing at 80 ft. per min. by a 400 H.P. engine. In another bigger ship there are two big steam engines. The application of electricity to such purposes would appear to be quite in line with modern practice, and the fact that coal is so cheap and readily obtainable at lower lake ports, would appear to make an all-electric ship a particularly worth-while proposition.

One such ship, the "Carl D. Bradley," a large ship (615 ft. by 65 ft. by 33 ft.) displacing 21 700 tons at 20 ft. draft, fitted with mechanical stokers, water-tube boilers, superheaters, air preheaters, and a main turbo-generator, has an extremely economical operating record. Under constant steaming conditions, she uses between 1·15 and 1·2 lb. per S.H.P. hour for all purposes, as compared with 1·65 to 2·25 lb. per S.H.P. hour for an ordinary reciprocating engine. The overal-coal consumption for 30 trips in 1927, including all coal used when loading and unloading, was 1·39 lb. per S.H.P. hour. This shows a very considerable economy for the electric ship.

The above remarks will, perhaps, indicate that the electric ship presents many points worth serious consideration. It should be emphasised, however, that the average shipowner is not aware of the possibilities of electric propulsion, nor of its special, rather than general, application. It cannot be said that the electrical industry has gone out of its way to show shipowners what it can offer them.

It is now generally accepted that the big high-powered ship of the future will be an electric ship, and probably a Diesell electric ship, because of the high auxiliary loads, and because of the tremendous fuel economy which cannot be secured by direct drive.

[Previous articles on the subject of Marine Electricity by Mr. Hardy have appeared in our issues of November 16th, 1928, and January 4th, 1929.—ED.]

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

"Some Fallacies of Load Factor."

[TO THE EDITOR.]

SIR,—In his article bearing the above title, Mr. E. V. Clark criticises the electricity supply companies quite as severely as he does the municipalities whom Mr. T. D. Martin has justifiably defended in your correspondence columns.

If the latter are mainly interested in statistics, the former are so timid that they are not prepared to face the diminishing returns available from new business and the risks attached to increased output! A company is, therefore, in the position of a taxi-cab driver who, being permitted to arrange his own fares, and estimating the same net profit at 1s. 6d. and 6d. per mile, chooses to charge on the higher scale. By doing so he can spend more time smoking on the cab rank, thus reducing the chance of street accident, and yet enjoy the same income as a more enterprising colleague. He would no doubt defeat his own ends, as his more active rival would tend to make taxi rides more popular and thus secure an ever-increasing share of custom, and hence a larger income for himself. "Whether it is best that a section of the community shall invariably" ride in taxis or pay nothing and walk, "it is outside the province of the engineer to decide."

In the supply of electricity refusal to take the risks inherent in increased turnover is similarly attended by the penalties paid by the business man of short views. The great British industries have not been built up by merely playing for safety. There is, it is true, a position in trade for the man of short views, but it is not one of responsibility for a great industry, such as the supply of electricity.

There is, however, another consideration. An electric supply company has had quasi-monopolistic powers bestowed upon it by Parliament, and has no right to take advantage of a sheltered position to avoid its responsibility for meeting any possible demands for electricity at reasonable prices.

Digitized by Google

Moreover, it has been claimed that a company is better able to take business risks than a publicly-owned body, and that consequently it can better fulfil a public service.

If it is not prepared to put this theory into practice it opens the door to Socialism; since we must prefer what best serves our purpose, despite political predilections. Socialism is ostensibly concerned first of all with meeting the public needs, but as good intentions do not necessarily pave the road to Paradise, and the longest way round is often the shortest way home, some of us still hold that a company's "selfishness," when truly enlightened, will prove more efficacious in the long run. Mr. Clark must look for other reasons than business pusillanimity for the lower load factors of company undertakings. The small size of many of them may be one reason. That larger ones take long views is shown by their high load factors (e.g., the Newcastle-upon-Tyne Electric Supply Co.) and by their willingness to incur commercial risks in securing such low-priced business as railway loads and domestic heating and cooking.

Mr. Martin, taking the progressive view, states the case for low prices very clearly, but his conclusion appears to require a corollary. It is unsound to reduce the price of an article either below the figure necessary to encourage its free serviceable use or so low as to destroy the stimulus to devising means for its more efficient use. We are perhaps not very far from the time when municipal undertakings may find themselves tempted to reduce the lighting rate below the economic minimum; since by doing so the appeal to the electorate will be more immediate than the pursuit of a progressive policy in other and less spectacular directions.

It must be admitted that the domestic tariffs quoted by companies do in many cases compare unfavourably with those published by municipalities, but in making a comparison of tariffs it ought to leave us quite cold to hear that one undertaking charges 6d. and another only 4d. per unit for lighting, since the former may be accompanied by a really favourable two-part tariff. The 6d. units might in that case be charged only to consumers who took so little electricity that they barely (if at all) paid their share of the cost of production.

For true comparison, one must evaluate several items:—

1. Availability of supply. Emphasis was placed on this aspect in the Weir Report, but seems to have been forgotten in the "lighting at a penny a unit" stunt of the popular Press. An undertaking which supplies a wide area can obviously make less profit per head than another supplying only an urban population. It must, therefore, either have very widely differing scales of charges in towns and villages or it must charge an average price for the whole of its mixed area higher than that required by the other, in order to earn the same profit. Nevertheless, an undertaking which makes electricity more widely available may justly claim to be fulfilling its duty at least as well as the other, even if its charges are higher.
2. The average price per unit sold for the entire output of the undertaking. This includes, of course, units supplied for large power upon which many consumers depend for their livelihood. The indirect advantage of low rates here may be of more benefit to the householder than a shilling or two in his lighting bill.
3. The average price per unit charged to domestic consumers who have substituted electricity entirely for the household services formerly performed by other means. This would be made practicable in most cases only by:
4. Hire or hire-purchase terms for all current-consuming apparatus, and by:
5. The readiness of the undertaking to give skilled attention in case of failure of apparatus and equally skilled advice in the choice and use of appliances. To give such essential attention and advice is expensive and may warrant a slightly higher rate than that found necessary by some undertakings, company and municipal, who counteract the effect of reasonable rates by a policy of leaving their consumers severely alone.

To return to load factor, Mr. Clark assumes a figure of 0.35d. per unit as the additional cost of night units. As this price is exclusive of capital charges, these cannot be spread over the new load as Mr. Martin suggests. The figure is, of course, intended by Mr. Clark merely as an illustration, but it is so wide of actual conditions as to vitiate his argument.

A large modern station should be able to deliver low-voltage units for a consumption of 2¼ lb. of coal each at 25% load factor. The fuel cost with coal at 12s. 6d. per ton would be 0.15d., of which about 0.035d. would be the stand-by cost. The extra cost is, therefore, only 0.115d. per unit, a figure far below that competitively necessary for any service and leaving ample margin for a greater coal cost or for the increased capital charges due to the greater margin of stand-by required with high load factors. (Incidentally, Mr. Clark might have claimed more in respect of these increased capital charges, but the subject is too wide to enter upon here.)

The surplus is available as a direct contribution towards the general standing charges of the undertaking and can be used, if thought fit, to reduce charges to other classes of consumers. It is interesting to note that one relatively small municipal undertaking in London sells three units a penny for night water heating—a rate that is about as low as it is competitively necessary to go to secure the entire business in the area.

There seems little ground for Mr. Clark's doubt whether the actual cost of supplying off-peak units can be ascertained. The most important factor being coal, "Parson's lines" over reasonable periods (summer and winter) will give all the information required. The cost of increased repairs and maintenance is the only difficult estimate to make from existing data, but the amount is comparatively small, and will be covered by any reasonable allowance for contingencies.

An increase in fuel costs would present no difficulty. It would probably necessitate the same kind of temporary surcharge as the competing coal or coke merchants see fit to impose for household fuel.

Mr. Martin rightly objects to the implication that there is antagonism between load factor and diversity factor, when one is so clearly an element of the latter. But was he not guilty of making the same kind of false antithesis in the *title* of his interesting article, "The Government Scheme *versus* Improved Load Factor"? There is surely nothing repugnant in the Act of 1926 to improvement in local load factors or the other desirable things to which Mr. Martin refers.—I am, etc.,

C. O. Brettelle, M.I.E.E.

32, Victoria Street,
Westminster.

Glass Insulators.

[To the Editor.]

Sir,—In his article on Glass Insulators in your current issue, Mr. North makes certain mis-statements relating to porcelain which cannot be allowed to pass uncorrected.

In the first place, there is no maker of any repute in this or any other country who turns out insulators full of pin holes, and dependent upon the glaze for their insulating qualities. The majority of insulator specifications still contain a clause stating that the material shall be absolutely non-porous and the glaze in no way relied upon for insulation, but this fact is now so well recognised that both the clause and the corresponding porosity test may be described as obsolescent practice.

In the second place, a relation between either the wet or dry flashover voltage (flashover value is somewhat indefinite) and the nature of the insulator glaze is to the best of my knowledge non-existent, identical results being obtained on both glazed and unglazed insulators of the same type within the limits of experimental error. Glaze is put on insulators for precisely the same reason that it is put on dinner plates, viz., to obtain a smooth surface to which dirt will not adhere, but has no other connection with the electrical performance.

That much of the argument on page 102 conveys little meaning to me is perhaps due to my own obtuseness. I should, however, like Mr. North to explain how it is that in spite of the many advantages of glass over porcelain, glass insulators usually fail on the temperature cycle test with a temperature range of about half that which the average porcelain will withstand. The desirability of this test may perhaps be argued, but this has nothing whatever to do with the result.

Finally, I should like to point out that in all the specifications with which I am acquainted, the temperature cycle test appears as a type test, i.e., is performed on selected insulators which are not subsequently put into service. Unless this practice is violated, the service troubles described by Mr. North cannot arise.

I am perfectly aware that glass insulators are widely used on the Continent and have many advantages—notably that of cost—which I do not wish for one moment to decry. Their introduction into Great Britain will not, however, be assisted by mis-statements of the type contained in Mr. North's article.—I am, etc.,

B. L. Goodlet,
Metropolitan-Vickers Electrical Co., Ltd.

Trafford Park, Manchester.

[Several letters are unavoidably held over due to pressure on space.—Ed.]

HEATING AND COOKING DEVELOPMENTS.

Low Temperature *v.* Radiant Heat Systems—Importance of Efficient Maintenance Service—Some Tariff Considerations.

"ELECTRIC Heating and Cooking Developments" were discussed at the January Salesmanship Conference of the E.D.A. in London. Mr. C. H. RAYNER, who introduced the subject, thought that the low temperature system of heating would supplant the radiant type of electric heater for continuous heating on account of its adaptability, low consumption and the ease with which it can be installed in various lengths in any position.

With regard to electric cooking, it was pointed out that manufacturers had recently made many improvements in both large and small electric cooking apparatus, particularly in hot plates, in the disposition of switches and fuses, enamelling hobs and oven interiors, whilst at the same time, providing a more pleasing and convenient design. As to the controversy regarding the respective merits of open type and closed type of hot plates, the verdict was decidedly in favour of the latter. Discussion, however, was still being carried on in regard to comparisons between top and bottom heat and side heat in the ovens, but in the northern districts where bread baking was carried on in the home, bottom heat appeared to be popular.

Increased Cooker Reliability.

On the score of reliability, it was pointed out, that although there are now 4 500 hired cookers on the Manchester circuit, the total number of breakdowns is less per annum than it was when there were fewer than 2 500 such cookers. As an example of the use of electricity for cooking on a large scale, mention was made of a 100 kW oven which has been in use in Manchester for nearly 3 years, giving complete satisfaction.

On the question of tariffs, Mr. Rayner favoured the two-part tariff for both industrial and domestic purposes. In Manchester, the consumer was offered a domestic "all in" tariff, based on a yearly charge of 20 per cent on the 1914 or equivalent rateable value of the house, plus ½d. per kWh for all current; this had been adopted by more than 8 500 consumers in Manchester. Two examples were given of consumers, one having a fixed charge of £4 5s. per annum, and a consumption of 11 600 kWh, and the other a fixed charge of £3 13s. 8d. and a consumption of 5 881 kWh. The total average price paid by these two consumers was 0.059d. per kWh, and 0.065d. per kWh respectively, no coal or gas being used in the first instance, whilst in the second, no gas was used, and coal only for one fire in the winter.

Finally, in a discussion of the relations between the undertaking and the consumer, emphasis was laid upon the necessity for a thoroughly efficient maintenance service, demonstrations both in the home where necessary and in showrooms, and the usual propaganda to encourage, not only the use of current for additional purposes by existing consumers, but also new consumers. Special emphasis was laid upon the necessity for bringing home to architects and builders the importance of providing sufficient points in new houses, and it was suggested that the E.D.A. should take this matter up with the representative organisations.

DISCUSSION.

Mr. R. GRIERSON, speaking of the necessity for confidence between the consumer and the supply authority, said the rateable value system was valuable in that it was easily understood by the consumer. At the same time, supply authorities frequently acted in a manner which created suspicion in the minds of the consumer and so hindered development. He mentioned one or two instances in which the supply authority had asked for the payment of lump sums ranging from £140 to £350 as a condition of giving an increased supply to premises already taking it, and it was impossible to ascertain upon what basis these amounts had been calculated. Another necessity was the standardisation of the voltage in consumers' premises, because the knowledge that the voltage in one district was different from that in another frequently deterred domestic consumers from purchasing apparatus if there was any likelihood of their moving to another district.

Mr. GREGORY suggested that the standing charges of £3 and £4 mentioned in the examples given in the paper were not sufficiently high to cover the actual costs to the supply undertaking.

Mr. HOWELL expressed the view that there had been very few developments in electrical heating and cooking apparatus in recent years, and asked how many of those engaged in the electrical industry were actually adopting electricity for cooking. He supported the action of supply authorities in some cases in demanding the payment of a lump sum before putting in a supply owing to the conditions of tenancy under which an intending consumer frequently occupied their premises.

Mr. STEELE argued that it was not necessary to have so low a running charge as 0·5d. per kWh, and said that in his own "all electric" house, his average cost was 1·1d. per kWh, and he was satisfied that he was doing his lighting, heating and cooking, etc., more cheaply than would be possible by any other means.

Importance of Tariffs.

Mr. H. W. WATTS, who thought that the development of electric cooking depended upon tariffs, said he was thinking out a three-part tariff, and did not consider it necessary to have so low a running charge as ½d. per kWh. He agreed that it was often difficult to avoid charging a consumer something for putting in a supply.

Mr. BIRKS, who said he represented a small company undertaking receiving a bulk supply, complained that owing to the terms upon which this supply was given, it was impossible to offer sufficiently low terms to encourage consumers to adopt electricity for continuous heating. In the same way it was difficult for him to develop cooking to the extent he would like owing to the load mainly coming on the peak. He suggested as a possible means of solving this problem, in cases such as his own, that the wiring of the cooker should be so arranged that the grill could not be switched on at the same time as one of the hot plates. This would reduce the demand at the time of the peak.

Mr. GARLICK said those who suggested that there had been no improvements in electric cooking and heating apparatus during recent years could hardly have had experience of what had really happened, more particularly as regards electric cooking and boiling by electricity. It was sometimes said that boiling by electricity was slow, but his experience was that this argument was being pushed too far in relation to the facts, and that the speed at which boiling could be carried out was quite reasonably satisfactory to most users. Again, the manufacturers of electric cooking apparatus gave two two years' guarantee, and the importance of that in demonstrating the reliability of the apparatus could not be over-emphasised. He also called attention to the better cooking that can be done electrically, and thought there must be some significance, as regards reliability of the apparatus, in the large maintenance staffs kept by gas undertakings. At any rate, in view of that the electrical industry need not regard it as a crime that electrical cooking and heating apparatus required supervision and maintenance from time to time. What was wanted in regard to electric cooking and heating apparatus was energetic salesmanship and demonstration of its real possibilities.

Lieut.-Col. W. A. VIGNOLES emphasised the point that the conferences were salesmanship conferences, and suggested that rather too much time had been taken up with blaming either the manufacturers of apparatus or the supply authorities for a possible lack of development of electric heating and cooking. What was wanted was some real effort at salesmanship to push the use of electricity for heating and cooking, because electricity would not sell itself. As an instance, he mentioned that on the Holly Lodge Estate where he lived, and where some 200 to 300 houses had been wired in the most modern fashion, there were not more than a dozen electric cookers. When he first went there, the gas company approached him and offered to do everything possible in the way of heating, cooking, etc., and he felt that it was this activity on the part of the gas company in getting apparatus installed which had made it impossible for electricity to be extended in the manner it might have been, had similar activity been shown on the electrical side. Electricity for heating and cooking had so many points in its favour that it only needed some real salesmanship to develop it properly.

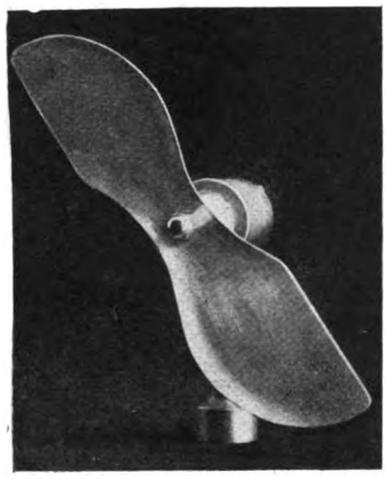
LIGHTING EQUIPMENT.

A Windmill Generating Set—An Emergency Plant.

WE have received from F. A. WILKINSON AND PARTNERS, LTD., of Gretting, near Kettering, Northamptonshire, details of a small windmill-driven generator giving alternating current. The device is fitted with a direct coupled propeller and is designed for directly lighting an additional headlamp on road vehicles. A further use is for lighting clocks, petrol pumps, advertisement signs, etc., and when used for these purposes the machine is fitted with a wind direction vane and tubular support 2 feet long with screwed socket for extension. For use with motor vehicles, the windmill dynamo is fitted on the radiator or the roof of a saloon car.



The windmill generator of F. A. Wilkinson and Partners, Ltd.

In order to meet the emergency of a breakdown in the public supply to public buildings, cinemas, hospitals, etc., the CHLORIDE ELECTRICAL STORAGE CO., LTD., of Clifton Junction, near Manchester, has designed a system, under the trade name of "Keepalite," whereby an instantaneous supply of energy is available for a number of auxiliary lamps fitted at selected points throughout the building. These auxiliary lamps are all connected by special wiring, which may be of the simplest type acceptable to the insurance companies, and are supplied at low pressure from a sealed-in battery, normally in constant connection with the mains, either through a resistance or a rectifier, according to the nature of the supply. A system of "trickle-charging" is also provided. By means of this latter a suitable charging current is trickled through the battery continuously day and night, the current being just sufficient to balance the losses which occur in that particular battery on open circuit. Should anything happen which brings about an interruption of supply, a change-over contactor-switch on the panel throws the battery over to the emergency lights. These are, consequently, instantly and automatically lighted, and remain alight until the main supply is resumed, when the battery is automatically disconnected from the emergency lighting circuit and reconnected to the trickle charging circuit. Should the breakdown be such that the emergency lighting will be required for some hours, it will, not unnaturally, appreciably reduce the charge in the battery, the capacity of which is not as a rule calculated to carry the emergency lights much longer than one hour. Should this happen, and it becomes necessary to recharge the battery promptly, then a higher charging-rate can be obtained by a special switch provided on the panel.

We have received from BERTRAM B. FENN, LTD., of 78/80, Edgware Road, London, W.2, details of a new anti-dazzle automobile lamp, which bears the trade name of "Fenn." It is claimed that one may look into the lamp when in use for an appreciable time before suffering any eye-strain, while at greater distances and slightly at one side the glare is "negligible." The lamp may be said to be made in two sections, each having its own filament. The top part of the bulb is of amber-coloured glass, while that part near to the cap is covered with fine indentations. The effect of these latter is that instead of producing a straight-forward reflection, the bulb offers to oncoming drivers, etc., a modulated reflection in the silver parabolic reflector of the head lamp. The normal driving light is given when the lamp filament contained within the indented section of the bulb is in focus, but by adjusting the lamp so that the upper filament within the amber-coloured section is in focus a yellow tinted light, for illumination when driving in foggy weather, is obtained. These two different adjustments are made by means of the lamp holder. The component is made for all standard voltages and in sizes to fit all existing head lamps.

NEWS IN BRIEF.

BURY St. Edmunds T.C. has adopted an assisted wiring scheme.

Sunderland elementary schools are to be equipped for electric lighting before next winter.

The Chief Constable of Exeter reports that every district in the city now has its police telephone.

Edinburgh point-duty policemen are to be illuminated by means of floodlights sunk below the road.

Ilford Electricity Committee seeks sanction for a loan of £5 000 for wiring installations on hire.

Tenders have been invited for the erection of a telephone exchange and postal sorting office at Oldham.

Holbeach Board of Guardians is to obtain details as to the cost of installing electric light in the workhouse.

The Faraday House Old Students' Association will hold a dance on March 5th, at the Victoria Hall, Southampton Row.

Hired cookers connected to Manchester Corporation's mains during November last numbered 63, making a total of 4 947. Orders received in November numbered 94.

Uxbridge Board of Guardians is to consider the question of installing its own electricity plant, and has instructed Mr. Eves, architect, to make inquiries with that end in view.

A meeting of the Institute of Wireless Technology will take place at the Engineers' Club, Coventry Street, W., on Feb. 11th, when Mr. Arthur W. Thynne will lecture on television.

A junior technical officer, preferably with an electrical engineering degree and experience in design of electrical apparatus, is required in the design section of an Admiralty establishment at Portsmouth.

The party of South African Public School boys who are touring England reached Rugby on Sunday. On Monday they made a tour of the British Thomson Houston Co.'s works, and were entertained at luncheon.

A special course of eight lectures on "Picture Telegraphy," will be given by Mr. E. S. Ritter at the Polytechnic, Regent Street, W., on Wednesdays, commencing January 30th, and continuing until March 27th, omitting March 6th.

Applications are invited for the Professorship of Electrical Engineering at the College of Engineering, Guindy, Madras. Forms from Secretary to High Commissioner for India, Grosvenor Gardens, S.W.1. Last date February 23rd.

West Riding C.C. Health Committee recommends an extension of the buildings and equipment at the Middleton-in-Wharfedale Sanatorium, where ultra-violet ray treatment has been given for some years. The cost is estimated at £1 092.

It has been reported to the Devon Sea Fisheries Committee that the Exe Power Experiment Association, which is proposing to harness the tides in the estuary of the Exe with a view to the generation of electrical energy, has applied to the Ministry of Fisheries for permission to place two pontoons in the estuary in a position slightly different to the one at first suggested. The Committee offers no objection.

The annual report of the Post Office on the London telephone service states that the total number of exchanges at the end of 1928 was 614 183, increase 48 593. Over 26 000 private branch exchanges are in use. One equipped during the year has 500 extension lines, 129 exchange lines, and 15 operating positions for receipt of incoming traffic. The charge for a three-minute call from Great Britain to the first Canadian and American zone has been reduced from £15 to £9.

At a meeting of Glasgow T.C. last week, Mr. McSkimming objected to a contract placed by the Watching and Lighting Committee for insulated cable. He said that while the contracting firm had a British name the work was to be done in Austria. Mr. MacDougall convener of the committee, stated that they were trying to break a ring in this industry. The tenders of the British makers had all been within 2s. of each other. The Committee's minute was approved.

At a meeting of the Insurance Students' Circle in Edinburgh, on January 22nd, Mr. Donald Smeaton Munro, chairman of the Scottish Centre, I.E.E., read a paper on "The Fire Hazards of Wiring." Mr. Munro expressed the view that our insurance companies would do well to follow the example of the American Board of Fire Underwriters and play a greater part in the protection of the public and property by ensuring the employment of qualified firms working to approved rules. The objects, aims, and working of the National Register of Electrical Installation Contractors were explained. The lecture was illustrated by experimental demonstrations designed to show how lack of continuity and defective earthing arrangements may cause outbreaks of fire.

PERSONAL.

MR. E. J. Strange, electrical engineer, Tunbridge Wells, has been elected unopposed to fill a casual vacancy on the Town Council.

The Mayor of Brighton, Coun. H. J. Galliers, has been elected to the vacant aldermancy created by the death of Ald. H. B. Lewis.

Sleaford Urban Council has increased the salaries of the assistant electrical engineers, Messrs. S. Thorlby and S. R. Smith, by £13 per annum each.

Mr. Herbert S. Goostry, of Wednesbury, has been elected chairman of the Midland Branch of the Electrical Contractors' Association, and Mr. G. R. J. Parkinson, president.

Having been appointed manager of the Norwich Electric Tramways Co., as announced last week, Mr. Frank Buckley has resigned his present position with the Bury Corporation Tramways.

Walsall Town Council has increased the salary of Mr. W. Vane Morland, transport manager, from £875 to £950 per annum, with a further increase up to £1 000 in October next year.

Mr. W. F. Marchant, chairman of the London and Home Counties Electricity Authority, has been elected chairman of the Conference of Joint Electricity Authorities, Advisory Boards and Committees.

The Council of the I.E.E. has made the Eighth award of the Faraday Medal to Signor Guido Semenza, of Milan, in view of the leading part he has taken in the development of the applications of electricity. See page 149.

Mr. H. P. Stokes, transport manager for the Plymouth City Council, has been presented by the Management Committee of the Tramways Social and Benefit Fund with a case of pipes and a tobacco pouch.

The Tramways Committee of the Derby Town Council on January 21st appointed Mr. P. W. Bancroft as deputy tramways manager for a period of six months. At the end of that period the question of the managership will be finally decided upon.

Mr. Stanley Cecil Davies and Miss Elsie Steel, members of the staff of the Hewittic Electric Co., Ltd., have been presented on their marriage with a cabinet of cutlery, a carpet cleaner, a pouffe, and a mahogany oval mirror by their colleagues.

Mr. V. W. Dale, the business manager of the British Electrical Development Association, who was taken ill at Christmas with influenza is, we are glad to say, improving in health. The influenza was followed by pneumonia and empyema and an operation was necessary, but good progress is now being made.

Estate of the gross value of £1 867 was left by the late Mr. Frank Schofield, commercial manager of the Stalybridge, Hyde, Mossley and Dukinfield Joint Tramways and Electricity Board.

M. Henri Lucien Boulanger, of Grenoble, has been appointed deputy director of the International Telegraphic Union, Berne, Switzerland.

Miss B. J. Lanfear, who has resigned from the position of Secretary of the I.M.E.A.

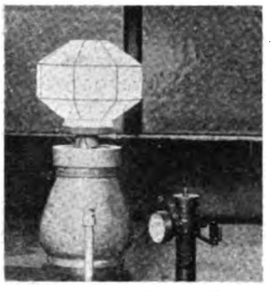
Many of our readers, particularly those connected with the electricity supply industry, will learn with regret of the resignation of Miss B. J. Lanfear from the position of Secretary of the Incorporated Municipal Electrical Association. During the nine years in which she has occupied the post she has worked in co-operation with the honorary secretary, Mr. A. C. Cramb, borough electrical engineer of Croydon. The organisation of the annual conventions of the I.M.E.A., with which Miss Lanfear was so notably associated is remembered by many of the members and visitors as a model of efficient organisation.

Mr. E. W. Hill has been appointed chief engineer of Aron Electricity Meter, Ltd., in succession to Mr. F. A. Nield, who is retiring by medical advice on account of ill-health. Mr. Hill is an old student of Finsbury Technical College (1900–1902) and has for many years been associated with the electricity meter and instrument branch of the industry in this country and abroad, and was recently one of the moving spirits of the late Meter Engineers' Technical Association.

THE EVERLITE LAMP.

A Battery Lamp Unit for which Efficiency and Economy are Claimed.

PROF. DR. ALFRED SCHMID, of Bale University, was recently interviewed by our representative in regard to the Everlite lamp, which was invented by Dr. Schmid, and is to be put on the market by EVERLITE, LTD., a subsidiary of the Metropole Gramophone Co., Ltd., of Metropole House, Finsbury Square, London, E.C.



Examples of the "Everlite" lamp.

Dr. Schmid said the fact that only from 5 to 10% of a dry battery is used up chemically, led him to develop a battery which has a constant discharge curve and can be re-charged, as the refills for the Everlite lamp battery are made in nonhydroscopic capsules which contain solidified extracts. The complete units are airtight and watertight, and, it is claimed, can be used under water. The smaller lamps, such as bicycle and torch types, are being made so that they light both in inverted and horizontal positions. Other types are also to be made, including miners' lamps, boy scouts' lamps and table lamps, and all can be made to operate by means of a switch, if desired. Lamps of 30 to 50 c.p. will be supplied for signalling. Bicycle lamps, we understand, will be on sale in April. An important claim for the new lamp is that it has no "self-consumption." It is stated that it can be left for years and will afterwards give its full output. It is claimed that a room can be lighted by it economically, because the materials used in the capsules can compete favourably in cost with paraffin oil. A 22 c.p. lamp with an 8-hours' output will be one of the types manufactured.

In a report on Dr. Schmid's battery, Mr. R. P. Wilson says he was primarily concerned in satisfying himself that the battery would develop the energy claimed, and that it would maintain a reasonably constant output throughout the period of its operation. Having satisfied himself on these points, he ascertained the nature and the cost of the ingredients used. That the battery will produce the energy and maintain its pressure was demonstrated to him in Bale, but on his return to London he made up a lamp in accordance with the inventor's formulæ and design, and has tested it over a continuous period of six hours. During the whole of this period the voltage was well maintained, and at the end of the six hours the lamp was giving its full illumination. He is satisfied from his test that the manufacture of this lamp, in accordance with Dr. Schmid's specification and complete with the necessary filaments, is a commercial proposition. The ingredients are all such as can be obtained freely on the market. The refills can be stored in any climate without deterioration. The battery used for this test was designed to give an output of 3 A for six hours at 1½ V, but the average output throughout this period was in excess of these figures. The mean current was 3·125 A and the mean voltage 1·69=5¼ W. At the beginning of the test the discharge rate was 5·8 W, or 30% in excess of what it should have been, but in spite of this excessive rate of discharge the output was satisfactorily constant.

ELECTRICITY COMPANIES' OBLIGATIONS.

The London and Home Counties Joint Electricity Authority issued, last week, a report upon the following questions: (*a*) the limitation placed upon the London electricity companies with regard to divisible or retainable profits; (*b*) the obligation imposed upon the London companies to reduce charges for electricity; (*c*) the reserve funds which the companies may keep as prescribed by the Acts referred to. The report states that the questions are not free from difficulties in the interpretation of the Statutes. It is clearly the intention of the scheduled agreements to limit divisible and surplus profits in such a way as to encourage reduced prices to and increased consumption by all classes of electricity users, and to exhaust the revenue of a company by (*a*) meeting proper expenses of generation and distribution; (*b*) providing limited interest, dividend charges and reserve and contingency funds; (*c*) reducing charges for electricity. It is reasonable to believe that the proper application of the Statutes will lead to these results.

LEGAL INTELLIGENCE.

No Infringement of Loud Speaker Patent by S. G. Brown, Ltd.

IN the Chancery Division on January 23rd Mr. Justice Tomlin delivered his considered judgment in the action by the Lektophone Corporation, of Jersey City, against S. G. Brown, Ltd., of Victoria Road, Willesden Lane, N.W., which was heard during last sittings.

The plaintiffs claimed an injunction restraining infringement of a patent relating to improvements in loud speakers granted in 1914 to Marcus Clarence Hopkins. They complained that in September, 1927, the defendant company sold a "Mascot" loud speaker which they alleged infringed the patent.

The defendant company denied infringement, and said their case was that the patent was invalid on the grounds of common general knowledge, and insufficiency of description in the specification. They counterclaimed for revocation of the patent.

His lordship said that at the date of the patent (1913) sound reproduction had a limited field. The first application in England for a patent for Hopkins' invention was made on July 11th, 1914, and the patent granted was for "improvements in or relating to sound regenerating machines."

In his specification Hopkins was confining himself to the art affecting instruments which produced vibration by the movement of a stylus over a record. He thought Dr. Eccles, the plaintiff's witness, was right in saying that Hopkins didn't appreciate that he could get lower frequencies with a larger diaphragm.

As to what Hopkins claimed in his specification his lordship said he was satisfied that the claims were for a stylus and record machine with a diaphragm reproducer operating without a soundbox, horn or trumpet, but with a tympanum at least 9 inches in diameter having conical and annular portions, the latter being supported by rings at its outer edge.

This view would be sufficient to dispose of the action, as the alleged infringing article was a loud speaker in the modern sense, and was not constructed for use on a record and stylus machine.

The granting of licences by the plaintiffs first began in 1926. He had seen a number of loud speakers said to be made under these licences, and many of them seemed to have little resemblance to Hopkins' diaphragm. Whatever was the tone construction of the specification of the patent he held that there was no infringement by the "Mascot."

The result of the case was that both the action and the counterclaim failed and must be dismissed.

His lordship divided the costs, four-fifths to the defendants and one-fifth to the plaintiffs, and dismissed the counterclaim with costs.

Trade Mark Infringement.

A motion by the Cable Makers' Association against the City Engineers' Supply Co. was mentioned to Mr. Justice Eve in the Chancery Division on January 18th.

Mr. D. H. Corsellis, for the plaintiffs, said it was a motion to restrain infringement of three registered trade marks. Defendants were prepared to treat the motion as the trial of the action and to consent to a perpetual injunction, an order for delivering-up or destruction of the infringing articles and to pay the plaintiffs' costs. There would be no order as to damages.

Counsel for the defendants agreed to this course.

Electricity Schemes Facilitate Settlement.

In the Chancery Division recently Mr. Justice Romer heard an action brought by Mr. Vincent Bambrick, who has a steam laundry at the junction of Reservoir and Diamond roads, at Whitstable, for an injunction to restrain the Whitstable Electric Co., Ltd., from committing a nuisance by vibration and noise. The power station is 50 yards from the laundry. It was complained that plaster was shaken down in the latter, and £75 had been spent on chimney repair and £200 other repairs were needed. The plaintiff feared injury to an employee by escaping steam or explosion, and the defendants replied that if his fabric was damaged it was by his own machinery. They denied both that the soil was London clay, conducive to the transmission of noise and vibration, and that they had taken no steps to abate any possible nuisance.

Mr. Bennett, K.C., and Mr. Wilfred M. Hunt, appeared for the plaintiff, instructed by Messrs. Walter Hills and Shea, Margate, London agents, Messrs. Kingsford, Dorman and Co.; and Mr. Gover, K.C., and Mr. Swords for the defendants, instructed by Mr. H. W. Guthrie, London.

Before all the evidence was heard Mr. Gover suggested that a settlement be arranged. Counsel consulted and Mr. Gover then announced that the electricity schemes now proceeding had facilitated a settlement.

Relay Telephone Patents.

In the Chancery Division, on Monday, Mr. Justice Tomlin granted an extension of the period of a number of patents relating to automatic or semi-automatic telephone exchange systems, for three years from April 23rd, 1929, on the application of the owners, the Relay Automatic Telephone Co., Ltd.

Mr. Trevor Watson, for the company, said that the main reason for the application was loss or damage in the use of the patents due to the war.

Marconi Royalties.

The action, Marconi's Wireless Telegraph Co., Ltd., against Attaix, Ltd., of High Street, Southampton, came before Mr. Justice Astbury, in the Chancery Division on January 22nd on a motion by plaintiffs for judgment in default of defence.

Mr. Trevor Watson for the plaintiffs said the action was brought for an account of certain royalties due to the plaintiffs under an agreement between the parties, an injunction to restrain breach of the agreement and damages. The defendants had entered an appearance in the action but had not put in a defence. There had been negotiations between the parties as the result of which an agreement was entered into in May, 1927. It was alleged that defendants had sold wireless receiving sets and battery eliminators which infringed plaintiffs patents. In the agreement entered into defendants acknowledged their liability to pay to the plaintiffs a royalty of 12s. 6d. per valve holder upon all broadcast valve receiving sets and a royalty of 12s. 6d. on each battery eliminator employing any of the plaintiff's patents and sold by defendants from April, 1925, to the date of the agreement. The defendants further undertook to render to the plaintiffs within seven days of the agreement, a complete royalty statement and account with respect to their liability and not to infringe plaintiff's patents. They had not rendered the account nor paid the royalties due under the agreement apart from £50 paid on account. Counsel accordingly asked for judgment against defendants and an inquiry as to the damages sustained by plaintiffs by reason of the breaches of the undertaking.

His Lordship gave judgment as asked.

Valve Selling Licences.

On a motion on January 25th before Mr. Justice Eve, in the Chancery Division, by the Mullard Radio Valve Co.,Ltd.,against Mr. C. Barnett, of Angel Lane, Stratford, E., Mr. Watmough, for the plaintiffs, said it was sought to restrain the defendants from selling valves in infringement of the plaintiffs' limited license. Defendants consented to an injunction and to the motion being treated as the trial of the action and had agreed to pay £5 damages, which would be handed to a charity, and costs.

His Lordship assented.

Pooled Telephone Patents

Mr. Justice Tomlin, in the Chancery Division, on Monday, heard an application by Standard Telephones and Cables, Lrd., for the extension of the period of seven patents relating to automatic telephone apparatus. The application was based on the loss or damage by reason of the war.

Mr. Trevor Watson, for the company, said the patents belonged to the Western Electric Co., Ltd., now Standard Telephones and Cables, Ltd. There was no opposition. He read an affidavit by the chairman of the company, which stated that soon after the war broke out the company became a controlled establishment, and the practical use of the patents had been postponed for six years because of that fact, and also because of the delay in the reorganisation of the automatic telephone proposals in this country.

The company's system was the rotary system, the features of it being that it was a part system, and it was applicable to systems manufactured by other companies. All the companies engaged in this work had pooled their patents for the use of the General Post Office.

His lordship made an order extending the period of all the patents to February 11th, 1934.

BUSINESS ITEMS.

THE GENERAL ELECTRIC CO., LTD. has reduced the price of the "Magnet" two-way adaptor.

According to a Customs Circular dated December 14th, 1928, wireless apparatus and accessories may be imported into Roumania without any permit from the Roumanian Postal authorities.

A Danzig firm desires to be put into touch with British firms able to supply 170 tons of copper wire and 4½ tons of bronze wire. Further details from the Department of Overseas Trade, reference A.X. 7 374.

We understand that the first regional station of the B.B.C. will be erected at Brookmans Park, Potters Bar, and an order has been placed with the D.P. BATTERY CO., LTD., Bakewell, for a battery of 115 cells with a capacity of 1 950 Ah.

An interesting church lighting installation has recently been carried out by Messrs. NICHOLSON AND CO., electrical contractors, Milford-on-Sea, under the direction of Mr. W. McIntyre, acting as consulting engineer, at New Milton Church, Hampshire, using G.E.C. floodlights and specially designed reflectors.

Extensive use has been made of electric locomotives in connection with the construction of the new Mersey Tunnel, and orders have been received by the D.P. BATTERY CO., LTD., Bakewell, from Messrs. Wingrove and Rogers and Messrs. Greenwood and Batley, for a total to date of 52 Kathanode batteries for use in this work.

The WOKING ELECTRIC SUPPLY CO., LTD. is taking a prominent part in the Woking Trades Exhibition to be held in the Exhibition Buildings, Oriental Road, Woking, from February 6th to 16th. The General Electric Co., Ltd. is co-operating with the supply company in this connection, and has undertaken to equip a five-roomed electric bungalow, as well as furnishing a number of household appliances for the company's stand.

In connection with the order for the S.E. England Scheme, which, as announced last week, has been placed by the Central Electricity Board with FERRANTI, LTD., we understand that the contract is for 60 000 kVA, 30 000 kVA and 20 000 kVA, 132 kV three-phase units of total capacity 1 100 000 kVA. Ferranti, Ltd., point out that the transformers are the largest to be ordered to date for use in this country, and by working in co-operation with the railway companies concerned they have succeeded in making 60 000 kVA units suitable for transport in oil by rail under normal traffic working conditions.

An unfortunate accident took place on January 19th in the Trafford Park works of the METROPOLITAN-VICKERS ELECTRICAL CO., LTD., to a 33 000 kVA frequency changer. Whilst running at full speed on test, a short circuit in the pit under the machine set fire to a temporary wood air discharge duct. Flames indrawn from the duct by fans at both ends of the machine then set fire to the stator windings, which were seriously damaged in the period of five minutes that elapsed before the rotor, weighing over 70 tons, could be brought to rest. On inspecting the damage it was decided to rebuild the stator, using new laminations, new copper, and new insulation throughout, and although the work is being pushed forward it is estimated that a delay of seven weeks may occur. We are given to understand that the set is notable as being the largest frequency changer yet built in this country. It is a reversible machine designed on the one side for three-phase 25 periods 11 000 V and on the other side for three-phase 50 periods 6 600 V. The normal rating is 33 000 kVA at 500 r.p.m., with a momentary overload capacity of 100%. The set is being built to the order of the London Power Company for the Deptford West station.

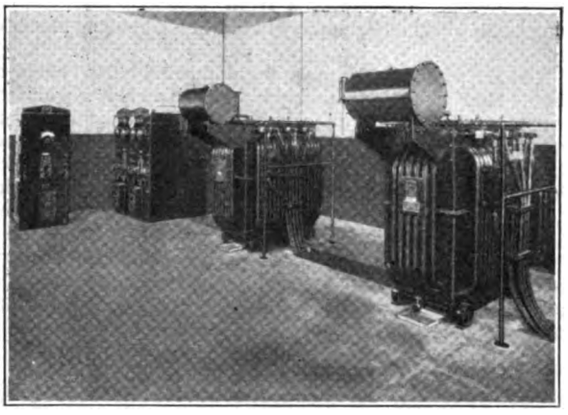
ROYAL WARRANTS OF APPOINTMENT.

Amongst the firms holding warrants of appointments to H.M. King George V are Allan Bros.; the Edison Swan Electric Co., Ltd.; the Grosvenor Electrical Co.; the Hart Accumulator Co., Ltd.; A. P. Lundberg and Sons; Burt, Escaré and Denelle, Ltd.; J. W. Gray and Son; C. A. Vandervell and Co., Ltd.; and Hoovers, Ltd. Amongst the firms holding warrants of appointment to the Queen is Tredegars (1923), Ltd. Firms entitled to style themselves "By appointment to the late King Edward VII," include Belshaw and Co. Firms permitted to style themselves "By appointment to the late Queen Alexandria," include Hassel and Tendt, Copenhagen; while firms holding warrants of appointment to H.R.H. the Prince of Wales include the Edison Swan Electric Co., Ltd.

WORKS ELECTRIFICATION.

Application of Electric Drive to Modern Biscuit Factory.

THE increasing use of electric drives in the factories of large industrial concerns outside the usual run of textile, colliery, iron and steel and similar works, is well illustrated by



View of sub-station showing G.E.C. truck cubicles and two 500 kVA transformers at Reading.

the electrification of Huntley and Palmerss' biscuit factory at Reading. Electric drives are here employed for many purposes, from the initial mixing processes right through to the final stages where, in the case of chocolate biscuits, for example, fractional H.P. motors are employed to wrap them in silver paper. Power for the operation of these motors is taken from the Reading Electrical Supply Co., Ltd., although, in case of emergency, sufficient power can be generated in the company's power house to keep the more important processes in operation. The equipment, manufactured and supplied by the General Electric Co., Ltd., includes two 300 kW motor converters, with starting panels, h.t. truck type cubicle switchboards, l.t. a.c. power and lighting switchboard, d.c. flat back switchboard, and two 500 kVA oil-immersed self-cooled core type transformers.

Power is received from the Reading supply mains at 3 700 V, three-phase, 50 cycles, but provision is made for an alternative source of supply, the incoming feeders from both sources being brought to two cubicles, each equipped with a direct operated oil circuit breaker of 75 000 kVA maximum breaking capacity together with ammeter, voltmeter, frequency meter, reverse power and overload relays, instrument transformer with current limiters and h.t. and l.t. fuses. The two outgoing feeders are taken one to the power house and one to a sub-station. The latter contains two 500 kVA oil immersed self-cooled core type delta star transformers, having a pressure ratio of 3 700/400 V, the h.t. supply to which is controlled by a truck switchboard of two cubicles equipped with direct operated oil circuit breakers. From these transformer secondaries cables are taken to an ironclad industrial draw-out pedestal switchboard also situated in the sub-station. The neutral points of the low tension side of the transformers are brought out to a l.t. lighting switchboard, thus enabling a voltage of 230 to be obtained for lighting purposes. The second outgoing feeder from the h.t. truck cubicle switchboard is taken to two similar trucks installed in the power house, each of which controls the h.t. supply to a 300 kW shunt wound motor converter, running at 1 000 r.p.m. and converting current at 3 500/3 900 V, three-phase, 50 cycles, into 210 V, for feeding a 2-wire d.c. system.

ELECTRICAL WOMEN.

The Manchester and Salford branch of the Electrical Association for Women spent an interesting afternoon at the new showrooms of Salford Corporation Electricity Department on January 15th. The city electrical engineer, Mr. L. Romero, had arranged an attractive programme, the first item of which was an inspection of the showroom. This was followed by an interesting and instructive address by Mr. Kellet on "Waterheating," in turn followed by an animated discussion.

Owing to the popularity of the E.A.W. ball held last year and the number of requests from all over the country for another one to be held this year, the Council of the Association has decided to hold a ball at the Hotel Cecil, London, on April 16th, the same day as the annual luncheon.

PUBLIC LIGHTING.

Regulations for Electrical Installations in Places of Entertainment.

THE London County Council has published a new book of Regulations and Rules with regard to structural and other requirements in places of public entertainment. These regulations came into force as from January 1st, and the following is an abstract of some of the rules affecting electrical installations.

The I.E.E. regulations may be complied with with the exceptions that the relaxations permitted in their regulations for "extra low pressure" installations shall not apply to such premises and that the I.E.E. regulations for "low pressure" installations must be observed in all cases in which the pressure is below "medium pressure." Batteries with celluloid or other inflammable containers shall not be used. The use of wood for mounting or enclosing electrical apparatus shall be avoided as far as practicable, and where permitted must be of English oak, teak or mahogany. With certain exceptions, twin twisted flexible cords without protection may be used only for pendant lights and portable table lamps.

Stage Lighting.

Local switches will not be required for stage sockets, provided the council is satisfied that the control at the stage boards is sufficient. Auto-transformers must not be used for any purpose. The regulations also point out that when a three-wire or four-wire system is brought into the premises, it shall be divided, unless the council otherwise agrees in writing, at or near the intake into two two-conductor services from which all main circuits other than circuits connected to the outer conductors only, shall be taken. These services shall be kept and spaced apart throughout as may be considered necessary by the council to remove the risk of shock. Wiring must not be run in a ventilating duct, flue or air shaft, or installed in a lift unless it is essential for the operation of the lift. A cable duct must be stopped at any point at which it passes through a fire-resisting wall or floor so as to prevent the passage of fire or smoke from one section of the duct to another. Cable ways must not be formed in the protective covering of structural steel work, and conduit must be efficiently protected against corrosion. Where cables are permitted without conduit or similar protection (e.g., for connections to battens), they should be protected by an asbestic or other non-inflammable covering. This regulation does not apply to cables used in connection with portable apparatus. The use of flexible cord or cable should be avoided wherever practicable and in any case in which such a conductor is permitted it should be as short as possible. Each cord or cable must be fitted with a separate plug connection. Sub-circuits for current-consuming devices other than lamps must not be connected to lighting circuits. Provided that any such device which consumes not more than 500 W may be connected to a separate sub-circuit of a lighting distribution board. Sub-circuits from one source of supply only must be taken into any fitting, and a voltage greater than 250 should not exist between any conductors in any fitting. Multiple core and bunched cables must be suitably insulated and protected. Wiring used in connection with bell, telephone and similar apparatus must be kept away from and should not be installed in the same conduit as wiring used for other purposes. Radiators, convectors and similar devices may not be installed except with the consent of the council in writing. If such a device is installed it must be securely fixed in position, and if liable in any circumstances to reach a high temperature, must be provided with a stout wire guard of close mesh, fixed in position and so arranged that no part of the guard is within six inches of any portion of the device which is at a high temperature. The metal framework and the guard must be earthed. Electric ketties, irons and other appliances may be used only in positions specially approved by the council for the purpose. If the temperature of a non-luminous appliance be liable to exceed 212° F., a pilot lamp must be installed to indicate whether the current is on or off. The pilot lamp final sub-circuit should be separately fused on each pole.

In any premises at which a safety curtain is provided to the proscenium opening electric light may be the only illuminant provided for on the stage and (where such accommodation is provided) in the stage basement, the flies, property rooms and scene stores. The supply services for such illumination must be independent of those for either of the systems required in the auditorium, etc. Wiring and apparatus on the stage side of the proscenium wall must be supplied from an intake situated on the stage side of the proscenium wall and may not be connected to either of the services or installations which supply the auditorium, etc.

Temporary electrical installations may be carried out in accordance with the regulations under the Act of 1878. All temporary installations which are not in accordance with these regulations must, however, be disconnected from the permanent installation immediately after each occasion on which they are used. If, in connection with a particular production at premises provided with a safety curtain to the proscenium opening, it is proposed to use for a period not exceeding one week apparatus or effects which do not form part of the recognised stage installations, but which are in compliance with the regulations, the submission of details is not required if, before the apparatus or effects are used, a certificate be submitted to the council by the licensee describing the apparatus and stating that they have been examined by his electrician and found to be in safe working order.

In premises at which exhibitions or bazaars are to be frequently held, suitable distributing mains must be permanently installed with tappings, each controlled by a double-pole switch and double-pole cut-outs. Distribution boards must be provided as the council may consider necessary. Unless in any special case the council agrees otherwise in writing, the electrical arrangements, whether for lighting or other purposes, in connection with exhibitions or bazaars must be in accordance with these regulations. Provided that if the exhibition or bazaar is to be held for a period of not exceeding one month, wiring described under classes L, S or W, of 87 of the I.E.E. regulations may be used in certain positions if it is installed out of reach of the public and is open to view throughout its length. Lamps and signs installed in connection with exhibitions or bazaars must not be placed in such a position as to obscure or render less conspicuous the notices indicating the exits. Showcases containing lights or electrical appliances must be permanently wired in hard wiring and should be ventilated so as to prevent undue rise of temperature. The framework of any showcase containing running motors or appliances should be constructed of metal or approved hardwood. Electrical wiring or apparatus may not be installed in showcases containing inflammable materials. All lampholders should be kept fitted with lamps. Wiring and apparatus which will be out of use for a period exceeding one month, must be disconnected by the withdrawal of the fuses on both poles Permanently disused wiring and apparatus must be removed.

BRIGHTON'S NEW SWITCHGEAR.

Borough Electrical Engineer's Suggested Arrangement for North Road.

MR. JOHN CHRISTIE, borough electrical engineer, Brighton, has reported to the Lighting Committee that as the new e.h.t. switchgear for the Corporation and the Central Electricity Board at Southwick has been allocated to the Metropolitan-Vickers Electrical Co., Ltd., the best arrangement they could now adopt would be to duplicate the plant for the e.h.t. section at North Road with that which is being installed at Southwick and both ends of the system can be protected by "Translay" relays which both the Central Electricity Board and the Corporation purpose adopting. The Metropolitan-Vickers Electrical Co., Ltd., has made an offer that if the order for this extension is placed with them as an addition to the existing contract which has been placed with them for Southwick, it will supply this at the same price as the Southwick gear, viz., £1 070 per panel, less a reduction of 2½%. As 14 panels are required, the cost will be £14 605 10s. Mr. Christie recommends that an order for this equipment be placed at once. The old equipment at Southwick and North Road can, if re-conditioned and worked in conjunction with reactances, be safely used for the subsidiary circuits controlling the plant at North Road, the outgoing e.h.t. feeders to Hove, the automatic sub-stations, etc.; the Metropolitan-Vickers Electrical Co., Ltd., has quoted £2 985 for these reactances, and an order should be placed with them for their delivery as required. This extension scheme will therefore work out as follows:—E.h.t. switchgear: Metropolitan-Vickers Electrical Co., Ltd., £14 605 10s.; reactances, ditto, £2 985; buildings, about £25 000; contingencies, £1 500; reconditioning switchgear: Metropolitan-Vickers Electrical Co., Ltd., £8 820; alterations and additions to e.h.t. feeders and sub-circuits, about £2 500. The Committee has adopted the report.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, when available.

BLACKBURN CORPORATION.—Electric light installation at the Roe Lee School. Specification, etc., from the Borough Engineer; deposit £1.

CARLISLE CORPORATION.—Supply and erection of 15 000 kW turbo-alternator, and condensing plant. Specification, etc., from Mr. C. W. Salt, city electrical engineer; deposit £2 2s.

EPPING GUARDIANS.—Electric light installation at the Institution. Particulars from the Clerk.

Overhead Lines and Transformers.

CHEADLE AND GATLEY URBAN DISTRICT COUNCIL, February 1st.—High tension overhead line (contract 45); and outdoor type transformers (contract 56). Specifications from Mr. R. W. Willis, 37, High Street, Cheadle, Cheshire; deposit £1 1s. for each contract.

HULL CORPORATION, February 1st.—Electric light wiring and fitting of senior department of Francis Askew School, Hessle Road, Hull. Specification, etc., from the City Architect.

OTLEY URBAN DISTRICT COUNCIL, February 1st.—Electricians' work in connection with erection of 40 houses on Westbourne housing estate. Specifications can be seen and quantities obtained on application to the Council's Surveyor; deposit £1 1s.

COUNTY ARMAGH EDUCATION COMMITTEE, February 2nd.—Electric lighting installation in Lurgan New Technical School. Specifications can be seen at the office of Mr. J. St. J. Phillips, 16, Donegall Square South, Belfast, or the Education Office, Armagh.

WANDSWORTH (LONDON) GUARDIANS, February 2nd.—Reorganisation of engineering plant at Tooting Hospital, Church Lane, Tooting. Plan may be inspected at the offices of the consulting engineer, Mr. W. M. Binny, 39, Carlton Road, East Putney, London, S.W.15.

AMPTHILL GUARDIANS, February 4th.—Electric heating installation, in the board room at the institution. Particulars from the surveyor, Mr. Leonard Foster, Flitwick, Bedford.

BATLEY CORPORATION, February 4th.—Supply of l.t. cable. Forms of tender from the Borough Electrical Engineer, Electricity Works, Batley.

EASTBOURNE CORPORATION, February 4th.—Automatic electrically-operated pumping plant. Specifications from the Borough Engineer; deposit £1 1s.

HALIFAX CORPORATION, February 4th.—Wiring 64 houses at Moor End Road for electric light. Particulars from the borough engineer, Mr. A. C. Tipple, Crossley Street, Halifax; deposit £2 2s.

LEEDS UNIVERSITY, February 4th.—Electric wiring, etc., of Mining Section of the University, Woodhouse Lane, Leeds. Specification from the Registrar of the University; deposit £1 1s.

LONDON COUNTY COUNCIL, February 4th.—Manufacture, and supply at East Greenwich power station of h.t. and l.t. cables, concrete core re-actors, control battery, etc. Specification from General Manager, L.C.C. Tramways, 23, Belvedere Road, S.E.1; deposit £2.

LONDON COUNTY COUNCIL, February 4th.—Wiring and fittings for electric lighting, heating and cooking in one block of dwellings, consisting of some 86 tenements and administrative quarters, on Ossulston Estate, St. Pancras (about 999 wiring points). Specification, etc., from Chief Engineer, Old County Hall, Spring Gardens, S.W.1; deposit £1.

HOLBORN (LONDON) BOROUGH COUNCIL, February 5th.—Twelve months' supply of electric lamps, etc. Specification, etc., from Mr. J. E. Parr, borough surveyor, or Mr. L. Walford, town clerk, Town Hall, High Holborn, W.C.1.

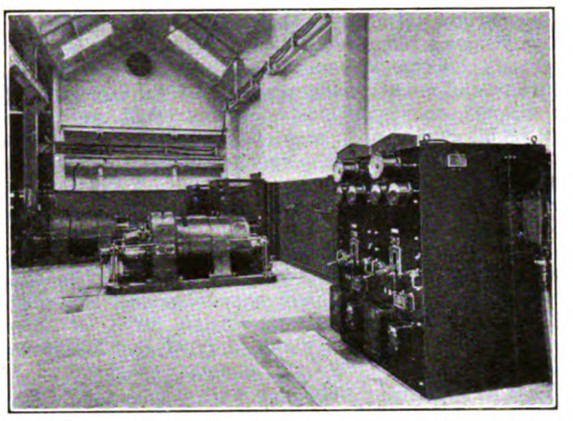
MANCHESTER GUARDIANS, February 5th.—Supply of Philips' portable X-ray plant, complete, 250 V, 50 cycles, to Crumpsall Institution, Crescent Road, Crumpsall, Manchester. Tenders to the Clerk, Union Offices, All Saints', Manchester.

BOOTLE CORPORATION, February 6th.—Supply of electric lamps. Forms of tender from the Borough Engineer.

GRIMSBY CORPORATION, February 6th.—Manufacture, supply, and erection of high-pressure steam pipes and valves, circulating water pipes and valves and water service pipes and valves, for the electricity department. Specification, etc., from Mr. S. R. Windle, Electricity Offices, Moss Road, Grimsby.

HAMMERSMITH (LONDON) BOROUGH COUNCIL, February 6th.—Twelve months' supply of electric lighting sundries, insulated wires, joint boxes, meters, h.t. and l.t. paper insulated cables, etc. Forms of tender, etc., from the Borough Electrical Engineer. Stamped addressed envelope to be sent.

PORTSMOUTH CORPORATION, February 6th.—Twelve months' supply of stores and materials to the tramways department,



A VIEW of the power house at the Reading works of Huntley and Palmers, Ltd., showing two G.E.C. 300 kW motor converters with their starting panels and h.t. switchboard.

including insulating materials, lamps, and motor windings (section Q), overhead line materials (section R), etc. Specification and form of tender from Mr. B. Hall, general manager and engineer.

GLASGOW CORPORATION, February 7th.—Electric lighting installation at Shettleston Baths. Specifications, etc., from the Office of Public Works, 64, Cochrane Street, Glasgow; deposit £3 3s.

LONDON COUNTY COUNCIL, February 7th.—Electric light wiring and fitting at Coroner's Court, Bethnal Green, and Weights and Measures Office and Coroner's Court, Clapham (about 80 wiring points). Specification, etc., from the Chief Engineer, Old County Hall, Spring Gardens, S.W.1; deposit £1 1s.

LEEDS GUARDIANS, February 8th.—Re-installation of electric light wiring in the Children's Block, at the Rothwell Institution. Specification, etc., from Mr. J. H. Ford, Poor Law Offices, 11, South Parade, Leeds. Stamped, addressed envelope to be sent.

LONDON, MIDLAND AND SCOTTISH RAILWAY, NORTHERN COUNTIES COMMITTEE (IRELAND), February 9th.—Twelve months' supply of stores, including telegraph ironwork, wire, electric lamps, porous pots, etc. (tender form No. 26). Forms of tender (6d. each) from Mr. F. J. Martin, Stores Superintendent, York Road Station, Belfast.

Wiring of Housing Estate.

NEWMILNS CORPORATION, February 9th.—Electric wiring, in connection with Council's housing scheme. Specifications from the Burgh Surveyor.

HENDON URBAN DISTRICT COUNCIL, February 11th.—Manufacture and erection of 29 closed circuit code-signalling street fire alarms. Specifications from Mr. A. G. Knight, engineer to the Council; deposit £3 3s.

ETON RURAL DISTRICT COUNCIL, February 12th.—Electrically-driven pumps, etc., at sewage disposal works, Iver, Bucks. Specification, etc., from Mr. A. Gladwell, Denmark House, Windsor Road, Slough; deposit £3 3s.

MANCHESTER CORPORATION, February 12th.—Supply of stores for the tramways department, including parts of tramcar electrical equipments, electrodes, cable, rubber strip, tramcar axles, wheel tyres and centres, etc. Schedules, etc.,

Digitized by Google

from the General Manager, Corporation Tramways, 55, Piccadilly, Manchester.

STOKE-ON-TRENT CORPORATION, February 13th.—Twelve months' supply of mains and cables (contract No. 2 904); and a.c. and d.c. meters (No. 2 905); sub-station e.h.t. switchgear (No. 2 906), and static transformers (No. 2 907). Specifications, etc., from the City Electrical Engineer, St. George's Chambers, Kingsway, Stoke-on-Trent; deposit £2 in respect of each contract.

STOKE-ON-TRENT CORPORATION, February 13th.—Overhead wiring and services to 170 new houses on Hanford housing site. Specification, etc., from the City Electrical Engineer, St. George's Chambers, Kingsway, Stoke-on-Trent; deposit £2.

Generating Station Equipment.

SHEFFIELD CORPORATION, February 14th.—Equipment for new generating station at Blackburn Meadows, Sheffield, including turbo-alternator, with condensing, evaporating and steam preheating plant (specification B.M. 67); water-tube boilers, with chimneys, superheaters, stokers (or pulverised fuel firing equipment), economisers, valves, etc. (B.M. 68); wagon tippers, conveyors and elevators (B.M. 70); cooling towers (B.M. 72); and overhead electrically and hand-operated cranes (B.M. 73). Specifications from Mr. S. E. Fedden, general manager and engineer, Electric Supply Department, Commercial Street, Sheffield; deposit, £3 3s. for each.

CENTRAL ELECTRICITY BOARD, February 15th.—Supply and laying of 66 000 V cables in London area, in connection with South East England Electricity Scheme. Specification (S.E.E.-L.C.1) and form of tender from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit, £2 2s.

LEEDS CORPORATION, February 15th.—One year's supply of stores to the electricity department, including castings (section C.), i.r. covered cables, mains boxes and fittings, jointing and insulating materials, fittings and sundries (section N.). Forms of tender, etc., from Mr. C. N. Hefford, manager, 1, Whitehall Road, Leeds. State section for which it is desired to tender.

BELFAST CORPORATION, February 18th.—Twelve months' supply of stores for the electricity department, including electrical accessories (form No. 8), lamps (No. 9), carbon brushes (No. 10), bitite strip, prepared tape and rubber tape for joints and joint box compound (No. 12), c.i. street box frames and covers (No. 14), copper cable connectors and solder (No. 18), electricity meters and instrument transformers (No. 19), m.d. indicators (No. 20), automatic time switches (No. 21), cut-outs (No. 22), transformers (No. 23), cables and joint boxes (No. 24), v.i.r. cables, wires and flexibles (No. 26), etc. Forms of tender, etc., from Mr. F. H. Whysall, city electrical engineer and manager, East Bridge Street, Belfast.

BETHNAL GREEN (LONDON) BOROUGH COUNCIL, February 18th.—Six or 12 months' supply of electric lamps, lanterns, etc. Specifications from the Borough Engineer.

CENTRAL ELECTRICITY BOARD, February 18th.—Supply and erection of 132 000 V overhead transmission lines, in connection with the North-West England and North Wales Electricity Scheme. Specification (No. N.W.E.-P.L. 1) and form of tender from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit, £2 2s.

CENTRAL ELECTRICITY BOARD, February 18th.—Supply and erection of 132 000 V overhead transmission lines, in connection with the Central England Electricity Scheme. Specification (No. C.E.-P.L. 1) and form of tender from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit, £2 2s.

TYNE IMPROVEMENT COMMISSION, February 18th.—One 1½-ton portal, electric, travelling, level luffing crane, for Riverside Quay, Albert Edward Dock, North Shields. Specification, etc., from the Secretary, Bewick Street, Newcastle-on-Tyne; deposit £1 1s.

WEST HAM EDUCATION COMMITTEE, February 18th.—Electric light installation in South Hallsville New School, Agate Street, Tidal Basin. Specifications, etc., from Mr. J. H. Jacques, 61, West Ham Lane, Stratford, London, E.15; deposit £1.

DUMFRIES CORPORATION, February 21st.—Supply and erection of one 1 500 kW turbo-alternator and condensing plant. General conditions, specification and form of tender from Mr. W. S. Johnston, engineer and manager, Electricity Works, Leafield Road, Dumfries; deposit £1 1s.

BEDFORD CORPORATION, February 22nd.—Supply of e.h.t., h.t., and l.t. underground cables (section 1) and incandescent electric lamps (section 2) during year ending March 31st, 1930. Only British manufacturers in the U.K. are invited to tender. Specifications, etc., from the Borough Electrical Engineer, Prebend Street, Bedford.

CENTRAL ELECTRICITY BOARD, February 22nd.—Supply of 132 kV outdoor switchgear, for transforming stations in area of Central England Electricity Scheme. Specification from Sir R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2.

HASTINGS CORPORATION, February 25th.—Electrically-driven pumping plant, of British manufacture, for Kent Street pumping station. Specification, etc., from Mr. G. M. C. Taylor (J. Taylor and Sons), Caxton House, Westminster, S.W.1; deposit £5.

CENTRAL ELECTRICITY BOARD, March 2nd.—Supply and erection of 66 000 V and other transformers in the London area, in connection with the South-East England Electricity Scheme. Specification (No. S.E.E.-L.T.1) and form of tender from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit, £2 2s.

CENTRAL ELECTRICITY BOARD, March 4th.—Supply and erection of 66 000 V switchgear, for South East England Electricity Scheme (London area), and supply and erection of 132 000 V transformers. Specifications from Sir R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2.

CENTRAL ELECTRICITY BOARD, March 4th.—Supply and erection of 132 kV outdoor switchgear, for transforming stations, in the area covered by the North West England and North Wales Electricity Scheme. Specification (N.W.E.-P.S.1) from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit, £2 2s.

CENTRAL ELECTRICITY BOARD, March 4th.—Supply and erection of 132 000 V transformers in connection with the North West England and North Wales Electricity Scheme. Specification (N.W.E.-P.T.1) from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit, £2 2s.

ERITH URBAN DISTRICT COUNCIL, March 4th.—Supply of h.t. and l.t. underground cables, joint boxes and other accessories during 12 months. Particulars and form of tender from the Electrical Engineer, Walnut Tree Road, Erith.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

VICTORIAN ELECTRICITY COMMISSION, February 4th.—Supply of 22 000 V switchgear and accessories, for Richmond Terminal Station. (Reference B.X. 4 901.)

VICTORIAN ELECTRICITY COMMISSION, February 4th.—Supply of 11 000 V switchgear, for installation in the Richmond Terminal Station. (Specification No. 29/3.) (Reference B.X. 4 898.)

VICTORIAN ELECTRICITY COMMISSION, February 4th.—Supply of 11 000 V switchgear, in connection with the Yallourn power station extensions. (Specification No. 29/5.) (Reference B.X. 4 897.)

VICTORIAN ELECTRICITY COMMISSION, February 4th.—Supply of pillar insulators, with metal parts, for use on 132 000 V outdoor circuits. (Reference B.X. 4 921.)

COLOMBIAN MINISTRY OF PUBLIC WORKS, February 5th.—Supply of two hand magnetos, with 400 metres of copper wire, capacity 25 detonators each.

INDIAN STORES DEPARTMENT, NEW DELHI, February 5th.—Supply of turbo-alternator, boiler, economiser, switchgear and cables. (Reference B.X. 4 944.)

VICTORIAN RAILWAY COMMISSION, February 6th.—Supply of a.c. line relays (contract 42 491). (Reference B.X. 5 042.)

DUBLIN BOROUGH COMMISSIONERS, February 9th.—Supply of arc lamp pillars. Specification, etc., from the City Electrical Engineer, Fleet Street, Dublin.

EGYPTIAN STATE RAILWAYS, February 9th.—Electrification and equipment of Heluan line, including equipment of power station, overhead transmission lines, track bondn

Digitized by Google

motor and trailer coaches, etc. Tenders to General Manager, Cairo Station.

GHENT MUNICIPALITY, February 11th.—Supply of 16 electric portal cranes. (Reference A.X. 7 398.)

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, February 11th.—Supply, erection and maintenance of hydro-electric generating plant, in connection with Hume reservoir hydro-electric development. (Reference B.X. 4 989.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, February 12th.—Supply of 110 kV switchgear, and controlling equipment, for Waitaki power scheme, section 3. (Reference B.X. 4 848.)

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, February 12th.—Supply of dry cells, for telephone work. (P. and T. 151/1 205.) (Reference B.X. 4 991.)

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, February 12th.—Supply of v.i.r. wire (No. P. and T. 151/1 184). (Reference B.X. 4 951.)

JOHANNESBURG MUNICIPALITY, February 14th.—Supply of two single-phase transformers, each of 1 080 kVA (contract 115). (Reference B.X. 5 005.)

LOUGH DERG, PETTIGO, CO. DONEGAL, February 14th.—Supply and erection of two heavy oil engine-driven, continuous current, 10 kW, 220/250 V generating sets (section I); storage battery, on nickel-iron-alkaline system (section II); and d.c. switchboard (section III), for the Venerable Dean Keown. Specifications for each section from Messrs. MacEntee and O'Kelly, 23, Upper O'Connell Street, Dublin; deposit, £2 2s.

SOUTH AFRICAN RAILWAYS AND HARBOURS, February 14th.—Supply of 15-ton electrically-driven portal titan crane (tender No. 1 366). (Reference A.X. 7 272.)

INDIA STORE DEPARTMENT, February 15th.—Supply of 62 248 metallic filament lamps, for train lighting. Form of tender (5s.) from the Director General, Belvedere Road, London, S.E.1.

INDIA STORE DEPARTMENT, February 15th.—Supply of hydro-electric plant, comprising four 12 000 kW water-wheel driven alternator sets, auxiliaries and spares (schedule 4). Forms of tender (5s.) from the Director-General, Belvedere Road, London, S.E.1.

NEW SOUTH WALES DEPARTMENT OF PUBLIC WORKS. Extension of date.—February 18th.—Supply and erection of hydro-electric generating plant for Burrinjuck development. (Reference 4 938.)

NEW ZEALAND POSTS AND TELEGRAPHS, February 19th.—Supply of bronze wire and copper binding wire. (Reference A.X. 7 252.)

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, February 19th.—Supply of 120 000 galvanised steel spindles for insulators. (Reference B.X. 4 948.)

POSTMASTER GENERAL'S DEPARTMENT, MELBOURNE, February 19th.—Dry cells and wet battery parts (schedule C. 404). Reference B.X. 5 068.)

Pumping Equipment.

CAPE TOWN MUNICIPALITY, February 20th.—Pumping equipment for storm water, etc., for the electricity department (specification 445/28). (Reference A.X. 7 345.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, February 26th.—Supply of induction coils and registers, for telephone work (schedule C. 394). (Reference B.X. 5 031.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, February 28th.—Supply and erection at Sollum of aerial ropeway, with dynamos, telephone and other equipment. Specification (10s. 6d.) from Chief Inspecting Engineer, 41, Tothill Street, London, S.W.1.

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, February 28th.—Supply of six-conductor telephone cordage (No. P. and T. 151/1 234). (Reference B.X. 4 990.)

WHANGAREI (N.Z.) HARBOUR BOARD, February 28th.—Supply of one 15-ton electrically:-operated level luffing gantry crane (contract No. 35). (Reference A.X. 7 263.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 5th.—Supply of seven single-phase 5 500 kVA transformers, for Waitaki power scheme, section 4. (Reference B.X. 4 873.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, March 7th.—Supply of hydraulic accumulator, horizontal ram pump, electric motor, motor or belt driven air compressor, starter and control gear.

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, March 12th.—Supply of switchboard cords (P. and T. 151/1 247). (Reference B.X. 5 017.)

CAPE TOWN MUNICIPALITY, March 15th.—Supply of metal-clad switchgear (specification 449/28). (Reference B.X. 5 004.)

CHILEAN MINISTRY OF MARINE, March 15th (extension of date).—Two electric travelling cranes, for Port of Valdivia. (Reference A.X. 7 353.)

VICTORIAN ELECTRICITY COMMISSION, March 18th.—Supply of 1 300 strings of suspension insulators, 600 strings of tensioning insulators, 1 300 conductor suspension clamps, 350 conductor tensioning clamps, 50 semi-anchor clamps for "V" strings of insulators, 200 semi-anchor clamps for single strings of insulators, 475 earth wire suspension clamps and 125 earth wire tensioning clamps. (Reference B.X. 4 997.)

LOURENCO MARQUES PORT AND RAILWAYS BOARD, March 19th.—Supply of three-phase, Diesel-driven 50 kVA generating set, and electrically-driven water pumping set. (Reference B.X. 5 050.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 19th.—Supply of 110 000 V transformer, for Mangahao electric power scheme (section 204). (Reference B.X. 4 952.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 19th.—Supply of 11 000 V switchgear, for Mangahao power development (section 203). (Reference B.X. 4 953.)

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, March 26th.—Switchboard cords. (Reference B.X. 5 067.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, March 26th.—Supply of telephones and dials (schedule C. 401). (Reference B.X. 5 023.)

EGYPTIAN MINISTRY OF THE INTERIOR, March 27th.—Supply and installation of electric lighting system for the town of Fashn. (Reference B.X. 5 037.)

Tenders Accepted.

ABERDEEN CORPORATION.—A. M'Kay, supply of electrical fittings for one year.

BRADFORD CORPORATION.—British Insulated Cables, Ltd., supply of 41 tons of copper wire.

ADMIRALTY.—General Electric Co., Ltd., part requirements of Osram gasfilled and vacuum lamps, and Robertson carbon lamps.

DOVER CORPORATION.—Switchgear and Cowans, Ltd., supply of switchgear, £640; Pirelli-General Cable Works, Ltd., supply of 6 600 V feeder cable, £2 232 10s. 7d.

SHEFFIELD CORPORATION.—James Laver and Sons, Ltd., concrete foundations, retaining wall and pipework for new cooling tower at Neepsend generation station, £3 523 12s. 10d.

WESTMINSTER GUARDIANS.—Bellis and Morcom, Ltd., installation of generating plant at St. Stephen's Hospital, £1 347; General Electric Co., Ltd., for alterations of existing switchboards, £171.

INDIAN STORES DEPARTMENT.—Callender's Cable and Construction Co., Ltd., wire, Rs. 4 826; General Electric Trading Co., steel poles, Rs. 1 696; Duncan, Stratton and Co., motor-driven drilling and tapping machine, Rs. 6 310, and electrically-driven, double railway wheel lathe, Rs. 67 650.

GLASGOW CORPORATION.—Ferranti, Ltd., supply of 12 kVA portable a.c. testing equipment, £168; Alex Robertson, electrical installation at Scotstoun for 510 houses, £2 361 8s. 4d.; D. Henderson, electrical installation at Gairbraid for 366 houses, £1 618 14s. 2d.; Alex. Stephen and Sons, Ltd., supply of a 50 H.P. motor, £143. (All recommended.)

BRIGHTON CORPORATION.—Le Grand, Sutcliffe and Gell, Ltd., boring work in connection with extension of condensing system at Southwick power station, £75 for 100 ft. in three borings, and 10s. per foot for any excess over 100 feet; Tudor Accumulator Co., Ltd., new battery at North Road sub-station, £6 811 16s.; Ferranti, Ltd., supply of two 200 kVA transformers, £277 10s.

LIVERPOOL CORPORATION.—General Electric Co., Ltd., supply of six 500 kVA transformers, for £224 each; Rimmer Bros., re-construction work at Lodge Lane sub-station, £4,088; Titan Trackwork Co., Ltd., supply of cranked steel tramway rail fishplates as follows:—100 pairs ⅛ in., at 18s. 6d. per pair; 100 pairs ¼ in., at 19s. per pair; 100 pairs ⅜ in., at 20s. per pair; 100 pairs ½ in., at 20s. per pair; 50 pairs ⅝ in., at 20s. per pair.

SUSPENSION INSULATORS.

In Mr. C. S. Garland's article on "Suspension Insulators for H.-T. Transmission Lines," published on page 109 of our January 25th issue, Fig. 3 was inadvertently described as a "Motor" insulator. The figure illustrated will, of course, be recognised as an insulator of the pin type.

ELECTRICITY SUPPLY.

Electricity at Forres—Charges at Pontefract—Hollywood Secures Electricity Order—Carlisle Plant Extension—Fulham will not Entertain J. E. A. Proposals—Supply to Film Studios—Marylebone's Extension Project.

OBJECTION has been raised at Odiham, Hants, to the proposal by Aldershot Gas, Water and District Lighting Co. to erect overhead electric cables in the High Street.

At a recent meeting of Forres T.C. it was reported that a committee had been negotiating with a London company for establishing electricity supply in the burgh.

Eton U.D.C. does not assent to the provisions in the London and Home Counties' Electricity Authority's Bill to transfer the purchase rights of councils to the Joint Electrical Authority.

Glossop Corporation has received an Order of the Ministry of Transport fixing the maximum charge for electricity in the borough at 8d. per kWh, and an agreement has been entered into with the Urban Electric Supply covering other points.

The Electricity Commissioners have fixed February 13th, for holding their inquiry into the joint petition of the Pontefract Chamber of Commerce and Town Council for a compulsory revision of the maximum charges for electricity in the borough imposed by the Yorkshire (West Riding) Tramways Co.

Walsall Electricity Committee is to extend mains to supply 40 houses which are being erected by the Corporation at Well Lane.—The Committee is to extend mains at a cost of £700, to supply 48 houses in course of erection by the R.D.C. at Aldridge and Pelsall.—The Committee recommends that, in order to give a supply in the Little Aston area, mains be extended at a cost of £3 100.

Holeywood U.D.C. has obtained a Special Order authorising its electricity supply scheme, and a supply is to be obtained from Belfast Corporation's system, by tapping the line which will be erected to supply Bangor. The distribution will be by means of underground cables in the main thoroughfares and by overhead lines in other streets. The current supplied will be three-phase, 50 periods, at 220 V for lighting and 380 V for power.

The Electricity Commissioners have intimated that they are prepared to give consent to the extension of Carlisle Corporation's generating station by the installation of one 15 000 kW turbo-alternator with three 30 000 lb. boilers and auxiliaries. They have been in communication with the Central Electricity Board as to the procedure in connection with the extension of selected stations, and the Board will shortly give a direction to the Corporation in respect of the above-mentioned extension.

Fulham (London) B.C. is recommended by the Electricity and Lighting Committee to inform the London and Home Counties Joint Electricity Authority that the Council intends to maintain direct relations with the Central Electricity Board in regard to the extension and alteration of its generating station and its subsequent operation under the South East England Scheme, and that the Council cannot, therefore, authorise any discussion with representatives of the Joint Authority as to the acquisition of the station by the Authority.

On the suggestion of Mr. C. I. Shuttleworth, acting city electrical engineer, Hull Electricity Committee has decided to increase the insurance of the electricity works and sub-stations against fire from £600 000 to £850 000. The insurance of boilers and fittings against breakdown is compulsory, and the insurance of other plant against breakdown is optional. With regard to the question of continuing the latter, in view of the considerable premium and the restrictions and limitations in policies, a report is to be obtained from the City Electrical Engineer.

An agreement has been made for the supply by Brighton electricity department to the proposed film studios at Whitehawk Valley at 0·625 per kWh, plus a further 0·025d. per kWh for every 1s. increase in price of coal over 20s. 6d. per ton, corresponding decreases to be made for each decrease of 1s. below 20s. 6d. per ton, the consumers to guarantee revenue of £3 000 for the first 18 months after connection and £3 000 per annum for following four years. An unrestricted supply is to be available during Saturdays and Sundays throughout the year, but on other days in December and January no demand is to be made between 4 p.m. and 6 p.m. beyond, say, 50 kW for ordinary lighting.

The Borough Electrical Engineer of St. Pancras (London), has been in negotiation with the London, Midland and Scottish Railway Co. with reference to a supply of electricity to Euston station. The amount required would be about 350 kW, and the load factor would be not less than 30 per phase. At present there is an agreement for a similar supply to King's Cross Station, and it is proposed that the charge for the Euston supply shall be the same, viz., £3 16s. per kW and ¾d. per kWh up to one million kWh, and beyond this ½d. per kWh, with a coal clause. The company's maximum demand would be 600 kW, representing a minimum consumption 1 576 800 kWh per annum for seven years, at the end of which the agreement could be determined by notice. The revenue would be about £4 496 per annum. The Electricity Committee has approved the terms.

The Electricity Commissioners have notified Bristol Corporation that they are prepared to grant an Order for the extension of area of supply for all the parishes proposed to be included, except Bitton, Hanham Abbots, Oldland and Siston in the rural district of Warmley. In respect of these last-mentioned parishes, Warmley R.D.C. has applied for an Order, and the Commissioners propose to grant it to the R.D.C. They propose to grant protective provisions to a non-statutory company operating in the parishes of Almondsbury and Olveston, and, as the Electricity Committee is of opinion that it is desirable that the area which would in certain events be allotted to this non-statutory company should be within the area of supply of the Corporation, it has provisionally agreed to purchase the goodwill of the undertaking, plant, etc., for £3 700.

Marylebone (London) Electric Supply Committee recommends that the Electricity Commissioners be informed that, so far as the immediate future is concerned, the Council prefers to contemplate plant extensions rather than additional bulk supplies, that the Council approve of the installation of two 20 000 kW turbo alternators, with the requisite boiler plant, etc., at a cost of £471 900; the scrapping of three existing 2 000 kW d.c. Parsons sets with auxiliaries, and two boiler feed pumps; the sale of scrapping of one of the existing 3 000 kW Oerlikon turbo-alternators, with auxiliaries, and the expenditure of £115 652, subject to obtaining consent, upon trenching, provision of ducts and re-instatement (£32 347), e.h.t. cables, drawing in and jointing (£47 544), switchgear at generating station, sub-stations and transformer stations (£26 291), and transformer groups (£9 470).

Godstone R.D.C. recently decided to oppose the application of East Grinstead U.D.C. for a Fringe Order to supply, in parts, the parishes of Lingfield and Godstone, on the ground that the Sevenoaks and District Electricity Co. had agreed to schedule the districts concerned, as a compulsory area. East Grinstead Council, which had applied to the Commissioners for an Order to supply to 39 premises at Baldwin's Hill and Felbridge, in the Godstone rural area, submitted that the consent of Godstone R.D.C. had been unreasonably withheld. A sub-committee of the latter council reported that the company's system would be alternating current, whereas it appeared that there would be unnecessary expense in changing consumers' apparatus if the U.D.C. obtained an Order to supply on the d.c. system, and the company's ring main transmission system would be imperilled. The Council decided at its last meeting to continue its opposition.

Stoke-on-Trent Electricity Committee has decided that where premises are electrically lighted and wired with separate circuits, in accordance with specification issued by the department, supply shall be given for domestic heating and cooking at 1d. per kWh. Electric baking ovens are to be supplied at ¾d. per kWh, provided that such supply is not taken during winter peak load hours, or that, if taken during winter peak load hours, the load factor is not to be less than 20%.—The electric kiln at the Burslem works of Doulton and Co., Ltd., which was started on October 13th, has given entire satisfaction. Mr. C. H. Yeaman, city electrical engineer, reports that the load factors for the four electric kilns already in use are from 85·56% to 94·2%.—Correspondence with the Imperial Sun-Ray Centres (Hanley) in regard to the supply of electricity has been submitted to the Electricity Committee, and it has been decided that, subject to a minimum payment being made of £50 per annum, supply be given at 2½d. per kWh for sun-ray apparatus, provided the consumers take general lighting and heating at tariff rates.

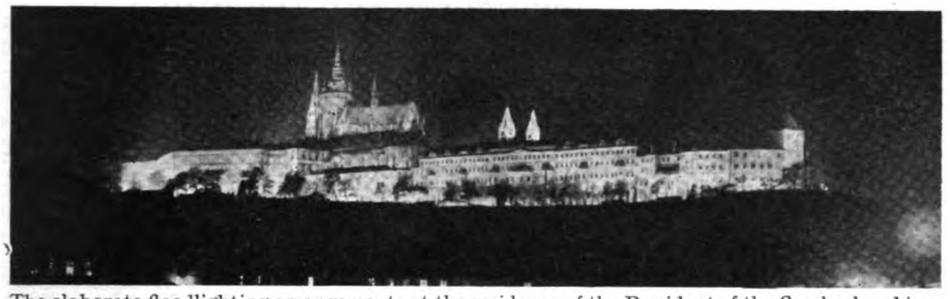
ELECTRICAL NEWS OF THE WEEK IN PICTURES.



The elaborate floodlighting arrangements at the residence of the President of the Czechoslovakian Republic, at Prague. The majority of other Government buildings are also equipped for decorative electric lighting, and this is brought into use on every suitable occasion.

Signor G. Semenza, who has been awarded the Faraday Medal of the I.E.E. (P. 141.)

The new offices of the S.W.S. Electric Power Co., at Mucklows Hill, which was visited by the Birmingham Branch of the Electrical Association for Women last week. Among those present were Lady Brooks, president of the Branch, Mrs. R. A. Chattock, Mrs. Beale, and Mrs. A. L. Hayes, secretary of the Branch.

A group taken at the Plaza Theatre, London, including, among others, Sir John Gatti, Lieut.-Colonel W. Ashley and Sir John Snell, on the occasion of the showing of the E.D.A. film "Rural Electrification" on Monday. The "story" was photographed in this country and takes about an hour to show.

Hastings Electricity Committee recommends that the voltage of the incoming supply from the proposed main grid be fixed at 11 000 V as recommended by the borough electrical engineer.—The Committee has arranged for the extension of the cables to Battle U.D.C. sewage pumping station for driving new pumps which are about to be installed.—The Committee seeks sanction for loans for services, £2 500; mains and overhead lines, £1 000; and transformers, £500, for the extended area of supply.

Mr. W. Redman, electrical engineer to Shipley U.D.C. has submitted an alternative lighting scheme prepared at the request of the Highways Committee. The scheme provides for 242 two-lamp points, each lamp being of 300 c.p. On the Bradford and Keighley Road the lighting points would be fixed on alternate tramway poles on each side of the road. On roads where tramway poles are on only one side of the road, one lighting point would be fixed on each pole. The Electricity Committee has informed the Highways Committee that the charge for the alternative scheme would be £5 per lamp per annum for maintenance, and 1½d. per kWh for current consumed.

Mr. John Christie, borough electrical engineer, reports to Brighton Lighting Committee that it is necessary to augment the capacity of the Portslade and Southwick sub-station. He suggests that the least efficient unit should this year be replaced by a 1 000 kW Bruce Peeble-La Cour motor converter, and that a second unit of similar capacity be installed at a later date. The cost of this new unit complete, including erection, will be £4 609, plus temporary h.t. switchgear, £330; l.t. switchgear, instruments, etc., £350; h.t. and l.t. cabling for connecting up, £150; alterations to foundations, etc., £350, and labour, etc, £200. The Committee has authorised the engineer to obtain offers for necessary plant, etc.

The Stewartry County Council, at a meeting on January 22nd, agreed to lodge an opposing petition to the electricity scheme of the Galloway Water-Power Co. In view of the fact that the scheme is entirely dependent on the natural resources of the Stewartry, the Council desires to secure more favourable terms than the grid, and that a supply should be made available at any of the power stations, and also at convenient points on the Company's own transmission lines throughout the county at the same pressure at which the company supplies electricity to the main transmission lines of the Electricity Board. It was stated at the meeting referred to, that the effect of the scheme would be that, in ten years, salmon in the River Dee would die out completely. Major Wellwood Maxwell, one of the promoters of the scheme, stated that on an average rate at present in force, of 8s. per £1, the scheme would yield an annual revenue to the county of £8 000.

At a recent meeting of electors Preston Corporation's Parliamentary Bill to construct a weir across the River Ribble was considered. Ald. Astley-Bell said the Council had a programme consisting of a 50 000 kW additional set in 1934–35, and a further 50 000 kW set in 1938–39. If they ran continuously their existing four 15 000 kW sets they would require four million gallons of water per hour. Under the proposed scheme, water would be impounded for a distance of three miles. The weir would be of ferro-concrete, with sluice gates, and the cost would be £75 000. The minimum flow of the river was 5 500 000 gallons per hour. Each generator needed over 1 000 000 gallons per hour, and they were faced with the necessity of augmenting this supply. The Central Board wanted the plant increased from four 12 000 kW sets to four 15 000 kW sets. Eventually they would need 11 500 000 gallons of water per hour. The proposal to promote the bill was carried.

ELECTRIC TRACTION.

Southern Railway Development Programme for the Current Year.

THE construction of an electric railway between the Republic of San Marino and Rimini (Italy) has commenced.

Preston T.C. has decided that hardening treatment be carried out on two miles of single tramway track, at a cost of £1 500.

Southend Corporation is applying for a Provisional Order authorising the running of electric trolley vehicles.

Exeter Corporation has approved the extension of the tramways from the Penhoe Road boundary to the boundary at Whipton, at a cost of £20 750.

Nottingham Corporation has decided to apply for sanction to a loan of £21 750 for the rearrangement of the tramway track necessitated by the new lay-out of the Great Market Place.

The net earnings on the New South Wales Government Railways and Tramways for the year ended June 30th, 1928, were £4 273 185, an increase of £837 505, of which the tramway net earnings were £619 205, increase £300 941.

Colne T.C. has been informed by the National Joint Industrial Council for the Tramways Industry that it has been agreed that wages of men employed on one-man trams and buses shall receive a 10% increase on their normal rates of pay.

The question of the terms of a new lease for the operation of the Prestwick tramways by the Salford tramways department has been considered by the Minister of Transport who has decided that he could not press Salford Corporation to renew the lease on terms more favourable to Prestwick than those offered.

An L.C.C. Tramway Test.

London County Council is about to test on the Camberwell and Catford route of the tramways, which includes Dog Kennel Hill and Denmark Hill, two cars which are being constructed at the Charlton works. Only four-wheeled cars have hitherto been employed on this route, but the new cars, which have been specially designed for steep gradients, are of the double bogie, eight-wheeled type.

Manchester Tramway Committee is to erect a transformer house at the Hyde Road depot, in connection with the car works extension. The Committee has had an interview with representatives of the Wythenshawe Estate Special Committee with reference to the question of transport facilities between the Wythenshawe Estate and the City. The Tramways Committee was in favour of the provision of a 100 ft. road in extension of Princess Road, from Barlow Moor Road to the Stockport-Altrincham road, and the construction therein of a reserved (sleeper track) tramway.

It is announced that the extensive electrification scheme on the central section of the Southern Railway, which has involved the conversion of the old overhead system to the third rail d.c. system, at a cost of £3 750 000, is due for completion next Month. The total mileage of electrified line on the Southern Railway will then amount to 875 track miles, the total cost being £11 500 000. The final stage of the scheme covers the lines between Victoria and Epsom via Mitcham Junction; London Bridge, Effingham Junction, and Dorking North via Mitcham Junction; Holborn Viaduct and Wimbledon via Herne Hill, Tulse Hill, Tooting Junction, and Haydons Road; and the section of line between Beckenham Junction and Crystal Palace, which will permit the Victoria to Crystal Palace services to be extended to Beckenham Junction and further extensions are under consideration.

At a recent meeting of the Council of the London Municipal Society a resolution was passed urging upon the Government the necessity of giving facilities for the speedy passage of the Bills dealing with the proposed London traffic scheme in order that new and urgently needed transport services may be provided, the congestion of the streets relieved, cheaper fares and better labour conditions secured, and an opportunity afforded for giving work to the unemployed by the construction of new tube railways and other important improvements.—A resolution was passed at a recent meeting convened by Deptford B.C. (attended by representatives of Battersea, Bermondsey, Deptford, Poplar, Shoreditch, Stepney and Woolwich Councils), "strongly protesting against the proposed surrender by the L.C.C. of the existing public control of the tramways," and asking the councils represented at the meeting to oppose by petition the legislation on the subject to be promoted in the present Session of Parliament.

THE SOCIAL SIDE.

THE London office staff of Bakelite, Ltd., held their first dance on January 19th, at the Temple Restaurant, Victoria Embankment.

Blackpool Electricity and Tramways Employees' Institute last week held one of the most successful whist drives and dances ever held. Over 2 000 persons paid for admission. The Mayor and Mayoress distributed the prizes.

Downes and Davies, electrical dealers, 1/3, Stanley Street, Liverpool, contributed ten guineas to the Liverpool Goodfellows Fund. The directors and staff of Pulford Bros., Ltd., 106/110, Whitechapel, Liverpool, contributed £5.

The fourth annual dinner of the staff of Lincoln Corporation electricity department was held on January 4th, under the presidency of the assistant electrical engineer, Mr. Arthur Letts. The toast of "The Undertaking" was proposed by the city electrical engineer, Mr. Stanley Clegg. During the evening, the chairman of the Electricity Committee, Alderman W. S. White, presented an inscribed clock to Mrs. Wicks in recognition of her services at the St. Swithin's power station.

The test room staff of the Westinghouse Brake and Saxby Signal Co. held a smoking concert this year instead of its annual social. The concert was held on January 18th at the Railway Hotel, Chippenham. Mr. W. M. Martin presided in the absence of Mr. L. V. Gardiner, who is recovering from a motor accident. Mr. F. C. Brittain, works manager, was present, and the company enjoyed an excellent programme of musical and vocal items arranged by the committee. A feature of the evening was a "never-ending" song in Hindustani rendered by Mr. Murari Lal Mehandru.

The fifth annual works social given by the directors of Heyes and Co., Ltd., Water-Heyes Electrical Works, Wigan, was held at Miss Churchill's Rooms, on January 19th. Among those present were Mrs. W. A. Heyes (Mr. W. A. Heyes, the governing director, being unavoidably absent through illness), Miss Heyes, Messrs. A. V. Heyes (director), J. W. Cartwright (works manager), and J. C. Muir (secretary). The evening commenced with whist, after which prizes were distributed by Mrs. Heyes. Supper and dancing, with items of entertainment by Mr. Elsworth, terminated a most enjoyable evening.

The annual dinner of the directors, staff, and employees of the Eagle Engineering Co., Warwick, which was held recently reflected in happy manner the good relations which have always existed between the employees and employers. Mr. H. Palmer, managing director of the company, attended and was accompanied by Mr. Guy Champ, manager of the radio department, Mr. Colin H. Gardner, technical consultant of that department, Mr. Semple, Western Area representative, and Mr. Marriott, London manager of the radio department. An attractive musical programme was provided by the company's radio engineers by means of a new electrical reproducing equipment, working independently of the mains, which is said to provide music at a volume sufficient to enable 800 people to dance to it. This equipment may be placed on the market in the near future. In addition, a musical programme was provided by the Romnay Dance Band, consisting entirely of members of the staff.

The S.W.S. Social.

The annual dinner of employees of the Shropshire, Worcestershire, and Staffordshire Electric Power Co. was held at Dudley Town Hall on January 19th, about 400 being present. The gathering was presided over by Mr. T. F. Boothby, chief generating engineer, and amongst other officials present were the chief engineer and manager of the company, Mr. J. T. H. Legge, department chiefs and district representatives. The visitors included the Mayor of Dudley and Mr. R. Matthias (general manager of the Midland United Newspapers, Ltd.). During the dinner music was provided by loud-speaking equipment through which gramophone records were amplified—this apparatus being the property of the company's publicity department. The toast of "The Company" was proposed by Mr. S. A. Woodhall, who coupled with it the name of the chief engineer and manager, Mr. Legge. Responding, Mr. Legge said it seemed only a year or so ago since he attended a similar dinner which was held at Smethwick. That was in the younger days of the company and there were then about forty people present. Following the toasts, an enjoyable concert was given by the "Merry Optimists," a well-known Kidderminster Concert Party, while Mr. G. Mountford, an employee, contributed songs.

COMPANY NEWS.

Manufacturing Holdings Show General Improvement—Electricity Supply Descriptions Harden—Cable and Wireless Stocks Both Higher—Another Important Merger—Statutory Report of Everlite, Ltd.—Company Reports—New Companies Registered.

GENERAL Electric shares have been in demand this week, the quotation being about 7s. above that when we last wrote. Crompton-Parkinson 2nd preference have improved from 18s. 3d. to 19s. and British Thomson-Houston preference from 23s. to 23s. 3d. In the lighting section Shropshire, Worcester and Staffs "B" have risen 1s. 3d. to 36s. 9d., and Yorkshire Power preference are 6d. better at 24s. 6d. County of London shares have improved 1s. 6d., and Kensington and Knightsbridge 6d. Cable stocks show a small improvement, Eastern stock rising 5 points. Marconi's Wireless and Marine are both higher.

RADIO CORPORATION.—Pft. for 1928, $18 983 000, against $7 110 170 for 1927. No. div. has yet been paid on common stk.

PAIGNTON ELECTRIC LIGHT AND POWER CO., LTD.—Mr. J. N. Philip, of Torquay, recently announced that up to Jan. 31 he was prepared to pay 41/3 p. sh.-cum.-div. for shs. in this co., and that during last week he had already purchased 5 000 shs., paying from 32/- p. sh.

AMERICAN RADIO-GRAMOPHONE COMBINE.—In connection with the Victor Talking Machine-Radio Corporation merger, holders of common stk. of former co. are asked to deposit their certificates by Mar. 4 with New York depository; or with Messrs. Seligman Bros., London.

VORARL BERGER ILLWERKE AKTIENGESELLESHAFT.—The "Financial Times" states that over 80% of the recent. issue of £2 000 000 of this co.'s 6% 30-year Sterling bonds has been left with the underwriters. Co. was incorporated in Austria for the production of electric power.

Sir Benjamin Longbottom who is on the board of Laurence Scott and Electromotors, Ltd.

MELBOURNE ELECTRIC SUPPLY CO., LTD.—Trading acct. for year ended Aug. 31, 1928, shows blce. £313 809, agst. £283 033. After providing £300 000, the sum determined upon by the Victorian Electricity Commission as payable under Act No. 3 377, there remained £124 308, plus £21 284 transferred from res. and £25 int. received. After placing £24 000 to taxation res. and providing £40 000 for div. on pref. shs., fin. div. of 5% actual on con. ord. stk. is recommended, making, as in previous year, 10%, British tax free. Fwd. £1 156.

WEST LONDON AND PROVINCIAL ELECTRIC AND GENERAL TRUST, LTD.—Directors announce that further sales of co.'s hldg. in Chiswick Electric Supply have been effected, resulting in substantial addition to cap. res. In order to capitalise £36 000 of res. fund directors propose to increase cap. to £390 000 by creation of 18 000 £5 shs. and apply that amt. in paying up £2 p. sh. on the new cap., which will be offered to existing hldrs. in proportion of one new sh. for each £10 of ord. stk. at £3 p. sh. New cap. will be split into £4 5% cum. pref. and £1 ord. and subsequently converted into stk.

EVERLITE, LTD.—Statutory rept. states that total shs. allotted are 2 000 000 of 1s. ea., of which 350 000 have been allotted as fully paid, as part consideratn. for purchase of inventn., patents and applicatns. and remaing. 1 650 000 shs. have been alloted wholly for cash as follows:—405 000 shs. at 2s. 6d. ea., 1 245 000 at 1s. ea. Total amt. received in respect of shs. issued wholly for cash, £112 875. Paymts. to Jan. 23 are as follows:—In connectn. with acquistn. of inventn. trade name, etc., including cash consideratn. (£30 000) payable to vendors, £34 635; prelim. exs. £1 017; excess of paymts. over receipts on trading acct., £71; cash £77 151—total £112 875. Prelim. exes. estimated at £3 500.

TRACTION AND GENERAL INVESTMENT TRUST.—Rev. for 1928, after deducting exes., was £74 432, agst. £59 980, plus £31 921, agst. £29 770. Intm. divs. of 2½% on pref. and 6% on ord. were paid, less tax, on July 31, 1928, with div. of 1s. 11d. p. sh., less tax, on 25 623 new shs., leaving £83 549. To res. £10 000 (same as last year) fin. divs. 2½% on pref. and 10% on ord. less tax. Fwd. £35 798. Premium from Feb. issue to ord. hldrs. of £83 260, after writing off exes. has been transferred to res. As from July 1 last new shs. were converted into £128 115 5% cum. pref. and £76 869 ord., rankg. *pari passu* with existg. stks. Directors also issued further £208 000 4½% deb. stk. Ord. div. for previous year was 15%.

DUBLIN UNITED TRAMWAYS CO., LTD.—Directors recommend, subject to fin. audit, paymt. of div. on pref. stk. at rate of 6% p.a., less tax, for half-year, and fin. div. on ord. stk. at rate of 5% p. a., less tax, for same period, makg. with the

Digitized by Google

3% intm. div. paid in Aug., total div. of 4% for year 1928. Directors have also decided to set aside for renewals to track £50 000; for mtge. and deb. redempn., £15 000; and for renewal of overhead lines and cables, £7 000; and to carry fwd. £13 785. Last year divs. were 6% on pref. stk., 6% on ord. stk., making 4½% for year; set aside in the track renewals, £50 000; mortgages and deb. redeptn., £15 000; fwd., £13 368. Although distributn. on ord. stk. for year is reduced from 4½ to 4%, £7 000 is set aside for renewal of overhead lines and cables, while carry fwd. slightly increased.

The amalgamation of LAURENCE, SCOTT AND CO., LTD., Norwich, and ELECTROMOTORS, LTD., Openshaw, Manchester, under the proposed title of LAURENCE, SCOTT AND ELECTROMOTORS, LTD., is, we understand, in process of completion. Laurence, Scott and Co., Ltd., established in 1883, have a wide range of manufactures embracing large generating units and motors, and they have for many years specialised in marine electrical equipment. Electromotors, Ltd., were established in 1899, and manufacture d.c. and a.c. machines up to 150 H.P. Like their future associates they also have a specialised range of motors for driving ships' auxiliaries. The Board of directors includes Mr. C. Wilson (chairman) and Mr. W. H. Scott (founder) of Laurence Scott and Co., Ltd., and Sir Benjamin Longbottom, of Electromotors, Ltd.

BRAZILIAN TRACTION, LIGHT AND POWER CO., LTD.—Purchase of nearly all ord. shs. of City of Santos Improvements Co., Ltd., has recently been completed. The latter co. owns and operates the services of light and power distribution and tramway and omnibus transport in Santos and Sao Vincente, Brazil. Acquisition of shs. of Santos Co. calls for an expenditure of approximately $14 000 000 and, in addition to this, rapid expansn. of other enterprises controlled by Brazilian Traction Co. call for considerable cap. expenditure in near future. Further large power units are shortly to be installed, one of 40 000 H.P. at the Parahyba plant in the Rio district, which has already been ordered, and one of probably 60 000 H.P. at the Serra plant in Sao Paulo district. Also other services of the co.'s subsidiaries call for a large amt. of additional cap. outlay to meet growth of business. The Board has decided to offer to hldrs. of ord. shs. additional ord. shs. of no par value, on basis of one sh. of additnal. stk. for each seven shares held, at $40 p. sh. At a recent mtg. of the Board a qtrly. div. of 50 cents p. sh. was declared on ord. shs., payable Mar. 1, 1929.

New Companies.

S. W. HOWES AND CO., LTD.—Cap., £5 000. Electrical engineers, etc. A director: L. T. Howes, 399, Gravelly Lane, Erdington, Birmingham.

RICH AND PATTISON (LEEDS), LTD.—Cap., £500. Factors of electrical fittings, wireless goods, etc. A first director: H. P. Rich, 323, Pershore Road, Edgbaston, Birmingham, factor.

ZENDIX ELECTRIC CO., LTD.—Cap., £100. Manufacturers of Zendix electrical brush and other electrical appliances, and to acquire trade mark "Zendix." Reg. office: 93, Mortimer Street, London, W.1.

H. J. ELECTRICAL SERVICES, LTD.—Cap., £1 000. To acquire business of electrical service agent and automobile electrical specialist carried on by F. Hargreaves at 2, Bedford Street North, Halifax.

ARTHUR J. HERON AND SONS, LTD.—Cap., £3 000. To acquire business of heating, lighting, ventilating and electrical engineer, etc., carried on by A. J. Heron at 108, Derby Street, Moss Side, Manchester, as "Arthur J. Heron, M.Inst.P."

REGENT STUDIOS, LTD.—Cap., £100. To acquire business of lampshade manufacturers, artists, electrical engineers and contractors formerly carried on by L. Bristow and E. Bristow at Pollen Street, Westminster, etc. Reg. office: 5, Maddox Street, London, W.1.

BRITISH POWER AND LIGHT CORPORATION, LTD.—Cap., £100. To promote companies, syndicates and partnerships of all kinds, particularly those to carry on businesses of electrical and general engineers and manufacturers and maintainers of plant for generation, accumulation, transmission and supply of electrical energy, etc. Solicitors: Herbert Smith and Co., 62, London Wall, London, E.C.2.

MUNICIPAL FINANCE.

Points from the Past Year's Accounts of Electricity Undertakings.

THE total revenue for the year 1927–8 of the 26 undertakings included in the following table and the 217 in the tables which appeared in our issues of August 17th, September 14th, October 26th, and November 30th, 1928, was £30 447 616. The gross profit on the year's working of the 243 undertakings was £14 341 517, and the aggregate sales of electricity amounted to 4 773 141 953 kWh, while 97 undertakings out of the total number have contributed, out of the year's profit or from reserve, an aggregate of £528 120 to the relief of rates. In many cases the costs include items of a capital nature, and net profits have been reduced as the result of reduction of charges for current.

Authority.	Total Revenue. £	Gross Profit. £	Net Profit or deficit. £	(*a*) Working Costs per kWh sold.	Total Cost per kWh (inc. capital charges).	Electricity sold (kWh). COMMERCIAL INFORMATION.

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

BERRY'S ACCUMULATORS, 41, Bolton Road, Irlam-o'-th'-Heights, engineers. £30 16s. 10d. December 4th.

FUCHSIAPHONE INSTALLATION, 11, Mill Street, Middleton, Manchester, electrical, etc., engineers. £18 5s. 3d. December 3rd.

T. J. HORN, 221, Banbury Road, Oxford, wireless dealer. £27 5s. 2d. December 18th.

NEW STANDARD WIRELESS VALVE CO., LTD., High Street, Bollington, wireless valve manufacturers. £21 14s. 2d. December 13th.

ROBINSON, (D.) AND CO., 76, Higher Temple Street, Chorlton-on-Medlock, electrical engineers. £22 16s. 6d. December 14th.

RUTHERFORD, (A.) Plowman's Yard, Church End, Finchley, electrical engineer. £14 6s. 6d. December 20th.

Receivership.

COMMERCIAL TELEPHONE AND ELECTRICAL CO., LTD. C. J. Hocking, builder, of 35, Great Queen Street, Holborn, W.C., was appointed receiver on January 10th, 1929, under powers contained in debentures dated April 30th, 1924. J. H. Rook, solicitor, ceased to act as receiver and manager for the debenture holder on the above date.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure, Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

HUTTON, Lawford Carr, trading as THE SPORTS AND RADIO STORES, Queens Parade, New Southgate, N.11. The above debtor executed a deed of assignment for the benefit of his creditors in September, 1926. Under this deed Mr. Charles Latham, of the Wireless and Radio Trades Guardian Association, Ltd., of 78, New Oxford Street, London, W.C.1, acted as trustee, and the business has since been carried on under his supervision and is still being continued. Dividends have been distributed from time to time, and it is now stated that a final dividend of 5s. in the £ is being paid, making 20s. in the £ in all. The greatest satisfaction has been expressed on this satisfactory realisation of the estate.

GLOVER, Mrs. Dora, trading as D. JOHNSON, electrical and wireless dealer, 71, King Street, Wallasey, Cheshire. The creditors interested herein were called together recently at the offices of Mr. Parkin S. Booth, accountant and auditor, Exchange Chambers, Bixteth Street, Liverpool. A statement of affairs was presented which disclosed ranking liabilities of £999 14s. 2d., made up of trade creditors, £534; cash claims, £295; and partly secured creditors, £170. The latter was the bank, who claimed £969 19s. 8d., but they held a charge on property valued at £800. In addition, there was a fully secured creditor for £198, who held security valued at a similar amount. The assets were estimated to realise £485, from which had to be deducted £35 for preferential claims, leaving net assets of £450, or a deficiency of £550. It was reported that when she started the present business debtor had £185 in cash, and a stock of electric sundries valued at £100. During the year to January 31st, 1926, the turnover was £3 562, with a net loss of £76, whilst in the following 12 months there was a net loss of £732 on sales of £3 870. In the succeeding year the turnover fell to £3 168, but the net loss was reduced to £215, and in that year friendly loans totalling £520 were brought in. During the 11 months to December 31st last the sales were £2 629, with a net loss of £546.

A resolution was passed in favour of the matter being dealt with under a deed of assignment executed with Mr. Booth as trustee, and a committee consisting of the representatives of Baxendale and Co., Ltd., Chloride Electrical Storage Co., and Rowe Bros. and Co., Ltd.

JONES, Percy, and MERCER, James Henry, trading as NORTHERN WHOLESALE ELECTRICAL SUPPLY, 266 and 268, Holloway Road, London, N7, electrical and hardware dealers. A meeting of the creditors of the above was held on January 24th at the offices of Sunderland, Mountstephen and Co., C.A., 15, Eastcheap, E.C. Mr. Sunderland submitted a statement of affairs which showed liabilities of £902, and assets were estimated to realise £1 248, less £148 for preferential claims, leaving net assets of £1 100, or a surplus of £198. The assets included stock, £953; fixtures and fittings, £78, expected to produce £40; and good book debts, £247. Mr. Sunderland added that there were three suing creditors, and as one was in a position to levy execution, a deed of assignment had been taken in order to protect the assets. He added that the business was commenced last March by the present partners. Mr. Jones then found £1 000 in cash, whilst Mr. Mercer introduced a connection which was valued at £700. The premises were taken on a lease for 21 years at a rental of £250 per annum. A premium of £250 was given for the lease, on which no value had been placed at the moment, although something might be obtained for it. Mr. Mercer had previously been in the same line of business, but Mr. Jones was in another trade, and during the time of the partnership had been in other employment. Full records had not been kept, and the usual trading figures could not be presented. Mr. Jones possessed separate assets, and if the partnership estate did not produce sufficient to pay 20s. in the £, then Mr. Jones' private estate would be liable.

London Gazette, etc.

Bankruptcy Information.

HUDSON, Fred James, late 44, Heath Road, Bradford, now at 63, Thurnscoe Road, Bradford, electrical engineer. Receiving order, January 21st. Debtor's petition.

JACOB, William Thomas, 14, Meyrick Street, Pembroke Dock, Pembroke, wireless engineer. Receiving order, January 26th. Debtor's petition.

Notice of Intended Dividends.

COLLIER, Thomas Frederick, 64, Union Street, West, lately carrying on business at 116, Union Street West, Oldham, electrician. Last day for receiving proofs, February 9th. Trustee: J. D. Turner, Byrom Street, Manchester, official receiver.

DAVIES, John Arthur, Church Street, Blaenau Festiniog, Merioneth, electrical contractor. Last day for receiving proofs, February 8th. Trustee: I. D. Hooson, Official Receiver, St. Peter's Churchyard, The Cross, Chester.

TEMPLE, Edward, and BURKETT, Jane Eva, Mrs., 105, Canterbury Street, South Shields, wireless dealers and electrical contractors, trading as THE WESTOE ELECTRICAL COMPANY. Last day for receiving proofs, February 13th. Trustee, A. J. Gray, 48, Pilgrim Street, Newcastle-upon-Tyne.

Partnership Dissolved.

CURRIE AND HANCHETT (Gordon HANCHETT and George CURRIE), electrical contractors, 5 and 7, Altrincham Street, London Road, Manchester, by mutual consent as from November 30th, 1928, so far as regards G. Hanchett, who retires from the firm. Debts received and paid by G. Currie, who will continue the business under his own name.

Application for Discharge.

WOOD, Norman Hurst, 32, Highbury Avenue, Thornton Heath, Surrey, lately at 38, St. Charles Square, North Kensington, W.10, electrical engineer. Hearing, February 21st, 10.30 a.m. County Court, Scarbrook Road, Croydon.

Bankruptcy Proceedings.

GOVETT, Charles Kenneth, trading as KENNETH GOVETT AND CO., 179, Albany Road, Cardiff, electrical contractor. The first meeting of creditors of this debtor was held recently at Cardiff. The debtor attributed his failure to illness of himself and bad trade. A statement of affairs was presented to the meeting which showed liabilities amounting to £412 against assets of £12, or a deficiency of £400. The case remained in the hands of the Official Receiver as trustee of the estate.

METAL AND CHEMICAL PRICES.

TUESDAY, January 29th

		Price.	Inc.	Dec.
Copper—

Rubber—Para fine, 11½d.; plantation, 1st latex, 10¼d.

*** The metal prices are supplied by British Insulated Cables, Ltd., and the rubber prices by W. T. Henley's Telegraph Works Co., Ltd.

LEAD MARKET REPORT.

The market has again been dull and uninteresting, and according to James Forster and Co. the small fluctuations seen were due to professional operations. Prices last week opened 5s. per ton higher, but this advance was lost.

Closing prices on January 25th were £22 1s. 3d. for January and February, £22 2s. 6d. for March, and £22 3s. 9d. for April, or unchanged on the week.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

303 534 Siemens-Schuckertwerke Akt.-Ges., O. Krell, and H. Gerdien. Electric arc-lamps. (5/8/27.)
303 391 G. Heptonstall and W. Shaw. Electrical distribution boards and structures. (22/9/27.)
303 427 British Thomson-Houston Co., Ltd., and E. D. Regis. Electric switchgear. (29/9/27.)
303 458 British Thomson-Houston Co., Ltd., and E. D. Regis. Electric switchgear. (30/9/27.)
278 705 Electrical Research Products, Inc. Composite signalling-conductors. (6/10/26.)
303 434 Hotpoint Electric Appliance Co., Ltd., E. R. Clarke, and W. J. Sims. Coil winding machines. (3/10/27.)
303 460 J. Y. Johnson (I.G. Farbenindustrie Akt.-Ges.). Method of and apparatus for rendering alternating-current differential wattmeter independent of frequency when employed as resistance meter. (3/10/27.)
303 462 J. Bathgate. Electric combined control switches for automobile lighting, signalling, and horn-sounding. (4/10/27.)
303 541 F. W. Twort. Electrical transformers or couplers. (4/10/27.)
303 465 Relay Automatic Telephone Co., Ltd., and B. B. Johnson. Electric signalling-devices. (4/10/27.)
303 550 Standard Telephones and Cables, Ltd. (Western Electric Co., Inc.). Electrical contact devices. (5/10/27.)
303 551 Standard Telephones and Cables, Ltd. (Western Electric Co., Inc.). Composite sets for telephone and telegraph lines. (5/10/27.)
303 552 Standard Telephones and Cables, Ltd., and E. P. G. Wright. Automatic telephone systems. (5/10/27.)
303 553 Igranic Electric Co., Ltd., and G. Holdway. Variable-inductance devices. (5/10/27.)
303 555 L. T. Payne. Electric inspection-lamps for motor-vehicle use. (5/10/27.)
303 556 A. B. Coleman. Wall or like clips for pipes, conduits, cables, and the like. (6/10/27.)
303 558 A. Reyrolle and Co., Ltd. and R. Willoughby. Load-discriminating systems for electric circuit-breakers. (6/10/27.)
303 561 W. E. Beatty (Bell Telephone Laboratories, Inc.). Composite electric conductors. (6/10/27.)
278 731 M. Singelmann. Rectifiers for alternating-currents. (6/10/27.)
303 563 A. Reyrolle and Co., Ltd., and J. R. Smith. Contacts for electric switches and circuit-breakers. (7/10/27.)
303 571 A. Reyrolle and Co., Ltd., and H. Leben. Electric protective arrangements. (10/10/27.)
303 575 Automatic Telephone Manufacturing Co., Ltd., and J. E. Ostline. Semi-automatic telephone systems. (10/10/27.)
303 578 K. Kaisser. Starting-device for electromotors equipped with a clutch. (12/10/27.)
303 580 M-O Valve Co., Ltd., and J. W. Wigan. Thermionic valves. (13/10/27.)
303 586 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Wireless receiving sets. (15/10/27.)
303 587 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Wireless receiving sets adapted for continuous or alternating current feeding as desired. (15/10/27.)
280 187 Z. B. Begg. Combined electric turn-switch and wall-plug. (3/11/26.)
279 883 M. Surjaninoff. Electric induction furnaces. (30/10/26.)
303 597 H. H. Berry. Electric heating elements. (28/10/27.)
303 603 Igranic Electric Co., Ltd., and A. H. Curtis. Remote-control apparatus. (4/11/27.)
303 606 R. A. F. Jackson and J. D. Place. Electrical heating-units. (8/11/27.)
303 608 Edison Swan Electric Co., Ltd., and L. H. Soundy. Wireless receiving-circuits. (9/11/27.)
303 617 General Electric Co., Ltd., and H. G. McClean. Electric motor control systems. (21/11/27.)
303 620 E. L. Dunand. Supporting-means for electric lamp shades. (23/11/27.)
303 628 Sun-Vi-Lite, Ltd., and R. J. Rawlings. Electric arc lamps. (2/12/27.)
282 765 F. Bornhardt. Stereoscopic Röntgen-ray fluoroscopy. (27/12/26.)
290 619 F. Bornhardt. Stereoscopic Röntgen-ray fluoroscopy. (18/5/27.)
303 666 Metallbank und Metallurgische Ges. Akt.-Ges. and J. Zagorski. Electric conductor of solid cross-section and smooth surface. (30/1/28.)
303 681 L. F. Douglass. Thermionic valve-amplifying circuits. (20/2/28.)
303 682 F. J. Stuart. Automatic switches for battery ignition engines. (22/2/28.)
286 607 C. J. A. Lange and L. J. E. Forest. Arrangement for detecting direction of propagation of current, particularly applicable to switching in telephone installations. (5/3/27.)
303 689 F. Berg. Insulator of the pintle type for live wires. (9/3/28.)
303 690 W. R. Edwards and R. Edwards and Co., Ltd. Boxes or containers for electrical accumulators. (13/3/28.)
287 916 Aktiebolaget Bergslagens Gemensamma Kraftforvaltning. Disconnecting switches for overhead electric lines. (29/3/27.)
292 152 H. Andre. Electric conductors of high negative temperature coefficient. (17/6/27.)
291 372 G. de Gasenko. Incandescent electric lamps having means for giving different degrees of luminous intensity. (31/5/27.)
292 906 J. P. Pegg and H. G. Roddy. Means for utilizing tidal and wave energy. (24/4/28.)

Applications for Patents.

December 20th.

37 701 International General Electric Co., Inc. Arc extinguishing chambers. (24/12/27, Germany.)
37 684 J. Mellersh-Jackson (Siemens and Halske A.G.). Electric meters, etc.
37 711 G. A. Mathieu. Radio telephone systems, etc.
37 699 Patent-Trenhand-Ges fur Elektrische Gluhlampen. Electric luminous tubes. (20/12/27, Germany.)
37 718 F. N. Scaife and Standard Telephones and Cables, Ltd. Variable electric condensers.
37 661 Scintilla A.G. Electric starters for engines. (15/3/98, Germany.)
37 654 Siemens and Halske A.G. Signalling and telephone systems.
37 716, 37 717. T. S. Skillman and Standard Telephones and Cables, Ltd. Telephone systems.
37 692 S. B. Smith and G. M. Wright. Picture, etc., telegraph apparatus.
37 649, 37 650 G. E. Spero. Loud speakers, etc.
37 651 G. E. Spero. Radio receiving sets.
37 652 G. E. Spero. Control switches.
37 624, 37 625 Standard Telephones and Cables, Ltd., and E. P. G. Wright. Telephone systems.
37 642 J. Stanley. Arc lamps.

December 21st.

37 733 T. Angus. Wringing machines, etc.
37 800 Brandes, Ltd. (Federal Telegraph Co.). Signal transmitting system.
37 780 British Thomson-Houston Co., Ltd., and T. Hands. Electric switchgear.
37 840 R. T. Clarke. Installations for generation of electric energy.
37 771 B. B. Fenn. Electric lamp holder, etc.
37 767 J. V. Foll and Muirhead and Co., Ltd. Telegraphic communication systems.
37 782 International General Electric Co., Ltd. Electric protective devices. (28/12/27, Germany.)
37 727 A. T. Koch. Safety control, etc., for electric ignition systems.
37 747 L. V. McKenzie. Electrically operated air suction pumps.
37 880 Maschinenfabrik Oerlikon. Arrangement for converts d.c. into a.c. (31/12/27, Switzerland.)
37 845 A. W. Larsky and C. D. Rowley. Irradiation of liquids, etc.
37 724 C. L. Morton. Operation of danger lights on tramcars, etc.
37 815 F. Newton. Field magnets for dynamos.
37 812 A. Preen. Radio receiving sets.
37 831 Siemens Schuckertwerke A.G. Arrangement for exciting synchronous machines. (23/12/27, Germany.)
37 764 M. C. Spencer. Means for operating polyphase motors.
37 738 Western Electric Co., Ltd. (Bell Telephone Laboratories, Inc.). Television systems.
37 850 J. C. Wood. Electric water heater.
37 732 W. C. Haynes. Electrical branding devices.

December 22nd.

38 004 M. von Ardenne. Terminal repeater device for reproduction of sound. (22/12/27, Germany.)
37 948 C. M. R. Balbi and H. T. Harrison. Light operated electric switches.
37 929 British Thomson-Houston Co., Ltd. (W. D. Coolidge). Electric discharge devices.
37 971 A. Carpmael (Telefunken Ges fur Drahtlose Telegraphie). Picture, etc., telegraph systems.
37 930 Cie Francaise pour l'Exploitation des Procédés Thomson-Houston. Sound reproducing apparatus. (22/12/27, France.)
37 965 S. C. Davey, A. E. Honey, and J. Stone and Co., Ltd. Electric switches.
37 911, 37 912, 37 913 V. C. From, A. W. Larsky, and C. D. Rowley. Electric lamps.
37 921 General Electric Co., Ltd., and W. Wilson. Electrical protective devices.
37 958 Grierson, Ltd., and R. Grierson. Electrical heating of buildings.
37 923 H. E. Humphries and Siemens Bros. and Co., Ltd. Selecting switches for automatic telephone systems, etc.
37 896 H. Plauson. Production of X-rays.
37 897 H. Plauson. Production of light.
37 898 H. Plauson. Cathode ray tubes.
37 947 Standard Telephones and Cables, Ltd. (Western Electric Co.). Radio-telephone, etc., systems.

December 24th.

38 079 Diamco Akt.-Ges. fur Gluhlicht and W. Saulmann. Dry batteries.
38 100 E. Citovitch. Electrochemical processes. (24/12/27, Germany.)
38 126 V. H. M. A. Dangerfield. Apparatus for generating actinic rays.
38 091 A. Einstein and L. Szilard. Electrodynamic movement of fluid metals. (27/12/27, Germany.)
38 127 G. E. A. Pohu. Thermionic valve circuit arrangements.
38 092 F. B. Woolford. Electric furnaces.

COMING EVENTS.

Friday, February 1st (To-day).

Institution of Electrical Engineers (Meter and Instrument Section).—Institution, Savoy Place, Victoria Embankment, London. Paper by Mr. J. L. Carr on "Recent Developments in Electricity Meters, with particular reference to those for special purposes." 7 *p.m.*

Monday, February 4th.

Institution of Electrical Engineers.—Institution, Savoy Place, Victoria Embankment, London. Informal meeting. Discussion on "Earthing and the Safety of the Public." (Opened by Mr. W. R. Rawlings.) 7 *p.m.*

Sheffield Illumination Society.—Lecture Hall, Y.M.C.A., Fargate. Lecture by Mr. R. G. Williams on "Colour Lighting." 7.30 *p.m.*

Royal Society of Arts.—John Street, Adelphi, London. Cantor Lecture III, by Dr. C. H. Lander on "The Treatment of Coal." 8 *p.m.*

Tuesday, February 5th.

Electrical Contractors' Association (Bournemouth Branch).—Ordinary meeting.

Electrical Contractors' Association (Derby Branch).—Ordinary meeting. 5 *p.m.*

Institution of Electrical Engineers (East Midland Sub-Centre).—University College, Nottingham. Paper by Mr. W. B. Woodhouse on "Overhead Electric Lines." (To be presented by Mr. E. T. Painton and illustrated by a cinematograph film.) 6.45 *p.m.*

School of Engineering and Navigation.—High Street, Poplar. Third lecture (course of five lectures) by Mr. H. Brazil on "Electrical Sub-Stations." 7 *p.m.*

Association of Supervising Electrical Engineers.—Junior Institution of Engineers, 39, Victoria Street, London. Illustrated lecture on "Beam Wireless," by Lieut.-Colonel A. G. Lee. 7.15 *p.m.*

Institution of Electrical Engineers (Dundee Sub-Centre).—Lamb's Restaurant, Reform Street. Discussion on "Earthed *versus* Insulated Systems." 7.30 *p.m.*

Institution of Electrical Engineers (North-Western Centre).—17, Albert Square, Manchester. Paper by Messrs. Johnstone Wright and C. W. Marshall on "The Construction of the Grid Transmission System in Great Britain." 7 *p.m.*

Electrical Society of Glasgow.—30, Gordon Street. Paper by Mr. W. D. Brassington on "Consumer, Contractor, and Supply Engineer." 7.30 *p.m.*

Wednesday, February 6th.

Electrical Contractors' Association (Bath Sub-Branch).—Ordinary meeting.

Electrical Contractors' Association (Cardiff Branch).—Ordinary meeting. 2.30 *p.m.*

Polytechnic (School of Electrical Engineering).—307–309, Regent Street, London. Second lecture (course of eight lectures) by Mr. E. S. Ritter on "Picture Telegraphy." 5 *p.m.*

Institution of Electrical Engineers (Wireless Section).—Institution Savoy Place, Victoria Embankment, London. Paper by Messrs. B. Hodgson, L. S. Harley and O. S. Pratt on "The Development of the Oxide-Coated Filament. 6 *p.m.*

Thursday, February 7th.

Electrical Contractors' Association (Newcastle Branch).—Ordinary meeting. 11 *a.m.*

Electrical Association for Women (Manchester Branch).—Visit to Barton Power Station of the Manchester Corporation Electricity Department. 2.30 *p.m.*

Electrical Association for Women.—Visit to the Soho School of Cookery, 20, Soho Square, London. Lecture-Demonstration on "A Five-Course Dinner," by Miss Mabel Collins. 3 *p.m.*

Electrical Contractors' Association (Bristol Branch).—Ordinary meeting. 3.15 *p.m.*

Royal Institution of Great Britain.—21, Albemarle Street, London. Lecture by Sir W. Bragg on "The Early History of X-Rays." 5.15 *p.m.*

Institution of Electrical Engineers.—Hotel Cecil, Strand, London. Annual Dinner. 7 *for* 7.30 *p.m.*

Friday, February 8th.

Engineering and Scientific Club.—Paper by Mr. L. Southerns on "Sound Waves and Musical Tones."

Credit Policy Defended.

ALTHOUGH the speeches of the chairmen at the annual meetings of the big joint stock banks are always read with interest, their utterances this year are of particular importance in their bearing on the main plaint in the last B.E.A.M.A. "Trade Survey." In this document, as our readers will recall, the credit policy of the banks was blamed for bringing this country "down to a state where industrialists are losing hope of ever being able to improve their conditions of production, and of earning satisfactory margins of profit." Almost with one mind the bankers have taken up the complaint, and, in speeches mainly devoted to the relations between banking and industry, have, on the whole, made a most effective reply to the charges. The experience we have had of credit manipulation in the past should act as a warning against similar essays in the future, but it is still insufficiently realised that a real return to national prosperity can only be made along the lines of financial stability. Mr. TENNANT put the matter very clearly when he pointed out that while banks should make no artificial restriction on credit, the adoption of an opposite policy would neither stimulate demand nor increase production and employment. Production can of course be stimulated by credit, but trade expansion depends on effective demand for the goods produced. In Mr. TENNANT'S own words, "Credit can help at the psychological moment, and those who control credit must always be ready and watching for the opportunity to help. But the initial impetus must come from the side of trade and industry. The function of banking is to be always ready to cater for an increased demand for commodities and an enhanced manufacturing activity by expanding the supply of credit *pari passu* with such developments. If the expansion takes place before the signs of an approaching increase in demand herald the need for an increase in production, the well-known evils of inflation are let loose."

Pictures Across the Sea.

ALTHOUGH a service of picture transmission by wireless has been in use across the Atlantic for nearly three years, the new system of facsimile transmission developed by MARCONI'S WIRELESS TELEGRAPH CO., and which was demonstrated by them at the Somerton "beam" station, on Sunday, is none the less remarkable. With this system it is possible to transmit two images, each measuring 8 in. by 10 in., in less than 20 minutes; while the apparatus is so designed that one picture after another may be transmitted without the necessity of shutting down; thereby reducing considerably both time and costs in running up motors and synchronising both ends of the service for each separate picture. The system depends upon the translation of the blacks and whites of a picture into electrical impulses, as do all other picture transmission systems, but the manner in which the conversion is fed into the "beam" transmitter is one developed by Mr. G. M. WRIGHT, who has been in charge of the research in connection with the system. The fact that this form of transmission may be regarded as the latest issue of electrical engineering makes it all the more remarkable that the highly sensitive receiving apparatus required to complete the service is largely dependent upon the application of a phenomenon discovered by KERR in 1875, namely, a Kerr cell. It is claimed that messages transmitted by the system are received with absolute accuracy, and that handwriting and the reproduction of anything that can be written or drawn on paper are also possible subjects of transmission. Our first acquaintance with this system was some two years ago, when the MARCONI CO. was thinking of distances in yards and obtaining results considerably less definite than those now possible over 3 000 odd miles. The progress made in so short a time is nothing short of remarkable, and is indicative of the enthusiasm which has been brought to bear on the problems involved in the field of electrical research.

Faraday Centenary Celebrations.

IT is gratifying to note that the tentative proposals to celebrate, in September, 1931, the centenary of MICHAEL FARADAY'S great discovery of electro-magnetic induction have resulted in the establishment of machinery to celebrate the occasion in a manner worthy of its importance. In view of the world-wide developments founded on one single discovery among the many made by this great Englishman, it is desirable that the celebrations should be international in their scope, and it is pleasing to note the existence of means whereby this can be achieved. The year 1931 will be notable for several scientific centenaries, including those of the establishment of the British Associa-

Digitized by Google

tion for the Advancement of Science, and of the birth of JAMES CLERK MAXWELL. The arrangements now under contemplation will probably concentrate the various celebrations around the date of the Faraday Centenary, and thus ensure a large attendance of interested people from all parts of the civilised world.

Early Swan Lamps Wanted.

IT was an interesting coincidence that, on January 17th last, Mr. E. S. EVANS should have delivered a Swan Jubilee Lecture in the very building in which the late SIR JOSEPH SWAN gave his first lecture on the incandescent lamp on January 17th, 1879. Still more remarkable was the fact, revealed by the Curator of the Sunderland Museum, in proposing a vote of thanks to Mr. EVANS, that although Sunderland was the birthplace of the incandescent electric lamp, it has no historical exhibits, and except for a photograph of SWAN there is nothing in Sunderland to commemorate his great discovery. Sunderland is, however, anxious to remedy the omission, and Mr. CHARLTON DEAS, the Curator of the Sunderland Museum, would be grateful if readers of THE ELECTRICIAN who possess examples of early Swan lamps will either give or make a long loan of an exhibit to the Museum.

Export Trade and the B.I.F.

WITH the approach of the British Industries Fair special interest is found in a recent "Commerce Report" dealing with the electrical export trade of the United States. This report, which is based upon the export figures for November last, shows that during the month under review refrigeration sets up to 1-ton capacity made the largest gain, with radio apparatus next in importance; substantial gains were also registered in interior and exterior lighting fixtures, heating and cooking devices, batteries and parts for motors. The total value of electrical goods exported during the eleven months' period of 1928 amounted to approximately £20 000 000, representing an increase of over £1 600 000 when compared with the same period of the previous year. Our own total of electrical exports for the same eleven months of 1928 amounted to £16 898 185, from which figures it will be gathered that the United States is not leading by the very wide margin that many would have us believe. The British Industries Fair affords an opportunity for intensive export propaganda, and manufacturers should not only be content to exhibit their goods, explain their merits and so on, but they should sell them with such enthusiasm that buyers, potential and actual, will themselves become unconscious propagandists for British electrical goods. The United States is valued largely by what it says about itself; Britain is valued to a large extent by its silence and what other people say about it. Let us drop this modesty and reliance on those Union Jacks in the four corners of the world to sell our goods. Let us rather make as much of ourselves as the United States, let us remind the world—for there is no need to tell it—that our goods are best. The British Industries Fair gives us that chance, let us make the most of it.

Industrial Designs.

ON many occasions we have emphasised the need, which many manufacturers of domestic electrical equipment do not yet seem to have realised, for getting away from traditional designs. Electric fires and cookers in particular have already suffered through being designed to look too much like gas appliances. In lighting fittings design similar conservatism was rife while designing was left to men who were essentially engineers. The collaboration of people with sound training in architecture and other decorative arts is having a notable effect on the design of lighting equipment, and opportunities exist for obtaining similar stimuli for other classes of electrical goods. One notable opportunity is to be found in the annual Competition of Industrial Designs which is organised by the Royal Society of Arts, and in which manufacturers and others offer prizes for acceptable designs to special requirements. In the 1929 Competition, details of which are now available, the electrical industry is only represented by an individual company offering a prize for a design for a showcard to advertise a wiring system. The gas industry, however, is offering 50 guineas for a design for a fireplace for a room and a gas fire of original design for use in connection therewith. A similar requirement for an electric fire—without a fireplace—would probably have attracted some interesting suggestions.

Rural Electrification.

THE film depicting rural electrification in practice in the Chester area which has been produced by the E.D.A., is quite the best of its kind that we have yet seen. The photography is good, and the ground has been covered in a way which should give to the general public the clearest possible idea of the advantages that electricity can bring to a rural area. Pictorially the film should command a showing on many cinema screens, but before this is done, the captions require some "gingering-up" if they are to be appreciated by the average cinema-goer. In one part of the film, for example, the audience reads the terse intimation that the apparatus before its eyes is "A Sub-station"; a few feet further on it sees a similar arrangement of apparatus, and is told that it is "Another Sub-station." Something much more "snappy" and informative is obviously required.

Outdoor Meters.

AN innovation in American domestic distribution practice which may be tried in this country consists of the installation of domestic meters with sheet steel boxes of weatherproof construction affixed to the exterior of consumers' premises. The boxes have a glass window aperture to permit inspection by the meter reader, and though the cost of these boxes is from 12s. to 15s. each, the supply authority responsible for the innovation claims that the expense is justified by the time saved in freeing employees from the necessity of making repeated calls to read meters, and by the elimination of the necessity for entering the consumers' premises and taking readings in inaccessible positions. As the percentage of "no-reads" in some districts is put as high as 10 per cent. of the domestic consumers, the saving in time under the new system should be considerable.

Extension of the Dancing Craze.

THE post-war craze for dancing is so widespread in human communities that we are not so surprised as might otherwise have been the case, to hear that the craze is extending to what have been considered inanimate objects. The dancing cable is the latest manifestation of the craze, and our American contemporary, the "Electrical World," has published a detailed symposium of experiences of the capers cut by conductors on a number of overhead systems. Under certain conditions conductors jump up and down the full length of spans, and though the dancing cables generally cause little physical damage the movement often sets up "shorts" and puts the lines out of service. No definite explanation of the phenomenon is offered, but it is thought to be due to sudden changes in temperature or to uneven loading setting up resonant effects which develop maximum amplitudes at certain points; as the amplitude of the vibration in resonance is a small fraction of an inch, while that of the dancing is several feet, this explanation is open to doubt. From the instances given, the action may occur on any type of construction with any type of insulator support or cables. The most natural theory is that the wires get into a swing and that the structures or cross arms sway backwards and forwards, accentuating the action to build up the dancing. Another theory is that conditions may be such that an upward movement of the air starts this action. It would be interesting to learn whether similar cases of dancing or whipping of cables have been observed in this country, and if so what remedy has been adopted.

STEEL CONDUCTORS FOR POWER LINES.

Choice of Material—Conductivity of Low Grade Steel—Minimum Permissible Sizes—Relative Values for All Conductor Metals.

By WILLIAM T. TAYLOR, M.Inst.C.E., M.I.E.E.

ON 50 cycle a.c. lines the magnetic qualities of the steel as well as the current load are matters of concern; therefore, the d.c. conductivity is not the correct basis on which to calculate losses or to compare the different metals used for line conductors. As regards the conductor metal, the cheaper grade of steel wire or cable generally has the lower d.c. conductivity (higher d.c. resistance), but a relatively lower a.c. resistance. Medium priced grades of steel are often found to be best for a.c. lines, i.e., a low-grade steel has usually better conductivity than one of high-grade steel.

For a given size of steel conductor the relative d.c. resistance-drop may be quite small as compared with the a.c. resistance-drop; and, for a given size and spacing of steel conductors, the external reactance-drop may be quite small, as compared with the internal reactance-drop. We thus see the great necessity for a close study of steel conductor grading.

not unreasonable if steel conductor lines are to come into being. In 1907 the writer erected a steel conductor two-phase line for a purely induction motor load, and the regulation was so bad that the line had to be partly replaced by copper.

According to regulations, an aluminium conductor of minimum permissible size must have the copper equivalent of 0·0201 sq. in., or $1{\cdot}64 \times 0{\cdot}0201 = 0{\cdot}033$ sq. in. for equal resistance (d.c.).

The question that would now seem to be at isue is: what minimum size of commercial galvanised steel conductor is permissible? It can hardly be based on the equivalent d.c. resistance, such as copper (or aluminium, which is relatively higher than copper due to the greater skin effect) because the most favourable grade of steel conductor is but 16% of that of copper, and, because the internal inductive reactance may reach very serious proportions. Therefore, where and on

TABLE I.—VALUES FOR THE SAME CURRENT DENSITY.

Conditions.	Single-phase. Two-wire.	Single-phase. Three-wire.*	Three-phase. Three-wire.	Three-phase. Four-wire.*
Relative Voltage.	E	E E	E E	$\sqrt{3}E$ $\sqrt{3}E$ E
Relative kW transmitted per amp.	1·0	2·0	1·732	3·0
Relative total weight of conductor	1·0	1·5	1·5	2·0
Weight per kW transmitted ..	1·0	0·75	0·866	0·666
Relative percentage loss	1·0	0·5	0·866	0·5

* Balanced load. Neutral conductor is of the same cross section as the outers.

Compared with copper conductors, the d.c. conductivities of commercial steel conductors vary from about 8 to 16%—remarkably pure iron has a d.c. conductivity of around 16% of that of commercial copper.

In 1906 the writer found that, due largely to excessive internal inductive reactance, it was not possible at ordinary a.c. voltages to burn off line faults. So far back as 1905 the writer erected and operated various overhead lines (chiefly 15 000 V lines), consisting of galvanised steel conductors throughout, the more usual size of steel conductors employed being around 0·033 sq. in. (0·205 in. diam.) *solid*. These lines radiated from main 66 000 V sub-stations to mining districts in the mountains, where severe lightning storms were frequent.

Compared with copper lines they gave less trouble from transformer burn-outs and from insulator breakages due to lightning, and gave less disturbances from short-circuits and other current surges emanating from the distribution transformer houses or from the lines. As regards voltage regulation, for normal operating conditions this was found to be quite satisfactory. The most serious operating objection was that of clearing a fault coming in from the line, as compared with a copper a.c. line or a steel d.c. line.

Largely to overcome this objection a ring loop-in system was constructed. This was also found necessary for the purpose of facilitating rapid location of a faulty section of the line. Where copper construction was used, in most cases, the writer made a practice of entering or leaving the sub-station or transformer site with one or more span lengths of galvanised steel conductor to serve the purpose of lightning and excess current protection.

A Disadvantage.

One of the principal disadvantages of steel conductors is their relatively short life, and, in a rust-forming country like this, it should be decided on with great care. The current must be kept relatively low because of the I^2R and XI excesses. For a three-phase four-wire 100 kW line, it is usually desirable to keep the maximum line-current around 10 A; it is preferable to operate a line of such kW at 11 000 V, because of the probable growth of load, etc. To allow of rural expansion it is evident that some relaxation must be made in the maximum permissible variation of voltage—6 to 8% up or down is what terms shall we base the minimum size of commercial grades of galvanised steel conductors?

Skin Effect.

For a.c. lines the high resistance of steel conductors is in large measure due to skin effect, and in some cases the effective resistance may be almost doubled, due to skin effect. A steel conductor may have about eight times as much resistance to d.c. as a copper conductor of the same size, and about seven times as much resistance for the same weight. Therefore, where steel conductor costs less than one-seventh as much as copper per lb., it would be more economical to use it, assuming the same conditions; however, the relative strength, longer spans, and other matters, may favour the steel conductor. For instance, we may safely use $\frac{1}{16}$ in. or $\frac{1}{4}$ in. ice loading, and *not* $\frac{1}{8}$ in. ice loading, because the heating due to current flow will be concentrated on the outer layer of the steel conductor; so that we should not allow the same ice loading for steel conductors as for copper or aluminium.

Of all the different factors involved, for a given length of line, the current in amperes is one of the most important affecting voltage drop, which latter is apparently the greater of the obstacles to the more extensive use of steel conductors. Hence, we must first make use of that system allowing of the greatest kW load per ampere transmitted.

This favours the *three-phase four-wire* system, which will transmit the greatest kW load, and requires the least total relative weight of conductor per kW transmitted, for equal voltage to earth, than other a.c. systems. And, the cheaper the line conductor, the less likely we shall be concerned with the weight-cost but the more we may be concerned with a smallest line current for a given kW transmitted; also, the more important may become the question of total line loss.

It is one thing delivering three times more power, and it is another thing when this can be done for one-half of the line loss. Hence the necessity of knowing that the best system is the three-phase four-wire, and the *second* best is the single-phase three-wire, for steel and other conductor lines.

The relative values given in Table I (above) apply to all classes of conductor metals, but more particularly to the copper line; the a.c. power loss for a steel conductor is, of course, made up of the d.c. resistance, the skin effect resistance loss, and the hysteresis loss.

PERMANENT MAGNET MOVING COIL AMMETERS AND VOLTMETERS.

Synopsis of a Detailed Report of an Investigation, undertaken by the B.S.I.R.A., on "Critical Examination of Characteristics of British and Foreign Permanent Magnet Moving Coil Ammeters and Voltmeters of Switchboard Pattern."

THE manufacture of permanent magnet moving coil switchboard instruments has a sufficiently long history for the general lines of design to have become almost universal. It must be recognised, however, that in order to obtain certain characteristics several different methods can be adopted, and that in the design of electrical instruments it is necessary to make compromises at almost every point in order to secure a general "balance" which will ensure satisfactory operation, length of service, adequate sensitivity, and all the other properties looked for in such an instrument. As is to be expected, different designers hold different views as to the best means of obtaining the required balance in the instruments they are designing, and as a result much difference is found in the details of their various designs. Many of the differences are of little importance, but others are of sufficient importance to affect appreciably the behaviour of the different instruments.

Many users of electrical instruments have definite preferences for instruments of one make or another, and occasionally this preference is associated in the mind of the users with some particular detail of design in the instrument preferred. Not infrequently, however, such preferences have no specific foundation, and, moreover, the preferences expressed by one user may be in direct conflict with those expressed by another.

In many instances the preferences expressed are for instruments of foreign manufacture, and they are frequently supported by a statement alleging some general superiority of the instruments preferred. Such statements are scarcely to be taken seriously, and in any case they cannot be dealt with in a scientific manner. If, however, definite reasons are put forward, it is possible to secure evidence regarding these, to investigate this evidence, and to decide whether or not it provided adequate support for the preference expressed.

Opinions of Users.

It is the constant endeavour of instrument makers of the first rank to maintain and improve the general quality of their instruments. It must be assumed, therefore, that in the instruments at present obtainable, all improvements which have been considered practicable by the individual makers are already embodied. In other words, each instrument maker has made the instrument which, in his opinion, best meets the average requirements of his market. If, therefore, preferences are expressed for certain instruments by a user, such preferences imply that, in his opinion, the manufacturers of those instruments are ahead of other manufacturers, as regards skill in designing or perfection of manufacturing methods and organisation. It may be, however, that the opinion held by the user is simply due to the better advertising and selling methods of the manufacturer whose instruments are preferred.

The members of the British Scientific Instrument Research Association interested in the manufacture of switchboard instruments were not prepared to accept or admit the position of inferiority implied by the preferences occasionally expressed for certain foreign instruments, and it was arranged that the Association should endeavour to get trustworthy evidence as to the relative merits of the instruments made by the best-known British and foreign manufacturers. The instruments selected to be investigated were the moving coil ammeters and voltmeters of the types commonly used as switchboard instruments.

Information based on prolonged experience with comparable instruments made by different manufacturers is not easy to obtain. If such information were available it would be of value in the appraising of different instruments; in certain respects, however, it would not be sufficiently complete in itself to allow of a perfectly fair comparison being made. There is a certain amount of published information available relating to construction and design, and much of this is of considerable interest; it has not been found possible, however, to obtain sufficient published information to allow of comparisons being made between instruments of similar types, of up-to-date pattern, made by different manufacturers.

For these reasons it was decided that the Association should itself examine a number of strictly comparable instruments of the current patterns made by different manufacturers. The types of instruments selected were the ordinary "dial type" switchboard ammeters and voltmeters, of six inches to eight inches diameter, and instruments of these types were obtained from the best-known British, American and Continental sources. In all, instruments from twelve different manufacturers were examined, the number of different instruments, not including duplicates of modified designs, being twenty-three. These instruments have been critically and impartially examined, both as regards behaviour and construction, and a general account of this examination, and of the conclusions arrived at, is given below. In this account it has been thought desirable to include some consideration of certain details of design, since some of the conclusions drawn refer to technical points, and such conclusions might not be convincing unless the evidence on which they are based were indicated.

Rapidity of Indication.

The instruments examined differed widely in the extent to which the movement of the pointer was damped, as the result of which there was a wide variation in the time taken for the pointers to come to rest after a current, sufficient to produce a deflection of about 90% of the full deflection, had been switched on through the instrument. In some of the instruments the damping was so small that with such a current the pointer moved over the scale in its first swing and struck violently against the stop at the upper end of the scale. In one or two instances, also, there was a tendency of the movement to stick at the upper end of the scale after the first swing. In other instruments the pointer oscillated several times over a considerable portion of the scale before finally coming to rest.

For a variety of reasons, which need hardly be discussed here, it would appear desirable that the damping should be almost, but not quite, critical, i.e., that the damping should be such as would allow the pointer to swing slightly beyond the position it will finally take up, and to return fairly quickly to (and actually through) that position, after which the movement should be imperceptible.

Certain of the instruments, both of British and foreign manufacture, were admirably proportioned in this respect. Other instruments required slight modifications before their damping was brought up to the amount needed to give the type of swing just described. As an experiment, two of these, both of British make, were modified by their makers in order to demonstrate that it is quite a simple matter to alter the proportion in such a way as to bring the damping to any desired value.

Of the instruments examined, about 60% were accurate to within 1% at ordinary temperatures, 30% had errors between 1% and 2%, 8% had errors between 2% and 3%, and one instrument had an error of over 9%.

The general level of accuracy of the British instruments was at least as high as that of the foreign instruments.

Correction for Temperature.

Most of the voltmeters were fairly accurately corrected for temperature variation, as is to be expected, provided a good type of resistance wire is used for the series resistances.

The ammeters were not, in general, provided with compensating coils, but the variation of sensitivity, over a range from 10 deg. to 50 deg. C. was not usually greater than 3%. For some of the instruments the variation of sensitivity (over the range taken) was greatest at the lower temperature; for most of them, however, the variation between 10 deg. C. and 30 deg. C. was only a small fraction, in some cases not more than one-tenth, of the total variation between 10 deg. C. and 50 deg. C. Three ammeters, two made by British manufacturers and one by a foreign firm, were fitted with compensating coils. In one of the British instruments the com-

Digitized by Google

pensation was practically perfect from 10 deg. C. to 50 deg. C., the sensitivity of the instrument being constant to within one or two parts in one thousand over this range of temperature. In both of the other instruments the compensation was good between 10 deg. C. and 25 deg. C., but was less perfect between 25 deg. C. and 50 deg. C., falling off comparatively rapidly at the higher temperatures.

A certain degree of compensation can be provided without the use of compensating coils, by a proper choice of the materials used in the moving coil circuit, control springs, shunt, etc. As examples of the high degree of compensation obtainable in this way, it may be mentioned that in one of the "uncompensated" foreign instruments the variation in sensitivity corresponded almost exactly to that found in the compensated instrument of foreign manufacture already referred to. Another uncompensated instrument, a British one, showed a temperature variation between 12 deg. C. and 30 deg. C., rather less than twice that of the compensated foreign instrument, the total variation in the uncompensated British instrument between 12 deg. C. and 50 deg. C., being only one-third of that of the compensated foreign instrument.

Internal Construction.

As regards the construction of the various instruments, a few points of difference may be touched on, however, as indicating the great variation met with in the instruments examined.

(*a*) *Zero Adjustments.* In some of the instruments no zero adjustment of any kind was fitted, while in several others the fitting provided was very light and flimsy. In less than half the instruments was the zero adjustment really robust and provided with bearing surfaces sufficiently large to ensure mechanical steadiness and ample electrical contact.

It would, perhaps, be unfair to say that the British instruments are superior to the best of the foreign instruments in this respect, but it is worth mentioning that zero adjustments were fitted in all the British instruments, though the adjustment fitted by one British manufacturer cannot be operated without opening the front of the instrument case. In over half of these instruments the zero adjustments are designed in ways to which no exception could be taken; the zero adjustment fitted by one British instrument maker in particular is singularly robust and efficient without being at all heavy or clumsy.

(*b*) *Coil Mounting.* In many instruments the coil was supported between bridge-pieces mounted on the pole-pieces in such a way that the movement could not be removed from between the pole-pieces without dismantling it. In other instruments the whole movement was held in a frame, either pressed or die-cast, which could be slipped from between the pole-pieces after one or two screws and connections had been loosened. The latter form of construction, which is adopted by most of the manufacturers whose instruments were examined, would appear for many reasons to possess advantages over the former.

In the instruments made by one foreign manufacturer the frame which carried the coil was of a very flimsy construction and was held in position between the pole-pieces by shellac; this instrument was rather unusually constructed in almost all respects.

In most of the instruments the coil was supported *between* pivots. Some manufacturers, however, fit the pivots on the *inside* of the coil-former, and the jewels on which the pivots are supported are mounted on the cylindrical core. There is little to choose between these two methods of suspension. The external pivots provided, perhaps, an increased stability of the coil, but in all the instruments the distance betwen the jewels was sufficiently large to provide ample stability of the movement.

In the instruments made by two British manufacturers the jewels were mounted on resilient supports, though this practice was not followed in any of the other instruments examined. Two instruments, neither of which was provided with resilient supports for the jewels, were found to be damaged when the instruments were opened. In one of these the ends of the pivots were flattened, showing that the pivots had been overloaded, either due to mechanical shock or to the jewels having been screwed in too far during assembly. In the other, one jewel hole was broken right through at the bottom, and the pivot itself had suffered damage.

The practice of fitting resilient supports to the jewels affords considerable protection to the movement against risk of damage due to vibration and mechanical shock, and the instruments made by the two British manufacturers who follow this practice have a distinct superiority over the other instruments in this respect.

(*c*) *Connections.* In the majority of the instruments all the internal connections were either soldered or were made between bright metal contact pieces, with contact areas of ample size, tightly screwed together. In most of the ammeters all screwed or rubbing contacts were bridged with copper connections soldered at both ends, the bridging connections being made flexible at those points where it was necessary to provide for any relative movement between the two surfaces in contact. This was not universal, however, and in one ammeter in particular two screwed contacts were not bridged, and, moreover, the contacts were made by screwing a very small metal tag down on to a black-finished metal strip, the screw itself having a quite small head.

In some of the voltmeters the series resistances were wound on porcelain bobbins, and in others they were wound on flat pieces of mica, porcelain, compressed fibre, or bakelite. In some also, the resistances were divided so as to provide equal resistance on each side of the moving coil, while in others the whole of the resistance was put between the coil and one terminal of the instrument; the coil being connected direct to the other terminal.

There is little to choose between the two types of resistance, or between the two methods of arranging the resistances. Any stray field in the air gap due to the current flowing through the resistance coils can be made very small by suitably disposing the coils. This stray field will, in any case, be proportional to the current flowing through the instrument, and will not, therefore, impair the accuracy of the instrument in any way, since it will be taken into account when the instrument is being calibrated, before or during the ruling of the scale. As regards radiation of heat from the series resistances, this will be so largely affected by the construction of the case that any slight difference in favour of either type need not be considered.

In most of the ammeters there was apparently no provision for temperature correction, but in two or three of them the movement was shunted by a coil, or coils, and also a small series resistance coil was fitted. This arrangement provides to some extent against variation of sensitivity with temperature. The temperature correction of the instruments has already been given.

Coil and Former.

The movements in the different instruments differ very considerably in weight. In some instances great attention has evidently been paid to reducing the weight of the moving system to as low a value as possible consistent with retaining the requisite rigidity, the formers being made of thin aluminium and the number of turns on the coil being cut down to a minimum. In others this matter had apparently not been considered as of paramount importance, as copper formers were used and the coils were wound with a fairly large number of turns. In general, however, these movements were not unduly heavy, though the type of construction adopted in one instrument, a foreign one, was such as to make the movement extremely heavy without any corresponding gain either in rigidity or sensitivity.

Some manufacturers wind the voltmeter and ammeter coils with copper wire, others use aluminium wire for the voltmeter and copper wire for the ammeter, while a small number use aluminium wire for both types of instrument. The preference shown for the use of copper wire in the ammeter coils is probably due to the fact that copper wire presents no difficulties in soldering. With aluminium wire it would appear that manufacturers experience some difficulty in getting satisfactory soldered joints since, except in the instruments made by one particular manufacturer, clamped connections were used for making contact with the ends of the coil if this was made of aluminium wire. In the two instruments in which this practice was not followed, a soft solder was used for making the connections to the ends of the aluminium wire with which the coil was wound.

In some instruments the former was soldered to one end of the coil, but in the majority both ends of the coil were insulated from the former, the ends being taken up to insulated pivot holders mounted at opposite ends of the coil.

In most of the instruments the number of turns of wire in the coil was kept down to a fairly small number. In only one or two instances was the number of turns sufficiently large to make more than one layer, in the ammeter, or two layers (of thinner wire) in the voltmeter.

THE MANUFACTURE OF BARIUM OXIDE FILAMENTS.*

The Barium-Vapour Method of Coating—Four Processes Described—Commercial Use of Oxide Mixtures—Controlling Thickness of Emissive Coating.

By B. HODSON, O.B.E., B.Sc., Ph.D., L. S. HARTLEY, B.Sc.(Eng.), A.M.I.E.E., and O. S. PRATT, B.A.

WITH the barium-vapour method of filament coating, barium filaments or barium oxide filaments can both be readily made. The authors have made valves with barium filaments to see how they compared with the barium oxide filaments in common use. When the usual tests were applied to these valves, no difference could be detected between them

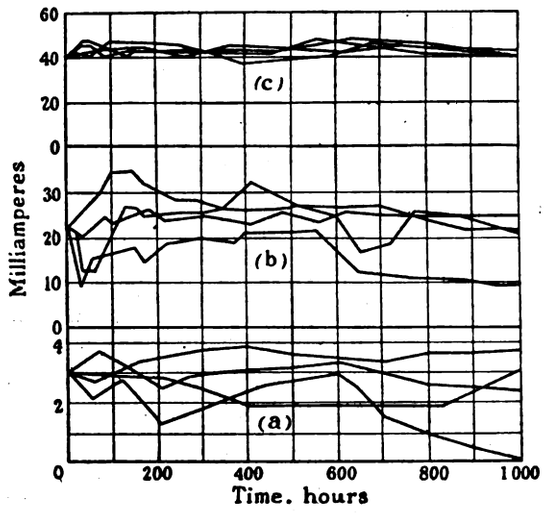

Fig. 1.—Variation of saturation current from various oxide-coated cathodes with life.

and the valves of commerce, except that the barium valves hardly retain their barium long enough to take measurements, whilst, on the other hand, an oxide-coated filament valve shows but little change in thousands of hours.

Thus direct support is given to the theory that barium and barium oxide valves appear to have similar properties; and that the oxide is essential as a support or carrier for the barium, which would otherwise vaporise.

The manufacture can be carried out in one of four ways, namely:—

1. The melting or fusing of a barium compound to the core wire.
2. The application to the wire of a resinous or paraffin paste containing a barium compound.
3. The evaporation of a solution of a barium salt which is painted on the wire.
4. Deposition on the filament of barium from vapour.

In the melting method the core wire, which may be platinum or nickel, is drawn through the fused salt bath. The nitrate of barium is often used. This process tends to make filaments rough in appearance, with loosely adherent coating, and the authors believe that it is not now in very common use.

The Paste Process.

The paste process is more common. In this process great care is taken to obtain very small particles of the barium carbonate usually used. The carbonate is ground in a mill for from 24 to 48 hours, and then the finer particles of this ground mass are selected. The separation is carried out in a way familiar to those who have separated abrasive powders such as emery. The paste is made up with paraffin or resin, kept in a molten condition and allowed to stand. The bigger particles sink first to the bottom, and the upper portion which contains only the finer particles in suspension is used.

This is again mixed to make a uniform paste, and is applied to the heated filament wire so that a portion of it adheres. The wire is then heated more strongly to evaporate, with a minimum of carbonisation, the paraffin or resinous carrier.

Finally, the core is heated to about 1 000 deg. C. to sinter the emitting substance to the wire, and to convert the carbonate to oxide. This process is repeated several times.

A process of this nature is used by the Western Electric Co. (Standard Telephones and Cables, Ltd.) and a more detailed description can be seen in their patent specifications. This process may be carried out by hand, or automatically in a series of ovens and pasting pots. With the use of such a machine, 80 metres of filament wire may be prepared per hour.

The resulting filaments are greyish in colour and slightly rough in texture, but if well done the coating is regular along the length of the filament. If the layer is too thick, it tends to crack, giving the appearance of a number of cylinders threaded on a wire.

The Core Metal.

The core metal is usually platinum or nickel, molybdenum or tungsten being rarely used owing to the risk of burning them during the necessary heat treatment. In the patent specification concerning such filaments it is usually asserted that platinates or resinates are formed; whether this be so or not, in all probability the emission process occurs as outlined by the authors, that is, the barium oxide, present either as barium oxide or in combination as a platinate, is electrolysed, and free barium is formed on the surface.

With both the first and second methods the filament is a barium oxide filament, and must be protected, before pumping, from the action of carbon dioxide and water vapour.

The third method, using solutions of salts, is still in use, and is probably the oldest of all. With this process as now used, the wire is dipped in the solution, taken out and heated in carbon dioxide gas. This is repeated perhaps 50 or 100 times, and finally a layer of carbonate is formed. This layer is almost insoluble in water. With this method the wire must be scrupulously clean before the coating is begun and the heating carefully carried out, otherwise a "pearl-string filament" is obtained.

A filament made by this method is not vitiated by contact with the atmosphere.

The fourth method is the only one in use in which the oxide coating is formed *in vacuo*. In this method the core wire is oxidised before the evacuation of the bulb; for example, tungsten may be used as a core and oxidised in lengths before assembly on the valve-foot, or oxidised on the valve-foot after the assembly has been completed. On the side of the anode towards the filament a piece of barium metal is fixed.

When a good vacuum has been obtained, the anode is heated, usually by high-frequency induction, and the attached metal evaporates. This metallic vapour surrounds the filament, which is kept at a dull red heat, whereupon the tungstic oxide is reduced and barium oxide is formed upon the filament.

Another means of producing the barium vapour is to use barium azide solution, which is painted on the anode and used instead of barium metal. On evaporation, crystals of barium azide are left upon the anode, which is subsequently heated *in vacuo*. Barium azide is a compound of barium and nitrogen, decomposing at about 225 deg. C. into metallic barium and nitrogen. The barium itself acts as a "getter" after this decomposition, but it is usual also to employ magnesium to produce a silvery mirror in the bulb instead of the brown or black mirror produced by barium alone.

With the first three methods the pumping takes a considerable time. The porous nature of the fused, pasted, or evaporated coatings makes it necessary to exercise some considerable care in this part of the process. The filament is heated to 900 or 1 000 deg. C. without anode voltage, and the pumps take away the gas evolved.

After this stage the anode may be heated either by induced high-frequency currents or by bombardment. There is usually sufficient emission at this stage to bombard the anode, especially as the gas still in the bulb enables the

* Extracts from a paper on "The Development of the Oxide-Coated Filament," read before the Institution of Electrical Engineers on February 6th.

Digitized by Google

current to attain large values by ionisation. Activation commences as the vacuum improves; and as the filament improves in emissivity it can be run progressively cooler before the valve is sealed off. Completion of the process by ageing can be carried out in the usual way, by heating the filament to its normal running temperature and applying a positive voltage to the anode.

With valves made by the barium-vapour process the anode is heated in the same way, and during this process the formation of the filament proceeds much more rapidly than with the other three methods. This is probably due to the fact that a supply of free barium is already there, and the ageing process is not always necessary.

A phenomenon which should be mentioned here is the formation of " bright spots." If the coating is not of uniform thickness, those parts where the surface is more remote from the core are cooler than the more thinly coated parts. This causes greater emission from the thinner parts, and thus the " hot spots " described by Arnold in 1920 are produced.

This disadvantage is present in all types of barium oxide filaments, and is perhaps the reason why such filaments have not so far been used in valves intended for operation at very high anode voltages.

An attempt has been made to remedy this defect by adding calcium oxide and strontium oxide to the barium oxide, and so making the emitting layer of a composite nature.

Filaments coated with a mixture of oxides are already in commercial use. The Western Electric filament is coated with barium oxide and strontium oxide, and the filament of the Round valve with barium oxide and calcium oxide. It is stated that the use of mixtures of these three oxides and the adoption of thin layers minimise the knot or pearl-string formation which is so liable to cause this " hot-spot " action.

With filaments made by the vapour process the thickness of the layer of emissive coating is under control. Measurements of this type of filament made by the authors have shown it to be a few hundreds of molecules thick. This measurement presents some difficulty, but it has been made by utilising the known solubility of barium sulphate, and also by the amount of oxygen available for the oxidation of the barium.

Filaments made by the vapour process show reasonably constant emission over long periods of life. With those made by the paste method, especially when thin cores are used, the variation from valve to valve is greater. Fig. 1, given by Dr. H. Simon, illustrates this: the filaments *c* are made by the vapour process, whilst those marked *a* and *b* are made by a paste process.

With valves made by the barium-vapour process, the authors have not been able to detect any change in the amount of barium present in a filament after 1 000 hours' life by the direct estimation method mentioned above, and measurements of the total emission of similar filaments show little change in the emission. Life curves of some of these valves are very similar to the Simon curves marked *c*.

MAINS TESTING.

At an informal meeting of the Institution of Electrical Engineers on January 28th, Mr. F. C. Raphael opened a discussion on " Mains Testing." Mr. Raphael thought the I.E.E. regulations for leakage tolerances were rather indulgent for many networks, and he showed how these tolerances permitted a very appreciable current to pass under certain conditions. For three-wire d.c. networks he advocated a high resistance voltmeter between each bus-bar and earth to indicate the remarkable rise in voltage when a main has a bad leakage.

Mr. A. H. BENNETT asked whether there was any value whatever in the continuously taken insulation tests. Tests at frequent intervals were sufficient, but on the d.c. part of a system he would change over the outers to earth lines periodically. Mr. R. GRIERSON pointed out to those who advocated abolishing the limiting resistances that without them the balancers of a three-wire system would have to take the earth wire potential, whatever it might rise to. He was sure the earthing of the mid-wire through limiting resistances was the lesser evil. Mr. A. G. HILLING thought the secret of success was to fuse a network properly and to keep the limiting resistances as low as possible. He felt that the resistance should be 0·2 Ω instead of the 2·0 Ω allowed by the regulations. Messrs. P. F. Allan, J. R. Bedford, E. Brown, W. A. Erlebach, A. F. Harmer, A. G. Kemsley, F. C. Knowles, H. J. Neill, J. Spiley and A. Watson also spoke.

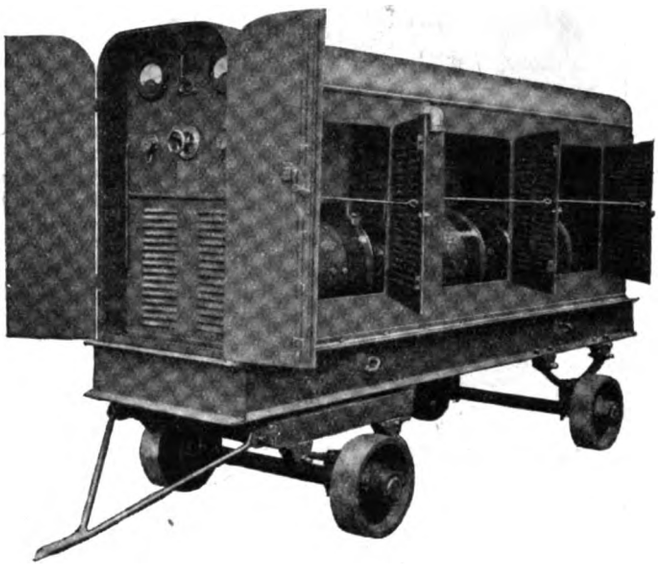
ELECTRIC WELDING.

Recent Advances in Manufacture of Portable Equipments.

As it has now become an accepted fact that electric arc welding machines, both stationary and portable, are as essential in a workshop as any other machine tool, the following description will no doubt be of general interest to engineers concerned in constructional and maintenance work. The machine illustrated represents a great advance in portable welding equipment, and embodies the latest developments.

One of these sets has recently been supplied to the Bengal and Nagpur Railway Co., who entrusted this order to Alloy Welding Processes, Ltd., of London. The contract is for the supply of a motor generator electric arc welding plant for two operators.

The machine which is under construction for the Bengal and Nagpur Railway is to be fitted with the manufacturers' latest



" B.P." type dynamos, which are self-stabilising, drooping characteristic machines giving the arc voltage at their terminals. The special features of the " A.W.P." generator are that no separate series resistances, reactors or transformers are required, neither is separate excitation considered necessary.

Portable machines of any kind may have to be used out in the open, especially in connection with railway work, and, as will be seen from the photograph reproduced herewith, this problem has been dealt with in a very efficient manner. The substantial steel cover, with its wide removable inspection doors at the sides, the protecting doors to the switchboard, the recessed control panel and the flush mounting switchgear have been well thought out to afford the maximum possible protection under adverse weather conditions.

Such refinements as laminated springs, wide steel wheels, fitted with roller bearings and swivelling fore-carriage, are points that will be appreciated by those who have to handle such a plant outside the workshops, where the surface over which the equipment is being moved might not be so hard or smooth as could be desired.

As is usual with electrical machinery destined for India, the dynamo had to be liberally rated and have special insulation.

It will be realised that the risk of breakdown and the maintenance cost will be reduced by the elimination of series resistances, reactors, transformers, diverter switches, separate exciters, contractors, solenoids, etc., which have been swept away in designing this new welding generator.

LONDON ELECTRICITY PRICES.

The London and Home Counties Joint Electricity Authority has just published a statement of charges made for lighting, power, heating, and cooking supplies by electricity supply undertakings in the London and Home Counties Electricity District as at January 1st, 1929. The undertakings are grouped alphabetically, and the statement is divided into three sections, i.e., lighting, power, and heating and cooking. Copies of this publication are to be had from the offices of the Authority (5, Millbank, Westminster, S.W.1), price 1s.

VERTICAL SWITCHGEAR MANUFACTURE.

Reducing Manufacturing Costs on Smaller Type Metal-clad Units—Standardised and Interchangeable Parts—Elimination of Cast Iron as Constructional Material.

AN interesting development in vertical type switchgear is announced by Messrs. Ferguson Pailin, Ltd., well-known for their pioneer work in the development of the vertical drop down principle of isolation as applied to heavy rupturing capacity e.h.t. metal-clad switchgear, who have now put on the market a smaller type of metal-clad unit which extends their range in a downward direction and gives a complete line of metal-clad switchgear with rupturing capacities from 1 500 000 kVA down to 25 000 kVA.

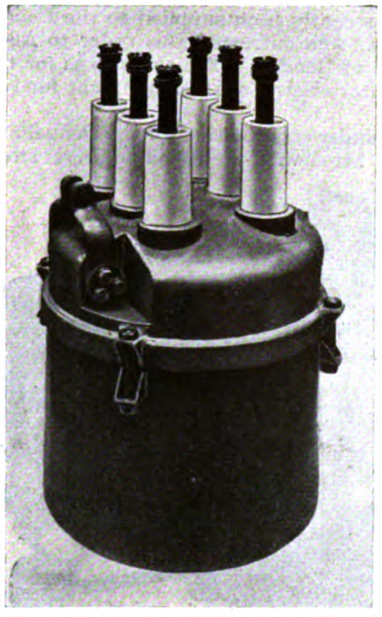

Fig. 1.—General view of triple pole circular tank breaker incorporated in the new unit.

The new units embody a number of novel features, and whilst maintaining the advantages and reliability of their existing designs enable manufacturing costs to be considerably reduced so as to render this gear an economic proposition for even the smallest sub-stations.

The whole of the component parts are manufactured to jig and template, and are interchangeable. The equipments will also be strictly standardised, so that mass production methods of manufacture can be employed and considerable stocks carried.

The space economy effected by the use of vertical pattern gear has been dealt with in previous articles, and the gear now under consideration is no exception to this rule. Taking, for example, a simple equipment including an oil breaker of 25 000 or 50 000 kVA rupturing capacity, the overall height of the equipment is only 4 ft. 4 in., the width 2 ft., and the depth from back to front 2 ft. 8 in., with an additional 10 in. or the operating handle. If a potential transformer is required he overall height increases to 5 ft. 11 in., the other dimensions

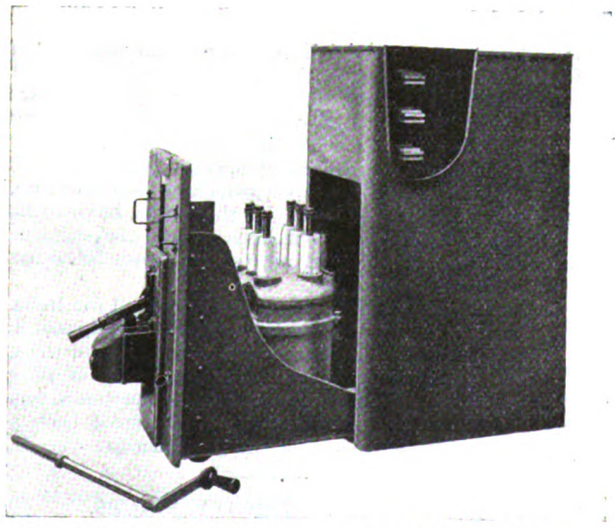

Fig. 2.—A view of the new unit with the breaker isolated and withdrawn from the housing.

remaining unaltered. The floor space required for the installation and operation of a complete equipment is only 11½ sq. ft. This, of course, compares favourably with truck or stationary cubicle type gear.

The general construction of the unit is interesting, in that cast iron has been entirely eliminated. The fixed portion of the unit is built up of a substantial boiler plate construction with welded joints, separate chambers being provided for the busbars and circuit connections. Porcelain insulation is employed in all places requiring mechanical strength, and the clearances and insulation employed are such that filling of the unit is optional. Automatic shutters are provided for screening all live metal when the oil breaker is withdrawn, and the relative disposition of the various parts, together with a simple interlocking arrangement, prevents any incorrect sequence of operation and renders the gear foolproof. The isolating plugs and sockets are of the makers' patent self aligning pattern.

The movable portion of the unit consists of a truck carriage which carries the oil circuit breaker together with its raising and lowering gear. It is interesting to note in this connection

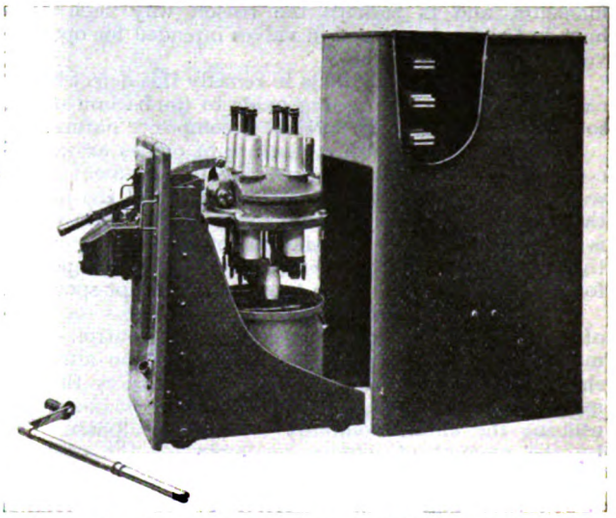

Fig. 3.—Another view of the unit with the breaker isolated and withdrawn from its housing.

that despite the simplicity of the unit each equipment retains its own raising and lowering mechanism so that it is not necessary to have a portable racking device for isolating or transportation purposes, and any number of units can be inspected simultaneously. Furthermore, as will be seen from an examination of Fig. 2, no tank truck is required, as this is incorporated in the moving portion.

The oil circuit breaker has a fabricated domed top and a single circular tank with domed base. It is generally recognised that the adoption of circular tanks in breakers of this class increases the factor of safety, and special groove and gasket joints between the tank and top plate prevent oil throwing under heavy pressure. The tank is lined throughout with insulating material, and arcing barriers are also fitted. The tank is fastened to the top plate by four short steel bolts which, even under heavy pressure, do not elongate sufficiently to destroy the efficiency of the gasket. The contacts are of the wedge and finger type and the whole of the operating mechanism is enclosed inside the breaker. A pebble vent of the latest type is fitted to each breaker, and discharges into a vent pipe which carries all gases outside the unit.

This gear has been primarily designed for simple equipments, but potential transformers can readily be fitted on the top of the fixed portion of the unit. These transformers form complete units in themselves and can be added or replaced at any time whilst the equipment is in commission.

Provision for instruments is made by providing a special panel which is mounted in front of the fixed portion. The question of extension has received careful consideration.

In connection with the shut down in the Stalybridge power station on February 1st, the METROPOLITAN-VICKERS ELECTRICAL CO., LTD., state that the trouble was in no way due to the turbine, but arose through a fault in some of the auxiliary wiring, which affected the protective device installed in connection with the turbo-generating unit; this, functioning properly, shut down the set. As no other unit was running at the time some time had to elapse before power could be got on to the busbars again.

MANUFACTURERS' EQUIPMENT & MATERIALS.

Special Protective Paints—Methods of Removing Fumes—An Extinguisher for Electrical Fires—Glass for Advertising Signs—Dust Collectors—Silent Fans for A.C. Supply.

AS the cost of applying paint to structures is considerably more than the cost of the paint it is obviously important to reduce the frequency of repainting to a minimum. A special paint known as "Ferrodor," made by GRIFFITHS BROS. AND CO. (LONDON), LTD., Macks Road, Bermondsey, London, S.E.16, possesses qualities which render it particularly suitable for covering such structures as electrical manufacturing works, power stations and transmission towers. In its natural steel grey colour it is specially recommended for steel overhead line towers. Its heat resisting powers also fit it for use on chimneys. The "Ferrodor" ore is iron oxide in the highest known form of oxidation, and the micaceous or flaky structure of the pigment adds considerable value to qualities of the paint. The flaky particles lie flat and overlap one another, interleaved with oil film, forming a flat surface which is only displaced with difficulty. The elasticity of the paint is another desirable feature, as the expansion and contraction of iron and steel structures quickly cracks paint surfaces which are insufficiently elastic. An interesting descriptive booklet produced by the manufacturers shows power stations and other structures treated with "Ferrodor," and includes a shade card and a film of the natural steel grey paint produced by coating a sheet of zinc with "Ferrodor" and then dissolving off the zinc in a bath of sulphuric or hydrochloric acid solution. The paint shows no signs of damage from its immersion in the acid.

Efficient and reliable fans must be employed to remove the fumes resulting from interior paint spraying operations, not only for health reasons, but also to secure quick drying and well finished products. In some cases the fixing of suitable fans in existing finishing rooms is sufficient to satisfy all requirements; in other cases it is necessary to have separate spray cabinets, each fitted with an exhaust fan. The JAMES KEITH BLACKMAN CO., LTD., 27, Farringdon Avenue, London, E.C.4, have developed for this purpose the "Streamline" fan. One design allows the fan to function inside the fume removal hood, with the motor working externally in clean air and easy of access. The motor is firmly secured to the external wall and the spindle is enclosed in an extended tube which carries the fan bearing at one end, and at the other is secured to the motor bracket. Where conditions make it impossible to discharge fumes direct to atmosphere, and duct work has to be employed, the "Paddle Wheel" fan is used instead of the propeller type.

Fire Extinguishers.

For the rapid extinction of fires, particularly in electrical manufacturing works and power stations, the British-made "Fire Foe" powder extinguisher is worthy of consideration, as its makers, the FIRE-FOE CO., King Street, Bury, Lancs., claim for it many advantages over other types, while offering it at a very moderate price. It is said to be as efficacious with electrical as ordinary fires. Operation is simple, as the contents of a canister are merely thrown at the base of the flames. Unaffected by climatic conditions, the powder is always ready for use, and never needs inspection. The gases generated when the powder comes in contact with a fire are claimed to be harmless to machinery, insulation, and to life.

The vast extension in the use of refractive signs, which has taken place during the last two years, has brought into prominence the refractive qualities of certain types of glass. It has been found that the use of coloured or crystal glass with high diffusion and transmitting indices obtains the maximum benefit from day or artificial light. For a shop sign or shop fascia a prepared stencil behind the glass enables any announcement, name or slogan to be shown in vivid letters, and changed, if need be, at comparatively little cost. It is, however, imperative that the glass employed should have a high transmission. The glass known as "Selenalyte" is claimed to possess great power of transmitting light, and its texture enables an almost perfect evenness of illumination to be obtained; in fact, the high degree of transmission and diffusion which it provides is the real secret of brilliant effect. Moreover, glass is said to retain its brilliance permanently. To take an example, a piece of amber-coloured "Selenalyte" glass, 3 mm. thick, has a light transmission index of 43. Ordinary glass of the same colour and thickness has an index of only 12. Thus it is not only the strength and quality of colour that count, but it is the texture of the glass itself which provides high refractive power and enables it to be effectively employed in outdoor advertising. The following table of light-transmission indices compares "Selenalyte" with ordinary coloured glass:—

Colour.	Selenalyte.	Ordinary Glass.
Scarlet	190%	100%
Flame	220%	100%
Orange	190%	100%
Amber	310%	100%
Olive	260%	100%

There has long been a need for a satisfactory method of collecting the dust generated during dry grinding operations. That this dust is extremely harmful when inhaled by human beings is well known, but to eliminate the danger and provide hygienic conditions is by no means easy. Settling chambers, coke boxes, water tanks and cyclone separators have hitherto been extensively used to this end, but in very many cases very crude arrangements are still employed. Simply to draw the dust from the wheel hood and along a pipe by means of a fan and blow it outside the building is unsatisfactory.

A Point of Law.

Apart from the unhealthy atmosphere created, the annoyance to neighbours, and the disfigurement of adjacent buildings, the dust finds its way back to the workshop through open windows. It is now required by law that efficient methods of dealing with this dust problem shall be employed, but space limitations very often make it almost impossible to adopt a method better than that of blowing dust into the open air. On the other hand, settling chambers, coke boxes, water tanks, and cyclones are bulky in themselves, and all require a more or less extensive system of connecting pipework. The "Visco" self-contained dust collector unit, which has been developed by the VISCO ENGINEERING CO., LTD., of 162, Grosvenor Road, London, S.W.1, is claimed to furnish a satisfactory solution of the problem. The outfit consists of an efficient exhauster and the dust collector. The exhauster is a special type for dust work, suitably mounted on the grinder itself, or alongside it on a separate pedestal, and in some cases on the collector casing. It is usually driven by belt from the grinder shaft, though with some machines an independent motor may be necessary. The exhauster suction inlet is connected to the grinder cowls, or, in the case of cylinder grinders, is fitted with a flexible pipe and suction hood. The discharge branch delivers the dust-laden air directly into the collector. This collector has only two parts, a rectangular box and a "Visco" filter cell. The box is provided with suitable baffles so that the dust stream is deflected and a considerable portion of the dust forced to settle in the bottom of the box, whence it can occasionally be removed by hand. The air then leaves through the filter cell. The metal "Visco" filtering rings lie irregularly between two expanded vertical metal walls, forming a substantial yet easily handled cell. These filter rings have an extremely large surface, dividing the air into innumerable small streams which continually change their direction and are flung against the viscous surfaces and into dead air pockets, where the dust is retained by a fine coating of "Viscinol" oil. The cell rests in the box on two small brackets, and is firmly held in position by a quick-release fastener. It can be removed and refixed in a few seconds. A large percentage of the collected dust can be removed by jarring the cell on the floor, but, occasionally the whole cell must be washed in hot soda water and after drying recoated with "Viscinol." The intervals between this operation entirely depend on the nature of the material ground and the daily working hours of the grinder. While ideal as self-contained units with single machines, these dust collectors are of equal value for a number of machines grouped together.

Efforts to produce silent running alternating current exhaust fans have led Messrs. S. G. LEACH AND CO., LTD., of 26-30, Artillery Lane, London, E.1, to put on the market a new range of single-phase regulating pattern types. These are all of the self-starting pattern, and even at full speed the usual hum noticeable on many a.c. machines is absent.

PHYSICAL AND OPTICAL EXHIBITION.

Obtaining Frequency Response Curves—A New Wavemeter—A 40 W Valve for 10-Metre Work—Plotting Magnetic Fields Round Straight Conductors—Telegraph and Telephone Testing Instruments.

(*Concluded from page* 65.)

THE apparatus shown by the BRITISH THOMSON-HOUSTON CO., LTD., was devised in order to provide a quick method of obtaining the frequency response curves of loud speakers and with such equipment it is possible to obtain a complete characteristic within a few moments of modifying a loud speaker.

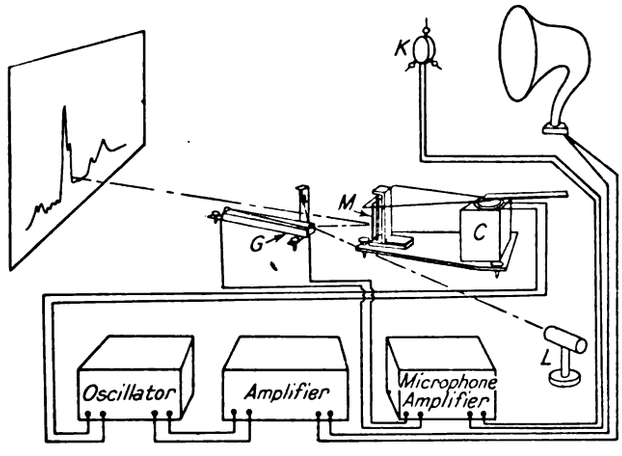

Fig. 1.—Illustrating the arrangement of the B.T.H. exhibit for testing loud speaker efficiency.

The general principle of the apparatus will be gathered from Fig. 1. The loud speaker to be tested is supplied with constant current of variable frequency from an audio frequency oscillator of the heterodyne type. A calibrated condenser microphone (*K*) is placed a few feet in front of the loud speaker to pick up the emitted sound. The output from *K* is amplified through the amplifier shown, and the output from this operates a special form of hot wire galvanometer (*G*) which will be described later. The frequency of the heterodyne oscillator is controlled by a condenser *C*, which is connected in one of the tuned circuits of the oscillator. Mechanically coupled to the spindle of condenser *C* is a mirror *M*, which rotates upon a vertical spindle. A beam of light from an arc lamp *L* falls first upon the small mirror of the hot wire galvanometer, which rotates about a horizontal axis and thus gives to the beam of light a deflection in a vertical plane proportional to the square of the amplified microphone current, and, therefore, proportional to the sound energy. After reflection from this mirror, the beam passes to the second mirror *M* and there receives a deflection in a horizontal plane corresponding to the rotation of the condenser *C*, and therefore corresponding to the frequency. From the second mirror, the light proceeds to the screen giving a luminous spot which, owing to the two deflections en route, traces out the frequency-output curve to rectangular co-ordinates.

The output of the oscillator is passed on to the detector and the unwanted radio frequency component filtered out. The signals are then fed into an ordinary resistance-capacity-coupled low frequency amplifier, the final stage having two power valves in parallel. This amplifier is capable of delivering 2·5 W of undistorted audio frequency power. The microphone amplifier which, owing to the insensitivity of the condenser type microphone used, has to have a very high overall amplification, in this case of the order of 20 000 : 1 voltage ratio. The galvanometer used consists of a very fine tungsten wire 0·6 mils. in diameter, stretched down a long metal tube and passes 90° around a fine spindle carrying the small galvanometer mirror; it is then secured to a spiral spring. It will be realised that any extension of the wire will be taken up by a contraction of the spring and that this must result in a rotation of the small spindle as the wire rolls over it. This construction is very simple, is dead-beat in operation, and requires only about 30 mA to obtain full scale deflection.

The MARCONIPHONE CO., LTD., exhibited receiving and rectifying valves, transmitting valves, including the new 'Detisw," a double-ended short wave transmitter dissipating up to 40 W and workable on wavelengths down to 10 metres. New apparatus was also shown by MARCONI'S WIRELESS TELEGRAPH CO., LTD., including a naval direction finder designed primarily for fitting on all classes of naval ships as a navigational instrument or as a means of locating other naval and mercantile ships.

The MULLARD WIRELESS SERVICE CO., LTD., this year exhibited a wide selection of transmitting valves, in addition to loud speakers, battery chargers and radio components. A transmitting valve for an input of 30 kW was shown, as was also a Holweck molecular pump. The "First Grade" induction instruments shown by NALDER BROS. AND THOMPSON, LTD., were of novel construction and it is claimed possess an inherent accuracy higher than B.E.S.A. first grade. The temperature coefficient is less than 0·02% per degree C. and the frequency error is less than 0·3% for a rise or fall of 10% in frequency. The momentary overload capacity is 5 000%. The length of the scale is 17 in. for 8 in. dial instruments. Other exhibits were indicating and recording power factor meters for single-phase and polyphase (balanced and unbalanced load) systems, the indications being independent of variation of current, pressure, temperature, frequency, and wave form met with in ordinary practice.

Many newly developed components, outfits, and complete apparatus for radio reception and gramophone electrical reproduction were shown by the IGRANIC ELECTRIC CO., LTD. The short-wave section of the exhibit comprised a new screen grid valve short-wave receiver employing h.f. amplification, with an over-all efficiency on wavelengths as low as 10 meters, a neutro-regenerative short-wave receiver, which also incorporated h.f. amplification and covered wavelengths from 15 up to 2 000 metres approximately, and various components for use in short-wave radio apparatus. The Igranic "Universal" portable receiver was also on view and this contains many features which represent considerable advances in portable receiver design. Other exhibits were the transverse current microphone, incorporating several striking features which enable it to respond uniformly to sound waves of all frequencies, with freedom from "background" noises, and a microphone control unit.

Telegraph Equipment.

Telegraph apparatus of various types, including an improved sounder in which more efficient methods than those hitherto used in such instruments are employed, both for converting the electric current into motion and for utilising that motion for producing sound were shown by the INDIA RUBBER GUTTA PERCHA AND TELEGRAPH WORKS CO., LTD. Among other features of the stand were self-contained direct reading portable Wheatstone bridges and a standard artificial telephone cable. The instrument shown was a 60-mile cable (standard cable, 20 lb. per mile), adjustable in steps of one mile by means of throw-over switches. The resistance of the two lines for each mile of cable consists of two resistances of 44 ohms each, and a mica condenser of 0·054 microfarad, representing the capacity between the lines. It is made in sections of two miles, each containing a separate condenser, and shielded by metal plates to prevent interference between sections. ISENTHAL AND CO., LTD., displayed an assortment of various types of sliding rheostats now manufactured, including enamelled steel tubular patterns, some wound on slate formers, and a new type employing ceramic formers which can be supplied in either the open or enclosed pattern. Special attention was drawn to the latter, as this had not been previously shown. A new type of testing transformer, for connection to the supply mains at 110 V up to 440 V a.c., designed to provide current of any value up to 2 000 A for short periods, was also shown. The whole is contained in a case for easy transport. Another exhibit was a large selection of various types of mercury switches capable of handling currents up to 20 or 30 A, some being suitable for use on circuits up to 1 000 V. A new type of direct reading voltmeter which can be made for voltages up to 500 000 V was exhibited, and this consists essentially of two condenser plates between which an electro-static field is created; the effect of this field upon a light rotating vane is directly shown as a luminous line on a scale according to the distance apart of the condenser plates. The instrument can be calibrated for comparatively low voltages (say 1 to 10 000 V)

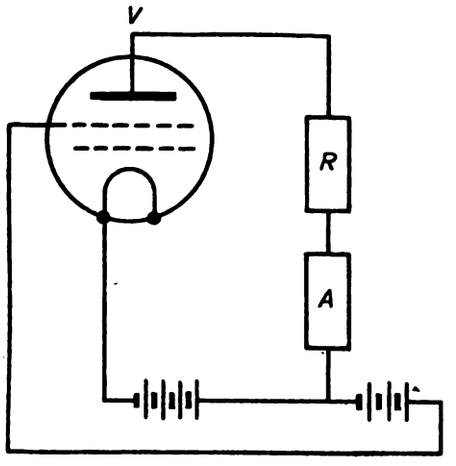
Digitized by Google

and the calibration curve extended up to any desired voltage. The movement of the vane is practically aperiodic and without friction. The instrument is suitable for researches in high voltage fields, being independent of frequency; it is also used in connection with therapeutic and diagnostic X-ray work.

Probably the most interesting of the exhibits of H. W. SULLIVAN, LTD., were those relating to radio frequency determinations. These included a phonic wheel and double amplifier for standardisation of the tuning fork of a multi-vibrator wavemeter. For the exact determination of the frequency of the tuning fork of a standard multi-vibrator wavemeter, a phonic wheel, to the design of Dr. D. W. Dye, has been developed in collaboration with him. The wheel is valve driven, following the principle given by Dr. Eccles, but has an additional driving magnet. A double thermionic amplifier is supplied with the wheel; this comprises two independent three-stage transformer-coupled low-frequency amplifiers. One of the amplifiers serves to run up the wheel as a self-driving motor and the other amplifies the small output e.m.f. given by the output winding of the tuning fork, and thus supplies power which can be applied to the additional driving magnet. After starting the wheel and running it up to speed (controlling its own power), power is gradually applied from the fork under test. The wheel quickly pulls into synchronism, and, upon cutting off the self-driving power, continues to run as a pure synchronous motor. A contact, operated through a suitable gearing from the main shaft of the wheel, gives impulses of one per sec. to the pen of a chronograph, which is also impulsed by seconds from the standard clock through a relay. With a run of 1 000 secs. duration, the frequency of the fork can be measured to one part in 100 000. Another interesting exhibit was an oscillation generator, due to Dr. N. W. McLachlan, in which a four-electrode thermionic valve is employed as a negative resistance. Two oscillatory circuits, one having an adjustable natural radio frequency, and the other a fixed natural audio frequency, are associated with the valve so as to produce a radio frequency oscillation modulated at audio frequency. This type of wavemeter should prove useful in tuning non-oscillating broadcast receivers—tuning being much more accurately effected than with a buzzer wavemeter, and yet with the same simplicity of operation. The theoretical circuit of the device is shown in Fig. 2. Potentiometers, wattmeters, galvonometers, Wheatstone bridges, inductance and capacity apparatus, wavemeters, etc., were shown by H. TINSLEY AND CO. Time switches in a variety of models for different applications, both hand and electrically wound switches representing a wide range of capacities were displayed by VENNER TIME SWITCHES, LTD. Thermostats fitted with a special type of mercury tube switch and of three types and three capacities were also shown. Time switches for Marconi d.f. wireless lighthouses and the "Venner-Dyke" buoy lamp for use by submarine cable companies for maintenance work at sea, were also shown.

An Interesting Oscillator.

The exhibits of the NATIONAL PHYSICAL LABORATORY included a beat note oscillator for use as a low and telephonic frequency source of good wave form and constant output for testing purposes. The apparatus comprised two similar high-frequency sources consisting of series fed Hartley circuits fitted with toroidal coils and the frequency of one of these was continuously variable by the adjustment of an air condenser. This was so designed that with the frequency of the fixed source at 100 kc per sec. the beat frequency varied between 10 and 10 000 cycles per sec. logarithmically over the condenser scale. A low-frequency amplifier capable of supplying an average output peak voltage of about 150 V, of good wave form, was included. Four output transformers, having seven ratios in all to suit a variety of loads, were provided in a separate box with an automatic change-over switch. Another exhibit was an apparatus for recording wireless time signals on wavelengths from 1 000 to 20 000 metres. The receiver comprised four separate units, each contained in a screened box with internal compartments for the mutual screening of stages. The second unit contained the main four-valve amplifier with two radio-frequency stages, one of which was provided with tuned transformer coupling. The local oscillator used for heterodyne reception on continuous wave signals was capacity-coupled to the detector of this amplifier. The fourth, an audio-frequency stage was followed by a selective audio-frequency amplifier comprising two amplifying stages and one output rectifying valve. This unit formed an important feature of the set, as it was found that even the fairly high selectivity given by the three tuned radio-frequency circuits was insufficient to prevent disturbance of the relay by interference. A switch was provided to enable the selective stage to be disconnected, as certain of the signals are not pure continuous waves and thus cannot be heterodyned to the appropriate frequency. The recorder shown was constructed by Messrs. NEGRETTI AND ZAMBRA, LTD., in consultation with the Meteorological Office. Mr. E. B. MOULLIN showed an ammeter for currents of extremely high frequencies and which could be calibrated by steady current. This instrument has been designed for measuring currents whose frequency is about thirty-million cycles per second, such as are employed in the beam system of radio communication. Its action depends on measuring the force between two circular cylinders carrying oppositely directed currents. The force increases slightly with the frequency because the current in the cylinders departs from axial symmetry and increases along the length of the system. The ammeter is a simplified current balance whose geometrical arrangement is such that the various magnetic and electric fields are capable of exact solution. The system is two long circular cylinders placed symmetrically within a circular screen tube, and so the longitudinal and transverse current distribution is calculable, and hence the correction factor for any frequency may be derived. In the instrument exhibited, the force at 3×10^7 cycles ($\lambda = 10$ m.) exceeded the force for the same steady current by 6%; in the most sensitive pattern of the instrument full deflection is produced by 1·2 A, but instruments can be made for any current up to many hundreds of amperes.



V = Screened Grid Valve.
R = Radio Frequency Circuit.
A = Audio " "

Fig. 2. The theoretical circuit of the Sullivan-McLachlan wavemeter.

The WIGAN AND DISTRICT MINING AND TECHNICAL COLLEGE demonstrated an apparatus for showing certain magnetic effects of a current. The apparatus consisted of three rectangular coils of different sizes and a specially designed mercury cup, a current of 2 to 3 A being used. The following effects, etc., were demonstrated:—(1) setting of a current-carrying coil in the earth's field; (2) effect of reversing the current in the coil; (3) setting of a current-carrying coil in the magnetic field due to a current in another coil; (4) effects of reversing the currents; (5) direction of motion of a current-carrying conductor when a magnet pole is presented to it (left hand rule); (6) mutual effect between two current-carrying conductors; (7) plotting the magnetic field round a straight current-carrying conductor; (8) plotting with other magnetic fields superimposed on that of the current; and (9) verification of the formula $F = \frac{2i}{d}$ using either an oscillation magnetometer or a deflection magnetometer.

On the stand of the M.L. SYNDICATE, LTD., were shown M.L. anode converters, rotary transformers and motor generator sets. These machines have a large number of applications and have been successfully used for supplying power for radio receiving and transmitting sets, gramophone amplifiers, public address equipment, talking picture equipment and television apparatus. There are also a number of uses for the machines in the laboratory. By their use a steady voltage is obtained for insulation testing, and they are useful for providing current for operation of cathode ray oscillographs. The M.O. VALVE CO., LTD., displayed a wide range of receiving and transmitting valves, high power rectifiers, and valves as used in the G.P.O. and beam stations. Examples were given of the technique of glass-to-metal gas-tight joints, e.h.t. rectifiers, screen grid and pentode valves, a.c. mains valves, etc.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

"Salesmanship."

[To the Editor.]

Sir,—As a one-time regular attendant at the E.D.A. Salesmanship Conferences, I was interested to read your comments under "Current Topics" last week. The achievements of the early pioneers in our industry were admirable, but instead of browsing over their experience we should try to utilise it as a jumping-off point for further developments and regard it as an inspiration to those with little faith. There is so much work to be done in spreading electrification in this country that we have but little time to sit back and examine what our predecessors did under very different conditions. It is therefore highly desirable that Salesmanship Conferences should deal with selling first and last, and that the tense should be future and not past.—I am, etc.,

"Sales Engineer."

London, S.E.22.

Safety Factor of Concrete Poles.

[To the Editor.]

Sir,—On page 89 of your January 25th issue, Mr. Gauvain refers to poles, saying: "The factor of safety allowed is two in the case of iron, steel, and reinforced concrete, calculated on the crippling load . . ."

As the climatic conditions in New Zealand are about the same as this country, the quality and state of cement at least as good or better here, the manufacturing plant and labour and other conditions for best manufacture and erection at least as good or better here, and a person's life just as valuable there as here, why cannot this country have the same factor of safety and loading conditions?

Those responsible for the New Zealand Regulations are, without doubt, quite well aware that the problem is both complicated and complex. That is, it very closely involves such practical questions as: (*a*) the *type* of reinforced concrete pole; (*b*) the best method and process of mixing, making, curing, drying; (*c*) the most effective size, number, manner, and depth of placing of longitudinal steel rods; (*d*) the best shape spacing, holding or keying, roughness, of longitudinal steel rods; (*e*) the best ratio of modulus of steel and concrete; (*f*) the best richness of mixture, etc. Also (*g*) whether the pole is made in sections and with or without taper, or made in one continuous column with or without taper; (*h*) whether the spirals (or hoops) are included (or not) directly or indirectly in the area of steel; and (*i*) whether the calculated area of the concrete is only that within the spirals and/or the longitudinal steel.

Without a good general knowledge of these and other conditions we cannot arrive at the most reasonable and just factor of safety. As with the different timbers used for poles, there is a wide difference in the strength, etc., of the different types and makes of reinforced concrete poles.

It is well understood that the Regulations for this country militate against the use of reinforced concrete construction for overhead lines—the required factor of safety of 3·5 is high, and is made much worse because it is calculated on the *elastic limit* of the steel. Thus, the factor of safety is as 3·5 : 2·0 favouring New Zealand electrical development; the elastic limit is but *one-half* the ultimate strength of the steel, yet, for a reinforced concrete pole, the latter (ultimate strength) may be appreciably less than the real crippling value.

Of additional importance is the fact that, when the crippling load on a steel, iron, or wood pole or structure is reached, there is no factor of safety left; not so, however, for the reinforced concrete pole, which generally retains a valuable factor of safety, varying in degree with the type of reinforcement and make and type of pole. In view of these various reinforced-concrete advantages, the writer ventures to propose that this country now adopt the same total net area as used in New Zealand, with a factor of safety of 2·5 based on the ultimate strength, but *preferably* on the crippling load, the factor of safety preferably reading: $F = F_f/F_d$; where, F_f = stress in material at failure, and F_d = stress in material when carrying designed load.

What is the formulæ used in New Zealand? Can Mr. Gauvain tell us if the figures for total safe load are based on the formula—

$$\text{Safe load} = f_c[A_c + (E_s/E_c)A_s] = f_c A[(1 + n - 1)p];$$

and if so, what are the constants, etc., used?

Where—

A = total net area.

f_c = compressive unit stress in concrete. (What figure between the values of 450 and 700 is taken?)

E_s = modulus of elasticity for steel. (Is this taken at 30 000 000 lb./sq. in.?)

E_c = modulus of elasticity for concrete. (Is this figure taken at 2 000 000 lb/sq. in.?)

$n = E_s/E_c$ = modular ratio. (What figure between 15 and 10 is used?)

A_s = effective area of steel. (Does this include any of the circular hoops or spirals? If any, what proportion?)

A_c = effective area of concrete. (Does this include the area outside the spirals? If so, what?)

p = ratio of effective area of steel to effective area of concrete. (Between the values of 0·015 and 0·05, what is the more common figure used?)

I would like to add five further questions:—

(1) Is the mixture taken at 1 : 2 : 4? (2) Is bonding strength between 300 and 400 lb./in. sq.? What is the opinion? (3) Can the cement used be taken at around 90 lb./cu. ft.? (4) Does the ultimate strength of steel employed range between 55 000 and 80 000 lb./sq. in.? What value is taken? (5) Can the co-efficient of expansion of steel used be taken at 0.0000065 per deg. F.?—I am, etc.,

London, February 1st. W. T. Taylor.

Glass Insulators.

[To the Editor.]

Sir,—With reference to the article on "the Development of Glass Insulators for Transmission Schemes" in your issue of January 25th, we are astonished to find that any high voltage engineer to-day harbours the notion that the insulating qualities of a porcelain insulator for overhead transmission depend on its glaze, and not on the thoroughness of the vitrification of the porcelain proper.

It seems difficult to realise that in the case of a metal cap and pin insulator of average thickness of ¾ in., its electric strength of the order of 130 kV to 160 kV lies mainly in the glaze of the thickness of a few mils, especially as, at any curved part, the glaze is thinner still!

Further, the statement that endosmose of moisture through highly vitrified porcelain, in which, even under pressures of 1 ton per sq. in., absorption of moisture does not take place, cannot be accepted.

In conclusion, Mr. North's contention that the flashover voltage for most porcelain insulators "depends almost entirely on their glaze" would not be accepted even by our junior students, taught to respect the field intensities (due to shape, etc., of insulator) as the predominant factors.—We are, etc.,

A. E. Marchant
G. A. Robertson } Students.

College of Technology, Manchester.

January 28th.

How Many Contractors?

[To the Editor.]

Sir,—"A Northern Contractor" indulged in speculations, in your last issue, as to the probable total number of electrical contractors in this country who are of sufficiently good standing to have their names entered on the National Register. It is difficult to agree that his suggested figure of 5 000 is correct, but it is equally difficult to prove him guilty of under-estimation. Probably the secretary of the E.C.A. could give as good a ruling as anyone on this point. Personal knowledge of the conditions in one large provincial centre suggests that if really reputable contractors only are counted, some current estimates are much too high. In the city in question, the supply authority is aware of the existence of about 500 so-called contractors within its area, but of these only about a hundred have so far shown themselves to be qualified for registration.—I am, etc.,

January 28th. "Sales Manager."

[Several letters are unavoidably held over, due to pressure on space.—Ed.]

NEWS IN BRIEF.

Another Electrical Band to Broadcast—Preston and Electric Cookers—Old Finsbury Students' Annual Dinner—Electrical Wages—Annual Meeting of the A.S.E.E.

THE Revo Electric Works Prize Band will broadcast from 5GB to-morrow (Saturday), from 3.45 to 5.30 p.m.

There are now over 1 000 electric cookers in use at Preston.

The generating plant installed in the Stirling Combination Poorhouse has resulted in a £100 decrease in the lighting costs.

An assisted wiring scheme to be applied to the Princess Road houses is the latest decision of Seaham Harbour Housing Committee.

Four sets of tenders for electrical equipment were opened by Hull Telephones Committee last week, and in only one case was a British tender accepted.

A conference on Industrial Canteen Management will be held by the Industrial Welfare Society on February 14th and 15th at the Hotel Victoria, London.

At a meeting of the Scottish Centre of the I.E.E. on January 30th, Mr. E. Seddon read a paper entitled "Recent Extensions to Portobello Power Station."

The annual dinner of the Finsbury Technical College Old Students' Association will be held on March 1st, at the Trocadero Restaurant, London, with Mr. E. W. Moss in the chair.

The Prince of Wales will give the toast of "The British Industries Fair" at the banquet at the Mansion House, London, on February 18th, and the proceedings will be broadcast.

At Fishpool Hospital, Bolton, improvements have been made consisting of a new all-electric laundry, to deal with 25 000 articles a week, to replace an out-of-date laundry department.

Mr. George Fletcher, late member of the Water Power Resources (Ireland) Committee, read a paper before the Royal Society of Arts last week on the Shannon Hydro-Electric Power Scheme.

The current issue of "Distribution," published by W. T. Henley's Telegraph Works Co., Ltd., gives some uses of statistics in business, with special reference to the electricity supply industry.

The next meeting of the Institute of Fuel will be held on February 13th, when Mr. W. F. Goodrich will read a paper entitled "Fuel Economy and the Small Steam User." Dr. Thomas Barratt will preside.

At a meeting of the North Eastern Students' Section of the I.E.E. to-night (Friday), Mr. S. Gibson will deliver a paper on "The City of Winnipeg Hydro-electric Installation." On February 22nd Mr. G. Waters will give a paper entitled "The Progress of Electrical Installations on Shipboard."

In accordance with the National Wages Agreements entered into by the N.F.E.A. and the E.T.U. it is announced that the variation in cost of living justifies a 27½% reduction in basic rates of wages, and that net hourly reductions and rates of pay now applicable are: Grade A, increase ½d.; B, increase, ½d.; C, nil; and Grade D, ½d. increase. These rates will remain current until the first pay day in June.

The telephone cable between Finland and Sweden was recently opened for traffic.

A charge engineer, salary grade 8, Class F, is wanted at the Lancashire Electric Power Co.'s Padiham station.

The chimes of the five bells in the new clock at the Exchange, Nottingham, are controlled by electric motors.

Accommodation has been provided in Fulham (London) Borough Council's new electricity showrooms for the accounts section.

Birkenhead Libraries Committee has authorised lighting experiments in the large (oil painting) rooms at the new art gallery.

Eastbourne Watch Committee has instructed the chief constable to investigate the advantages of automatic traffic signalling.

The Post Office Telephone services are providing for a chain of underground communications from Southampton to Birmingham.

Electric lighting is to be installed at Alma Road School, St. Alban's, at a cost of £140, and at the Garden Fields School at a cost of £150.

Seaham Harbour Electricity Committee recommends, in connection with the proposed assisted wiring scheme, that local contractors quote for separate installations.

The Egyptian Government has appointed a committee to study a scheme for utilising the Assouan dam for the generation of electricity.

An assisted wiring scheme and a scheme for hiring of meters for electric advertising signs, shop window lighting, etc., are being considered by Bolton Electricity Committee.

Tynemouth Electricity Committee has authorised the electrical engineer to arrange for demonstrations to be given of electric cooking ovens, water heating apparatus, etc.

The date of the annual meeting of the Association of Supervising Electrical Engineers which was to have taken place on February 12th has been postponed until March 19th.

The next meeting of the Optical Society will be held on February 14th, when a demonstration of Prof. Coker's "Photo-electric apparatus" will be given by Adam Helger, Ltd.

Tenders have been invited for the erection of a telephone exchange at Shere, Guildford, and for the erection of the Evington, Belgrave and Stoneygate telephone exchanges at Leicester.

Stepney (London) Finance Committee recommends that four Benham electric radiators, estimated to cost £90, be installed in the first class swimm ng baths at Whitechapel to prevent condensation of vapour rising from the water.

A Sunderland man, Mr. Lawrence Robert Callum, has patented an electrical signal device for motorists. Coloured illuminated arrows, or pointers, are fixed to the vehicle one on each side at both front and rear, and the device is controlled by a single four-way switch.

THE chairman, directors and staff of the Wholesale Fittings Co., Ltd., at the company's annual dinner at the Moorgate Street Restaurant, on February 2nd. The dinner was followed by an excellent concert, the names of the artists being given on page 170.

PERSONAL.

MR. H. H. Dewey, of Schenectady, has been appointed vice-president of the International General Electric Co., Inc.

Mr. G. W. Brench has received a clock, as a wedding present, from the staff of the British Hanovia Quartz Lamps, Ltd.

Chester Electricity Committee has recommended that the salary of Mr. S. E. Britton be increased to £1 100 per annum.

Major C. E. Prince, late of Marconi's Wireless Telegraph Co.,Ltd., has joined the board of Radiovisor Parent, Ltd.

Mrs. J. Glynn has been appointed Canteen Superintendent to the Isleworth Works of Lissen, Ltd., London.

Ald. Nuttall, of Burnley, has been appointed vice-chairman of the Mid-Lancashire Electricity Advisory Board.

Burnley General Purposes Committee recommends an increase in the salary of Mr. J. E. Starkie, chief electrical engineer, from £731 to £900.

Coun. A. E. Kempson has been elected chairman of Shoreditch Electricity Committee and Ald. W. Hebden, vice-chairman.

Mr. W. Parker, late sales manager of British Furnaces, Ltd., has joined the staff of Premix Gas Plants, Ltd., as their sales engineer.

Mr. J. W. Dunning, chief traffic assistant, succeeds Mr. Howell David, who is retiring, as traffic superintendent in the Cardiff tramways department.

Major H. J. Holmes, late of the Strand Electric and Engineering Co., Ltd., has joined Messrs. Mortimer and Gall, in the capacity of contracts manager.

Mr. G. Langford has been appointed factory manager of Everlite, Ltd., and Mr. S. R. Mullard has resigned from the board of directors. See page 180.

It is announced that Mr. Andrew Robertson, chairman of the Westinghouse Electric and Manufacturing Co., has been elected a director of the Radio Corporation of America.

Mr. B. T. Ware has been appointed assistant works manager of Petters, Ltd. He was previously with the British Thomson-Houston Co., Ltd., Birmingham.

The marriage of Mr. Denis Ziani de Ferranti and Miss Elizabeth Thomson will be solemnised at All Saints' Catholic Church, Hassop, to-morrow, February 9th.

Mr. Newcomb Carlton, president of the Western Union Telegraph Co., was a passenger in the "Aquitania," which left New York on February 2nd. While in London he is staying at the Ritz Hotel.

Estate of the gross value of £2 741 with net personalty £2 606 was left by the late Mr. Reginald Alexander Dalzell, formerly director of British Telegraphs and Telephones, who died on November 27th last, aged 62 years.

The marriage of Mr. W. H. Rossitter, electrician and radio engineer, of Market Street, Bradford-on-Avon, and Miss Robinson, was solemnised at the Parish Church, Bradford, on January 19th.

Mr. D. A. S. Porteous, formerly and for the past twelve years with Johnson and Phillips, Ltd., has been appointed works manager to the Enfield Cable Works, Ltd., as from the beginning of the current year.

Many of our readers will join us in expressing sympathy with Sir Charles and Lady Bright in their recent loss through the death of their only grandchild, Julian Cunliffe Berthoud. It will be remembered that their only son died only a few years ago whilst he was still at Oxford.

Mr. E. H. Adams, of Vancouver, formerly of London, and Mr. J. I. Newell, also of Vancouver, have been appointed vice-presidents of the British Columbia Electric Railway. This change has been made necessary by the appointment of Mr. W. G. Murrin, the former vice-president, as president of the company.

Ald. J. W. Longley has been elected chairman of Bradford Electricity Committee in succession to Mr. Wilfred Turner, who has resigned from the City Council. Ald. Longley is a consulting engineer in both the mechanical and electrical branches and the vacancy of deputy chairman of the Committee caused by his new appointment has been filled by Mr. Chris Watkin.

Mr. F. Brown having resigned his position as repairs engineer in the Hammersmith (London) electricity department, the Establishment Committee proposes that Mr. G. A. Tottman, engineer-in-charge, be promoted to the position at a salary of £398 18s. 2d. per annum, and that Mr. D. D. Evans, junior engineer-in-charge, be promoted to the position of engineer-in-charge.

Following on the appointment of Mr. F. A. Fitzpayne as manager of Edinburgh Transport Department, the Transport Committee has recommended that Mr. Robert M'Leod be promoted from his present position of traffic superintendent to that of deputy transport manager. The committee has also recommended that Mr. T. Kinghorn be promoted to traffic superintendent.

Mr. J. W. McKay, general secretary of the Electrical Wholesalers' Federation, has been adopted as prospective Liberal candidate for Coventry at the next election. He has held a number of important appointments in the electrical industry and was the pioneer in the overseas wireless transmission of commercial market reports. He is a practised speaker on business building and management.

In anticipation of the silver wedding day of the Mayor and Mayoress of Brighton, Ald. and Mrs. H. J. Galliers, the employees at the Mayor's electrical depots at Brighton, Hove, Worthing, Lewes, and Hayward's Heath, have presented them with a handsome silver rose bowl, bearing the arms of the places mentioned, together with the inscription: "Presented to Alderman H. J. Galliers, J.P. and Mrs. Galliers, Mayor and Mayoress of Brighton, with the best wishes of their employees, to commemorate their silver wedding, February 25th, 1929."

Obituary.

COL. H. J. WALDUCK, on January 23rd. He was a former President of the British Industries Fair.

MR. JOHN ALFRED HENDERSON, aged 35 years. He was an official of the Vera Cruz Electric Light, Power and Traction Co., and served his time with the old British Westinghouse Co.

MR. HENRY MARSHALL, on January 20th, aged 66 years. He was associated with the firm of John Tinsley, Ltd., electrical engineers, of Darlington.

MR. CHARLES CLARKE, on January 31st. He was joint managing director of Waygood-Otis, Ltd., and was actively associated with the lift industry for a period of over 40 years.

MR. CHARLES WESLEY PARKES, on January 19th. He was for over 25 years on the staff of the Westinghouse Electric International Co., for whom he travelled extensively as construction superintendent.

MR. RICHARD TOOTALL, on February 2nd, aged 69 years. He was formerly in partnership with his brother in an electrical engineering business at Darwen, and before the local undertaking was started he installed electric light in several business premises in the town.

ALDERMAN CEDRIC CHIVERS, on January 30th, aged 75 years. He was in his sixth mayoralty of the City of Bath, the last five years having been consecutive. Members of the I.M.E.A. and visitors to last year's convention will remember that he played an important part in the social activities of the gathering. Alderman Chivers was a self-made man who revolutionised the art of bookbinding in two ways: one by a new method of stitching which greatly added to the life of library books, and the other by a new decorative process for special books. He had factories in Bath and in Brooklyn, New York. See page 177.

MR. SYDNEY MORSE, on January 27th, aged 75 years. Mr. Morse, a solicitor, specialised for many years in work connected with London electrical companies. He acted for the original promoters of the Chelsea, the City of London and the County of London Electric Lighting Orders and many others. He was also connected with the promotion of a large number of Tramway and Light Railway Orders. He was at one time an associate member of the Council of the Institution of Electrical Engineers and chairman of the Electrical Trades Section of the London Chamber of Commerce.

MR. ROBERT MONTGOMERY HORNE-PAYNE, on January 30th, aged 59 years. He had for a long time been intimately connected with some of the largest industrial and power companies of Western Canada. He was for many years chairman of the British Columbia Electric Railway. This company was the first big electrical venture on the Canadian Pacific Coast, and it prospered so greatly that recently there was a struggle between two or more contending parties to secure control of it. Finally the control passed into Canadian hands after a long and successful English management. In the tramway, light, and power companies at Rio de Janeiro and Sao Paulo in Brazil, Mr. Horne-Payne was director and vice-president. He had also interests in the West Gloucestershire Power Company.

LEGAL INTELLIGENCE.

Electricity Supply Companies and the London Joint Authority.

MR. JUSTICE ASTBURY, in the Chancery Division, on January 31st, heard a motion by the Attorney-General at the relation of the Richmond (Surrey) Electric Light and Power Co., Ltd., the County of London Electric Supply Co., Ltd., the Chiswick Electricity Supply Corp., Ltd., and the Hendon Electric Supply Co., Ltd., for an injunction against the London and Home Counties Joint Electricity Authority. Plaintiffs sought to restrain the defendants until judgment in the action, or further order, from applying any of the funds of the defendants in or towards the payment of any costs or expenses incurred or to be incurred in relation to the preparation or promotion of a Bill in Parliament entitled "A Bill to transfer to the London and Home Counties Joint Electricity Authority the powers of local authorities to acquire electrical undertakings in their district, to extend such district, to confer further powers upon the said authority and for other purposes," or otherwise in relation to such Bill, also for employing at the expense or upon the credit of the defendants any of their officers or servants or other persons in the preparation or promotion of such Bill unless and until they should be authorised by Parliament so to do.

Mr. Tyldesley Jones, K.C., Mr. Wilfrid Greene, K.C., and Mr. C. S. Crossman appeared for the plaintiffs, and Mr. R. Stafford Cripps, K.C., and Mr. S. G. Turner for the defendants.

For the Defendants.

Mr. Tyldesley Jones said defendants were a lawfully constituted joint authority and under the Act of 1919 and later Acts they had power to levy contributions on the plaintiff bodies who were bound to contribute to the defendants' administrative expenses. In his view the Bill in question was contrary to the scheme and was *ultra vires*, and he asked his Lordship to restrain the application of defendant's funds for that purpose.

Mr. Jones further said the idea under the act was that the distribution should remain in the hands of the distributors, but that the generation of the energy should not, the underlying idea being that generation should be absorbed into the hands of joint authorities. Generating stations and undertakings of distributors might be acquired by agreement and the joint authority was to supply electricity in bulk to the distributors. Under the Electricity Act of 1926 an entirely different scheme was prescribed, and a new body called the Central Electricity Board was created which was to operate for the whole of England, and was to do practically what each joint authority was supposed to do.

The defendants promoted a Bill authorising them to construct a generating station at Chiswick to which there was considerable opposition. A clause was put in the Bill by Parliament to the effect that the scheme was not to be carried out unless within five years the Central Board made the station a "selected" one. Within two years the new body said that they would not select that station, and the result was that the constituent bodies of the joint authority had had to pay nearly £9 000 as administrative expenses of a Bill which was now waste paper.

Mr. Stafford Cripps, K.C., for defendants: The Commissioners were the people who urged the authority to promote the Bill.

In reply to his Lordship, Mr. Jones said the Bill was objected to because it altered the scheme and extended the district and altered the powers of the joint authority and because it also enabled the authority to delegate its powers to committee and not of themselves, and indeed to go right outside the whole scheme.

At the resumed hearing on February 1st, Mr. R. Stafford Cripps, K.C., said the Bill dealt with several matters and each of these must be judged separately. But in order to get the injunction which was asked for the onus was on the plaintiffs to show that the whole of the things in the Bill and each of them was something upon which the defendants were not entitled to spend money. He submitted that there was no limitation on the expenditure of the administrative fund in question.

Mr. Cripps, continuing his arguments on Tuesday, contended that Parliament contemplated the formation of a body having power to promote Orders or Bills to vary the terms of the incorporating documents. The Act of 1919 stated that the purpose for which a scheme might be put on foot by the Commissioners, and the object or purpose of the scheme, was to create a joint electricity authority for the improvement of the existing organisation for the supply of electricity in a district. The scheme itself included the power to vary the scheme. Some mention had been made by Mr. Tyldesley Jones of the Chiswick Act of Parliament which was promoted by the joint electricity authority, and that, he said, was an example of the sort of thing the defendants could do. The powers given by the Act of 1919 and the scheme included powers to apply by Special Order or a Bill in Parliament to vary the scheme and the powers given to the authority, and, therefore, there was no implied limitation preventing the defendants from spending their money on obtaining a variation of their powers. Every clause in the proposed Bill was a clause asking for powers which were incidental to or ancilliary to the main purposes of the scheme. He therefore submitted that the injunction sought ought not to be granted.

Mr. Tyldesley Jones, K.C., replying on behalf of the plaintiffs, contended that there was in the Act an express limitation on the expenditure of the fund, and a necessary limitation by reason of the fact that the body in question was one created for limited purposes.

His Lordship on Wednesday granted an injunction restraining the joint authority from applying their funds to the promotion of the Bill. His Lordship said that the authority had no right to levy upon its members the costs of promoting such a Bill, and for which they would have to pay both for its promotion and for their opposition.

Court Petition Granted.

In the Chancery Division on January 28th, Mr. Justice Romer granted a petition by the City of London Electric Lighting Co., for confirmation of a proposed alteration to its memorandum so as to enable it to guarantee an issue of debenture stock by a subsidiary company—the Bankside Investment Trust.

Mr. Buckmaster, for the petitioning company, said it supplied electrical energy to the City of London and the Borough of Southwark, and had to provide transformer stations to split up the distribution. The Bankside Investment Trust was formed to acquire leasehold properties, recondition them and let them out as offices, etc., reserving a portion for the purpose of providing transforming stations for the petitioning company, which owned all the shares in the Bankside Trust. Owing to the extension of the work of the City of London Company it was necessary to provide further stations, and it was proposed that the Bankside Trust should issue debentures to the amount of £1 000 000, of which £700 000 worth would be issued at once. If that issue could be guaranteed by the City of London Company it could be issued much more cheaply. It could be issued at 97½, with an underwriting commission of 1¼% and a small overriding commission.

THE NATIONAL REGISTER.

Further Additions Made to the Register at Last Meeting of Executive Committee.

AT a meeting of the Executive Council of the National Register of Electrical Installation Contractors on February 1st fourteen applications from electrical contractors for membership were considered. Of this number eight were accepted by the Committee and six were declined.

The names and addresses of the accepted applicants are:—Skinner and Burtonshaw, 76, London Road, Southborough; Jones and Gifford, Silver Chambers, Conway, North Wales; Barratt and Co., 2, Grange Terrace, Wilmslow Road, Rusholme, Manchester; Thomas K. Richardson and Co., 6, Errol Street, Aigburth Road, Liverpool; John Passmoor, 7, Lorne Terrace, Sunderland; J. V. Meiklejohn, Ltd., 115, Bath Street, Glasgow, C.2; Sparkes Electrical Co., 43, Victoria Road, Aldershot; and Stone and Co. (Bristol), Ltd., Redland Road, Bristol.

The staff of Black and Decker, Ltd., portable electric tool makers, of the Trading Estate, Slough, have formed a social club, and the following officers are among those appointed:—President, Col. W. B. Franklin; vice-presidents, Messrs. O. F. Smith, E. H. Williams, J. V. Franklin, and C. H. Vidall; hon. secretary, Mr. W. L. Brown; hon. treasurer, Mr. T. Garnett; chairman of committee, Mr. G. S. Barnett. The club's activities will be opened with a carnival dance at the Castle Hotel, Windsor, on February 15th.

BRITISH INDUSTRIES FAIR.

Special Conference Arranged — Improved Conditions of the Fair.

ALWAYS under one continuous roof, the British Industries Fair in Birmingham is this year for the first time one single building, approximately 11 acres in extent. Not only have the five large exhibition halls occupied by the heavy section been thrown into one, with the removal of all passages and dividing walls, but lateral extensions, stage by stage, have been made all along, the area now taken up by the Birmingham Section having grown to four times its size in as many years. These improvements and extensions, systematically carried out at a capital charge of about £30 000 a year, have made it possible in 1929 to arrange the whole of the exhibits in symmetrical lines throughout the length and breadth of the Fair. Parallel avenues a third of a mile long stretch from one end of the building to the other; they are intersected by similar avenues across the Fair. Lengthwise every row of stands is numbered, crosswise every row is lettered. Moreover, illuminated signs above the aisles indicate from a distance exactly where any individual stand will be found.

As already announced in THE ELECTRICIAN, it is interesting to note that an outside service of petrol-driven cars will be inaugurated at the Fair this year, and these will run the entire length of the building on the south side, serving three public entrances as well as the new Conference Hall and the Outside Section of some 50 000 sq. ft. This service is free to all visitors, who will be able to board the cars or alight at any point that best suits them, according to the section of the display to which their business takes them. Recent alterations and extensions have afforded new facilities for meeting the convenience of visitors, these including an entirely new block in a central position, comprising a reception and luncheon hall to be known as the Bradford Room, a spacious public restaurant to seat 2 000, a buffet bar and smoke room, occupying more than half an acre; the Royal Room, public dining-rooms, smoke room and refreshment buffets at various points account for another acre. In addition, the new Conference Hall, immediately outside the building, seats 250 for lunch and 350 for conference.

It has been arranged to hold a conference of electrical engineers and others connected with the industry at 11.15 a.m. at the Fair, Castle Bromwich, on February 22nd. The chair will be taken by Sir John Gatti, president of the E.D.A., and an address upon how to increase the sales of electricity and electrical apparatus will be delivered by Lt.-Col. W. A. Vignoles. After the address the meeting will be open for discussion. The chairman of the local committee, Mr. R. A. Chattock, city electrical engineer, 14, Dale End, Birmingham, will, on application, be pleased to send an admission ticket to anyone who proposes to attend the conference.

IN PARLIAMENT.

Replies to Questions of Electrical Interest in the House of Commons.

THE Electricity Commissioners expect to be able during the present year to complete the preparation of schemes for South-West England, and East England, respectively, in that order.

Transatlantic telephone calls which originated in this country and passed to Canada were 16 in September, 39 in October, and 21 in November last.

The number of wireless receiving licences in force on December 31st, 1926, was 2 178 430; on December 31st, 1927, 2 395 106; and on December 31st, 1928, approximately 2 628 000.

Underground trunk telephone cables augment rather than displace existing main overhead routes. It is estimated that about 13 500 miles of overhead wires will be replaced by underground wires within the next three months.

The Postmaster-General has received reports from the German authorities concerning an experimental service which is in operation on certain trains running between Berlin and Hamburg for the provision of telephonic communication between passengers in trains and telephone subscribers. Similar experiments conducted in this country have demonstrated the practicability of establishing telephonic communication with moving trains, but at present the demand for such communication does not seem likely to be sufficient to justify the expense involved to the railways in the provision of facilities.

THE SOCIAL SIDE.

THE staff of Marchant and Co., electrical and radio engineers, of Folkestone, held their second annual dinner at the Bouverie Hotel. Mr. W. Marchant presided, and responding to the toast of his health, said that the past year had been the most prosperous in the history of the firm.

The staff of Walker Brothers, Birmingham, held their fifth annual whist drive and dance on January 18th at the Priory Rooms, when upwards of 200 employees and friends were present. Prizes were distributed by Mrs. G. N. Walker.

At the second annual dinner of the Rochdale Electricity Works Benevolent Fund, which was attended by over 100 subscribers, all employees of the electricity department, a presentation was made to Mr. Charles Smith who had retired from the service of the department on attaining the age of 73. The gift took the form of a gold mounted walking stick.

Hospital Saturday Fund.

At the 25th annual committee meeting of the Brookhirst Hospital Saturday Fund held at the offices of Brookhirst Switchgear, Ltd., it was stated that since the formation of the fund £1 221 had been subscribed by the employees of the firm and contributed to local hospitals. Last year's collections amounted to £144, which was a record for the firm.

Members of the Welfare Club of the Relay Automatic Telephone Co., Ltd., gathered at Anderton's Hotel, Fleet Street, E.C.4, on January 26th, to attend their annual dinner. Major White, the sales manager of the company occupied the chair, and Mr. W. T. Finlay, the chairman of the Welfare Club, responded to the toast of the evening. The Richard Fox Trio kindly provided the musical entertainment, and were an invaluable contribution in the enjoyment of the evening.

The annual staff dinner of the Wholesale Fittings Co., Ltd., was held at the Moorgate Street Restaurant, London, on February 2nd, with the chairman of the company, Mr. J. Altman, in the chair. The gathering included some 120 guests, and following the dinner a concert was given by Miss Nellie Walker, Miss Nancie Haines, Messrs. Ashmoor Burch, Will Kings and Walter Montague. The speeches during the evening were brief yet pertinent, being given by Mr. J. Altman, Messrs. Barnet, Bedwell, Rose, Francis and John. A photograph of the gathering is given on page 167.

A recent development by the Shropshire, Worcestershire, and Staffordshire Electric Power Co. has been the acquisition of the Stratford-on-Avon Electric Power Co. The S.W.S. Co. is now operating the whole of the old company's plant over an extended area including many villages and hamlets in Warwickshire. To mark the fusion, a fancy dress ball was organised by the company at the Red Lion Hotel and this was attended by about 200 old and new employees of the company. Mr. J. T. H. Legge, the company's chief engineer and manager, was in attendance, and the event symbolised in a complete manner the happy relations which the company is careful to cultivate with its employees.

The annual staff dinner of Ernest F. Moy, Ltd., of Greenland Street and Bayham Street, Camden Town, N., was held on January 19th, at the Britannia, High Street, Camden Town, about 100 of the staff being present. As is usual at this dinner, the Mayor of St. Pancras was the guest of honour, and the chairman of the company, Major C. G. Fox, presided. Other guests present included Messrs. G. Baker and Collins (Underground Railways), Messrs. Rowland, Mace, Dean and Cox (St. James's and Pall Mall Electric Light Co., Ltd.), and Messrs. Walters and Mann, of the St. Pancras Electricity Department. During the evening the following cricket club prizes were presented:—1st (best batting), W. Kirby, a barometer; 2nd (best bowling), H. Sadler, a leather case; 3rd (best improvement), R. Cheesman, an 8-day clock; club prize, S. Winkworth, a leather case.

The Area Circle associated with the S.W.S. Electric Power Co. held its second annual dinner at the Lion Hotel, Kidderminster, on January 24th. There was an excellent attendance. The company was presided over by Mr. J. T. H. Legge, chief engineer and manager of the company and chairman of the Circle; and the guests included the Mayor of Kidderminster, Mr. E. C. Eddy, Lt.-Col. W. A. Vignoles, and Mr. R. Matthias. During the evening a presentation of a case of pipes was made to Mr. E. E. Hamar, commercial engineer of the company and hon. secretary of the Circle; and to Mr. C. C. MacLeod, Circle Officer, a two-bottle Tantalus was presented. An enjoyable concert programme followed, by the Merry Optimists Party,

FACSIMILE TRANSMISSION.

Successful Demonstration of Picture Transmission by Wireless Across the Atlantic.

FOLLOWING upon the success of the first public wireless telegraphic picture service which has been in commercial operation between Radio House, London, and New York, since May, 1926, it is interesting to learn that the Marconi short-wave beam services have opened the way to new achievements in facsimile transmission and a system has been developed for application to short-wave wireless and to land-line circuits which will give higher speeds and clearer reproduction. A demonstration of this system was given by Marconi's Wireless Telegraph Co., Ltd., on Sunday, at the Somerton station, the transmission being made from Rocky Point.

The new system differs both mechanically and electrically from any other, and while there are certain difficulties still to be overcome before practical perfection is attained, it is now possible to transmit two images each 8 in. by 10 in. in less than 20 minutes.

The new system eliminates the necessity of stopping the apparatus every time a new picture is put on the transmitter or taken off the receiver, for as soon as one message is finished another can be placed on the cylinder and transmission begins at once, thus obviating the running-up of the machinery and synchronising the two ends of the circuit separately for every picture.

The process is that of translating the blacks and whites of the message into electrical impulses by means of a photo-electric cell. The picture or message to be transmitted is placed upon a metal cylinder, around which is a narrow slit, across which the messages are slowly drawn by a traversing mechanism. A point of light, focussed through the slit, revolves and so lights up, successively, every part of the image as this travels along the cylinder. The light is focussed into a fine spot on the surface of a steel chopper disc, 14 in. in diameter with 144 equally spaced holes near its periphery, running at speeds up to 5 000 r.p.m., its purpose being to provide a maximum carrier frequency of 12 000 cycles per sec. which is modulated by the varying intensities of the image. The interrupted light emerging from the chopper disc is collected by a condensing lens and focussed down to give an intense illumination in a pin hole, from which the light is collected and converted into a parallel beam. This beam travels down the hollow spindle of the motor driving the optical rotor to the inside of the transmitting cylinder, and is there thrown through a slit in the cylinder on to the image to be transmitted. The reflected light from the image, varying according to the tone shades, is collected by a lens and again converted into a parallel beam which is thrown on to the photo-electric cell. The varying current flowing through the latter is applied to the input grid circuit of a bank of amplifying valves, the output of which is utilised to modulate the beam transmitter.

The Receiver.

The receiver is similar in its main features to the transmitter, but provides a means of reversing the process. This is achieved by the application of a Kerr cell acting as a light shutter, and allowing a spot of light to fall on a sheet of sensitised paper only when an electrical current is passed through the cell. A source of light is passed through two Nicol polarising prisms, between which is placed the Kerr cell. The light traversing the first prism is polarised and passes between the two small electrodes of the cell, which is filled with nitro-benzine. After traversing the cell, the light passes to the second prism, which is so arranged that the light is cut off from the receiving cylinder when no voltage due to an incoming signal is applied to the electrodes of the cell.

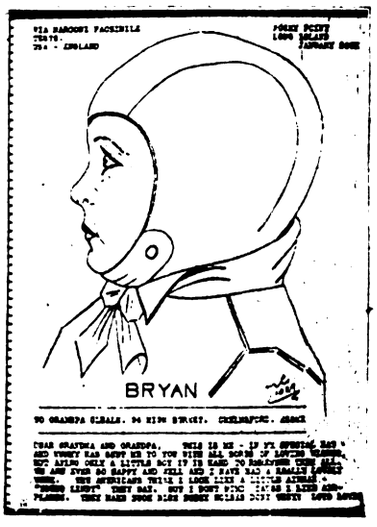
When a signal causes a voltage to be applied the light is able to pass to the receiving cylinder. This light is then collected in a parallel beam which throws a fine spot of light through the slit in the receiving cylinder on to a piece of photographic bromide paper which is placed around it and laterally pushed over the slit. In this manner the light and dark portions of the image on the transmitting apparatus are recorded.

Synchronous rotation is achieved by motors whose speed is controlled by valve-maintained tuning forks at the transmitting and receiving stations. In order to obtain constancy in the rate of vibration the forks are enclosed in a heat-insulating box, the air of which is kept at a steady temperature.

BUSINESS ITEMS.

THE address of the L.C.C. tramway offices has been changed to 23, Belvedere Road, S.E.1.

Mr. W. T. Fenn, of THE CENTRAL WIRELESS AND ELECTRICAL STORES, on January 29th opened larger premises at 1, Camden Road, Tunbridge Wells.



SPECIMEN of message received by the Marconi facsimile system during the trans-atlantic tests between New York and Somerton, referred to in the previous column. The size of the picture when received was 8 in. by 10 in. *See also page 177.*

MR. ALFRED H. SHIRLEY, electrical and radio engineer, of 327, Banbury Road, Oxford, has taken larger premises at 130, Cowley Road.

POLLOCK AND CO., electricians, 222, Argyle Street, Glasgow, have acquired the wireless business previously carried on by W. and A. Smith, Ltd., 236, Argyle Street, Glasgow.

The MARCONIPHONE CO., LTD., Tottenham Court Road, London, W.C., announces that in addition to the lecture entitled "The Screen Grid Valve," a second one, "A.C. Mains Valves," is now ready for loan to secretaries of radio societies and others.

The Red Bank Restaurant in D'Olier Street, Dublin, has been floodlighted, and is said to be the first restaurant in the Free State to be so treated. MI. PATRICK RYAN, 204, Pearse Street, was the electrical contractor, the projectors and lamps being manufactured by the General Electric Co., Ltd.

A manufacturers' representative, with offices in York Street, Sydney, and agents in other states, desires to get into touch with British manufacturers of electrical and radio apparatus and of small refrigerating plants. Inquiries to the Commercial Officer, Australia House, Strand, London, W.C.2, quoting ref. No. 581.

Approximately 5½ lb. of 48 S.W.G. 0·0016 in. enamelled copper wire were stolen from the BROMLEY-LANGTON ELECTRIC WIRE AND INSULATOR CO., LTD., 34-35, Newman Street, London, W.1, and in view of the unusual size of such wire, the company would be pleased to hear from anyone to whom the material may be offered.

The "Daily Telegraph" on Monday and Tuesday contained articles, extending to two pages each day, on Efficient Power Generation. The inception and growth of the organisation of INTERNATIONAL COMBUSTION, LTD., was dealt with, and the titles of the articles included "Power Station Requirements" and "Development in High Pressure Steam Generation."

A firm of agents in Johannesburg, the partners of which have had considerable technical and commercial experience in South Africa with connections among the principal mining groups, desire to obtain the agency for South Africa of British manufacturers of steam turbine and electric generator sets, condensing plants, water-tube boilers, electric motors and switchboard gear. Further information from the Department of Overseas Trade, ref. No. 53.

The RELAY AUTOMATIC CO., LTD., Relay House, Streatham Hill, London, S.W.2, has been awarded in open competition the contract for the supply of a 350 line private automatic telephone system to be installed in the Imperial Japanese Navy Department at Tokio. The installation is to be equipped forthwith with 300 lines. In addition, the same department has placed an order with the Relay Co. for the equipping of the H.I.M.S. "Mamiya" with an automatic system.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, when available.

STIRLING CORPORATION.—Electric light and power installation at municipal slaughter house. Particulars from Burgh Electrical Engineer.

FEATHERSTONE (YORKS).—Electric light installation at North Featherstone Lane Council Schools. Specification from Mr. C. Harris, Education offices, Knottingley.

THE above photograph relating to the recent gas explosion in London, has been sent to us by Ferranti, Ltd., who state that in the basement of the building at the back of the flames there was installed an amplifier, containing an AF5 audio frequency transformer, an OP1 output transformer and a B1 choke, the whole of this being submerged in water for two days. When the basement was pumped dry the owner tried out the set and found that it functioned perfectly. Ferranti, Ltd., also point out that similar experiences were common in the Fleetwood flood disaster some time ago.

LEEDS GUARDIANS, February 8th.—Re-installation of electric light wiring in the Children's Block, at the Rothwell Institution. Specification, etc., from Mr. J. H. Ford, Poor Law Offices, 11, South Parade, Leeds. Stamped, addressed envelope to be sent.

MANCHESTER CORPORATION, February 8th.—Supply of 20 500 kVA transformers, for sub-stations. Specification, etc., from Mr. H. C. Lamb, Electricity Department, Town Hall, Manchester; deposit £1 1s.

LONDON, MIDLAND AND SCOTTISH RAILWAY, NORTHERN COUNTIES COMMITTEE (IRELAND), February 9th.—Twelve months' supply of stores, including telegraph ironwork, wire, electric lamps, porous pots, etc. (tender form No. 26). Forms of tender (6d. each) from Mr. F. J. Martin, Stores Superintendent, York Road Station, Belfast.

NEWMILNS CORPORATION, February 9th.—Electric wiring, in connection with Council's housing scheme. Specifications from the Burgh Surveyor.

BRUNSWICK P.M. CHURCH, MORLEY, February 11th.—Electric light installation. Particulars from Mr. J. R. Gaunt, 6, Hartley Street, Morley.

HENDON URBAN DISTRICT COUNCIL, February 11th.—Manufacture and erection of 29 closed circuit code-signalling street fire alarms. Specifications from Mr. A. G. Knight, engineer to the Council; deposit £3 3s.

ETON RURAL DISTRICT COUNCIL, February 12th.—Electrically-driven pumps, etc., at sewage disposal works, Iver, Bucks. Specification, etc., from Mr. A. Gladwell, Denmark House, Windsor Road, Slough; deposit £3 3s.

MANCHESTER CORPORATION, February 12th.—Supply of stores for the tramways department, including parts of tramcar electrical equipments, electrodes, cable, rubber strip, tramcar axles, wheel tyres and centres, etc. Schedules, etc., from the General Manager, Corporation Tramways, 55, Piccadilly, Manchester.

SALFORD CORPORATION, February 12th.—Supply and installation of sunlight apparatus. Specification from the Medical Officer of Health, 143, Regent Road, Salford.

STOKE-ON-TRENT CORPORATION, February 13th.—Twelve months' supply of mains and cables (contract No. 2 904); and a.c. and d.c. meters (No. 2 905); sub-station e.h.t. switchgear (No. 2 906), and static transformers (No. 2 907). Specifications, etc., from the City Electrical Engineer, St. George's Chambers, Kingsway, Stoke-on-Trent; deposit £2 in respect of each contract.

STOKE-ON-TRENT CORPORATION, February 13th.—Overhead wiring and services to 170 new houses on Hanford housing site. Specification, etc., from the City Electrical Engineer, St. George's Chambers, Kingsway, Stoke-on-Trent; deposit £2.

SHEFFIELD CORPORATION, February 14th.—Equipment for new generating station at Blackburn Meadows, Sheffield, including turbo-alternator, with condensing, evaporating and steam pieheating plant (specification B.M. 67); water-tube boilers, with chimneys, superheaters, stokers (or pulverised fuel firing equipment), economisers, valves, etc. (B.M. 68); wagon tippers, conveyors and elevators (B.M. 70); cooling towers (B.M. 72), and overhead electrically and hand-operated cranes (B.M. 73). Specifications from Mr. S. E. Fedden, general manager and engineer, Electric Supply Department, Commercial Street, Sheffield; deposit, £3 3s. for each.

CENTRAL ELECTRICITY BOARD, February 15th.—Supply and laying of 66 000 V cables in London area, in connection with South-East England Electricity Scheme. Specification (S.E.E.-L.C.1) and form of tender from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit, £2 2s.

LEEDS CORPORATION, February 15th.—One year's supply of stores to the electricity department, including castings (section C.), i.r. covered cables, mains boxes and fittings, jointing and insulating materials, fittings and sundries (section N.). Forms of tender, etc., from Mr. C. N. Hefford, manager, 1, Whitehall Road, Leeds. State section for which it is desired to tender.

ST. THOMAS'S CHURCH, GOOLE, February 16th.—Electric light installation in church, presbytery, schools and club. Specifications from the Rev. J. J. O'Shea.

BELFAST CORPORATION, February 18th.—Twelve months' supply of stores for the electricity department, including electrical accessories (form No. 8), lamps (No. 9), carbon brushes (No. 10), bitite strip, prepared tape and rubber tape for joints and joint box compound (No. 12), c.i. street box frames and covers (No. 14), copper cable connectors and solder (No. 18), electricity meters and instrument transformers (No. 19), m.d. indicators (No. 20), automatic time switches (No. 21), cut-outs (No. 22), transformers (No. 23), cables and joint boxes (No. 24), v.i.r. cables, wires and flexibles (No. 26), etc. Forms of tender, etc., from Mr. F. H. Whysall, city electrical engineer and manager, East Bridge Street, Belfast.

BETHNAL GREEN (LONDON) BOROUGH COUNCIL, February 18th.—Six or 12 months' supply of electric lamps, lanterns, etc. Specifications from the Borough Engineer.

CENTRAL ELECTRICITY BOARD, February 18th.—Supply and erection of 132 000 V overhead transmission lines, in connection with the North-West England and North Wales Electricity Scheme. Specification (No. N.W.E.-P.L.1) and form of tender from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

Overhead Lines for Central England Scheme.

CENTRAL ELECTRICITY BOARD, February 18th.—Supply and erection of 132 000 V overhead transmission lines, in connection with the Central England Electricity Scheme. Specification (No. C.E.-P.L.1) and form of tender from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

HULL CORPORATION, February 18th.—Twelve months' supply of stores to the tramways department, including controller parts, trolley parts, car truck parts, cables, lamps, lighting fittings, armature repairing material, overhead line material, etc. Forms of tender, etc., from the General Manager, Albion Street, Hull.

LANCASTER CORPORATION, February 18th.—Supply of 400–600 Ah battery (at one hour rate) booster, switchgear, cable connections, etc., for Caton Road generating station. Speci-

Digitized by Google

fications, etc., from Mr. G. C. Milnes, borough electrical engineer; deposit £2.

STOKE AND WOLSTANTON GUARDIANS, February 18th.—Electric lighting installation at Relief Offices, 18, Church Street, Tunstall. Specification from Mr. W. Pendleton, Union offices, Stoke-on-Trent.

TYNE IMPROVEMENT COMMISSION, February 18th.—One 1½-ton portal, electric, travelling, level luffing crane, for Riverside Quay, Albert Edward Dock, North Shields. Specification, etc., from the Secretary, Bewick Street, Newcastle-on-Tyne; deposit £1 1s.

WEST HAM EDUCATION COMMITTEE, February 18th.—Electric light installation in South Hallsville New School, Agate Street, Tidal Basin. Specifications, etc., from Mr. J. H. Jacques, 61, West Ham Lane, Stratford, London, E.15; deposit £1.

HOVE CORPORATION, February 20th.—Supply of electric lamps, etc. Forms of tender, etc., from the Borough Surveyor.

METROPOLITAN ASYLUMS BOARD, February 20th.—Electric lighting installation at Southwark Casual Ward. Guildford Street, London, S.E.1. Specification, etc., from the Board's office, Victoria Embankment, E.C.4; deposit £1 1s.

DUMFRIES CORPORATION, February 21st.—Supply and erection of one 1 500 kW turbo-alternator and condensing plant. General conditions, specification and form of tender from Mr. W. S. Johnston, engineer and manager, Electricity Works, Leafield Road, Dumfries; deposit £1 1s.

BEDFORD CORPORATION, February 22nd.—Supply of e.h.t., h.t., and l.t. underground cables (section 1) and incandescent electric lamps (section 2) during year ending March 31st, 1930. Only British manufacturers in the U.K. are invited to tender. Specifications, etc., from the Borough Electrical Engineer, Prebend Street, Bedford.

CENTRAL ELECTRICITY BOARD, February 22nd.—Supply of 132 kV outdoor switchgear, for transforming stations in area of Central England Electricity Scheme. Specification from Sir R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2.

BAKEWELL GUARDIANS, February 23rd.—Three-valve wireless apparatus, with three loud speakers (for connection to a.c. mains), for Haddon District Hospital. Tenders to the Clerk, Hospital Committee, Union Offices, Bakewell.

HASTINGS CORPORATION, February 25th.—Electrically-driven pumping plant, of British manufacture, for Kent Street pumping station. Specification, etc., from Mr. G. M. C. Taylor (J. Taylor and Sons), Caxton House, Westminster, S.W.1.; deposit £5.

NEWTON ABBOT GUARDIANS, February 28th.—Electric lighting installation at the Institution. Forms of tender and specification from Messrs. Watson and Watson, 36, Torwood Street, Torquay; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, March 2nd.—Supply and erection of 33 000 V overhead line—Luton to Aylesbury—in connection with the South East England Electricity Scheme Specification (No. S.E.E.-S.L.2) and form of tender from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2.; deposit, £2 2s.

CENTRAL ELECTRICITY BOARD, March 2nd.—Supply and erection of 66 000 V and other transformers in the London area, in connection with the South-East England Electricity Scheme. Specification (No. S.E.E.-L.T.1) and form of tender from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit, £2 2s.

Bromley School Lighting.

BROMLEY EDUCATION COMMITTEE, March 4th.—Electric lighting installation in Raglan Road Council School. Particulars from Mr. W. G. Trend, borough electrical engineer, West Street, Bromley.

CENTRAL ELECTRICITY BOARD, March 4th.—Supply and erection of 132 kV outdoor switchgear, for transforming stations, in the area covered by the North-West England and North Wales Electricity Scheme. Specification (N.W.E.-P.S.1) from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit, £2 2s.

CENTRAL ELECTRICITY BOARD, March 4th.—Supply and erection of 132 000 V transformers in connection with the North-West England and North Wales Electricity Scheme. Specification (N.W.E.-P.T.1) from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit, £2 2s.

ERITH URBAN DISTRICT COUNCIL, March 4th.—Supply of h.t. and l.t. underground cables, joint boxes and other accessories during 12 months. Particulars and form of tender from the Electrical Engineer, Walnut Tree Road, Erith.

CENTRAL ELECTRICITY BOARD, March 6th.—Supply and erection of 66 000 V switchgear, for South-East England Electricity Scheme (London area), and supply and erection of 132 000 V transformers. Specifications from Sir R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

EGYPTIAN STATE RAILWAYS, February 9th.—Electrification and equipment of Heluan line, including equipment of power station, overhead transmission lines, track bond in motor and trailer coaches, etc. Tenders to General Manager, Cairo Station.

GHENT MUNICIPALITY, February 11th.—Supply of 16 electric portal cranes. (Reference A.X. 7 398.)

NEW SOUTH WALES PUBLIC WORKS DEPARTMENT, February 11th.—Supply, erection and maintenance of hydro-electric generating plant, in connection with Hume reservoir hydro-electric development. (Reference B.X. 4 989.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, February 12th.—Supply of 110 kV switchgear, and controlling equipment, for Waitaki power scheme, section 3. (Reference B.X. 4 848.)

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, February 12th.—Supply of dry cells, for telephone work. (P. and T. 151/1 205.) (Reference B.X. 4 991.)

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, February 12th.—Supply of v.i.r. wire (No. P. and T. 151/1 184). (Reference B.X. 4 951.)

JOHANNESBURG MUNICIPALITY, February 14th.—Supply of two single-phase transformers, each of 1 080 kVA (contract 115). (Reference B.X. 5 005.)

LOUGH DERG, PETTIGO, CO. DONEGAL, February 14th.—Supply and erection of two heavy oil engine-driven, continuous current, 10 kW, 220/250 V generating sets (section I); storage battery, on nickel-iron-alkaline system (section II); and d.c. switchboard (section III), for the Venerable Dean Keown. Specifications for each section from Messrs. MacEntee and O'Kelly, 23, Upper O'Connell Street, Dublin; deposit, £2 2s.

SOUTH AFRICAN RAILWAYS AND HARBOURS, February 14th.—Supply of 15-ton electrically-driven portal titan crane (tender No. 1 366). (Reference A.X. 7 272.)

EGYPTIAN MINISTRY OF THE INTERIOR, March 6th.—Supply and installation of underground and overhead cables, for transmission of current from Mit Chamr power works to the town of Kom el Nour. (Reference B.X. 5074.)

POSTMASTER-GENERAL'S DEPARTMENT, Melbourne, March 12th.—Supply of telephone relays (schedule C. 408). (Reference B.X. 5078.)

CAPE TOWN MUNICIPALITY, March 21st.—Supply of 300 A fuses (specification 453/1928). (Reference B.X. 5080.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, March 28th.—Supply of telephone switchboard cords. (Tender No. 148.) (Reference B.X. 5 048.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, April 2nd.—Supply of jumper rings and terminal strips (schedule C. 405). (Reference B.X. 5 066.)

VICTORIAN ELECTRICITY COMMISSION, April 8th.—Galvanised steel transmission line towers (specification 29/13). (Reference A.X. 7 401.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, April 9th.—Supply of induction voltage regulators, for Lake Coleridge scheme (section 215). (Reference B.X. 5 018.)

VICTORIAN ELECTRICITY COMMISSION, April 29th.—Supply of two or three steam turbo generator sets, with condensers, etc., for Yollourn power station extension (specification 29/7). (Reference B.X. 5 062.)

VICTORIAN ELECTRICITY COMMISSION, April 29th.—Steam turbo-generators (section 1), condensing plant, including circulating water pumps (section 2); and evaporating, deaerating and feed heating plant, including boiler feed pumps (section 3). Specification, etc., from the Agent-General for Victoria, Victoria House, Strand, London, W.C.; deposit, £3 3s.

Digitized by Google

VICTORIAN ELECTRICITY COMMISSION, April 29th.—Supply of two swing hammer mills, with electric motors, for brown coal (specification 29/9). (Reference A.X. 7 434.)

TANGANYIKA GOVERNMENT, June 1st.—Concession for utilisation of Pangani River Falls for the development of electric power. Copies of the draft concession may be obtained from the Crown Agents for the Colonies, 4, Millbank, London, S.W.1.

STATE ELECTRICITY WORKS, MONTEVIDEO, July 8th.—Construction and equipment of 50 000 kW power station.

Tenders Accepted.

ILFORD CORPORATION.—Union Cable Co., Ltd., supply of cable, £1 060.

DUMFRIES CORPORATION.—R. Macaulay, electrician's work for ensuing year.

CHELMSFORD CORPORATION.—Carter and Co., supply of fire alarms, etc., £280.

GENERAL POST OFFICE, DUBLIN.—Edison Swan Electric Co., Ltd., supply of electric lamps.

WIMBLEDON CORPORATION.—W. F. Iles, electric lighting installation for new swimming baths, £265 10s.

HERTFORDSHIRE COUNTY COUNCIL.—Griffins, electric lighting at Buntingford police station, £79 18s. 3d.

SALFORD CORPORATION.—S. Dickinson, re-wiring premises at Encombe Place, for the Medical Officer of Health.

GLASGOW CORPORATION.—British Insulated Cables, Ltd., supply of insulated bolts, for tramways department.

DIRECTOR OF NAVY CONTRACTS.—Metro-Vick Supplies, Ltd., Met-Vick (Cosmos) vacuum and gasfilled lamps.

YORK CORPORATION.—Callender's Cable and Construction Co., Ltd., supply of cables, £4 770 3s. 5d. (Recommended.)

GLASGOW CORPORATION.—W. T. Glover and Co., Ltd., 220 yards of lead covered cable, for Dalmarnock power station, £628.

FULHAM (LONDON) GUARDIANS.—Hammond Bros. and Champness, installation of two electric elevators at hospital, £1 079.

PORT OF LONDON AUTHORITY.—General Electric Co., Ltd., six months' requirements of Osram gasfilled and vacuum lamps.

BRISBANE CITY COUNCIL.—Babcock and Wilcox, Ltd., supply of three boilers, for new power house, £74 266. (Recommended.)

EDINBURGH EDUCATION COMMITTEE.—Robert Edgar and Co., electric light installation at Leith Academy Secondary School, £3 951 15s. 1d.

WANTAGE RURAL DISTRICT COUNCIL.—Callas, Sons and May, electric light installation and other works, at Old Cottage Hospital, £237 7s. 6d.

ADMIRALTY.—Siemens Electric Lamps and Supplies, Ltd., large quantity of Siemens vacuum and gasfilled lamps, for ship and dockyard use.

WORTHING CORPORATION.—Callender's Cable and Construction Co., Ltd., supply and laying of e.h.t. cable to Ferring sub-station, £8 404. (Recommended.)

GREAT HORTON INDUSTRIAL SOCIETY, BRADFORD.—A Taylor and Co., Ltd., electrician's work in connection with alterations and additions to offices at Blacksmith Fold, Bradford.

SOUTHWARK (LONDON) BOROUGH COUNCIL.—Hackbridge Cable Co., Ltd., supply of cable, £3 018; W. Lucy and Co., Ltd., supply of feeder pillars, £53 15s. each. (Both recommended.)

WEST HAM CORPORATION.—Hewittic Electric Co., Ltd., installation of mercury static rectifiers, etc., in connection with the supply of electricity to the tramways, £13 200. (Recommended.)

WESTMINSTER CITY COUNCIL.—Buchanan and Curwen, electric light installation on entrances, staircases and in laundries, at Regency Street dwellings, £579. (Recommended.)

MARYLEBONE (LONDON) BOROUGH COUNCIL.—Davidson and Co., Ltd., fitting six sets of receivers to induced draught fans for two Brock chimneys at power station, £1 080. (Recommended.)

ROTHERHAM CORPORATION.—British Thomson-Houston Co., Ltd., supply of Tungar rectifier for keeping batteries of petrol-driven 'buses fully charged during winter months, £45. (Recommended.)

LEEDS CORPORATION.—Cables: W. T. Henley's Telegraph Works Co., Ltd., £865; Enfield Cable Works, Ltd., £1 552 10s.; Macintosh Cable Co., Ltd., £1 177 10s.; Greenwich Cable Works, Ltd., £2 315 9s. 6d.

HULL CORPORATION.—The Automatic Telephone Manufacturing Co., Ltd., supply of automatic telephones and bell sets, £378 15s. 9d.; Richard Johnson and Nephew, Ltd., supply of one mile of trolley wire, £108 5s. 4d.

MANCHESTER CORPORATION.—Metropolitan-Vickers Electrical Co., Ltd., repairs to generator transformer at Barton; Stewarts and Lloyds, Ltd., supply of weldless steel spigot and faucet tubes; Brooks and Co., Ltd., electric lighting at Oldham Road depot.

SOUTHEND CORPORATION.—Edgar Allen and Co., Ltd., tramway points and crossings, £1 097 15s.; Titan Trackwork Co., Ltd., two sets of scissors crossings for pier tramway, £990; Richard Garrett and Sons, Ltd., two six-wheel double-deck top-covered trackless trolley vehicles, £2 004 5s. each.

LONDON COUNTY COUNCIL.—Electrical Installations, Ltd., electric light wiring and fittings, at stores, Clerkenwell, £852. Also tendered: J. Briggs (Electrical Contractors), Ltd., £1 200; A. Hawkins and Sons, £1 249; A. Dean and Co., Ltd., £1 260; Smethhurst and Co. (London), Ltd., £1 897.

GLASGOW CORPORATION.—Hadfields, Ltd., and Edgar Allen and Co., Ltd., special tramway track work; James Robertson, car-washing machine; Macfarlane Engineering Co., Ltd., motor generating set for battery charging at new garage; Brush Electrical Engineering Co., Ltd., forgings for car trucks.

LONDON COUNTY COUNCIL.—Supply of insulating materials for 12 months: Attwater and Sons, British Central Electrical Co., Ltd., Butterfield and Renton, Connollys (Blackley), Ltd., Hamnett and Andrew, Mica and Micanite Supplies, Ltd., Micanite and Insulators Co., Ltd., Rykneld Mills Co., A. A. Sample and Siemens Bros. and Co., Ltd.

STOKE-ON-TRENT CORPORATION.—Hamworthy Engineering Co., Ltd., supply of electrically driven air compressor, £552 4s.; Metropolitan-Vickers Electrical Co., Ltd., supply of switchgear, £8 354 10s.; Hawley, Ingram and Co., wiring and fitting eight all-electric houses in Avenue Road, Hanley, £361 11s.; Crompton, Parkinson, Ltd., switchboard, at Stoke sub-works, £712 16s.

POST OFFICE.—Standard Telephones and Cables, Ltd., automatic telephone equipment for Newcastle, comprising main exchange, Newcastle Central, and eleven satellite or sub-exchanges, providing in all nearly 20 000 lines, with an ultimate capacity of 42 000. The exchanges will be equipped with step-by-step apparatus, and it is expected that they will be completed by the end of 1930.

NEWTON-IN-MAKERFIELD URBAN DISTRICT COUNCIL.—Electrical Apparatus Co., Ltd., supply of 80 2½ A and 70 5 A electricity meters, £1 4s. each. Also tendered: Ferranti, Ltd., £1 5s.; British Insulated Cables Ltd., £1 3s. 9d.; Chamberlain and Hookham, Ltd., £1 5s.; Metropolitan-Vickers Electrical Co., Ltd., £1 5s.; Measurement, Ltd., £1 3s. 9d.; British Electric Meters, Ltd., £1 3s. 3d.; R. Hornby and Co., Ltd., 18s.

INDIAN STORES DEPARTMENT.—Harland Engineering Co., Ltd., pumping set, Rs. 4 663; General Electric Co. (India), Ltd., generating set, Rs. 15 566; British Thomson-Houston Co., Ltd., rectifiers, Rs. 1 530; Crossley Bros., air compressor, Rs. 1 075; Siemens (India), Ltd., telephone sets, Rs. 945; Duncan, Stratton and Co., 25 generators, d.c., pipe ventilated, shunt wound, having continuous output of 1·5 kW at 220 V, 1 000/1 500 r.p.m. with fittings, Rs. 7 375; 25 regulators, vibrating reed type, 9⅜ in. dia., 7 in. deep, for panel mounting, suitable for above generators, Rs. 6 875.

Electric Pumping Equipment.

LONDON COUNTY COUNCIL.—W. H. Allen, Sons and Co., Ltd., supply of four electrically-driven pumping sets, at Abbey Mills pumping station, £36 677, on condition that a further four sets shall be supplied at £23 985. Also tendered: Lilleshall Co., Ltd., £36 780 and £24 110; Gwynne's Pumps, Ltd., £38 805 and £24 914; Metropolitan-Vickers Electrical Co., Ltd., £38 640 and £25 850; English Electric Co., Ltd., £39 800 and £25 800; Worthington-Simpson, Ltd., £39 800 and £25 800; Vickers-Armstrong, Ltd., £36 500 and £35 300. Chief engineer's estimate, £49 000 and £26 000.

CENTRAL ELECTRICITY BOARD.—Stream-Line Filter Co., Ltd., filter plant to deal with transformer and switch oils at each of the thirteen stations included in the Central Scottish Grid Scheme. The value of the order is understood to be approaching £20 000, and the scheme for the handling and storage of the dirty and clean oil has been prepared by Messrs. Kennedy and Donkin, in conjunction with the Board. The Stream-Line Filter Co.'s purification plant is based upon the stream-line principle of edge-filtration, the plant being a simple static one, independent of centrifugal principles.

WORK IN PROSPECT.

BARNES.—Church hall to cost £3 867, for Holy Trinity Church Council. Particulars from the contractors, W. H. Gaze and Sons, Ltd., Kingston-on-Thames.

BATLEY.—Basket works. Particulars from the architects, W. Hanstock and Son, Branch Road.

BLACKBURN.—Additional 200 houses, for the Town Council. Particulars from the Borough Surveyor.

BRISTOL.—Additional housing scheme (246), for the Town Council. Particulars from the Borough Engineer.

DARLINGTON.—Central repair depot for the United Automobile Services, Ltd.

DARLINGTON.—Houses (46). Particulars from the architect, Mr. J. E. Chilton.

DORCHESTER.—Housing scheme (24), for the Town Council. Particulars from the Borough Surveyor.

FOLKESTONE.—Additional 20 houses, for the Town Council. Particulars from the Borough Surveyor.

GLOUCESTER.—Reconstruction business premises, Eastgate Street and Brunswick Road, for the Co-operative and Industrial Society, Ltd. Particulars from the General Manager.

HALIFAX.—Block of shops for the Town Council. Particulars from the Borough Engineer, Crossley Street.

HEADINGLEY.—Hostel for male students, for Leeds University Council. Particulars from the architects, John C. Proctor and F. L. Charlton, 40, Clarendon Road, Leeds.

HOLMFIRTH.—Housing scheme (56), for the Urban Council. Particulars from the Surveyor.

NORTHAMPTON.—Bazaar premises, Abington Street, for F. W. Woolworth and Co., Ltd., Kingsway, London.

MAIDSTONE.—Rebuilding licensed premises, Pudding Lane, for Style and Winch.

WREXHAM.—Additional 150 houses, for the Rural Council. Particulars from the Surveyor.

NORTH-EAST COAST EXHIBITION.

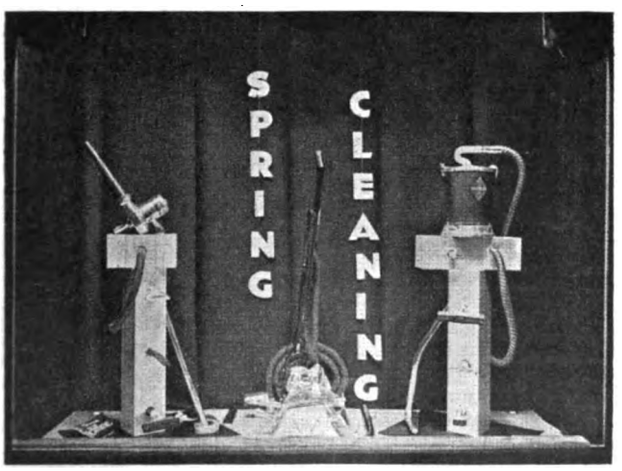
Electrical exhibits will form one of the many features of the forthcoming North-East Coast Exhibition which opens in Newcastle-upon-Tyne in May next and will run to the following October. The exhibits will be accommodated in two exceptionally large pavilions, which are known as the Palaces of Engineering and Industries. The floor space of these palaces totals 260 000 square feet, which gives a rough idea of their size. Forward progress has been made in getting the pavilions ready for the reception of goods. It is expected that in another week or so the heavier exhibits—and there are a number of them—will begin to arrive. Among more prominent electrical firms who are exhibiting are the Sunderland Forge and Engineering Co., Ltd., A. Reyrolle and Co., Ltd., Messrs. Robson and Coleman, John Taylor, Dunford and Co., Ltd., Clarke, Chapman and Co., Ltd., Bernard Holland and Co., and J. H. Holmes and Co., Ltd.

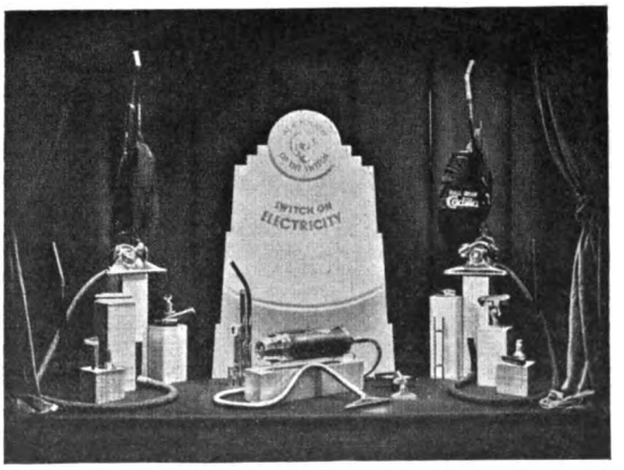
The exhibition gives promise of being one of the most attractive held in the north of England for a long period of years, and is certain of exceptional patronage from visitors from all parts of the country.

ELECTRICAL "BLUE BOOK."

Electrical Trades' Directory and Handbook for 1929.

THE 47th edition of this well-known work of reference, which has just been issued by Ernest Benn, Ltd., Bouverie House, Fleet Street, London, E.C.4, at the usual price of 25s. net, shows further expansion, as it contains nearly 50 pages more than its immediate predecessor, although the actual bulk of the book is not increased, in consequence of the use of super-calendered paper, which tends to a better printing effect and is more pleasant to handle. The book has been thoroughly revised and brought up to date; the geographical section, which was introduced for the first time last year, has been amplified, and Northern Ireland is now included. A new feature which will be of service to many users of the book is a complete list of electrical contractors, with the names of those enrolled upon the National Register of Electrical Contractors, members of the Electrical Contractors' Association, and members of the Electrical Contractors' Association of Scotland specially marked. Another new feature, which has been greatly appreciated, is the system of guide cards, which facilitate the turning up of particular sections of the book and headings in the classified trades' section, and the number of these cards has been increased in the present edition. There are, as usual, alphabetical and classified trades sections containing entries of the names and addresses of firms in (1) the United Kingdom, (2) the British Colonies and Dominions, (3) the Continent of Europe, (4) Asia and Africa, (5) Central and South America, and (6) the United States of America, and all these have been carefully revised so as to enhance their value for circularising and reference purposes. The British alphabetical division alone contains about 20 000 names and addresses, and there is again an increase in the number of pages comprised in this section. In the handbook portion of the book particulars are given of the Patents, Designs and Trade Marks Acts, procedure for obtaining patents, registration of trade marks, etc., useful tables in reference to resistance materials, wire gauges, electricity supply cables, aluminium, etc., notes on illumination, factory and workshop lighting, the international candle and the Imperial ohm, ampere and volt, the British Engineering Standards Association, the International Electro-technical Commission, international symbols, the British Electrical and Allied Manufacturers' Association's machinery standardisation rules, the rules, etc., of the National Register of Electrical Installation Contractors, loans for electricity supply, tramways, etc., import duties leviable upon imported electrical goods in British Colonies and foreign countries; particulars of British and foreign owned submarine cables, including lengths, landing places, etc., international telephone and wireless facilities, the constitutions, rules, officials, etc., of technical societies, the staffs of universities and technical colleges and schools, officials of British and foreign Government Departments, wiring rules, etc. The manufacturers' Who's Who, and the telegraphic addresses section have been improved and brought up to date, and should prove increasingly valuable.





THE selling campaign of the Electrical Development Association is this month devoted to Spring Cleaning, and special window displays in connection with the campaign are reproduced above. Both schemes are simple and easy to arrange, irrespective of size of window, and each should do much to promote "cleaner" sales.

ELECTRICITY SUPPLY.

Many Extensions to Mains Proposed—The London Joint Authority and Electricity Charges—The Central Board and Southport—Assisted Wiring at Grays—Guildford's New Connections—Stoke Newington and Shop Window Lighting.

COVENTRY Town Council is applying for a loan of £17 805 for mains, etc.

Forty-seven objections have been lodged against the Grampian Electricity scheme.

Manchester Electricity Committee is seeking sanction to borrow £10 000 for h.t. mains.

Blakeney P.C. has asked the West Gloucester Power Co. to extend its cables to the village.

Eastbourne Corporation is seeking sanction to borrow £11 350 for electricity mains, extensions, etc.

Arrangements are being made by St. Helens Corporation to carry out extensions in the Rainford district.

Aberdeen Electricity Committee has authorised extensions to the generating station estimated to cost about £7 300.

An expenditure of £3 300 for a new feeder main and £4 183 for distributors is recommended by Bexhill Corporation.

Battersea Electricity Committee has decided to extend mains and services and convert gas lamps at a cost of £4 845.

Stoke-on-Trent Corporation is to extend mains at a cost of £720 to supply 38 houses to be erected in Marlborough Street, Fenton.

Forty cable extensions, involving an approximate cost of £4 000, have been authorised by Plymouth Electricity Committee.

A scheme for installing electric light in small houses on a system of payment by weekly instalments has been adopted by Grays U.D.C.

Lancaster Corporation proposes to promote a Special Order to include a considerable area of the Lancaster R.D.C. and the whole of Lunesdale R.D.C.

A scheme for extensions of works £4 300, distribution £47 862, and mains expenditure £12 000, has been prepared by Croydon Electricity Committee.

Southport Town Council is to seek sanction to borrow £1 900 for h.t. and l.t. mains, switchgear, transformer, etc., in connection with supply to Scarisbrick.

Colne Town Council has decided to apply for an Order to supply electricity to Trawden. The district has been canvassed and about 120 initial customers are expected.

Preston Corporation is seeking Parliamentary powers to construct three sluice gates in the River Ribble for impounding water in connection with the electricity undertaking.

Negotiations having been concluded for the installation of electric light in Dunbar, the Lothians Electric Power Company is preparing to lay cables from Luggate to the town.

The Central Electricity Board has made an application to Southport Corporation for a temporary bulk supply. The Corporation has appointed a sub-committee to arrange terms.

The Ministry of Transport has informed Stratford-on-Avon R.D.C. that Mr. A. D. Erskine will hold an inquiry on March 31st respecting objections to the use of overhead cables at Kineton.

Expenditure not exceeding £465 for providing electricity at the Bow, Burdett Road, Hammersmith, Old Kent Road, and West Hampstead fire stations, has been sanctioned by the L.C.C.

Droxford R.D.C. has received from Portsmouth Corporation an intimation that the latter contemplates applying for a Special Order to supply electricity within a portion of the rural district.

York Corporation is seeking consent to alter the system of supply to consumers at present taking continuous current from a three wire system at 230 and 460 V, to a supply of three-phase 50 cycle at 230 and 400 V.

Guildford Electricity Committee has decided that lighting by electricity be substituted for gas along the London Road from the White Horse Hotel to the borough boundary, and that 22 electric lamps be erected.

Hounslow U.D.C. are to extend mains from Lampton Corner in an easterly direction along the Great West Road at a cost of £435 to supply current to 34 houses to be erected on the Stuckley Estate, and along Heath Road, at a cost of £173 10s. to supply 10 houses.

Battersea Electricity Committee has authorised electricity services to 65 premises at a cost of £678 10s., mains extensions for private services at £443 and £53, and replacement with armoured cable of old vulcanised bitumen distributors in Northcote Road at £1 559.

Shipley Electricity Committee has agreed to the laying of a l.t. cable from Kendall Avenue, down Moorhead Lane, to the Saltaire Car Shed sub-station, in readiness for the contemplated change over from d.c. to a.c. in the Moorhead district. The length of the cable required is 300 yards.

During December, 100 new connections were made to Guildford mains for lighting purposes and 71 for heating, domestic, and power purposes. The number of new connections made during November was a record for the undertaking, which has in turn been exceeded during December.

As the result of an inquiry held at Ulverston on November 20th, the Ministry of Transport has approved, with modifications, the scheme of the Barrow-in-Furness Town Council for an overhead transmission line from Ulverston Viaduct to Meathop, in order to supply Cartmel, Lindale, and Meathop Sanatorium.

Stoke-on-Trent Electricity Committee has decided that an e.h.t. feeder be laid from Hanley to Greenbank Road, Tunstall, and l.t. mains from the sub-stations at Greenbank Road and Sneyd Hill, at an estimated cost of £13 000, and that two sub-stations be provided at an estimated cost of £4 000. It has been decided to extend mains at Trentham at a cost of £900.

Stoke Newington (London) Electricity Committee recommends that time switches be supplied on rental terms, for late shop window lighting and other purposes, at the following rates: up to 10A, 5s. per quarter; 10 to 15 A, 6s.; and 25 to 50 A; 10s.—The Committee seeks sanction for loans of £10 000 for mains and services and £1 500 for free wiring installations.

Beckenham Electricity Committee has considered a report by the engineer and manager recommending a revision of the percentage of rateable value, applicable to the "all-in" tariffs, in consequence of the revaluation of the district, to come into operation on April 1st next, and adjourned the matter, the engineer meanwhile to circulate a statement giving the effect of the proposed revision.

The borough electrical engineer, Wimbledon, has reported that it is advisable during the present year to supplement several of the existing h.t. mains at an estimated cost of £13 238 13s., and also to replace one of the existing e.h.t. mains between Raynes Park and Malden sub-stations, and a similar main from the electricity works to Raynes Park sub-station, by cables of a larger section, at the total cost of £23 000.

A letter has been received by Ilford Electricity Committee from the County of London Electric Supply Co., Ltd., stating that the company gives its consent to the Council's application to the Electricity Commissioners for a Fringe Order to permit the Council to supply electricity to certain premises in Grange Crescent, Grange Hill, and stating that the company consents to the Council's proposed extension of mains in the Chigwell area along a continuation of Tomswood Hill and Forest Lane and a proposed new road leading from Forest Lane.

Wrexham T.C. has adopted a scheme for installing electric light in houses on the hire-purchase system, with a maximum of five points, and a loan of £6 000 is to be applied for to meet the estimated cost of 400 installations during the first year. The wiring is to be carried out by electrical contractors, to the Corporation's specifications, and the charge for electricity is to be 8d. per kWh, through a slot meter, until 800 kWh have been paid for, when the ordinary lighting rate for slot meters generally will be charged. A net surplus of £280 per annum is anticipated.

Reporting on the Mid-East England electricity scheme, Sheffield Electricity Committee states that the saving in Sheffield over five years is £57 803, the difference between £1 929 193 (0·348 per kWh) the cost of 1 330·5 million kWh under individual development, and £1 871 390 (0·3376d. per kWh), estimated cost of the same supply under the scheme, a little less than 3%. This is by far the lowest saving anticipated for any undertaking in the area, and is, the Committee states, evidence of the fact that the present and prospective cost of generation in Sheffield is lower than in any other undertaking. —The electricity department committee is to extend mains at a cost of £7 000.

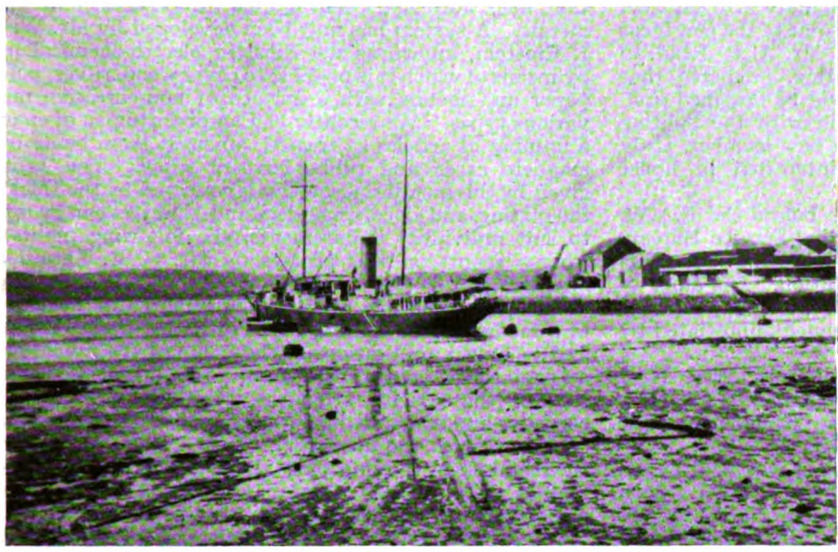
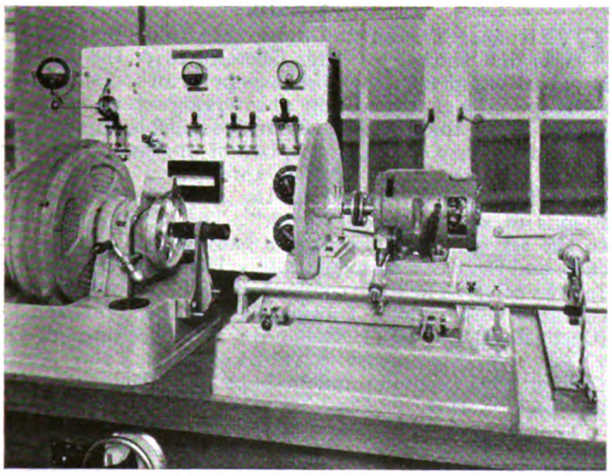
ELECTRICAL NEWS OF THE WEEK IN PICTURES.

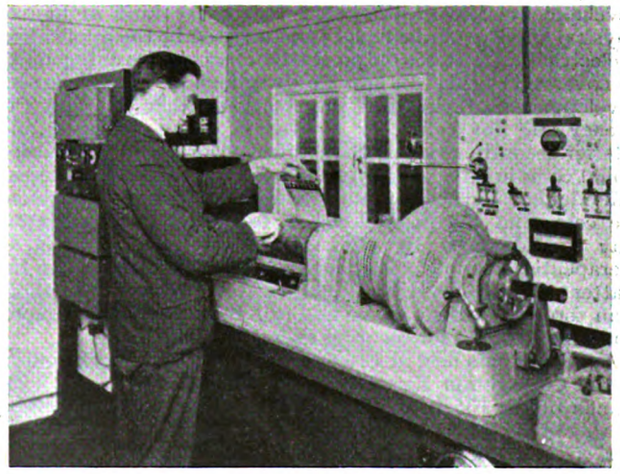


The left-hand picture shows the cable ship "John Pender" in Stonehouse Pool, Plymouth, while on the right is a snapshot taken on board while at sea. The names, left to right are: J. J. Denison-Pender, H. Spencer Saville, A. F. Cole (second officer), W. H. Skinner (chief engineer), F. L. Fisher (chief electrician), L. Hannaford (chief officer). Both these photographs were taken by Captain N. J. C. Lawson.

Alderman Cedric Chivers, who it will be remembered did so much at the last I.M.E.A. Convention to add to the social success of the gathering, died on January 30th, in his 76th year. He was six times Mayor of Bath, the last five years being consecutive. He was a bookbinder, and did much to advance the interests of his trade. See page 168.

The carnival at Nice is now in progress, and our view of some of the illuminations shows on the right the Casino Principal. The street decorations resemble those adopted at Blackpool during the summer.





A demonstration of the facsimile transmission of pictures by wireless was given by Marconi's Wireless Telegraph Co., on Sunday, through the stations at Somerton and Rocky Point, Long Island. Several pictures were received, and one of these is reproduced on page 171. The apparatus required for this system is shown in part in the left hand picture, the motor with stroboscope, motor driven chopper disc and lamp all being portions of the transmitter. The receiving gear is much the same in appearance, though the apparatus of course provides a means of reversing the process. The right-hand picture shows a message being placed in position for transmission. A technical description of the system is given on the page referred to above.

ELECTRICAL WOMEN.

Successful Branch and Other Meetings of the Electrical Association for Women.

THE first fixtures of the New Year proved to be of exceptional interest. London members gathered at the showrooms of Troughton and Young, Ltd., on January 23rd, and had an opportunity of seeing for the first time some of the new ideas in lighting as expressed by Jean Perzel. Mr. A. B. Read, in an interesting lecture dealing with lighting, predicted that in future electric lighting equipment would be designed first, and the rest of the house later, to fit in with the lighting arrangements. Those present included a new member, Lady Balfour of Burleigh, who is herself interested in house decoration.

Mr. F. W. Purse gave his first lecture before the E.A.W. on January 27th, at the E.L.M.A. Lighting Service Bureau, London, and using lantern slides showed the improvements taking place in the West Ham power station. His story of the generation and the distribution of electricity "From the Coal Heap to the Electric Cooker," was much appreciated by the audience.

Further evidence of the work being done by West Ham Electricity Committee for the working woman was given by Coun. Mrs. Gregory, Mrs. Hollis, and Mr. Bridgeman. The chair was taken by Mrs. Llewelyn B. Atkinson.

On January 30th a very enjoyable social was held at 46, Kensington Court, in aid of the funds of the E.T.B.I. As a result Mrs. Llewelyn B. Atkinson and her Social Sub-Committee were able to hand over to the E.T.B.I. the useful sum of five pounds.

Swansea Branch.

Following a preliminary meeting, a well-attended inaugural meeting was held at the Corporation Electricity Showrooms, Swansea, on January 24th, to form a Swansea and District Branch of the Association. The branch is fortunate in having Lady Bryn Edwards as its president. The chairman (Mrs. J. W. Burr) opened the meeting, and introduced Miss C. Haslett. Mr. J. W. Burr, borough electrical engineer, in a short address welcomed the formation of the branch in the district.

Miss C. Haslett, in a most interesting talk, outlined very clearly the aims and objects of the Association. Mrs. Matters-Porter also spoke in support. The first fixture takes the form of a cookery demonstration to be held on February 20th, and lectures and visits are being arranged for the remainder of the session.

On January 30th Mr. Fleming gave an address to the Manchester and Salford Branch of the Association, the title being, "Milestones in the Progress of Electricity." He traced the progress of electrical development from the time of Thales of Miletus (1600 B.C.) down to the present time, noting the influence of its progress afforded by such experimenters as Dr. Gilbert of Colchester (1600 A.D.), Gray, Franklin, Galvani, Volta, Davy, Oersted, Faraday, Bell, Morse, Wheatstone, Clerk Maxwell, etc. As to future developments Mr. Fleming said that every kind of human physical effort could be replaced or assisted by the application of electricity, and it was only a matter of economics or ingenuity to cover this field. In specific directions one might expect developments of electrical illumination either by high frequency, by gas tubes, or by varied colour schemes, and interior decorations would be modified accordingly. Television would come in time. Means of wireless communication between individuals would become much more flexible than was at present the case, and the possibilities of telepathic communication may be advanced by electrical means. In the field of therapeutics one might look for the greatest advance. In the matter of the generation of electrical energy other methods than those at present in use and of a more efficient character would be adopted for securing energy from fuel.

A meeting was held at Bristol on January 15th at the offices of the Corporation Electricity Department, whereat a local branch of the Electrical Association for Women was formed. At this preliminary meeting, the chair was taken by the Hon. Mrs. J. H. Inskip, the chief speaker being Miss C. Haslett. Mr. H. Faraday Proctor, chief engineer and general manager of the Electricity Department, also spoke. The formal business concluded, the meeting took the form of a discussion, wherein suggestions and questions were invited.

A preliminary meeting was held at 21, Eastgate Street, Gloucester, on January 25th, to discuss the formation of a Gloucester and District Branch of the Association, and it was decided to hold an inaugural meeting.

THE EINSTEIN PROCESS.

The Electro-deposition of Metals on Non-Conductors by a New System.

ALTHOUGH the process of electro-plating both conductors and non-conductors of electricity is not new, its application has, however, been limited to certain materials and metals. A system has now been developed by Mr. Wladimar I. Einstein, known as the Einstein electro-chemical process, by means of which it is possible to cover wood, silver, porcelain, paper and metals with a surface of non-corrosive metal of various types. We recently had an opportunity of examining a number of articles so treated, amongst them being bakelite magneto cases and rubber-covered wires. The protection given by this metallising process is governed by the thickness of the plating, and since, we understand, that this can be arranged to suit individual requirements, the following points taken from a report on the process by Mr. C. E. Larard are of interest.

The process is one of the most remarkable developments of a modern invention, in virtue of its industrial, commercial and technical applications. The value of the invention from an engineering point of view resolves itself into the determination of the relative strengths, elasticity, durability, anti-corrosive and non-splitting properties of the metallised material compared with the untreated "base" material round which the metal forms the envelope. In addition there are important factors of protection against weathering (which primarily resolves itself into the relative absorption against moisture or rain), protection against organic pests (insects, etc.) and also immediate protection against fire. With respect to the problem of strength, experiments demonstrated that a very small thickness of the metallised coating was sufficient to increase the crushing or crippling load of certain metallised wood struts by nearly 65%, as compared with the corresponding wood struts when untreated; while for tension tests on a composite wood metallised over, produced an increase in tenacity of over 42%. At the same time, from cross-bending experiments the mean modulus of elasticity was increased by over 50%. Experiments on the absorption of water, in the case of wood metallised over the surface by the process, showed a percentage increase, after a three days' immersion of less than half of 1% by weight. With petrol immersion for the same length of time, the absorption was only 0·16%. Another interesting result came out in determining the ultimate tenacity obtained from a tension test on very light metallised fabric, compared with that from a tension test on the same kind of fabric when untreated—the former being reinforced over one side of the fabric only. The ultimate tensile strength of the metallised fabric per ft. width being 3-4 times that of the untreated material.

WIRELESS NOTES.

Tristan da Cunha now a Link in the Short-Wave Chain.

EVER since Tristan da Cunha, the world's loneliest island, was first settled by Peter Glass, in 1816, the inhabitants have been cut off from the world except for an occasional visit by some specially chartered ship at intervals extending up to two years. When the Rev. A. G. Partridge sailed last month to take up his voluntary duties as chaplain of the island he took with him a standard Marconiphone three-valve short-wave set, which has been presented to the island by the editor and friends of the "African World." The high tension supply to the set will be taken from a bank of 90 large Leclanché cells, and the valve filaments will be heated by special Sterling Invicta cells. The little community will be brought into daily contact with three continents—Europe, through 5SW (Chelmsford) and PCJJ (Holland); America, through 2XAD, 2XAF and other short wave transmitters, and Australia, through 2FC (Sydney) and perhaps 3LO (Melbourne). It is also possible that the Cape Town station may be received.

The MARCONIPHONE CO., LTD., this week placed on the market a Model 37 three-valve receiver for reception on the broadcasting and long-wave bands. The instrument may, with additions, be operated direct from the mains, while its price is likely to be popular.

Wireless telephone communication between Geneva and Buenos Aires was commenced last month, when the Argentine Consul at Geneva had a long conversation with an official of the Foreign Ministry in Argentina. The conversation was held through Nauen wireless station.

COMPANY NEWS.

General Electric Shares still Rising—Henley's and British Insulated also Improve—London Power Co.'s Debenture Issue—St. James and Westminster Co.'s Final Dividends—Anticipated Television and Wireless Pictures Merger—Everlite Statutory Meeting.

GENERAL Electric shares are still buoyant. On Friday of last week they were as high as 78s. 9d., and at 75 the quotation shows a rise of 8s. 9d. as compared with that ruling when our last number went to press. W. T. Henley's Telegraph Works ordinary are 3s. 9d. higher, at 121s. 3d., and British Insulated Cables 1s. 3d. at 92s. 6d. Marconis Wireless at 81s. 3d. are 2s. 6d. to the good. Ever Ready shares have fallen 6s., to 25s. 6d., and Electric Constructions at 23s. 9d. are more than 3s. down. Shropshire Worcester and Staffs Power " B " ordinary shares have risen 9d. to 37s. 6d.

TRUPHONIC RADIO, LTD.—Subscriptions have been invited during the present week for an issue of 425 000 2s. shs. at par.

LONDON POWER CO., LTD.—This co. announced on Wednesday an issue of £3 000 000 5% red. deb. stk. at £99 10s. %.

YORKSHIRE ELECTRIC POWER CO.—Final div. on ord. shs. of 1s. p. sh., less tax, payable Feb. 19, making 8% for year. Same as last year.

ALLGEMEINE ELECTRICITAETS GESELLSCHAFT.—Annual report for 1927-28 announces a div. of 8%. Rev. of co. increased by 30% over that of the preceding year.

ST. JAMES' AND PALL MALL ELECTRIC LIGHT CO., LTD.—Blce. divs. of 8·4d. p. sh. (=3½%) on £1 pref. shs. and 9·949d. p. sh. (makg. standard div. for year 1928) on £1 ord. shs. are recommended.

WESTMINSTER ELECTRIC SUPPLY CORPORATION, LTD.—Final div. of 13·12d. p. sh., less tax, on the ord. sh. cap. in respect of year 1928, payable March 1. This div. completes the co.'s standard div. of 8·8% in accordance with the provisions of the London Electricity (No. 2) Act, 1925. Div. for 1927 same.

METROPOLITAN RAILWAY CO., LTD.—Final pymt. of 2¼% actual, div. for the year 1928, 3½% on ord. cap. of £7 578 667, as compared with fin. of 2%, making 3% for 1927, increase £37 894 in cash distribution. Proposed repeat allocation reserve at £10 000 and to carry fwd. £23 988, as against £26 464 from last year. The £2 640 914 surplus lands stk. to receive fin. div. 2¼% actual, making 3¾%, as against 3⅝% for 1927. Traffics for 1928 £1 864 000, increase over 1927 of £59 000.

LONDON POWER CO.—Output of stations increased from 506 387 796 kWh in 1927 to 593 915 537 in 1928, and demand from 226 811 to 242 700 kW. Notwithstanding increased output, total amt. charged by co. for current decreased from £1 681 942 for 1927 to £1 641 162 for 1928, due to economies in costs of productn. The whole of the generatg. statns. and the 22 000 V transmissn. mains of the constituent cos. have now been transferred to, and are directly operated by, the Power Co. Directors recommend div. at rate of 6% p.a. on sh. cap. of £50 000.

NORWICH ELECTRIC TRAMWAYS CO.—In a statement published to meet requirements of Stock Exchange, it is announced that the authorised capital is £300 000 in £10 shs., and issued cap. £264 000 in fully paid £10 shs. There are £66 000 (including £2 200 owned by co.) 4% mtge. bonds of £100, redeemable at par, but only on purchase of undertaking by Corporation of Norwich. If and when unissued cap. of £36 000 is raised, co. has power to borrow further £12 000 on mtge. Co. works 16½ miles of track, which can be purchased by local authorities on Aug. 6, 1932, or any seventh year thereafter.

TELEVISION AND WIRELESS PICTURES MERGER PROSPECTS.—The " Daily Telegraph " understands that Wireless Pictures, Ltd. (Fultograph system) and the Baird Television Co. may shortly join forces. Conversations have recently taken place between representatives of the respective boards of directors with a view to a merger. It is hoped that under this new arrangement the B.B.C. will continue to transmit Fultograph still pictures, in accordance with the contract signed with Wireless Pictures (1928), Ltd., last year. It is possible that another test of the Baird system will be made shortly, so as to obtain views as to the present value of television with regard to occasional television transmission in the near future from B.B.C. stations. Officials of both companies admit that conversations have taken place, but are unable to make any further statement.

HALL TELEPHONE ACCESSORIES (1928), LTD.—Net pft. for 1928, £30 094. Placed to cap. res., £2 393; to gen. res., £5 000; and to income tax res., £5 800. Additnl. remuneration to directors, £1 070. Fin. div., 6%, less tax, makg. 10%. Fwd., £4 631. During year directors have been able to maintain growing expansn. of business and to obtain satisfactory contracts for thr. mfres. from several Government Departments and telephone cos., including further long-term contract from British Post Office. Directors have decided to purchase business of Thomas Watson and Sons, who are tenants of a portn. of co's. factory, and who are suppliers of telephone and allied equipment to home and foreign Govern-

Digitized by Google

ments. Purchase consideration of £25 950 is payable in cash. Earning capacity of this business is such that directors expect to maintain present rate of distributn. on increased cap. Shareholders will be asked to authorise the creation of a further 70 000 shs., of which it is proposed to issue 56 000 to provide necessary funds for purchase.

Company Meetings.

RECORDAPHONES, LTD.—Mr. C. K. Sugden, presiding at the statutory meeting last week, said the company had taken orders for machines up to its present production capacity, including a considerable number to India. It had how trained a sufficient number of electrical technicians to carry out installations on a considerable scale, and they had organised a sales department to cope with the inquiries and orders they had been receiving. Another development was the successful conclusion of negotiations for the purchase of the Bowyer-Lowe Co., Ltd. The purchase included a modern factory, situated in Letchworth, with plant, machinery, patents, and trade marks. The Bowyer-Lowe Co. had for the past five years paid an annual dividend averaging over 30%, which was probably unique in that type of business. This purchase would enable the company to manufacture in this country in large quantities, at a considerable saving in the cost of production, and at the same time the existing business carried on at the acquired factory would bring immediate additional substantial profits.

EVER READY CO. (GREAT BRITAIN), LTD.—An extraordinary general meeting was held on January 31st, for the purpose of considering a resolution authorising the capitalisation of £74 000 from the undivided profits standing to the credit of the general reserve and its utilisation in paying up 296 000 ordinary shares to be distributed as fully paid among the ordinary shareholders in the proportion of one to every five ordinary shares held. Mr. Magnus Goodfellow, chairman and managing director, presided, and said that the proposed distribution of bonus shares to the ordinary shareholders would give them, calculated conservatively, a fair proportion of the increase in capital value, and earning power. Earlier reference had been made to the acquisition of an interest in Lissen, Ltd. The net profit earned by this business for the year ended September 30th, 1928, amounted to £115 000. From October 1st, 1928, to date its sales showed an increase of 25% over the sales for the corresponding period of the previous year, and this acquisition should have beneficial effects for both companies. The Ever Ready Trust and Finance Co., Ltd., had assisted financially in this transaction, and would consequently participate in the benefits obtained. The capital expenditure during the past year had been considerable, as, in addition to the Lissen Company interest, they had subscribed in cash for the deferred shares in the Trust and Finance Co., and had made considerable expenditure in the enlargement of their factories and plant. The resolution was carried unanimously.

EVERLITE, LTD.—At the statutory meeting on Monday, the Marquis of Winchester (chairman) dealt with the particulars in the statutory report abstracted in our last issue. They had, he said, acquired accommodation in the factory at Waltham Abbey which had been acquired by Metropole Developments from Imperial Chemical Industries. Here was a complete lay-out for assembling the lamps, and the manufacture of the refills was well under way. For the manufacture of the smaller lamps they had made arrangements with a very responsible and one of the largest concerns in the country and their programme in the smaller lamp would be carried out in time to make deliveries of these lamps from April onwards. The domestic lamps, which would be made chiefly out of Metduro, would be available during the coming autumn. Mr. S. R. Mullard, who was elected to the board on January 15th, had resigned his position as a director. On January 25th he (the chairman) received a letter from him in which he complained (*a*) That at demonstrations and interviews prior to his joining the company he had understood that the Metduro material was to be controlled by the Everlite Co.; (*b*) that the present quoted price of Everlite shares, in view of the company's capital, capitalised the undertaking at well over £1 000 000 sterling, and he desired that the board of the company should make a public statement to correct the position of affairs and not allow it to be misled by various rumours and statements which were at present permitted to be in circulation; and (*c*) that within a matter of hours the decisions at conferences were known all over the Stock Exchange. He recommended (1) That a statement be made to the Press which exactly related the present position of the company. (2) that immediate action be taken to preserve the secrecy of decisions made at all meetings; and (3) that the Everlite Co. be granted at least the selling rights of all Metduro articles suitable for the electrical industry. He concluded by stating that he could not see how it would be possible to make good the statement already issued that Everlite lamps would be on sale in April. The Chairman then said the large Birmingham firm of lampmakers who had undertaken to manufacture the lamps, the shareholders would think, knew better what they were doing than Mr. Mullard. There had never been any question of the Metduro forming part of the Everlite Co., and the cash resources of Everlite would be quite insufficient for the purposes of Metduro manufacture. He had informed Mr. Mullard that the market value of the shares was not a matter concerning the directors, but that in view of existing contracts and inquiries received, including inquiries from the Admiralty and the Board of Trade, it did not seem impossible to invisage a revenue compatible with the present market value of the shares. The "rumour" which Mr. Mullard had heard on the Stock Exchange had been public property since the latter part of December. They had secured in the person of Mr. G. Langford a man fully competent to carry out the important duties of factory manager. Mr. Langford had up to the period of his engagement with the company, been in the service of the Radiation Co.

New Companies.

ELECTRIC SUPPLIES (BLOXWICH), LTD.—Cap., £5 000. Manufacturers of electric supplies, apparatus and appliances, etc. Solicitors: Enoch Evans and Sons, Walsall.

CITY ELECTRICAL ENGINEERING CO., LTD. (HULL), LTD.—Cap., £2 500. Electrical, wireless and general engineers, etc. A director: S. T. Cooper, 24, Porter Street, Hull.

ELECTRICAL FACTORS, LTD.—Cap., £500. Factors of and dealers in electrical, wireless and engineering goods and equipment, etc. Secretary: R. Parker, 3, York Street, Manchester.

OVERHEAD, LTD.—Cap., £10 000. Electrical engineers and contractors, manufacturers and suppliers of and dealers in electrical overhead line equipment, etc. Solicitors: Blundell, Baker and Co., 16, Serjeants' Inn, London, E.C.4.

EDISON ACCUMULATORS, LTD.—Cap., £10 000. Electricians, electrical and mechanical engineers and contractors, manufacturers of and dealers in electric storage batteries, etc. Reg. office: 15, Upper George Street, Edgware Road, London, W.1.

VALE-ROYAL ELECTRIC LAMP MANUFACTURING CO., LTD.—Cap., £100. Electrical and wireless engineers, designers and manufacturers of and dealers in lamps, globes, brackets, dynamos, etc. A permanent director: J. Jones, 13, Vale Royal, Islington, London, N.7.

JERUSALEM ELECTRIC AND PUBLIC SERVICE CORPORATION, LTD. (Additional particulars).—Cap., £P500 000. Incorporated in Palestine to acquire concessions (1) for generating, supplying and distributing electrical energy, and (2) for supplying and distributing potable water in Palestine. British address: 66, Queen Street, London, E.C.4, where T. K. Anderson is authorised to accept service of process and notices on behalf of company.

COMMERCIAL INFORMATION.

County Court Judgments.

[NOTE.—*The publication of extracts from the "Registry of County Court Judgments" does not imply inability to pay on the part of the persons named. Many of the judgments may have been settled between the parties or paid. Registered judgments are not necessarily for debt. They may be for actions. But the Registry makes no distinction. Judgments are not returned to the Registry if satisfied in the Court books within 21 days.*]

ALLEN, William, and BECKWITH, Hugh James (trading as EASTERN ELECTRICAL CONSTRUCTIONAL CO.), St. Clements Shipyard, Ipswich, shipbuilders and electrical engineers. £38 17s. 6d. December 17th.

ARNETT, Mr. F. T., 74, Norroy Road, Putney, wireless and electrical engineer. £14 7s. 7d. July 24th.

FAWKE, Mr. E. B., 9, Charles Street, Mansfield Woodhouse, electrical contractor. £14 13s. 5d. December 4th.

GORDON, Leslie Henry (trading as GORDONS), 31, Loughborough Road, West Bridgford wireless dealer. £10 16s. 11d. December 5th.

JOHNSON, Mr. R. A., 943, Romford Road, Manor Park, wireless supplier. £28 2s. 7d. December 14th.

JONES BROS., 193, Fawcett Road, Southsea, electrical engineers. £60 19s. 4d. December 11th.

JONES, Mr. I., Church Street, Merthyr Tydfil, electrical and wireless dealer. £16 8s. October 22nd.

JONES, William W., 45, Milnrow Road, Rochdale, electrical contractor. £16 2s. December 21st.

LEWIS, Mr. E. J., 15, Park Avenue, Bideford, wireless dealer £15 19s. 11d. December 8th.

PARKER BROS., 135, School Road, Moseley, Birmingham, electrical contractors. £10 4s. December 11th.

PEARCE, Mr. S. J., 2, Church Road, Stanmore, electrical engineer. £17 15s. 2d. November 9th.

PREMIER ELECTRICAL STORES, 184, Railway Approach, W., electrician. £21 2s. 9d. July 24th.

ROWNTREE, E., and Co., 86, Manchester Road, Limehouse, electrical engineers. £18 0s. 7d. July 24th.

TEASDALE, Southern, South Road, Chopwell (trading as TEASDALE BROTHERS), wireless dealer. £11 12s. 7d. December 12th.

Bill of Sale.

BEARMAN, Hyman Joseph, 48, Mayfield Road, Chadwell Heath, wireless engineer and retailer. Dated January 24th, filed January 26th. £40.

Deeds of Arrangement.

EAVES, Reginald Ernest Allen, 56, Furzehill Road, Mutley, and CAMERON, Harold Douglas, 20, Furzehill Road, Mutley, Plymouth, and trading at Manor Works, Emma Place, East Stonehouse, as EMPRESS RADIO AND ELECTRICAL CO. and at 105, Union Street, East Stonehouse, 14K, The Avenue, Bridgwater, 2, The Bridge, Taunton, and 10, Bank Street, Newquay, as WESTMINSTER RADIO, dealers in wireless apparatus and electrical engineers. Dated January 29th, filed February 4th. Trustee, P. White, 6, Sussex Terrace, Plymouth, I.A. Secured creditors, £1 200; liabilities unsecured, £5 103; assets, less secured claims, £1 437.

MACLEAN, Hector, 79A, High Street and 43, Suffolk Street, Stockton-on-Tees, wireless dealer. Dated January 30, filed February 4th. Trustee, H. T. Sherwood, 115, High Street, Stockton-on-Tees, accountant. Liabilities unsecured, £414; assets, less secured claims, £113.

Mortgages.

[NOTE.—*The Companies Act of 1908 provides that every Mortgage or Charge, as described therein, shall be registered within 21 days after its creation, otherwise it shall be void against the liquidator and any creditor. The Act also provides that every Company shall, in making its annual Summary under the Companies Act, specify the total amount of debt due from the Company in respect of all Mortgages or Charges. The following Mortgages and Charges have been so registered. In each case the total debt prior to the present creation, as specified in the last available Annual Summary, is also given—marked with an *—allowed by the date of the Summary, but such total may have been reduced.*]

COLSTON ELECTRICAL CO., LTD., Bristol.—Registered January 10th. £3 000 debenture, to W. J. F. Dutson, Grove Lodge, Parry's Lane, Stoke Bishop, engineer; general charge. *Nil. September 20th, 1928.

GRAY (J. W.) AND SON, LTD., London, E.C., electrical engineers —Registered January 2nd, £1 500 debentures; general charge.

NANTWICH ELECTRIC, LTD.—Registered December 24th, £400 charge, to Sandbach Permanent Benefit Building Society; charged on 5, Hospital Street, Nantwich.

SAMDON WIRELESS CO., LTD., Manchester.—Registered December 29th, £150 debenture, to M. Morris Woodcroft, Broom Lane, Higher Broughton, waterproof manufacturer; general charge (subject to prior debenture).

SHEPHERDSON, (E. and W.), LTD., Morecambe, electrical engineers.—Registered January 15th, £350 debenture, to W. Shepherdson, Sunning Hill, Longlands Lane, Morecambe, electrical engineer.; general charge.

WHITE (J. C.) AND CO., LTD., Manchester, electricians.—Registered January 10th, debenture, to Bank; general charge.

YELDON (G.), LTD., Portsmouth, radio engineers. Registered January 23rd, £500 1st debenture and £2 500 1st debenture (subject to £500 debenture), to E. H. Hawkins, 4, Charterhouse Square, E.C., I.A.; general charge.

Satisfactions.

EDISON ACCUMULATORS, LTD., London, W.—Satisfaction registered December 31st, £18 000, registered May 29th, 1925.

MARCONI'S WIRELESS TELEGRAPH CO., LTD., London, W.C.—Satisfaction registered January 7th, £1 206 786, part of amount registered November 23rd, 1922.

METROPOLITAN ELECTRIC SUPPLY CO., LTD., London, W.—Satisfaction registered December 20th, £250,000, registered May 31st, 1917.

RADIO SERVICE (LONDON), LTD.—Satisfaction registered January 2nd, £125, part of amount registered July 26th, 1927.

REASON MANUFACTURING CO., LTD., Brighton, electrical manufacturers. Satisfaction registered January 26th, £25 000, balance of amount outstanding July 1st, 1908.

London Gazette, etc.

Companies Winding-up.

COUNTY ELECTRICAL AND WIRELESS STORES, LTD., Garrick Yard, St. Martin's Lane, London. Winding-up Order, January 28th.

NEUTRON, LTD., Sentinel House, Southampton Row, London. Second and final dividend, 4½d. per £, payable February 14th, at the office of the liquidator, 40–43, Norfolk Street, W.C.2.

Bankruptcy Information.

HUDSON, Fred James, 63, Thurnscoe Road, Bradford, electrical engineer. First meeting, February 8th, 11 a.m., Official Receiver's Office, 12, Duke Street, Bradford. Public examination, March 8th, 10 a.m., County Court, Manor Row, Bradford.

JENKINS, Edward Charles, 124, Cheltenham Road, Bristol, wireless dealer. Receiving order, January 26th. Debtor's petition.

Notice of Dividend.

NICHOLS, John Tucker, 4, Glebe Road, Kingsland Road, Dalston, London, wireless parts merchant. First and final dividend, 5s. 7½d. per £, payable, February 19th, Philip M. Mordant, 115–117, Cannon Street, E.C.4.

Partnership Dissolved.

DOWN AND ABBOTT (Albert DOWN and James William ABBOTT), electrical engineers and contractors, at Barnard Castle, Durham, as from December 30th, 1928. Debts received and paid by J. W. Abbott, who will continue the business under the style or firm of ELECTRICAL ENGINEERING AND SUPPLY CO.

Bankruptcy Proceedings.

ANGERS, Arthur, trading alone as A. ANGERS AND CO., 19, Bristol Road, Wavertree, Liverpool, electrical engineer. Liabilities of £3 190 against assets of £112 were disclosed in the statement of affairs presented at the adjourned public examination of this debtor, held recently at the Court House, Government Buildings, Victoria Street, Liverpool. In reply to questions, the debtor stated that he had suffered with neurasthenia since the war, which had interfered greatly with his business. He admitted that he had been aware of his position for some years, and had been in the hands of money lenders since 1924. The strike in 1926 and losses on contracts also contributed to his failure. He stated that for overdraft purposes he submitted balance-sheets to his bank which did not reveal loans and private debts, but the overdraft was guaranteed by his brother. The debtor added that he had had very heavy expenses in connection with the sale of a patent, his share of which he sold for £650, the money going into the business. The examination was closed.

SHEFFIELD ILLUMINATION SOCIETY.

A good company of members and friends of the Sheffield Illumination Society attended the fourth annual social evening, held at Stephenson's Restaurant, Sheffield, January 28th. The chair was occupied by Counc. R. H. Minshall (chairman of the Corporation Lighting Committee) and amongst those present were Counc. and Mrs. A. Ashmore; Counc. A. Smith and Mr. and Mrs. J. F. Colquhoun. The chairman in his opening remarks referred to the progress of the society, the increased membership, which is now 103, and the beneficial effects of social gatherings. The first portion of the entertainment consisted of musical items, and the remainder of the evening was devoted to a whist drive.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

290 643 Associated Telephone and Telegraph Co. Remote control of electric power sub-stations. (11/10/26.)
292 064 Maschinenfabrik Oerlikon. Transformer for polyphase rectifiers. (11/6/27.)
292 625 International General Electric Co., Inc. Electric switching-apparatus. (23/6/27.)
293 827 General Electric Co., Ltd. Electric incandescent lamps. (13/7/27.)
303 727 G. Pate and J. R. Laird, Insulating-blocks for the heating-elements of electric heaters and the like. (6/7/28.)
293 803 Marconi's Wireless Telegraph Co., Ltd. High-frequency signalling systems. (12/7/27.)
294 989 Telefunken Ges. fur Drahtlose Telegraphie. Coupling-devices suitable for use with rotatable frame aerials and the like. (3/8/27.)
295 280 G. Fischer. Current-collectors for electric vehicles. (8/8/27.)
297 466 International General Electric Co., Inc. Methods of securing fine wire cables or ropes to massive metal parts. (23/9/27.)
274 083 International General Electric Co., Inc. Excess current safety devices for electric circuits. (7/7/26.)
303 771 J. L. Baird and Television, Ltd. Reproduction of pictures, views, scenes, images, and the like. (5/7/27.)
303 574 D. F. Campbell and Electric Furnace Co., Ltd. Manufacture of linings of furnaces. (16/4/28.)
277 005 M. Zack. Electric arc welding. (31/8/26.)
303 814 British Hard Rubber Co., Ltd., and P. E. Wells. Ebonite and the treatment thereof, more particularly ebonite sheets, such as those employed as panels for wireless apparatus. (6/9/27.)
303 779 A. Reyrolle and Co., Ltd., and T. R. Warren. Electric synchronising apparatus. (5/10/27.)
288 594 Bastian-Morley Co. Heating apparatus. (13/4/27.)
278 730 Associated Telephone and Telegraph Co. Automatic train control systems. (6/10/26.)
303 767 E. Y. Robinson and Metropolitan-Vickers Electrical Co., Ltd. Vacuum electric discharge tube devices. (8/10/27.)
303 848 D. S. S. Steuart. Hand set telephones and the like. (11/10/27.)
282 351 Hall Telephone Accessories, Ltd. Coin collecting apparatus for telephone services. (14/12/26.)
278 763 Associated Telephone and Telegraph Co. Telephone systems. (11/10/26).
303 920 S. Baxter. Electric motors. (12/10/27.)
303 921 Automatic Telephone Manufacturing Co., Ltd., and J. E. Ostline. Key-operated impulse-sending devices. (12/10/27.)
303 925 Standard Telephones and Cables, Ltd (Western Electric Co., Inc.) Wire drawing machines. (14/10/27.)
303 928 W. E. Beatty (Bell Telephone Laboratories, Inc.). Methods of treating magnetic materials. (14/10/27.)
303 929 Automatic Telephone Manufacturing Co., Ltd., and J. E. Ostline. Telephone systems. (14/10/27.)
303 930 Automatic Telephone Manufacturing Co., Ltd., and A. E. Flenley. Automatic or semi-automatic telephone systems. (14/10/27.)
303 919 W. E. Beatty (Bell Telephone Laboratories, Inc.). Submarine cables. (17/10/27.)

Applications for Patents.

December 27th.

38 195 British Thomson-Houston Co., Ltd. Electric lamps. (28/12/27, U.S.
38 181 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Advertising, etc., devices.
38 182 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Means for transmitting electric impulses.
38 183 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Control of electric circuits by light sensitive devices.
38 167 F. W. V. Fitzgerald. Electrolyte for secondary batteries.
38 137 E. A. Hailwood. Suspension fittings for illuminating ware.
38 139 B. W. and G. B. Hanley. Electric switches.
38 201 J. Y. Johnson (I.G. Farbenindustrie A.G.). Apparatus for production of electrical oscillations.
38 174 H. Leben and A. Reyrolle and Co., Ltd. Electric protective relays.
38 189 Lodge-Cottrell, Ltd. (Metallges Akt.-Ges.). Electrodes for precipitation of suspended particles from gases.
38 193 F. C. Malin and Marlo Refrigerating Co., Ltd. Fluid pressure operated electric switch.
38 196 L. M. Myers and Universal and General Radio Co., Ltd. Television apparatus.
38 209 H. Onishi. Telephone systems. (28/12/27, Japan.)
38 141 H. C. Sanders and Santon, Ltd. Electric liquid heaters.
38 236 L. Smeets. Electric safety device.
38 213 B. A. Spaull. Electric plug fittings, etc.
38 171 C. C. Turner and Young, Osmond and Young, Ltd. Resistance units, etc.

December 28th.

38 038 F. S. Adkins and R. W. Crabtree and Sons, Ltd. Dynamo-electric machines.
38 347 B. Baxter. Electric motors for gramophones, etc.
38 344 K. Brensing and U. Gottesmann. Producing uniform metal deposits electrolytically.
38 299 British Thomson-Houston Co., Ltd. Pressure measuring instruments. (28/12/27, U.S.)
38 245 W. Brown and T. Coughtrie. Short circuiting devices for electric couplings, etc.
38 264 English Electric Co., Ltd., and C. T. Scarf. Cam operated electric switches.
38 286 G. Ferrobino. Voltaic cells.
38 289 A. Gerhold. Electric switches.
38 337 F. C. Grund and Three Star Accumulators, Ltd. Carriers for galvanic cells, etc.
38 239 T. Hough and J. G. Threlkeld. Condenser microphones.
38 296 L. Mellersh-Jackson (Sunlight Electrical Manufacturing Co.). Dynamo-electric machines.
38 269 A. Jasicek and F. Polnauer. Electric shuttle-operating devices for looms. (28/12/27, Austria.)
38 247 A. C. Johnson. Hygienic device for telephone receivers.
38 312 Micafil Akt.-Ges. Manufacture of insulating materials. (28/12/27, Germany.)
38 308 Telefunken Ges. fur Drahtlose Telegraphie. Circuit arrangements for valve transmitters. (29/12/27, Germany.)
38 240 C. H. P. Wheatley. Direction finding, etc., apparatus.

December 29th.

38 412 F. C. Blackwell and Co., Ltd., and F. Firth. Electric conduit fittings.
38 392 British Electric Transformer Co., Ltd., and J. L. Thompson. Radiators for transformer tanks, etc.
38 382 Igranic Electric Co., Ltd., and A. H. Mackley. Gramophone pick-ups.
38 396 Landis and Gyr Soc. Anon. Electric switchgear. (1/1/28, Switzerland.)
38 362 R. Siddall and Siddall and Hilton, Ltd. Seats for tramcars, etc.
38 428 Soc. des Etablissements Industrielle de E. C. et de A. Grammont. Cathode from electron discharge device. (31/12/27, France.)
38 417 Standard Telephones and Cables, Ltd. Circuit arrangements comprising piezo crystals. (29/12/27, U.S.)
38 353 O. Sweeny. Electric reading lamp.
38 410 Telefunken Ges. fur Drahtlose Telegraphie. Circuit arrangements for valve transmitters. (31/12/27, Germany.)
38 390 L. Thurm. Television, etc., receiving apparatus. (30/12/27, France.)

December 31st.

38 466 H. Bakofsky and F. E. Raike. Fire alarms.
38 561 British Thomson-Houston Co., Ltd. Thermionic cathodes. (31/12/27, U.S.)
38 562 British Thomson-Houston Co., Ltd. Amplifying systems. (31/12/27, France.)
38 563 British Thomson-Houston Co., Ltd. Electric switches.
38 509 S. G. Brown. Sound reproducing instruments, etc.
38 539, 38 540 Central Mining and Investment Corporation, Ltd., and L. B. Woodworth. Electric junction boxes, etc. (22/6/28, Union of South Africa.)
38 469 B. S. Cohen. Telephone systems.
38 479 J. Dieux. Thermionic amplifiers, etc., operating on electric mains. (6/3/28, France.)
38 480 J. Dieux. Electromagnetic pick-ups.
38 481 Dubilier Condenser Co. (1925), Ltd. Valve for radio signalling, etc. (31/12/27, Germany.)
38 587 Electrical Research Products, Inc. Electric signalling conductors. (29/6/28, U.S.)
38 588 Electrical Research Products, Inc. Telegraph systems. (9/3/28, U.S.)
38 529 Felten and Guilleaume Carlswerk A.G. Electric conductors. (29/2/28, Germany.)
38 532 V. C. From, A. W. Larsky, and C. D. Rowley. Illuminated signs, etc.
38 470 General Electric Co., Ltd., M. Kahn, and R. Orsettich. Electric supply systems.
38 545 C. W. Hansel. Devices for making and breaking electric circuits.
38 546 C. W. Hansel. Apparatus for measurement of electric currents.
38 436 A. A. Hood. Thermoinic valves, etc.
38 434 A. Katsch and Loewe Audion Ges. Vacuum discharge device. (31/12/27, Germany.)
38 439 H. M. Price. Electrical distribution boxes.

COMING EVENTS.

Friday, February 8th.

Engineering and Scientific Club.—Paper by Mr. L. Southerns on "Sound-Waves and Musical Tones."

Institution of Electrical Engineers (London Students' Section).—Institution, Savoy Place, Victoria Embankment, London. Paper by Mr. H. H. Taylour on "Electric Welding." 6.15 *p.m.*

Institution of Electrical Engineers (South Midland Students' Section).—Birmingham University, Edmund Street. Paper by Mr. P. E. Lyddon on "Hydro-Electric Stations in Switzerland." 7.15 *p.m.*

Monday, February 11th.

Electrical Contractors' Association (Hastings Sub-Branch).—Ordinary meeting.

Electrical Contractors' Association (Liverpool Branch).—Ordinary meeting. 7 *p.m.*

Institution of Electrical Engineers (North-Eastern Centre).—Armstrong College, Newcastle-on-Tyne. Paper by Messrs. Johnstone Wright and C. W. Marshall on "The Construction of the Grid Transmission System in Great Britain." 7 *p.m.*

Tuesday, February 12th.

Electrical Contractors' Association (Swansea Branch).—Ordinary meeting.

Electrical Contractors' Association (Leicester Branch).—Corridor Chambers. Ordinary meeting. 2.30 *p.m.*

School of Engineering and Navigation.—High Street, Poplar. Lecture IV (Course of five lectures), by Mr. H. Brazil on "Electrical Sub-stations." 7 *p.m.*

Electrical Association for Women.—E.L.M.A. Lighting Service Bureau, 15, Savoy Street, Strand, London. Lantern lecture by Mr. H. de A. Donisthorpe on "Radio Progress and Its Connection with the Thermionic Valve." 7 *p.m.*

Institution of Electrical Engineers (North Midland Centre).—Hotel Metropole, King Street, Leeds. Paper by Messrs. E. B. Wedmore, W. B. Whitney and C. E. R. Bruce on "An Introduction to Researches on Circuit Breaking." (Electrical Research Association Report.) 7 *p.m.*

Electrical Power Engineers' Association.—Junior Institution of Engineers, 39, Victoria Street, Westminster. Paper by Mr. H. Gough on "The D.C. Pressure Testing of E.H.T. Cables, with Notes on Modern Systems of Fault Finding." 7.15 *p.m.*

Institution of Electrical Engineers (Scottish Centre).—Royal Technical College, Glasgow. Paper by Mr. W. B. Woodhouse on "Overhead Electric Lines." (To be presented by Mr. W. C. Barry, and illustrated by a cinematograph film.) 7.30 *p.m.*

Wednesday, February 13th.

Electrical Contractors' Association (Eastbourne Sub-Branch).—5, South Street. Ordinary meeting.

Rugby Engineering Society.—Benn Buildings. Paper by Messrs. C. H. Holbeach and Dr. Simey on "Application of Electricity in Curing Disease."

Polytechnic.—School of Electrical Engineering, 307, Regent Street, London. Lecture III (Course of eight lectures), by Mr. E. S. Ritter on "Picture Telegraphy." 5 *p.m.*

Electrical Contractors' Association (Sheffield Branch).—Ordinary meeting. 5.30 *p.m.*

Institution of Civil Engineers.—Great George Street, Westminster. Informal meeting. Paper by Messrs. H. P. Gaze and W. H. Patchell on "Merits of Alternative Methods of Driving Auxiliaries in Modern Power Stations." 6 *p.m.*

Thursday, February 14th.

Electrical Contractors' Association (Nottingham Branch).—Ordinary meeting.

Institution of Electrical Engineers.—Institution, Savoy Place, Victoria Embankment, London. Paper by Mr. W. Cruickshank on "Voice-Frequency Telegraphs." 6 *p.m.*

Electrical Wholesalers' Federation.—Savoy Hotel, Strand, London. Annual Dinner. 6.30 for 7 *p.m.*

Institution of Electrical Engineers (Dundee Sub-Centre).—University College. Paper by Mr. W. B. Woodhouse on "Overhead Electric Lines." (To be presented by Mr. W. C. Barry, and illustrated by a cinematograph film.) 7.30 *p.m.*

Friday, February 15th

Institution of Mechanical Engineers.—Storey's Gate, Westminster. Annual general meeting. Paper by Mr. H. J. Ward on "Refrigeration on Ship-board." 6 *p.m.*

Electrical Development Association.—Royal Society of Arts, John Street Adelphi, London. Conference on "Organising for Increased Sales—Spring Cleaning Season, 1929." Speaker, Mr. H. W. Roberts. 7.30 *p.m.*

Saturday, February 16th.

Association of Mining Electrical Engineers (Western Sub-Branch).—60, Wind Street, Swansea. Paper on "Fault Localisation," by Mr. S. T. Richards.

The British Industries Fair.

WITH the opening of both the Birmingham and London sections of the British Industries Fair on Monday, the electrical industry will once again provide one of the largest, and certainly most interesting, collections of apparatus. As usual, the domestic appliances and industrial exhibits will be housed at Castle Bromwich, while at the White City in London, the industry will be largely represented by radio and high-frequency equipment of domestic types. Though the London section is of considerable importance, its interest from the electrical point of view is somewhat eclipsed by the Birmingham section, on account of the fact that the bulk of the heavy electrical equipment is included at the latter place, to say nothing of transmission lines and switchgear for every purpose. As a result, we are becoming more and more inclined to look upon the Birmingham section of the Fair as exclusively electrical; and since, in fact, it is nearly 25% of the show, such a regard is not without excuse. The extent to which the electrical industry has supported this year's Fair will be gathered from the list of exhibitors given elsewhere in this issue. This list is made up of firms whose stands contain items of interest to the industry as a whole, and though some of the stands do not fall within that portion of the Fair known as the Electrical Section, they are nevertheless still worthy of attention. In order that our guide and reference to the Fair at Castle Bromwich may be of even greater value to visitors than it has been in previous years, we include in this issue, a detailed plan of the Electrical Section, indicating not only the stand numbers, but the names of the exhibitors showing at those numbers. This plan, used by itself, will show at a glance whether a required exhibitor is within the Electrical Section, and if he is not, the list will indicate the stand number outside that section. We also include this week a brief review of some of the domestic equipment to be seen, and though, for obvious reasons, it is not possible to cover the whole of the exhibits in the space available, those not reviewed this week will be dealt with in a later issue, together with those of industrial and electrical interest. Evidence of the importance of the domestic side of the Fair is furnished by the arrangements which have been made by the E.D.A. this year for a conference upon the selling of electricity and electrical apparatus on February 22nd, a conference which we feel sure will be well attended and one which we heartily support. In expressing the hope that all readers who can make time to visit Castle Bromwich will do so during the coming fortnight we would also commend to their attention the invitation, which Mr. T. R. MARTIN makes in our correspondence pages, to consider during their visit the question of this annual Fair in all its bearings, and formulate plans and suggestions in regard to its future.

British Overseas Trade.

THE Board of Trade Returns for the month of January indicate to some extent a revival of British industry, showing as they do a big increase in the importation of raw materials, with an improvement in exports of £6 485 278 when compared with the previous month. The total imports for January amounted to £116 064 145, representing an increase on December, 1928, of £14 612 255, but, since this increase included £8 074 390 for raw materials, the figures may be taken as an expression of the confidence of manufacturers, since most of these materials will be made up and shipped abroad as manufactures. The coal position, so far as exports are concerned, showed a decline during January, 1929, of £805 120 when compared with the same month of 1927, and an improvemnt of £401 580e on the figure for January, 1928. The proportion of increase and quantity however, shows that whereas in January, 1927, 4 092 879 tons were shipped, at a value of £4 290 806, during January of this year 4 372 631 tons were shipped, at a value amounting to only £3 475 676. Similarly, comparing January, 1929, figures with those for the same month last year, shows us that, though 567 931 tons more were shipped abroad last month, the increase in value was only £401 580. Contributing to the total increase in exported manufactured goods during January were electrical equipment and apparatus which, as will be gathered from the detailed figures published elsewhere in this issue, amounted to £1 614 301 as against £1 546 691 for January, 1928, the increase being £67 610. Imports of electrical goods during January of this year amounted to £598 095, or £25 341 more than for the same month last year, thus giving a favourable balance of exports over imports of

Digitized by Google

£1 016 206, an increase of £42 259 on the position at the same time last year. The increase in imported goods is largely due to telegraph and telephone instruments, various wires and cables, excluding submarine cables. On the export side improvement is shown in such items as motors and generators other than railway and tramway motors, rubber and other insulated wires and cables, glow lamps, and so on; submarine cables, on the other hand, declined by £11 464. These, the first returns for the current year, are decidedly hopeful, and with the British Industries Fair to assist us there is no reason why the months yet to come should not be equally hopeful. Though the electrical figures for January may be regarded as satisfactory, it should at the same time be remembered that many overseas electrical buyers withhold their purchases until after the British Industries Fair, and though our electrical exports for January amounted to £1 614 301, much additional trade anticipated in January has yet to come.

"Tote" Developments.

WE have every reason to believe that the early indications given in these columns of the big new electrical field presented by the decision of the Racecourse Betting Control Board to instal Totalisators on British racecourses had been vigorously followed up by certain electrical firms in this country, and that there will be keen competition in tendering for the necessary equipment, in respect of which bids have this week been invited. We hope in an early issue to give more technical details of systems designed to meet the complicated requirements of the Board.

Craigweil House.

IN connection with the King's journey last week to Craigweil House, Bognor, it is interesting to note that the BOGNOR GAS AND ELECTRICITY CO. has laid a special main in connection with an auxiliary supply thereto, over 700 yards of cable having been placed and jointed in three days. This supply, we understand, is principally for cookers, of which three large models have been installed, thus leaving the existing plant of Sir ARTHUR DU CROS, to deal with the lighting load. In addition, it is thought that several heating circuits on the original installation will have to be transferred to the company's supply. We understand from Mr. H. A. HARDING, the electrical engineer of the company, that the offers of manufacturers to loan plant, cookers, and electric fires for use in Craigweil House have been innumerable, and while present requirements are more than satisfied, we feel sure that future needs will meet with an equally wholehearted response.

The Profession Honoured.

COL. EDGCUMBE fittingly expressed the feelings of the electrical engineering profession when he described the PRINCE OF WALES'S acceptance of the honorary membership of the Institution of Electrical Engineers as an honour not only to the Institution but to the whole electrical profession. The interest of the Royal Family in general, and of the PRINCE OF WALES in particular, has in the past been of considerable service to a developing industry, and the outward and visible sign of this interest is a logical sequel. As an electro-farmer the Prince has already a more than nodding acquaintance with some of the practical applications of electricity, and it may not be unreasonable to hope that his experiences on the well-equipped electric farm at Lenton will in due course be set down for the benefit of fellow members of the Institution.

Organising for Increased Sales.

HAVING dealt rather severely, but not, we think, unjustly, with the "angle" of some of the speaking at recent E.D.A. Salesmanship Conferences, we look hopefully to the meeting which is to be held at the Royal Society of Arts this (Friday) evening to restore the right perspective. The subject for discussion is "Organising for Increased Sales—Spring Cleaning Season, 1929," and as the meeting is being opened by Mr. H. W. ROBERTS, one of the outstanding figures in electrical sales management, with Mr. F. W. PURSE in the chair, an interesting and stimulating evening may confidently be anticipated. If—as we persist in believing—contractors and commercial engineers in the London area prefer the planning of sales organisations to the exchange of reminiscences at a *sales* conference, seats will be at a premium and arrival before the advertised time of the meeting a desirable precaution.

Catalogue Economy.

So much money is spent each year by engineering firms in the production of catalogues, and so much of this expenditure is wasted because the catalogues get into the hands of people who are not particularly interested, that any scheme for reducing the proportion of unprofitable copies is of interest, as tending to free money for expenditure on other publicity activities. A promising essay has been made in this direction by a firm of chain drive manufacturers. In a recent catalogue they inserted a folded wrapper addressed to themselves, bearing, on an inside fold, the following note:—"This is an expensive publication. If you have no further use for it, please be good enough to return it to us in this wrapper, and we will be pleased to refund the postage." We have no knowledge of the extent to which this invitation has been complied with, but the idea seems to merit a trial.

Still Life.

IF further evidence were needed of the undoubted fact that electricity has emerged from the infant stage, we would wax enthusiastic over the discovery that a Continental artist has included in one of his still-life pictures a representation of an electric lamp. Its precise relation—practical or spiritual—to the pots of cacti and the sheet of postage stamps which share the surface of a table top in a window, is not obvious. It may be that the layman's description of the lamp as an electric bulb was considered sufficient reason for this unusual conjunction with specimens of plant life.

Money for Research.

IT is, we think, a reflection on an otherwise progressive industry, that the operations of the organisations concerned with co-operative publicity and co-operative research are hampered by meagre financial support from those who stand to gain most from their activities. We, therefore, commend to all concerned the plea made by Mr. C. P. SPARKS, in a speech reported on a later page of this issue, for a larger contribution, particularly from the electricity supply industry, to the funds of the British Electrical and Allied Industries Research Association. While there can be few who do not pay at least lip-service to the value of the work already achieved by this Association, we fear that neither the direction nor the extent of these services is generally appreciated. It should, for instance, be understood that co-operative research need not, and does not, interfere with, or overlap the independent researches carried out by a growing number of individual firms. In fact, observation has shown that the general trend of co-operative research has been to encourage independent private research. It is obvious that certain fundamental researches which would usually be undertaken contemporaneously by private research organisations, all searching in an unco-ordinated manner for the same thing, are better and more economically undertaken by a central body like the B.E.A.I.R.A. Then, looking at the financial side, it may confidently be asserted that co-operative research on electrical problems has justified itself up to the hilt. In round figures the Association has spent £160 000 during the last eight years. In return, it is already able to show an annual saving to the industry of nearly £1 000 000 as the result of seven specific researches. For the next five years, at least, an annual research expenditure of £50 000—twice the present figure—is desired. We hope the increased contribution will be forthcoming, for, as Col. EDGCUMBE has said, money spent in this direction is a really safe investment, and is bound to come back.

EXPERIMENTAL METHODS FOR DETERMINING THE DISTRIBUTION OF ELECTRIC AND MAGNETIC FIELDS.

Problems Demanding New Methods of Calculation—Scope of Mathematical Methods—The Graphical Process—Use of the Magnetic Potentiometer—The "Electrostatic Probe."

By B. HAGUE, D.Sc., Ph.D., A.M.I.E.E. (Lecturer in Electrical Engineering, Glasgow University).

THERE has been, in recent years, a continually increasing interest among designers in the accurate determination of the distribution of electric and magnetic fields met with in engineering practice. The enormous development of modern electrical engineering has called into being a large number of problems to which the older methods used for the calculation of electric stresses or for the estimation of magnetic permeance provide, at best, inadequate solutions. For example, the high voltages used in modern electrical transmission plant have rendered necessary much more refined ways of dealing with the problems of insulation design in generators, transformers, transmission line insulators and cables than have hitherto been required. Again, in the theory and design of electromagnetic machinery the importance of an accurate knowledge of the magnetic flux distribution, especially of the leakage field in large modern generators and transformers, cannot be over-estimated when it is remembered that the solution of such practical problems as the economical calculation of excitation, the predetermination of reactance and regulation, and the computation of short-circuit forces depend upon such knowledge. It is not difficult to appreciate, therefore, the importance of an exact investigation of the electric and magnetic fields in order that more precise methods of design, such as modern practice renders necessary, may be obtained. The results of such an investigation are rendered requisite, not only in design, but also in the theory of the internal interactions in electrical machinery, wherein many difficult and complex problems still await solution.

Satisfying Laplace's Equation.

Confining attention for the moment to the electric field of a system of charged conductors maintained at specified potentials, it is well known that the qualitative and quantitative properties of such a field can be completely expressed if we are able to map out the equipotential surfaces and the lines of force (or better, the tubes of electric induction) which characterise the field. In other words, we must seek for (i) an electric potential function which will satisfy the potential conditions imposed at the boundary conductors, and which will express the distribution of potential throughout the field in such a way that Laplace's equation is satisfied: (ii) an electric flux or stream function which characterises the lines of force (these necessarily cutting orthogonally through the equipotential surfaces, starting and finishing on charged conductors) and which also satisfies Laplace's equation. The satisfaction of Laplace's equation by the potential and flux functions, which in three-dimensional cartesian co-ordinates may be written

$$\frac{\delta^2 f}{\delta x^2}+\frac{\delta^2 f}{\delta y^2}+\frac{\delta^2 f}{\delta z^2}=0,$$

where f is the potential or flux function as desired, expresses respectively the physical conditions, (i) that tubes of electric induction are continuous, that, is, the electric flux into a small element of volume is equal to the flux issuing therefrom; (ii) that the line integral of the electric force is zero round any closed path, in particular when of infinitesimal size. Such a field is a non-curl or scalar potential field, and in most problems found in engineering practice exists in a single dielectric medium, though there are many important instances where at least two media may be involved—e.g., the electric field in the porcelain of an insulator and in the surrounding air.

If we now briefly examine the magnetic field of an electrical machine, this field exists partly in regions of permeable iron and partly in regions of air; it is, moreover, produced by the action of currents flowing in conductors which are accommodated within or upon the iron members, and is consequently a curl or vector potential field. In the strictest mathematical and physical sense, such fields are not amenable to treatment by processes derived for use in dealing with non-curl or scalar potential fields, though by the adoption of some conventions and approximations we may make valuable use of those processes. We observe in the first place that the iron parts have usually a high permeability, so that the magnetic tubes of induction cross the interfaces between the iron and air regions in such a way that on the air side they are practically perpendicular to those surfaces; these surfaces will exhibit apparent north or south magnetisation as the case may be. Practical interest is largely centred in the air-space field. If, therefore, the region of the air-space field under consideration is such that it is not under the immediate local influence of the magnetising coils (as would be the case in the field under a pole, but not in the cases of the interpolar field issuing from a pole core or of the field inside a slot) we may picture the field as if it were set up in the air by a distribution of "magnetic potential" upon the bounding iron surfaces. With this idea in mind, it is possible to treat certain magnetic fields as if they were scalar potential fields—i.e., to solve them by the processes used for electrostatic problems.

Serious Limitations.

Unfortunately when we come to seek for the necessary solutions serious limitations are immediately imposed. All our problems are essentially three-dimensional and of such complexity as to be quite outside the range of mathematical analysis; moreover, of the available experimental, methods few are adaptable to three-dimensional problems and even those few present considerable difficulties. We are compelled, therefore, to divide up our three-dimensional fields into portions, each of which may be regarded with sufficient practical approximation as two-dimensional. In somewhat greater detail, we find a portion of our complex field wherein there is one direction in which the electric (or magnetic) force is practically zero; take this direction as the axis of z for the portion concerned and draw the plane of x, y, normal thereto. The form of Laplace's equation then is:

$$\frac{\delta^2 f}{\delta x^2}+\frac{\delta^2 f}{\delta y^2}=0.$$

Then the field can be fully depicted by drawing in the x, y plane a system of equipotential lines cut orthogonally by a system of lines of force; movement of this plane in the direction of z traces out the entire field in the region under consideration. When such a plane field map has been drawn it is a simple matter to compute from it the value of the electric stress at any point or the electrostatic capacity, if the problem be an electrostatic one, or the magnetic force and magnetic permeance, if the problem concern a magnetic field. Each approximately two-dimensional region may be so treated, and there become available a large variety of methods, both mathematical and experimental, by which solutions of such potential fields may be obtained. Some care is necessary in determining the way in which the field is apportioned, particularly in treating those parts where the solutions of different portions are to be fitted together.

The terms "lines of force" and "equipotentials" are given to the respective systems of orthogonally intersecting curves entirely on physical grounds; mathematically there is no distinction between them. It follows, therefore, that every field map, whether mathematically or experimentally obtained, is the solution of two distinct physical problems: one in which the two sets of lines are given their normal nomenclature and the other when their physical meanings are interchanged. This fundamental conjugate property is often made use of in practical work in order to provide both sets of lines.

It is not our intention here to enter into a discussion of the mathematical methods used for the solution of two-dimensional field problems, but we may briefly remind the reader of their scope. A large number of solutions to important engineering problems have been found by the use of the theory of conjugate functions, conformal representation and the Schwartz-Christoffel transformation, with both electric and magnetic applications. Considerable progress has been

Digitized by Google

made in the treatment of the magnetic fields of currents both inside and external to the conductors—i.e., of two-dimensional vector potential fields, by combination of the method of images and simple Fourier's series in the work of Searle, Rogowski, Strutt, and the present writer, and by the use of double Fourier's series in the remarkable work of Roth. All these mathematical methods require for their use considerable mathematical skill and experience, and are often very laborious when numerical solutions are required. Many problems, also, are only formally soluble, the analytical work being of prohibitive complexity and difficulty. Hence it is necessary to use experimental ways of solving the problem of the two-dimensional field, particularly in those cases where mathematical methods fail to provide a useful solution. A considerable number of different physical phenomena have been utilised for this purpose, and it is with these that this paper is chiefly concerned. These experimental methods are of two classes. In the first class are those purely qualitative methods which provide a picture of the field without giving any numerical result—e.g., the use of iron filings in delineating magnetic lines of force. In the second class are the methods which give one or both of the sets of curves of the field map, properly spaced and with complete numerical data from which the quantitative properties of the field may be computed.

It is appropriate here to mention one process which is very much used, especially in France and in America, gives excellent and highly accurate results, and which is directly derived from the mathematical and physical properties of fields; this is the graphical process independently introduced by Richardson * and by Lehmann,† and brought to perfection by the latter. Briefly the method consists in drawing the boundaries of the field and marking their potentials; then, taking account of any obvious conditions of symmetry which the field must have, a freehand sketch of the possible shapes of the equipotentials and lines of force is made. This sketch will have obvious errors, which are corrected by making a second sketch on a sheet of tracing paper put over the original map. This is again amended, and so on, until the two systems of curves intersect accurately at right angles and divide up the whole field into small curvilinear rectangles all of which have the same ratio of mean length to mean breadth; this can be ensured partly by judgment by the eye and partly by the use of dividers. The method is somewhat tedious and requires not a little experience, but by adopting a systematic procedure and using suitable standard charts, as described by the inventors of the method, the work can be considerably reduced; the field maps obtained by its aid are in very close agreement with the results of mathematical analysis. Lehmann has solved a very large number of hitherto unsolved problems by the use of this method, and has extended its application to the treatment of the field inside current-carrying conductors‡ and to magnetic fields where the boundary iron is not infinitely permeable. The method is extremely valuable when used in conjunction with an experimental method, even of a merely qualitative kind; if, as is better still, the latter gives definitely one set of curves, e.g., the equipotentials, Lehmann's process enables the other set to be added and the field map completed with great ease and precision.

Another trial and error method has been applied by Müller§ to the solution of magnetic problems, the general procedure being as follows. The field region is set out on drawing paper and the boundary potentials are indicated; the entire region is divided up into small squares, values of potential being marked by trial at the corners of the squares. From the principles of the calculus of finite differences, it is not difficult to show that the value of the potential at the middle of each square is the arithmetic mean of the values at its corners. Proceeding systematically along the rows of squares the mid-point values are calculated from the trial corner values. Then, by extending the process, these calculated mid-point potentials may be used to check the original guess at the corners. Discrepancies will necessarily occur; the original trial values are adjusted and the process repeated successively until improvement is satisfactory. The potentials at a series of points being thus determined, it is easy to draw lines of equipotential; a precisely similar method may be applied to find the flux function and lines of force. The process is often rather slow, but the arithmetical labour can be considerably lightened by the use of a calculating machine or suitable charts.

Direct Depiction of Fields.

The simplest direct method of depicting the lines of force of a magnetic field in air is by the use of iron filings strewn upon the surface of suitably situated pieces of glass or card. The method, which is naturally only qualitative, is too well known to require detailed description. It has often been used as a guide or as a check in accurate work, beautiful examples of its application in this way being found in the classic papers of Du Bois.*

It is not very well known, however, that the lines of force of an electric field can be easily depicted by an analagous method. In one form of the process † suitably shaped tinfoil electrodes are stuck upon a sheet of plate glass, the surface of which has been strewn with a finely powdered dielectric material. The powder should be one in which the particles are not too small and are of an elongated shape, so that they may experience directive forces tending to align them with the electric field when a p.d. is applied to the electrodes by means of an influence machine; suitable powders are tourmaline, gypsum, glasswool, mica dust, mahogany dust, and even tea! Deutsch has investigated by this method the electric field in three-core cables. In a second form of the process‡ a shallow, flat-bottomed dish of large diameter is filled with turpentine into which a suspension of a fine dielectric powder in turpentine has been stirred; suitable electrodes are immersed in the liquid and, when the agitation has subsided, a p.d. is applied. The particles set themselves along the lines of force and are ultimately precipitated upon the bottom of the dish in that form; they can then be photographed. Seddig recommends for the powder either quinine sulphate or the aniline dye, glycin; alternatively, melted paraffin wax may be used instead of turpentine, with an indicator of fine particles of wood charcoal, the wax being allowed to set when the field has arranged the particles in position.

Quantitative Methods.

Turning from direct qualitative to quantitative exploration of the magnetic or electric field the best methods measure the potential differences between points in the field. For the magnetic field the magnetic potentiometer,§ invented by

Digitized by Google

Chattock in 1888 but reintroduced and developed by Rogowski in 1913, is the most important instrument.* The magnetic potentiometer consists of a flexible non-magnetic core, such as a strip of card or a piece of rubber-canvas hose, over which a coil of fine wire is uniformly and closely wound, preferably in an even number of layers. This coil is connected by twisted leads to a sensitive ballistic galvanometer. If one extremity of the coil be kept in a given position while the other is suddenly moved from a point A to a second point B in the field, it is not difficult to show that the transient throw of the ballistic galvanometer is proportional to the difference of magnetic potential between A and B, independently of the contour of the flexible core. By this means the potential of a number of points can be found relative to A, and from these results the magnetic equipotentials can easily be plotted; if desired the field map may be completed by drawing the lines of force by Lehmann's method. It is clear that the application of the instrument is not limited to two-dimensional investigations. Apart from its use in plotting equipotentials the magnetic potentiometer is a valuable instrument in research and has been used in the magnetic testing of iron, especially curved or very small specimens; the investigation of the distribution of magnetic potential over portions of a magnetic circuit; and in the measurement of the magnetisation characteristics of instrument transformers.

For the direct exploration of the equipotentials in an electric field the "electrostatic probe" of Semenoff and Walther† may be used. The two electrodes, between which the electric field is to be investigated, are joined to the terminals of a source of alternating voltage in parallel with a potential divider resistance. A testing electrode or "probe" (Sonde) is then inserted in the field and is connected through a telephone to the slider of the potential divider. If the testing electrode has the form of a portion of an equipotential surface it can be put into a position in the field where it coincides with part of such a surface; the telephone then emits a minimum sound, and by movement of the slider this sound may be made to disappear. Retaining this setting of the slider, the probe may be moved to a new position giving zero sound and so on, until the whole of the equipotential surface corresponding to the setting has been traced; the process is then repeated for other surfaces until an adequate map of the equipotentials has been found. The probe will be a small plane for the testing of the field between plane electrodes, a ring for a field with axial symmetry, or a thin straight wire for the exploration of the two-dimensional field between parallel cylindrical electrodes. The method has recently been used to plot the equipotentials in three-core cables;‡ enlarged models of the cores and sheath were made of sheet metal and the field, with air as the dielectric, was explored by the use of a thin wire probe.

These methods are all that have been described in technical literature for the direct investigation of magnetic and electric field distributions.§ We will next turn to methods in which we make use of the analogy between the potential and flux functions which characterise the magnetic and electric fields and the corresponding quantities found in other branches of physics where Laplace's equation is satisfied.

BOOK REVIEWS.

Life and Work of Sir Norman Lockyer. By T. Mary Lockyer and Winifred L. Lockyer. (London: Macmillan and Co.). Pp. 474. 18s. net.

The late Sir Norman Lockyer, though best known for his work in the astronomical field, had many points of contact with electrical affairs, as would appear natural in the son of a father who, so long ago as the 1830's was lecturing to the Rugby Literary and Scientific Institution on "electromagnetism," "magneto-electricity," and "electricity." Inspired by Faraday's discoveries, Lockyer senior carried on researches connected with what became known as the electric telegraph. As his biographers say, Norman Lockyer's early years were spent in the atmosphere proper to these inquiries, and to the end of his days he recollected electric batteries located in the corners of some of the rooms of the house, and pieces of apparatus very like some which he saw during the Loan Exhibition of 1876 on a copy of Amperè's table. His literary bent, which early took the form of publishing his discoveries and ideas in technical form for the specialist and popular form for the general public, found various outlets, and in 1864 he was editing The Electrician during the absence of the regular editor; later he became first editor of "Nature."

In the early stages his scientific work was restricted by the apparatus available, but the provision by his friend Mr. (afterwards Sir William) Siemens of a gas engine driven Siemens dynamo, in place of a battery of 30 Grove cells, permitted experiments on a larger scale to be carried out.

In 1903, when his interests turned to meteorology, Sir Norman attempted to establish an accurate system of weather forecasting, and arranged with Mr. Marconi to receive weather reports from the Atlantic by the then novel method of wireless telegraphy; he called these wireless messages "ethergrams."

Of his many and important scientific discoveries, his spectroscopic researches, and of his striking personal qualities it is impossible to write here; they are all set out in very readable form in the book which contains, in addition to the main story, contributions on various aspects of Lockyer's work by Dr. C. E. St. John, Prof. Megh Nad Saha, Sir Napier Shaw, Prof. H. U. Russell, the Rev. J. Griffith, Sir Richard Gregory, and Prof. A. Fowler. B. C.

Practical Aids to Retail Selling. By A. Edward Hammond. (London: Sir Isaac Pitman and Sons). Pp. 160. 7s. 6d. net.

Without unkind intentions it may be said that in no sphere of commercial activity is the art of retail selling in so rudimentary a state as it is in the electrical trade. This is due, of course, to the fact that from the outset the industry's contact with the public was through the electrical installation contractor who held stock or obtained it specially for definite installations, and who was rarely called upon to provide things for casual sales. While circumstances have changed with the development of the use of electricity, the retail side of the trade has not shown corresponding progress, due mainly to the prevalence of the idea that shopkeeping is an undignified rôle for men trained as electrical engineers. Spurred by the competition of the supply authorities, many electrical contractors have in the past few years come to realise the importance of the despised shop, but only a relatively small proportion of them have brought to this new aspect of their business any up-to-date knowledge of the arts of presentation and display which are so important a factor in securing the attention and custom of a sophisticated public. For those who have not kept abreast of modern aids to retail sales Mr. Hammond's book will prove invaluable. Essentially practical and pleasantly written, it contains just the sort of information that is needed to make the show window the good salesman it ought to be, and to facilitate the service of customers. The quality of the author's work is well-known to retailer readers of The Electrician through the series of articles on window display and allied subjects which he has contributed to these columns. It is therefore, unnecessary to do more than indicate the ground covered by the various chapters. Starting with emphasis on the importance of retailer-manufacturer co-operation, he deals in turn with the printed appeal in the shop window; colour as an aid to display; price marking in the window; showcard printing machines; illuminated publicity and modern shop signs; moving display aids in the window; wax and papier maché models; linking up with press and cinema advertising; supplementary display aids; combining storage with display; modernism in display; and aids to quick service, and packing accessories. THE I.E.E. DINNER.

Prince of Wales Accepts Honorary Membership—L.C.C. Encourages Electricity for Tenement Dwellings—Electricity as the Antidote to Civilisation—Australia and the "Grid"—French Invitation for Summer Meeting Accepted.

THE annual dinner of the Institution of Electrical Engineers was held at the Hotel Cecil, London, on February 7th, when the President, Lt.-Col. Kenelm Edgcumbe, presided over an attendance of more than 600 members and their guests, among whom were Admiral of the Fleet Sir Charles Madden, Sir Ernest Rutherford, Air Marshall Sir H. M. Trenchard, Sir William Bragg, Sir Charles Parsons, Col. R. E. Crompton, Sir George Sutton, Sir Joseph Petavel, Sir J. R. Brooke, Sir Philip Nash, Col. T. F. Purves, Mr. W. T. Leech, the Earl of Clarendon, and Mons. P. Bunet. Special interest was lent to the proceedings by the announcement made during the evening that the Prince of Wales has consented to become an honorary member of the Institution.

Lt.-Col. C. B. LEVITA, chairman of the London County Council, in proposing "The Institution of Electrical Engineers," said that as the representative of a body responsible for the local government of some five million people, he was very appreciative of the work of the Institution. A thoroughly representative body of electrical engineers, it was not only of national fame and importance, but also of international relationship. Time would not permit a definition of the scope and magnitude of electrical applications, but they could be said to cover every industrial and commercial requirement of modern civilisation.

As a layman, he thought it was remarkable that, for so many ages this vast power should have lain dormant. From the time of the ancient Greeks with their amber experiments there was a very great hiatus until one came to the patron saint of electricity, Michael Faraday. He also thought we lacked the boosting properties of some of our friends, for if there was one science in the world for which Englishmen could take full credit, it was that of electrical inventions and development, with which the names of such men as Kelvin, Clerk Maxwell, Swan, Siemens, Bell, Hughes, Fleming, Ferranti, and Parsons, were indelibly associated.

There was, he thought, too much talk of the infancy of electricity. Electrical engineering to-day was a very healthy adult; its latest child was radio broadcasting, and waiting to be born was television.

He wondered whether the great developments of the last century could be traced to the advances made at the same time in education. It could at least be said that even if education had not produced these inventions it had produced a body of intelligent people who could make use of them.

Electricity for the Working Classes.

The London County Council was a very large user of electrical power, not only for transport, but for lighting and other applications. He was happy to say that they were now able to make electricity available for working-class dwellings. In L.C.C. estates of this character, there were at least 100 000 lamps installed, and these dwellings provided a load of some 4 000 kW for heating and cooking, while a further 8 000 kW was in preparation. In one block of their tenements alone, the tenants used as much electrical energy as a modern battleship, and he thought a load of 7 kW per tenement was fairly creditable.

The number of students receiving education in electrical work under the auspices of the L.C.C. was very great, and he was glad to say that this work was greatly facilitated by the Institution of Electrical Engineers.

Lt.-Col. KENELM EDGCUMBE, responding to the toast, announced that the Prince of Wales had consented to become an honorary member of the Institution. All who had heard the Prince's speech at their dinner two years ago must have been struck by the insight into electrical matters which he then displayed. It was therefore fitting to place on record their deep appreciation of the honour which the Prince had accorded, not only to the Institution, but to the whole profession, by becoming an honorary member of the I.E.E.

Apropos Col. Levita's references to the services which electricity had rendered to civilisation, Col. Edgcumbe recalled having heard civilisation described as a disease through which all had to pass, and from which many succumbed. If this were correct the common debt to electricity was even greater than was generally conceded. The most prominent symptom of the disease was a desire for speed, and to squeeze 90 minutes into every hour. It might be called the Einstein complex; and we were all suffering from it, though, perhaps, not so acutely as the lady of the limerick who "went out one day in a relative way, and came back on the previous night." Our only saviour was the electrical engineer with his labour and worry-saving devices, without which a large proportion of the populace would be occupying padded cells. But whether one called electricity an ally of civilisation, or its antidote, it was in either case absolutely essential.

Cheapness of Electricity.

Recent inspection of the Board of Trade cost-of-living index had shown, Col. Edgcumbe continued, that while commodity prices were considerably above pre-war figures, the cost of electricity was slightly below, in spite of the fact that coal prices had increased by 80 per cent. As the item for fuel and light in the B.O.T. index was 70 per cent. above pre-war he decided to make inquiries, as the result of which he found that the Board of Trade had apparently never heard of electricity, because the only items allowed were coal, oil, candles and gas. It was, high time that they revised the index.

In conclusion, the President referred to a suggestion that the "grid" should be enlarged to take in Australia. The reason of this was that as the hours of darkness in Australia corresponded with the hours of daylight in England, power stations would have a twenty-four hour load. A further advantage was that if Australia burnt the coal we might carry away the Ashes.

Mr. W. B. WOODHOUSE, who proposed "Our Guests," endeavoured to associate electricity with the five senses. Touch could be represented as the muscular effort which electricity replaced by the pressing of a button, eliminating drudgery and increasing production. As to taste, electricity helped the agriculturist to produce more and better food at less cost, abated the rigours of our climate, and persuaded the hen to work overtime and lay more eggs, while electric cooking and refrigeration would produce devilled kidneys or iced drinks to perfection. With regard to hearing, those who controlled the "mikey" paths of communication could claim that electrical communication was changing the habits of the world. By twisting a few knobs one could listen to all the countries of Europe, and could hear such musical masterpieces as "All by Yourself in the Moonlight" in twelve languages. The connection with the sense of sight was obvious, for the electrical engineer was illuminating the dark places of the world. The working classes could now enjoy its light instead of the candles and oil lamps of a bygone day, and instead of something not as good as either, which they had since used. Having dealt with four senses, Mr. Woodhouse acknowledged his inability to complete the task, as it was a recognised fact that electricity could not make a smell.

Referring to the presence among other distinguished guests of Mons. Paul Bunet, President of the Société Française des Electriciens, Mr. Woodhouse mentioned that the French society had invited the Institution to hold its next Summer Meeting in France, and that the invitation had been accepted.

THE EARL OF CLARENDON, who with Mr. H. T. Tizard, responded to the toast, said the Institution of Electrical Engineers, was correctly described as the representative body of electrical engineers in this country, and its founders had justly earned the title of true prophets in their realisation of the wide scope of the science in the days that were to come; exactly fifty-seven years ago one of their early members had said that electrical science would ultimately embrace every operation in nature, a prophecy which had been remarkably well realised. Electrical science to-day had not only transformed life but had accelerated civilisation and broadcasting was only one of the many current examples of that application of this science. Already about one in every three households in this country was equipped with some sort of wireless receiving apparatus. This meant that between 25 and 30 million people could hear and enjoy broadcast entertainment.

ELECTRICAL INSTALLATION PRACTICE.

Continuity in Theory and Practice—The Cheap Installation for Small Houses—Need for Insulated Switches—New Switchboard Design.

By W. B. ROGERS, A.M.I.E.E.

WHEN one has absorbed the mass of literature on electrical installation topics, it will be realised that the best type of job, at the highest first cost, comprises 2 500 megohm grade v.i.r. cables, drawn into ¾ in. screwed conduit, and with an abundance of boxes to facilitate drawing in, repairs and extensions, etc., provided that horizontal conduit runs of any length are provided with a sufficient number of open tee pieces at intervals to ensure adequate ventilation.

No matter how or when erected, hemp cord or red lead at the screwed joints should in no cases be permitted or used. I know of a large installation carried out in London some three years ago where red lead was used at the screw threads by a firm of reputable electrical installation contractors, and I feel fairly confident that metallic continuity of the presumably earthed conduit system never did and never will exist, owing to the clogging insulation of red lead.

However, the foregoing applies to what is supposed to be an expensive, good-class job, whereas to-day we are more concerned with what is broadly termed, cheap small house installations comprising, say, 3 to 20 lighting points, and unfortunately usually a very meagre supply or equipment of standard interchangeable plug points, for other uses, such as domestic utility appliances.

Of literature on the subject there has been a flood during the past few years. I would, however, particularly draw the interested reader's notice to the following: "Modern Electric Wiring as Applied to Small Houses," by D. S. Munro (Proceedings of the Institution of Electrical Engineers, Vol. 66, No. 379, 1928; "Domestic Electrification: Its Development and Equipment," by J. L. Carr and J. D. Peattie (paper read at the I.M.E.A. Convention at Bath, during June, 1928).

Slip tube jobs have now served their purpose, and to my mind are out of date, as also is wood casing. The best that can be said of the former is that it is cheap, and, like most cheap things, nasty. It certainly does not cover the field of security and safety. How often does one actually find continuity of light gauge slip conduit to exist?

Frequently one finds a slip conduit section of an installation terminating at a wood block, the latter surmounted by a 5 A metal covered tumbler switch, the latter having the customary porcelain insulated base. Frequently the operator thereof is a lady standing on the conductive floor of a scullery or kitchen, and I have personally known of a number of cases where the switch manipulator has received a shock to earth, or even a minor shock from finger to wrist. To-day safety and security demand that we should give up the metal covered s.p. switch and instal something akin to the bakelite insulated variety.

From the point of view of the owner of a small installation the screw conduit system is too costly. The cheap slip tube competitor should be ruled out on the score of security and safety. It is now about seventeen years since tough rubber covered conductors were introduced and promptly became popular and known as C.T.S. Cubs of the date in question have disappeared, but the sterling properties of cab tyre sheathed cables and wire endures with ever increasing popularity. The C.T.S. system has of late been supplemented by another tough rubber compound known and marketed by the respective makers as "Maconite" and "Lecite."

With any of the foregoing tough rubber systems I submit that a perfectly safe and secure type of installation can be put in anywhere at a cost not exceeding that of the ⅝ in. slip conduit variety, with the added advantage of flexibility, neatness and all-round security and efficiency, provided that insulated insulation switches are provided. The main switch fuse for cutting off the entire installation has, however, not yet reached finality, as a really reliable insulated d.p. switch fuse at a reasonable cost, has yet to be put on the market.

At present, therefore, we are driven to put in the ironclad combination. Now, to secure safety and conformity with the regulations leaves us no other course than to earth all metal other than conductors on a safe installation. However, in regard to this latter problem, protection has recently been granted to a device which will, I believe, adequately clear the situation.

Imagine a plywood meter board carrying the whole of the main control devices in addition to the meter. The board in question is covered on the gear carrying side by a metallic conducting sheet, and is also equipped with a substantial earthing terminal. The whole design being such as to enable the earthing terminal to be adequately connected to the lead of the service cable, or the supply side of a house water pipe system. We thus have all metal other than conductors earthed and in conformity with the ninth edition of the I.E.E. Rules.

A point I have so far omitted is the question of distribution boards. Broadly speaking, the small type of home installation herein referred to should include a teak-cased distribution board. I have yet to meet a better article for the purpose than the "Desco" apparatus, which incorporates many advantages, particularly concentric compression virtues as appertaining to contacts and terminals.

AN EARLY CONTRACTORS' DINNER.

MANY of our older readers will be interested in this reproduction of a photograph taken at the first dinner of the London Electrical Contractors' Association in 1902. Mr. G. F. Ratcliff, by whose courtesy the picture is published, recalls that when he was articled in 1880 his employers "favoured" him by accepting a premium of only £210, "but," he adds, "we had a fine training—pushing hand trucks of casing and cable through the streets, filing castings, making small patterns, a term on the lathe, drilling machine, planing, helping with engine and pump and shafting repairs; then a turn at making joints, taking curves of dynamos, coupling in series and parallel, and then out on wiring and plant work. We also had a time in the drawing office and laboratory, with lectures."

THE BRITISH INDUSTRIES FAIR.

Arrangements for the Official Luncheons at Castle Bromwich—Plan of the Electrical Section of the Fair—Stand Numbers and Names of Exhibitors.

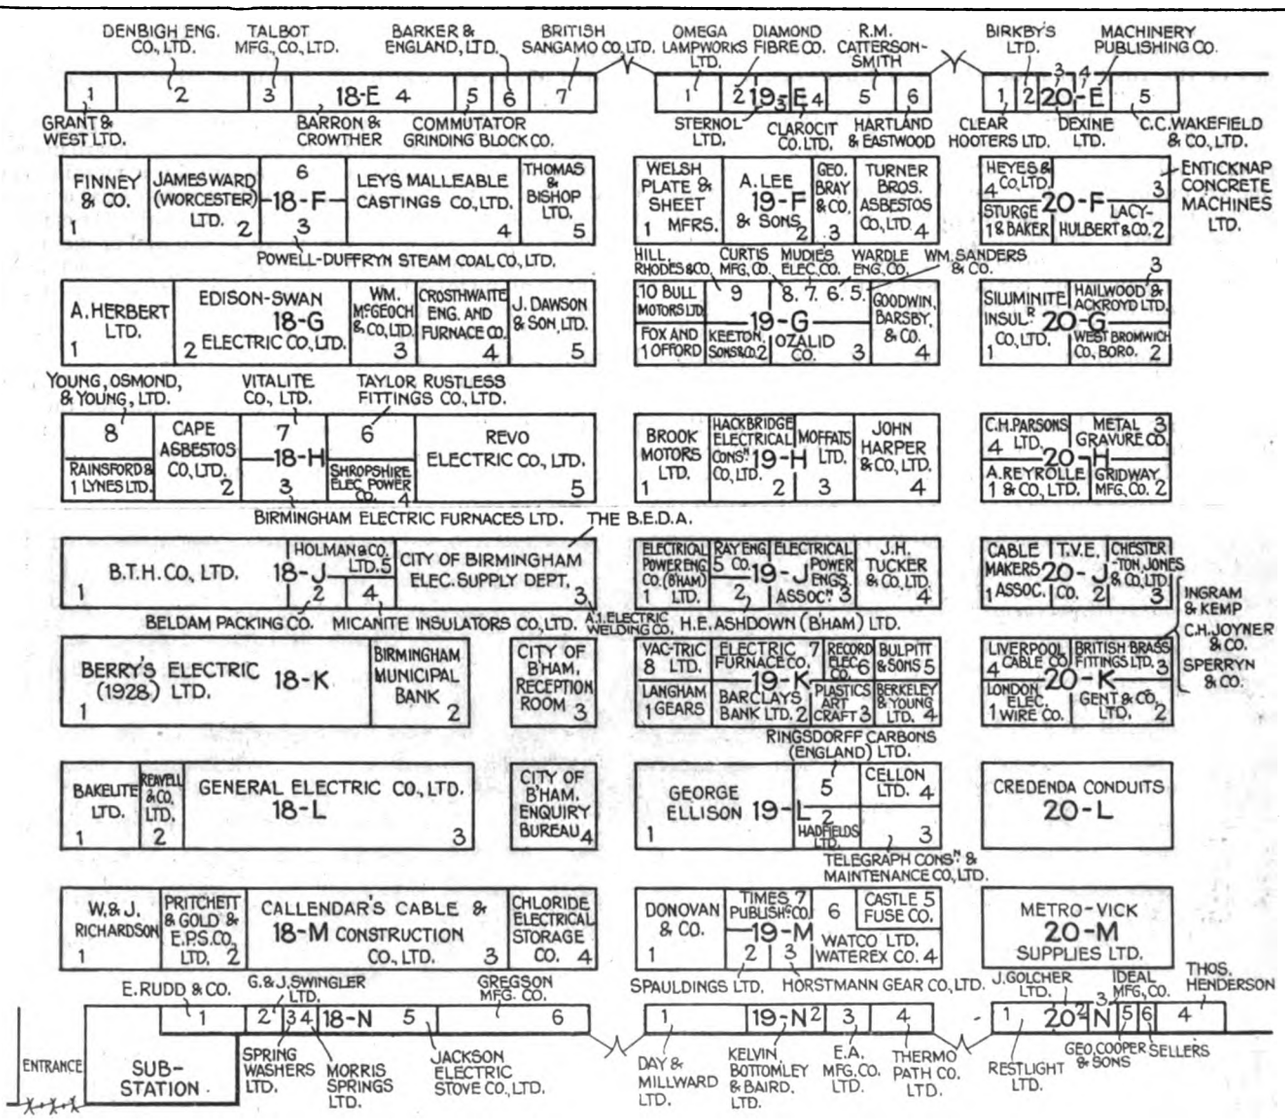
NEXT Monday sees the opening of the British Industries Fair, both at Castle Bromwich and at the White City, London. So far as the electrical exhibits are concerned the majority of the firms engaged in the industry are to be seen at Birmingham, and we give below a detailed plan of the Electrical Section. This includes the stand numbers of exhibitors, together with their names, while on the opposite page will be found a complete list of exhibitors of electrical interest within and outside the Electrical Section.

The arrangements for official visits to the Birmingham Fair, of Associations connected with every phase of electrical industry, are now complete, and a conference arranged by the South Midland Area Committee of the E.D.A. will be held in the Conference Hall on February 22nd, at 11.30 a.m.

A luncheon on the same day in the Royal Dining-Room (Electrical Section) will be attended by representatives of the Incorporated Municipal Electrical Association, the Incorporated Association of Electric Power Companies, the Provincial Electric Supply Association, the British Electrical Development Association, the Municipal Tramway and Transport Association, and the Tramways and Light Railways Association.

Representatives of the Electrical Power Engineers' Association will attend luncheon in the same room on February 23rd, while the South Midlands Students' Section of the I.E.E. will assemble for tea. After luncheon members of the E.P.E.A. will attend a conference in the Conference Hall.

On March 1st a luncheon will be given in the Royal Dining-Room to the Institution of Electrical Engineers, the Association of Consulting Engineers, the Association of Supervising Electrical Engineers, the Electrical Contractors' Association, the Electrical Contractors' Association of Scotland, the Electrical Wholesalers' Federation, Ltd., the Electrical Merchants and Manufacturers' Association, the Illuminating Engineering Society, and the Association of Mining Electrical Engineers. In the afternoon the Electrical Association for Women (Birmingham and Midlands Branch) will be entertained to tea.



A PLAN of the Electrical Section of the British Industries Fair at Castle Bromwich, showing stand numbers and names o exhibitors. A list of firms, including those of electrical interest whose stands are outside the Electrical Section, is given in alphabetical order on the opposite page.

STANDS TO LOOK FOR AT CASTLE BROMWICH.

List of Exhibitors and Stands of Electrical Interest.

Name of Exhibitor.	Block and Stand No.
Accles and Pollock, Ltd.	16G-1
Aerostyle, Ltd.	14B-2.
Allen-Liversidge, Ltd.	14J-4.
Anchor Cable Co., Ltd.	20J-1.
Ashdown, H. E. (Birmingham), Ltd.	19J-2.
Attwood's Spraying Equipments, Ltd.	16F-6.
Avery, W. and T., Ltd.	15L-1.
Bakelite, Ltd.	6G-2, 18L-1.
Berkeley and Young, Ltd.	19K.
Berry's Electric (1928), Ltd.	18K-1.
Birkby's, Ltd.	6C-5, 20E-2.
Birmingham, City of, Elec. Supply Dept.	18J-3.
Birmingham Electric Furnaces, Ltd.	18H-3.
Blackstone and Co., Ltd.	15H-3, 15J-2.
Bray, Geo. and Co., Leeds	11E-2, 19F-3
Britannia Tube Co., Ltd., Birmingham	14C-1.
British Brass Fittings, Ltd.	20K-3.
British Electrical Repairs, Ltd.	16H-2.
British Sangamo Co., Ltd.	18E-7.
British Thomson-Houston Co., Ltd.	18J-1.
Bromford Tube Co., Ltd.	12K-1.
Brook Motors, Ltd.	19H-1.
Brown, S. G., Ltd.	16L-3.
Bull Motors, Ltd.	19G-10.
Bulpitt and Sons, Ltd.	5G-1, 19K-5.
Buncher and Haseler, Ltd.	4H-1.
Cable Makers' Association	20J-1.
Callender's Cable and Construction Co., Ltd.	18M 3,A-4,
Canning, W. and Co., Ltd.	17K-1.
Cape Asbestos Co., Ltd.	18H-2.
Carron Company	14E.
Castle Fuse and Engineering Co.	19M-5.
Chesterton, Jones and Co., Ltd.	20J-3.
Chloride Electrical Storage Co., Ltd.	18M-4.
Clear Hooters, Ltd.	20E-1.
Commutator Grinding Block Co., Ltd.	18E-5.
Crane (Frederick) Chemical Co., Ltd.	9K-2.
Credenda Conduits Co., Ltd.	20L.
Crossley Bros., Ltd.	16M-3, 16N-4.
Crosthwaite Engineering and Furnace Co.	18G-4.
Davey, Paxman and Co., Ltd.	17H-1.
Davidson and Co., Ltd.	17G-2.
Davis and Timmins, Ltd.	16G-5.
Dexine, Ltd.	20E-3.
Dick, R. and J., Ltd.	17N-6.
Diecastings, Ltd.	2J-2.
Donovan and Co.	19M-1.
Dorman, W. H. and Co.	17L-3.
Drayton Regulator and Inst. Co.	16F-5.
Earle, Bourne and Co., Ltd.	17K-3.
Edison Swan Electric Co., Ltd.	18G-2.
Electric Furnace Co., Ltd.	19K-7.
Electrical Power Engineering Co. (B'ham.) Ltd.	19J-1.
Electrical Power Engineers' Association	19J-3.
Ellison, George	19L-1.
Enfield Cable Works, Ltd.	20J-1.
Ever-Ready Co. (Great Britain), Ltd.	7G-3.
Fielding and Platt, Ltd.	15G-1.
Firth, Thos. and Sons, Ltd.	10F-1, 10G-1.
Foster Instrument Co.	11L-1.
Fox and Offord, Ltd.	19G-1.
General Electric Co., Ltd.	18L-3.
Gent and Co., Ltd.	20K-2.
Gillespies, Ltd.	7F-5.
Gilman, F. (B.S.T.), Ltd.	16E-4.
Gregson Mfg. Co., Ltd.	18N-6.
Hackbridge Electric Construction Co., Ltd.	19H-2.
Hadfields, Ltd.	19L-2.
Hailwood and Ackroyd, Ltd.	20G-3.
Hale, Thos. (Tipton), Ltd.	14H-4.
Harper, John and Co., Ltd.	4J-2, 19H-4.
Herbert, Alfred, Ltd.	18G-1.
Hewittic Electric Co., Ltd.	19H-2.
Heyes and Co., Ltd.	20F-4.
Holden and Hunt	14L-1.
Hollings and Guest, Ltd.	17L-5.
Holmes, W. C. and Co., Ltd.	12D-2.
Horstmann Gear Co., Ltd.	12D-3, 19M-3.
Imperial Chemical Industries, Ltd.	9K-1, 9K-2.
India Rubber, G.P. and Tel. Works Co., Ltd.	20J-1.
Ingram and Kemp	20K-3.
Jackson Electric Stove Co., Ltd.	18N-5.
Johnson, Rd. and Nephew, Ltd.	17F-3.
Johnson, Rd., Clapham and Morris, Ltd.	13H-1.
Johnson and Phillips, Ltd.	20J-1.
Joyner, Chas. and Co.	20K-3.
Kelvin, Bottomley and Baird, Ltd.	19N-2.
Lacy-Hulbert and Co., Ltd.	20F-2.
Lighting Trades, Ltd.	12G-2.
Lister, R. A. and Co., Ltd.	17G-1.
Liverpool Electric Cable Co., Ltd.	20J-1, 20K-4.
London Electric Wire Co. and Smith's, Ltd.	20K-1, 20J-1.
Macinlop, Ltd.	14C-4.
Macintosh Cable Co., Ltd.	20J-1.
Marconi's Wireless Tel. Co., Ltd.	10L-4.
May and Padmore, Ltd.	4E-1.
McGeoch, Wm. and Co., Ltd.	18G-3.
M.C.L. and Repetition, Ltd.	17N-3.
Metro-Vick Supplies, Ltd.	20M.
Micanite and Insulators Co., Ltd.	18J-4.
Midland Fan Co., Ltd.	1H-2.
Moffats, Ltd.	9H, 19H-3.
Moorwoods, Ltd.	8H-1.
Mudies' Electrical Co., Ltd.	19G-7.
Negretti and Zambra	16H-6.
Omega Lampworks, Ltd.	19E-1.
Pantin, W. and C.	16L-2.
Parker, Winder and Achurch, Ltd.	5H.

SOME DOMESTIC EXHIBITS AT THE FAIR.

A pressed steel cooker by the General Electric Co., Ltd.

A few particulars of the domestic equipment which will be displayed by some of the electrical exhibitors at Castle Bromwich, on Monday. A complete list of exhibitors of electrical interest is given on page 191, *while a detailed plan of the Electrical Section is given on page* 190. *A further article, dealing with the Fair at greater length, will appear in our next issue.*

A 3 kW "Louis Newberry" fire by Berry's Electric (1928) Ltd.

WE are able to give this week advance particulars of some of the equipments and appliances of electrical interest which are to be seen at the Birmingham Section of the British Industries Fair. In giving these descriptions we have confined ourselves mainly to domestic apparatus and though it is not possible to include in one issue details of the exhibits of all the manufacturers of such equipment, those which have been omitted will be dealt with in a subsequent issue, together with the remainder of the electrical exhibitors. In cases where a firm mentioned is also showing industrial equipments of electrical interest, these will be subject to description in a later issue.

CARRON COMPANY (Carron, Falkirk). In the electric cooking and heating appliances section of this stand will be seen an extensive range of fires, including the "Carraflex," "Stella," "Cathedral" and "Careole" series. The exhibit also includes a new electric dog grate and two new electric cookers. Small domestic appliances such as 4 and 5 lb. electric irons, large electric cookers with double-ovens and independent grillers are included.

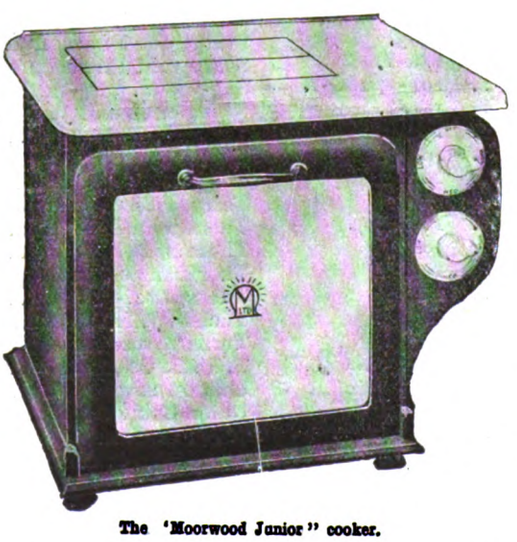
BERRY'S ELECTRIC (1928), LTD. (Touchbutton House, Newman Street, London, W.). This stand features a wide range of "Magicoal" fires, day and night signs, switchgear and Berry-McClary cookers. The exhibit includes a number of fires designed for inclusion in newly built houses, where the fire places have not been completed, while a range of new cookers is also shown.

MOORWOODS, LTD. (Harleston Iron Works, Sheffield). Electric cookers with various loadings up to 7 900 W are exhibited, together with a special junior model for use by small families. Cooking equipment in all finishes is shown, while the number of types and variety of loadings available cover practically every requirement.

THE OMEGA LAMP WORKS, LTD. (Rodney Place, London, S.W.19). Here are shown lamps of every type and for every purpose, including traction, factory and domestic use. Part of the exhibit is formed by a collection of the raw materials and parts used in lamp manufacture.

CORFIELD, LTD. (Trafalgar Works, Merton Abbey, London, S.W.19). This stand should be of interest to users of electric cookers in that the wide range of aluminium domestic utensils shown has been designed with a view to obtaining the best efficiency from a hot-plate. Specimens of presswork which have been made for the electrical industry are also shown.

CHARLES JOYNER AND CO. (Icknield Square, Birmingham). Electric cookers are also exhibited by this firm, including a new range incorporating an improved "Angelus" boiling ring. Another new exhibit is the "Perfection" oven, while overseas visitors will be interested in an "Empire" oven which has been specially designed for overseas use. Thermal heating systems, fires, etc., are also included.



The 'Moorwood Junior" cooker.

METRO-VICK SUPPLIES, LTD. (Trafford Park, Manchester). Besides a number of cooking, washing, ironing and cleaning demonstrations, this firm is showing various types of storage water heaters and electric geysers. A complete range of fires, as well as a range of radio apparatus for operation from both a.c. and d.c. mains are exhibited, while a display of wiring accessories includes lamp-holders and switches in various finishes, lamp standards, brackets, electroliers, etc. On the pillars and partitions of the stand more than thirty different types of panel fittings have been installed, several of these incorporating the new "Gilbert Riley" glassware. This latter, it is claimed, is the only glassware of British manufacture available at the present time.

THE GENERAL ELECTRIC CO., LTD. (Magnet House, Kingsway, London, W.C.2). The chief domestic exhibits here are "Cosy-Glow" fires, self-protective electric kettles, wash boilers, cooking equipment, irons, cleaners, etc. A new wash boiler is shown for the first time, together with a new range of pressed steel electric cookers. A special feature of the latter is the convenient position of the oven. This range of cookers has been designed for both the home and overseas markets and in almost every case the oven interior is withdrawable for cleaning. The exhibit also includes electric grillers, boiling and hot plates, electric gramophone motors, irons, immersion heaters, fires, etc. The industrial exhibits on this stand will be described next week.

YOUNG, OSMOND AND YOUNG, LTD. (Excelsior Works, The Broadway, Bexley Heath). The exhibits here comprise "Utility" tubular heaters for schools, churches, offices, factories, houses, etc.; electric towel airers for floor and wall mounting; four bar heaters for use where wall space is limited, available with or without 3-heat control; car bonnet heaters and linen cupboard heaters. In addition there is shown a model block of offices incorporating a typical layout of heaters throughout. Special tubular heaters for use in bow windows are shown, together with parts in their construction. Heaters for tar, crude oil and traction work are shown, the latter being available up to 600 and 1 600 V.

THE JACKSON ELECTRIC STOVE CO., LTD. (143, Sloane Street, London, S.W.1). A complete range of domestic appliances is again featured by this company, including a new cooker series. This latter comprises a range of cookers of sizes suitable for three and four persons up to fourteen persons, with loadings ranging from 4 200 W to 9 350 W. Another new exhibit is the "Junior" cooker, which, with a total loading of 3 160 W, has a

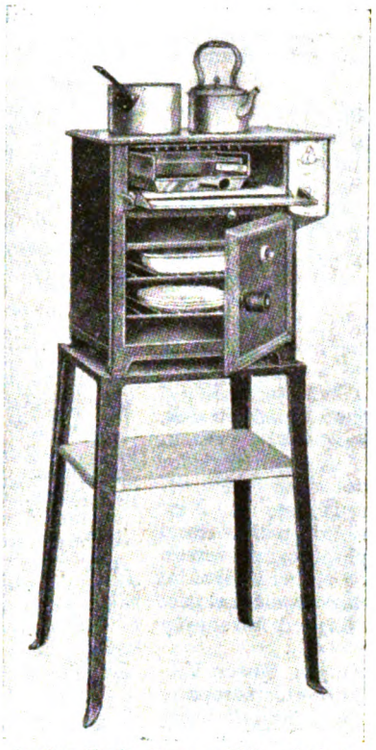
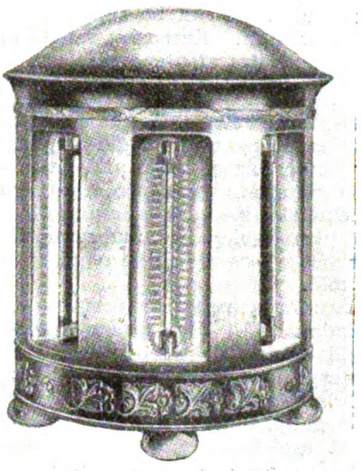
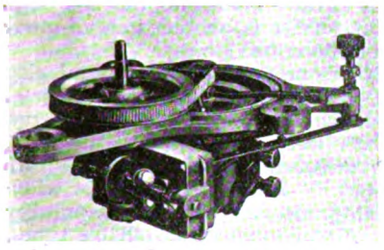
The "Angelus Perfection" oven, shown by Charles Joyner and Co.



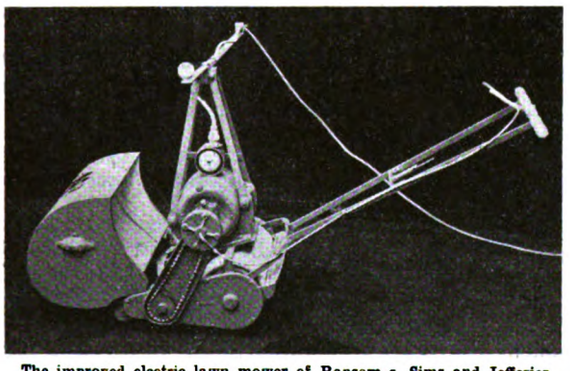
Another Charles Joyner exhibit, suitable for small family cooking requirements.



A vertical bar fire shown by the Thermo Path Co., Ltd.

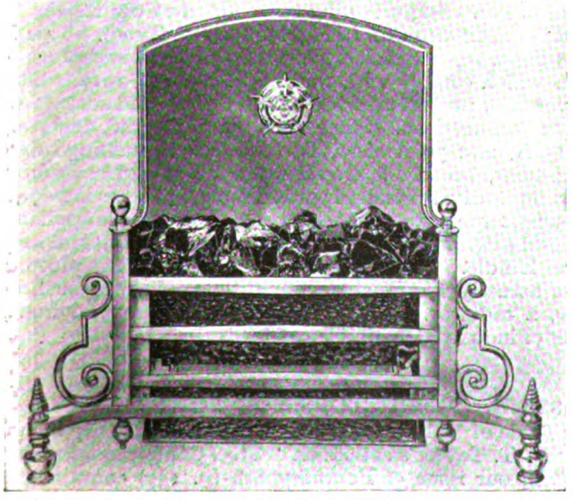


An electric gramophone motor, by the British Thomson-Houston Co., Ltd.



The improved electric lawn mower of Ransom s Sims and Jefferies, Ltd.

One of the lighting fittings shown by Metro-Vick Supplies, Ltd.



An attractive imitation coal-fire, also by Metro-Vick Supplies, Ltd.

A boiling-plate by A. Reyrolle & Co., Ltd., with three-heat elements.

Digitized by Google

cooking space of 10 in. by 12 in. by 13 in. An interesting point in connection with the "Junior" is that the grill-boiler plate is independent of the oven, while another is that the equipment can be supplied with or without 18 in. legs and pot shelf. Extensive ranges of fires and other domestic appliances are also shown.

More Lighting Fittings.

HAILWOOD AND ACKROYD, LTD. (Morley, Leeds). The chief exhibits on this stand are glassware and fittings suitable for home, office, hotel and theatre lighting. Coloured and clear glassware are shown, together with a new ply glass. The exhibit also includes examples of the "Hailuxo" heat resisting glass which, we understand, is recommended for any purpose where it will be required to withstand extreme heat or cold.

THE GREGSON MANUFACTURING CO., LTD. (31, Tenby Street, Birmingham). This firm specialises in the manufacture of wood electric light fittings, and is showing a range of hall lanterns, lounge, dining and drawing room pendants, table and floor standards, etc. These fittings are made chiefly in oak, mahogany, and walnut. Some novel designs in silk and parchment are shown for the first time, while wood fittings for church and cinema lighting are another interesting line.

THE THERMO PATH CO., LTD. (Albion House, 59, New Oxford Street, London, W.C.1). The exhibits on this stand are mainly "Meracol" fires, cooking apparatus and screen fires. There is also to be seen a range of new model horizontal bar fires in black enamel sheet metal and vitreous enamel cast iron in colours, which has been specially designed for supply authorities who hire fires.

THE EDISON SWAN ELECTRIC CO., LTD. (123/5, Queen Victoria Street, London, E.C.4). The products of this company are shown to full advantage, including lamps and lighting accessories, domestic and heating appliances, cables, accumulators for house lighting and wireless, starter batteries, dry cells, meters, decorative fixtures, receiving and transmitting valves, battery eliminators and other radio products.

RANSOMES, SIMS AND JEFFERIES, LTD. (Orwell Works, Ipswich). Though a considerable number of electric motors are shown by this firm, the most interesting exhibit from the domestic point of view is the "Electra" electrically driven lawn mower.

BERKELEY AND YOUNG, LTD. (Hay Mills, Birmingham). This company specialises in fans for both a.c. and d.c. supply, and table, bracket and ceiling types form the main subject of the exhibit. Battery charging equipment of the type to interest wireless enthusiasts is shown, together with the "Ellipso" oscillating fan, and industrial fans.

THE STURTEVANT ENGINEERING CO., LTD. (147, Queen Victoria Street, London, E.C.4.). Apart from industrial vacuum cleaning equipment, the exhibits here include the "Croydon" vacuum cleaner. This latter is of the bag type, easily portable, and is made for all standard voltages. The industrial items of the exhibit will be described in a later issue.

THE REVO ELECTRIC CO., LTD. (Britannia Works, Tividale, Tipton). The complete range of cookers exhibited embraces models from the small "Breakfast" cooker to the "Maxima" (ten persons) model. Of overseas interest is the "Colonial" cooker, which we understand has been designed to compete with American cookers in the empire markets. A series of fires is shown incorporating the "Emitter" fire bar, the most popular fires of the series being the "Dinky," "Pearl," "Dainty," and "Ruby." Two and three-pint kettles with safety switches, electric irons, water heaters, wash boilers, etc., are also included. Electric fans of the table and bracket variety, ceiling fans and oscillating fans for a.c. and d.c. supply form another interest. The industrial exhibits will be dealt with separately.

STUART TURNER, LTD. (Henley-on-Thames, Oxon). The exhibits on this stand include 120 W sets for country house lighting, and for yachts and motor boats, 25 V ½ kW lighting plants, and 1½ and 3 kW plants. These are available for driving by petrol, paraffin or gas. A 12 V, 50 A battery is supplied with the 120 W set, while either a 25 V or 50 V battery is used with the ½ kW plant. The 1½ and 3 kW sets are available with either 50 or 100 V batteries with capacities up to 150 Ah in the case of the smaller set and up to 300 Ah in the case of the 3 kW plant.

HENRY WIGGIN AND CO., LTD. (Wiggin Street, Birmingham). Electric fires of various types incorporating "Brightray" elements are shown here, together with a range of sample reels of nickel-chromium electrical resistance wires. Domestic type resistances and rheostats are shown, together with a material called "Silveroid," for use in fire surrounds. The items of industrial interest will be the subject of a separate review.

R. A. LISTER AND CO., LTD. (Dursley). The three plants exhibited are representative of the range of "Lister" house lighting plants which can be obtained in various capacities. On view there are 1 kW and 1½ kW sets for battery charging, as well as a 1½ kW "Lister-Brunton" fully automatic plant. The power for all plants is supplied by a four-stroke, slow speed, vertical, water-cooled engine. The generators are of open protected construction, shunt wound for battery charging. The dynamos are of the four-pole type, fan ventilated, and are designed with a powerful starting winding. Plants are supplied with switchboard and instruments, mounted direct on the plant or as a separate wall type arrangement.

C. H. PARSONS, LTD. (Britannia Works, Tyseley, Birmingham). This firm is displaying, among other lines, an extensive range of switches and lamp-holders, and bakelite switchplates and rings.

S. G. BROWN, LTD. (Western Avenue, North Acton, London, N.). The domestic side of this exhibit is made up of radio equipment comprising loud speakers of the reed and moving coil types. The latter are not supplied complete, but are already assembled suitably for mounting on a baffle board. They are of the electro-magnetic type and are wound for 6 V as standard. A suitable transformer is already fitted into the box casting. A new low-frequency transformer is another item of interest. The marine exhibits will be described later.

SPERRYN AND CO. (Moorsom Street Works, Birmingham). Samples of "Sperrynwood" switches, fuses, and other electrical equipment, including "Sperson" and "Sperryn" models are shown in great variety.

THE CHLORIDE ELECTRICAL STORAGE CO., LTD. (Clifton Junction, near Manchester). "Exide" batteries for wireless, house lighting, car starting, etc., are shown in a number of capacities and voltages. A new range of unspillable types, in celluloid boxes, for portable wireless sets and a selection of h.t. and l.t. batteries suitable for medical purposes are also shown. Specimens of the "Lux" battery, specially designed for heavy loads, together with batteries for portable lamps, are included in the exhibit. Industrial items will be included in our next issue.

Pumps for Country Houses.

THE UNIFLO PUMP CO., LTD. (Fordhouses, near Wolverhampton). This exhibit includes a number of electrically-driven pumps suitable for country houses, motor boats and yachts. These are available in a variety of sizes for both a.c. and d.c. supply. Exhibits of industrial interest will be the subject of a separate review.

THE BRITISH THOMSON-HOUSTON CO., LTD. (Rugby). In addition to industrial equipment, which will be dealt with in our next issue, this firm is showing "Mazda" lamps, lighting fittings, radio apparatus, valves, and moving coil loud speakers. Among the exhibits is an electric gramophone motor suitable for supply from 50 to 250 V d.c. and 100 to 200 a.c., 25 to 60 cyles, fitted with an adjustable graduated resistance. In this section of the exhibit there is also a display of "Tungar" battery charging equipment and trickle chargers. The lighting fittings shown include practically every type, a number of new designs having been added to the range.

A. REYROLLE AND CO., LTD. (Hebburn-on-Tyne). This firm is showing a representative collection of domestic plugs and sockets which comply with the B.S.S. No. 196–1927, which is for reversible, protected type, two-pin plugs and sockets with earthing connections. Since this specification deals with 5 A, 15 A, and 30 A sizes, it marks an interesting stage in development, because it provides for metal-clad enclosure of these comparatively small plugs and sockets, and so introduces, for domestic apparatus, a safe connector for portable appliances. The metal earthing of the enclosure makes the plug and socket safer to handle. In addition to examples of their plugs and sockets actually mounted on domestic appliances, such as a washer, a radiator, a kettle, a toaster, and several irons, a number of industrial exhibits are shown.

(To be continued.)

STEEL CONDUCTORS FOR POWER LINES.

The Table of Values for the Same Current Density included in Mr. W. T. Taylor's article on "Steel Conductors for Power Lines" in our issue of February 8th (p. 157) contained two printers' errors. In column four referring to three-phase four-wire conductors $\sqrt{3}E$ should in each case have been $\sqrt{3}E$.

THE GRID AND "SHODDY" WIRING.

Parasites of the Electrical Contracting Industry—The Domestic and Industrial Position Compared—Compulsory Registration Necessary—An Electrical Leader Wanted—Further Examples of Bad Work.

By HARRY MOSS. A.M.I.E.E.

FOR some considerable time, by means of the written and spoken word, and with the aid of photographs, I have been trying to draw the attention of the whole electrical world to the disease of "shoddy" wiring which has attacked the electrical installation contracting industry. With the development of the grid and the additional facilities for electricity supply, it is to be feared that there will be a considerable growth in the number of these parasites of what would otherwise be a healthy industry.

These parasites, consisting of a variety of "shoddy" wiring men and "contractors" of very doubtful quality, the usual odd man and handy man, the country mechanic, who claims himself to be an "electrical engineer," the "clever" boy from school who just knows the difference between a conductor and an insulator, the wireless "fan" who knows quite a bit about his set, but nothing about the dangers of 230 V a.c. supply, are fast preparing traps for the unsuspecting low-price loving public, and a series of electrical fires is almost inevitable.

A Public Danger.

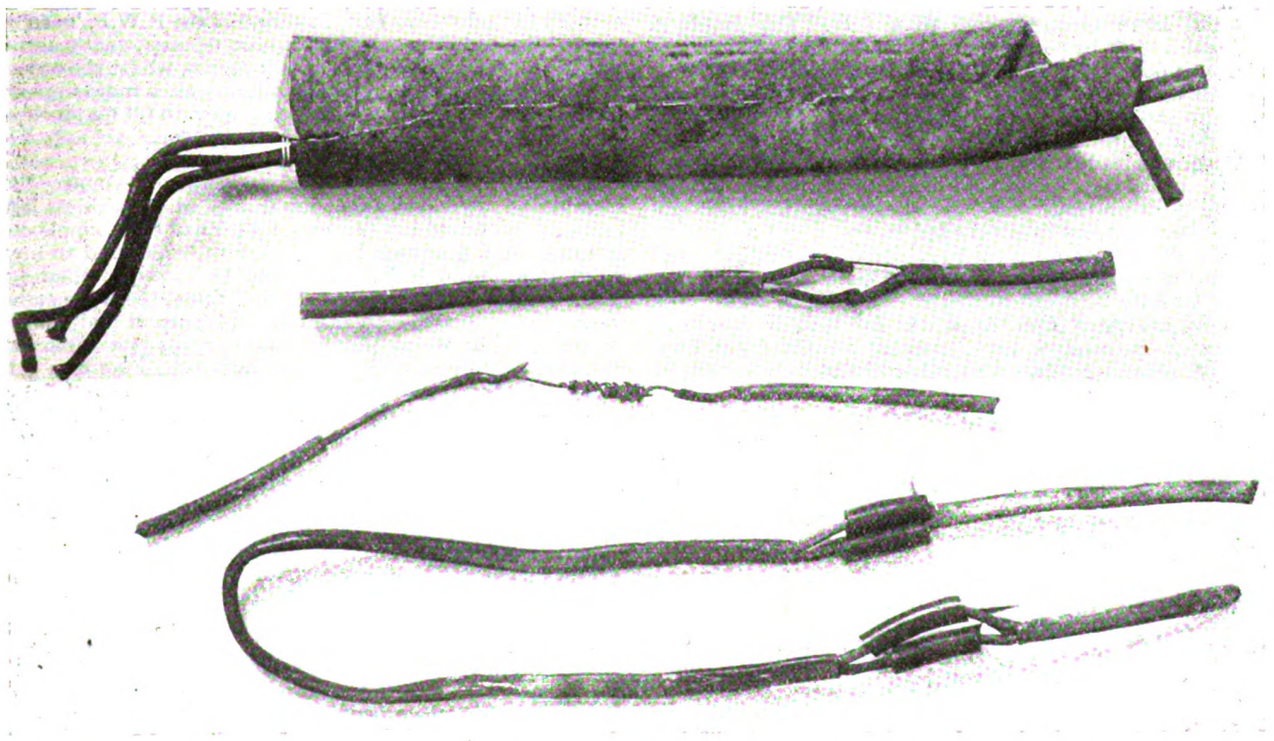
A comparison of the conditions applicable to the domestic and industrial sides of the electrical wiring position is of interest, and may be explained in the imaginary picture of work being done on two sides of a fence: on one side skilful men are operating a system of electrical distribution incorporating the latest and improved methods, ironclad and foolproof gear to guard trained technical operatives, and safeguards of every description; while on the other side we have an electrical system which can be, and is, often highly dangerous to the user, the ordinary everyday cottager or householder with no knowledge of electricity. In many cases the installation is put in by one of the previously mentioned parasites of the trade, at the lowest possible price, with "shocking" lamp-holders and switches, unbonded and non-continuous metal sheathed wiring systems, loose arcing and fire-raising joints, uncovered connections, overloaded wires and flexibles, and traps and risks of every conceivable description.

How can the two be reconciled? Is it reasonable to protect the skilled and competent men, who know better than to handle dangerous equipment, with all the scientific gadgets it is possible to produce, and then leave the "ignorant" domestic user with a house full of death-dealing wiring and appliances? Surely not. Some steps must be taken quickly, either by compulsory registration of *all* who are allowed to carry out electrical installation work, or other similar measure. That the "shoddy" and highly dangerous work now being carried out must cease every one agrees, but where and who is the electrical leader capable of calling a halt?

A Wireless Expert.

A few days ago a wireless enthusiast and electrical "dabbler" went to a wholesaler and arranged to purchase a length of flimsy twin flex, similar to that used for extending or connecting up loud speakers, also a length of close joint conduit through which to run this flex. His purpose was to supply a h.t. eliminator from the Corporation 230 V a.c. supply mains, and the odd length of tube was to "protect" the flex from the wet walls of a cellar. It requires little or no imagination to realise what might have happened if this man had been allowed to carry out his plan, which was only prevented by the alertness of the assistant in the store who was executing the order, and had entered into conversation with him at the same time. In any case, it can be assumed that some kind of "shoddy" wiring job has been done to connect the Corporation supply to the input side of this particular eliminator, which is only one of many thousands now in use. Supply authorities do not know when such equipment is added to their mains, and, in consequence, do not appreciate the "fire risks" that are being added to their supply daily. The point at issue is: when will they take drastic action to stop this risk of continuity of supply to users?

The illustrations accompanying this article are samples of work done on a metal sheathed system by one of the many handy chauffeur-electricians. Note the sheet lead covering to the joints. This was exposed to the elements, and was evidently the workman's idea of a lead-covered job.



SOME specimens of "shoddy" wiring on a metal sheathed system. At the top of the photograph is shown a bunch of wires wrapped round with sheet lead. This was situated in an exposed position subject to all sorts of weather.

CORRESPONDENCE.

The Editor welcomes the free expression in these columns of genuine opinion on matters of public interest, although he disclaims responsibility alike for the opinions themselves and the manner of their expression.

Glass Insulators.

[To the Editor.]

Sir,—Mr. Goodlet's letter in your issue of February 1st justly criticises the article on glass insulators by Mr. North in the previous issue, and it is a pity so many statements should have been made which cannot be upheld.

We can confirm what Mr. Goodlet says regarding the flashover voltage of glazed and unglazed insulators, and we have never been able to detect any difference in the flashover voltage on insulators of the same design and size, whether glazed or unglazed.

Mr. North appears to be under some misapprehension regarding the test which, in the present B.E.S.A. specification, is called the " Inherent Stress Test." This title is really a misnomer, and we believe that in the revised B.E.S.A. specification it will be referred to as the " Temperature Cycle Test." The object of the test is to find out whether the insulator is capable of withstanding sudden changes in temperature, and, as such, the test (contrary to the statement in this article) is perfectly satisfactory.

The polarised light test is very interesting, but any argument that it can be used to enable the temperature cycle test to be avoided cannot be admitted.

The remarks about cement come as a surprise to those who have used Portland cement for many years with perfect success. It is well known that trouble has been experienced in the past, more especially in America and Germany, but we are inclined to think that this must have been due to the use of a different quality of cement. The use of Portland cement to the B.E.S.A. specification can certainly be recommended, but of course it may not be suitable for use with glass insulators. —We are, etc.,

Electrical Firms and the B.I.F.

[To the Editor.]

Sir,—The British Industries Fair which opens its doors in London and Birmingham on February 18th will again be larger and more representative than ever. The buildings have again had to be considerably extended to accommodate more than 2 000 exhibiting firms. At Birmingham this year's extensions have given the Fair a building under one roof, and without an intervening wall, of approximately, 12 acres, with a stand frontage estimated at 15 miles.

The electrical trade makes a bigger show than ever this year. Visits of various associations and official luncheons have been arranged, as in previous years, and more electrical men will visit the Fair this year than ever before.

A new feature this time is the provision of a Conference Hall to enable the various industries to hold conferences, and it is going to be fully occupied during the run of the Fair. The South Midland Area Committee of the British Electrical Development Association are arranging an Electrical Conference on February 22nd, and other trades and industries are arranging similar meetings.

Intending visitors to Birmingham who have not already secured accommodation, or who are finding it difficult to obtain accommodation, should communicate with the Accommodation Department, British Industries Fair, Chamber of Commerce, New Street, Birmingham, where a register of suitable accommodation is kept; officers of the Department will be glad to make the necessary arrangements.

Questions have at different times been raised as to whether the time at which the Fair is held is really the most suitable—and on this there is undoubtedly much to be said from the point of view of overseas visitors—whether its being held partly in London and partly in Birmingham is advantageous or otherwise, and so on.

Assuming for a moment that everything connected with the Fair is at present not ideal—including the fact that the buildings themselves are perhaps hardly worthy of the examples of British industry that they house—and bearing in mind its comparatively humble beginnings and that it has had no subsidy or grant, but has had to erect its own buildings and generally pay its own way, is not its continuous expansion all the more remarkable ?

Whatever shortcomings, if any, and in whatever respect, the Fair may have, its continued definite and steady growth, the ever increasing number of manufacturers and different trades participating, and the steadily rising number of visitors year by year cannot be without significance. It would appear as justifying the belief of its organisers that in an annual co-operative display of British products, such as this Fair is, British manufacturers would find a powerful instrument to help them in the expansion of their overseas trade and influence—whilst definitely strengthening it at home.

If the ten years' persistent success of the Fair has established or is establishing that fact, then has the time not come for the industries of the country themselves to assist in perfecting the instrument or any details thereof that may still require perfecting ?

I suggest that manufacturers generally, manufacturers' associations and federations in particular, might, during its run, take the opportunity of carefully considering the question of this annual Fair in all its bearings, and formulate plans and suggestions in regard to its future.

At the Leipzig Fair, for instance, many of the principal German industries, such as the electrical industry and the machine tool industry, have each erected their own permanent building in which every year their own products are exclusively shown, such buildings, needless to say, being all that they should be for the purpose.—I am, etc.,

T. R. Martin,
Member of the Fair Management Committee.

Birmingham.
February 5th.

Electrical Firms and Radio Retailing.

[To the Editor.]

Sir,—That part of the " reciprocal understanding " between the R.W.F. and the W.R.A. which provides for the circulation amongst members of the former of " the names of applicants for trade terms, who, in its view, do not comply with recognised trading requirements," reveals a somewhat ludicrous situation.

The chief " recognised trading requirement " of the R.W.F. appears to be that the person or firm entitled to trade terms for radio apparatus from its members must hold a representative stock of these articles and display them in a shop window. The trade of the applicant is not stipulated; in other words, anyone who is willing to buy a stock of radio components and display this in his shop window is presumably entitled to trade terms from members of the R.W.F., even if his normal line of business is that of boot repairer, gent's outfitter or fishmonger, and his radio knowledge nil, whilst the orders of the qualified electrical engineer, who requires radio apparatus for resale to his clients but does not want to fill his stockroom with them or allocate a window for their display, are apparently not wanted by R.W.F. members.

As a case in point—during the extension of a country house installation, my client asked me to look at his wireless installation which would not function. This had been supplied and installed by a firm included amongst those entitled to buy at trade terms from R.W.F. members by virtue of their stock and window. Amongst other things I found totally unsuitable valves in every stage, an inadequate supply of plate current, an aerial of the Heath Robinson type, a gas pipe earth and a so-called battery charging arrangement consisting of a generator coupled to a very old single phase squirrel-cage induction motor, the running coils of which had been connected in some extraordinary manner *through a thermionic rectifier to the d.c. house supply*, doubtless on the assumption that since the rectifier had been advertised as being capable of converting a.c. to d.c. it should behave vice-versa when required, and so run the motor !

I have also come across several examples of battery eliminators installed by similar firms of " radio retailers " which have come very nearly up (or rather, down) to the standard of those examples of horrid wiring which Mr. Moss shows us in his articles.

Recently my moderate, but sustained, stream of orders for radio apparatus has been diverted from a member of the R.W.F. direct to the manufacturers in some cases, and to non-members of the R.W.F. in other cases, by reason of a communication received from this R.W.F. member informing me that, since I do not display a stock of radio components in a shop window, they can no longer supply me ! ! ! The fact

Digitized by Google

that I carry a stock of engineering and electrical plant and accessories apparently cuts no ice !

The inconvenience thus caused is admittedly negligible, and there are undoubtedly many other electrical engineers in a similar position, but does it not seem curious that the R.W.F. should thus restrict its member's sales, and also that it should thus encourage all and sundry shopkeepers to dabble in radio apparatus in preference to electrical engineers ?—I am, etc.,

"AMUSED."

Steel Conductors for Power Lines.

[TO THE EDITOR.]

SIR,—Having erected a considerable amount of 11 000 V steel wire transmission lines in Buckinghamshire, the article by Mr. Taylor in your issue of February 8th was much appreciated.

With regard to the life of the wire, I am expecting this to be between 10 and 15 years, which is satisfactory considering the cost of the conductors.

A favourable point is that aluminium steel conductors, having the same characteristics as the existing steel conductors, can be put on the existing poles when the load develops or the steel becomes obsolete.

Mr. Taylor mentions that the inductive reactance may reach very serious proportions. I do not agree. If the current is heavy then the load will warrant a copper conductor, but for light loads the external and internal reactance is negligible ; for instance, with 10 A (190 kW, 11 000 V) the impedance for a 7/12 S.W.G. steel wire is only increased from a d.c. resistance of 3·6 to 3·7 Ω. The point is, that for low resistance copper, the reactance is comparatively large, but for a high resistance steel conductor, the reactance is comparatively small.

Mr. Walton's paper on Steel Conductors in the "I.E.E. Journal" of October, 1928, gives details on this reactance problem.—I am, etc.,

W. A. TURNBULL,
Borough Electrical Engineer.

Aylesbury.
February 11th.

SIR,—In your issue of February 8th a paper by W. T. Taylor on "Steel Conductors for Overhead Power Lines" is published.

It may be of interest to draw the attention of your readers to a paper recently published in the Proceedings of the Institution of Electrical Engineers, by Mr. E. C. Walton, B.E., volume 66, page 1065, on "The Electrical Properties of Galvanised Steel Conductors for Overhead Transmission Lines."

This paper records the results of a large number of observations on four kinds of material suitable for overhead lines, and it is shown that the best of the four grades of material tested is a hard drawn steel having a tensile strength of 45 tons per square inch. As Mr. Taylor states in his paper, the electrical resistance for alternating currents does not correspond at all with that for direct currents and varies very considerably with the current which is passing through the conductor.—I am, etc.

ELECTRICAL RESEARCH.

Association's Work Represents Large Savings to Supply Undertakings.

THE British Electrical and Allied Industries Research Association held a luncheon at the Savoy Hotel, London, on February 8th, in connection with the Association's eighth annual general meeting.

Col. KENELM EDGCUMBE, proposing the toast of "The Electrical Research Association," said he had unbounded faith in research. It was a really safe investment, as money spent in this direction was bound to come back. The industry stood to gain enormously from research, the supply side, perhaps, more than others.

Mr. C. P. SPARKS (the President), in responding, recalled that prior to the formation of the E.R.A. both the B.E.A.M.A. and the Institution of Electrical Engineers had started co-operative work on a small scale, and, while valuable work was done on one or two researches, it was soon recognised that the funds available from this source were quite inadequate to handle the many problems requiring investigation.

The E.R.A. owed its existence chiefly to three sources : First and foremost to the manufacturers, in guaranteeing £8 000 a year for the first five years of its existence ; secondly, to the Department of Scientific and Industrial Research, who contributed pound for pound during the initial period ; and thirdly, to the large body of voluntary workers controlling the ndividual researches under the supervision of the director.

Object of the Association.

The main object of the Association was to undertake co-operative research in all matters affecting the electrical industry, including problems affecting both the manufacture of plant and the supply of electricity which lay outside the capacity of individual undertakings.

It was important to note that co-operative research undertaken to benefit the community as a whole was entirely distinct from, and not in any way meant to replace, independent research carried out by individual firms ; in the opinion of the Department of Scientific and Industrial Research, the general trend of co-operative research had been to encourage independent private research.

In round figures, £160 000 has been expended by the E.R.A. during the last eight years—an average of £20 000 a year, the present rate of expenditure being some £25 000 per annum. The real investment was represented by a much larger figure, as it was supplemented by the valuable services of some three hundred voluntary workers, the use of plant, etc.

The annual saving arising out of the work of the E.R.A. from the seven specific researches—on underground cables ; insulating material ; insulating oil ; dielectrics ; overhead transmission ; switchgear and control apparatus ; and steam turbine nozzles—was estimated as already saving a figure approaching £1 000 000 per annum.

The last report of the Department of Scientific and Industrial Research recorded that certain researches of the E.R.A. had been "curtailed or suspended for lack of the necessary funds."

This had been the position for the last two years, and the 1928/29 programme, involving an expenditure of £36 000, and which the staff organisation was well able to handle, had been curtailed to some £25 000.

To meet the whole position, an important conference held last June recommended—(*a*) Extension of the present scale of expenditure (£25 000 per annum) and to double it within five years ; and (*b*) to widen the articles of association to give adequate representation to all contributing interests. The whole matter was now under consideration by a committee representative of all the interests concerned.

From the conference of last June £50 000 per annum should be found within the next five years. In 1928 some £5 000 (one-fifth of the income) had been derived from the supply section of the industry. While the proportion which should be found by each section of the industry was now the subject of inquiry by the committee appointed last June, he could not but feel that the supply section—subject to adequate representation on the Council—should find a much greater proportion in future.

The investment in the electricity supply industry at home was over £300 000 000, and the gross revenue some £45 000 000 per annum ; if only one-tenth of 1% of that sum were contributed to the E.R.A., all the funds necessary for a full programme would be available.

RAILWAY ELECTRIFICATION.

A Critical Examination of Proposals for the Manchester Area—The "South Junction Line"—Third Rail and Overhead Systems.

By J. G. B. SAMS. A.M.Inst.M.E., M.Inst.Loco.E.

IT has been reported in the Press, and seems to be generally accepted in informed circles, that the length of railway extending from the back of the joint station at London Road (Manchester) to the Cheshire town of Altrincham, locally known as the "South Junction Line," and operated by a combination of the L.M.S. and L.N.E. Railways, is to be converted to electric traction on a 1 500 V d.c. system, with overhead transmission.

Existing Systems.

This, to put it mildly, is surprising. In the first place, let us consider the sections of railway already electrified in the immediate neighbourhood. In the Liverpool district we find the Mersey and the Overhead Railways together with the L.M.S. Liverpool-Southport lines, all using 600 V d.c. with third rail transmission.

In the Manchester district, there are the Manchester-Bury etc., lines recently converted to electric traction on a 1 200 V d.c. third rail system. The small length of railway between Tottington and Holcombe Brook was experimentally electrified with an overhead transmission system many years ago, and, being only a very short length of railway, can still be considered something of an experiment.

There are, no doubt, many excellent technical reasons for the application of the suggested installation to the South Junction Line, but let us carry our minds back a little; first to the "Broad Gauge" of the G.W.R., which, although superior to the narrow gauge, had to be altered at great cost to the narrow gauge in the interests of standardisation. Next, let us recall that the original installation schemed for the London suburban electrification of the ex-S.E. and C.R. was one of 1 500 V d.c. third rail on a "three-wire" system, giving 3 000 V across the outers, but the approaching amalgamation of the Southern group compelled them to modify their ideas and to fall into line with the ex-L.S.W.R. system of 600 V d.c. third rail; this system being what might be termed the London standard, observing that it is also in use by the L.M.S., the Underground and the Metropolitan Railways. In addition, the Southern Railway, in order to secure final standardisation, have been compelled to convert the ex-L.B. and S.C.R. section from its original a.c. overhead transmission to the London standard. All this, then, may be taken as proving the necessity for standardisation at the *outset*.

Returning to Lancashire, as it is possible to run 600 V motors two in series using a 1 200 V supply, the difference in pressure can easily be overcome if necessary, but the South Junction proposal represents a hopeless departure from the standard of the existing majority.

We have seen that out-of-standard railways cannot finally exist, and have to be converted sooner or later at great (and unnecessary) expense, and, bearing in mind that in the immediate future the present electrified sections will be extended until they practically cover all North Cheshire and South Lancashire, the time would appear to be ripe for evolving a definite electrification standard to be applied to all railways in this district; and financial reasons will, in all probability, compel this standard to be in consonance with the existing electrified portions.

Opponents claim that standardisation prevents the use of the latest and most economical plant and methods, and point to the continual advance of electrical science. But is it not better to determine upon a definite system and to centre on improving that system, remembering the considerable advantages of standardised production and repairs, and of through running which must eventually take place if the traffic offering is to be handled properly.

Given, then, a complete electrified Manchester suburban system, what would be needed to make it fully convenient to the public, and consequently of the greatest earning power to its owners, is a link between the three Manchester terminals, London Road, Victoria cum Exchange and Central. This might well take the shape of an overhead railway extending from London Road to Central via Victoria, with possible intermediate stations at Oldham Road and Deansgate. Overhead is preferable to underground, as the connecting railways are both well above street level, and no architectural or civic features would be interfered with to their disadvantage; in fact, the station serving Victoria cum Exchange might well be built to cover in some more of the River Irwell, which informed parties would allow to be an advantage.

The provision of the suggested link would enable the suburban services now terminating at London Road and Central stations to run right across Manchester into the suburban area at the far side. (This idea might advantageously be applied as far as possible to similar services now terminating at Exchange and Victoria stations). Passengers between all suburban stations would be able to travel frequently without change, and at most with one change; traffic into the City itself would also be stimulated by the offer of a greater range of stations, some of them right in the shopping area, and others convenient for warehouses and offices.

In the same way, to stray from Manchester to Liverpool, the Mersey Railway might be converted from a very short and comparatively unimportant passenger-carrying line into a valuable through link across the Mersey for both passengers and goods. In order to bring this about, it would be necessary to extend the Railway from its present terminus under the Central station to the L.M.S. at Edge Hill, and to build a branch from (say) James Street Station to the ex-L. and Y. line somewhere between Exchange and Sandhills stations. This might well be considered by the railway companies concerned (who stand to lose yet further traffic to the road when the new Mersey Tunnel is complete), as a method of conserving and increasing their trade between the north and south sides of the river.

CANADIAN ELECTRICAL CODE.

Wide Acceptance of Standard Rules—No Major Revisions for at Least Two Years.

THE following statement relative to the present position in regard to the acceptance of the Canadian Electrical Code, published by the Canadian Engineering Standards Association in 1927, is contained in a recent Bulletin of the Ontario Hydro-Electric Power Commission:—

The matter of legislating regarding electrical inspection is within the jurisdiction of the provinces and municipalities, and the situation when the Code work was undertaken was that many different sets of rules were in operation in the various provinces, and in many cases in different cities within the same province. This condition imposed hardship and inconvenience upon manufacturers of electrical equipment and upon inspectors and contractors, and was therefore highly undesirable. The Canadian Engineering Standards Association undertook the work of preparing a code, and after several years of effort the first draft of the Canadian Electrical Code was adopted at a meeting in Winnipeg in June, 1927.

After the adoption of the Code at the Winnipeg meeting it was published and distributed to all parts of the country. It was, within a year, adopted by the provinces of British Columbia, Saskatchewan, Ontario, Quebec and Nova Scotia. In Ontario the Hydro-Electric Power Commission was empowered by legislation to administer such rules for many years. In British Columbia and Nova Scotia the conditions were somewhat similar, but in the other provinces it was necessary to enact legislation before the code could be adopted. As has just been stated, legislation was enacted in Quebec and Saskatchewan in 1928, and it is expected that several provinces will follow suit in 1929. The progress of the Canadian Electrical Code has thus been very satisfactory, and it may be stated that the work has been very successful, since the most populous provinces have adopted the code.

It is expected that no major revisions will be required for at least two years, and the next meeting of the main code committee is tentatively arranged for 1930. In the meantime the provincial committees will meet regularly, and exchange views on the suitability of the rules and suggestions for revision.

The Code, as its name implies, is a set of rules governing inside electrical installations. Its preparation was undertaken by the Canadian Engineering Standards Association several years ago in answer to a practically universal demand from many sources for rules which would be uniform throughout Canada.

NEWS IN BRIEF.

Faraday House Old Students' Dance—Finsbury Technical College Old Students' Dinner—Electrical Wages—The Batti-Wallahs—Callender's Hospital and Distress Fund—Faraday and Maxwell Scholarships.

AN effort is being made in Tewkesbury to provide funds for the installation of X-ray apparatus at Tewkesbury Hospital.

Electric lighting is to be installed at the Merry Hill School, Bushey, at a cost of £120.

Ultra-violet ray equipment is to be installed at Dudley Clinic at a cost of £80.

The Faraday House Old Students' Association will hold a dance at the Victoria Halls, Southampton Row, London, W.C., on March 5th.

Past students are reminded that the Finsbury Technical College Old Students' Association are holding their annual dinner at the Trocadero, London, on March 1st.

The annual festival of the National Advertising Benevolent Society will be held on March 22nd. Sir Ernest Benn will preside.

According to "Telephony," the organ of the industry in the United States, 860 000 telephones were added to the American systems during 1928, making the total now in service 19 380 000.

Imports of electrical apparatus and machinery into the Irish Free State during December last amounted to £69 752, as compared with £35 665 for the same month of 1927.

Renfrew County Council is installing fourteen police telephones in public places for connection with Giffnock police station. They will be available for public use in emergencies.

At a joint meeting of the E.P.E.A., Sheffield and District Section, and the Sheffield Illumination Society at Sheffield on February 4th, Mr. R. G. Williams delivered a lecture entitled "Colour Lighting."

The annual dinner of the South Wales Branch of the Association of Mining Electrical Engineers will be held in the Wyndham Room, Cox's Café, Queen Street, Cardiff, on February 23rd.

At a meeting of the Institution of Mechanical Engineers, on March 8th, a collection of recent industrial cinematograph films of engineering subjects will be displayed, including one on "Electro-farming" by Mr. R. Borlase Matthews.

Estimates are being prepared for the new illumination scheme for the coming season now under consideration by Llandudno Electricity Committee. The promenade from the Pier to Craigside will be included, and the invalid shelter illuminations will be improved.

A meeting of the Institution of Welding Engineers will be held in the Assembly Room of the Birmingham Chamber of Commerce, on February 27th, when Mr. C. S. Milne will read a paper entitled "Welding and Cutting Practice with Low Pressure Plant."

Mr. William O'Brien, director of telegraph and telephone utilities, Boston, Mass., says, in the United States, under any other arrangement than private operation, it would have been impossible to extend telephone service to rural communities to anything like the same extent as has been done.

Marylebone (London) B.C. Salvage Committee, reports that the only a.c. motor now in use at the wharf is a 25 H.P. motor used for driving the hydraulic press for baling scrap metal. To obviate purchasing power from the Metropolitan Electric Supply Co., a new d.c. motor, estimated to cost £100, is to be installed.

The Industrial Court decided, in an award issued on Monday, that the wages paid to the staff employed in the electrical generating and sub-stations and on h.t. cables of the Metropolitan Railway, London, be reduced by 2½%. The Electrical Trades Union and the National Union of Railwaymen argued that the Metropolitan could not be regarded as a trunk railway and was more analagous to the London Electric Railways where no reduction had been put into operation.

At a meeting on January 25th, the Postal, Telephone and Telegraph Advisory Committee of Manchester adopted the annual report, which states that during 1928 the number of new telephones fitted was 8 999, the net increase, after allowing for cessations, being 5 091. Effective trunk calls and telegrams numbered 6 482 134, an increase of 264 028. Local calls for the year ended September 30th, 1928, were approximately 66 000 000, against 61 000 000 for the previous year. Street kiosks at December last numbered 386, increase 139, and 122 police telephone boxes were introduced during the year.

A police telephone system is being organised at Reading, with boxes at 26 points to completely encircle the borough.

At Warrington Corporation's Winwick pumping station an additional electrically-driven high-lift pump is to be installed.

The Banbury and District Electric Supply Co. is arranging an all-electric demonstration house to be opened on the Easington housing estate on February 19th.

At a meeting of the Paisley Association of Electrical Engineers on February 6th, Mr. G. Herbert, of the Craigpark Electric Cable Co., delivered a lecture on "Electric Cable Manufacture."

Glasgow Electricity Committee recommends that the annual subscription of £100 to the Electric Lighting Service Bureau be renewed for the current year, and that a supply of electricity be given, for demonstration purposes, free of charge.

In reference to the acceptance by Salford Corporation of the tender of a Dutch firm for supply of electric cable amounting to £9 358, it was stated by a councillor that the difference in price in tenders from British and foreign firms was £2 080.

Mr. E. E. Calvert, electrical engineer to Finchley U.D.C., is preparing an estimate of the cost of certain extensions to the rectifier plant which will be necessary during the present year.

A course of five lectures on high voltage cables will be given at the I.E.E. by Mr. L. Emanueli on February 20th, 22nd, 26th; March 1st, and 5th. At the first lecture, Prof. C. L. Fortescue will preside.

The next luncheon of the Batti-Wallahs' Society will be held at the Hotel Cecil on February 27th, when Lt.-Col. K. Edgcumbe will speak on "Prosperity." The Society's annual dinner and dance, fixed for March 1st at the Hotel Cecil, already promises to eclipse previous records.

Owing to the General Election, Blackpool Corporation has decided not to proceed with any special early season attractions in 1929. The usual illuminations are to be held in the autumn, however, the dates fixed being from September 21st to October 21st.

The annual examinations for a Faraday scholarship of fifty guineas per annum, tenable for two years in college and one year in manufacturing works, and for a Maxwell scholarship of fifty guineas per annum, tenable for one year in college and one year in works, will be held at Faraday House on April 9th, 10th and 11th.

Southport Council has had under consideration plans for the electrical illumination of Lord Street. The Electrical Engineer estimates that the cost of providing coloured electrical illuminations in the trees on the shop side of Lord Street on the basis of from 12 to 15 lamps per tree, including new mains, wiring and lamps, with necessary alterations to the existing switchboxes, transformers, etc., would be £1 077, and that the total number of lamps to be used in the scheme would be 1 378. It has been decided to provide lamps, as an experiment, in about 15 trees.

The Hull Medical Officer of Health reports that workers in departments for light treatment of patients have experienced difficulty owing to the fact that the output of ultra-violet light from certain lamps varies materially, and no simple and accurate method of measuring the output has yet been devised. He has suggested that the University College be asked to co-operate with his department in research work on the devising of a simple and efficient method of measuring the output of ultra-violet light from different sources, and the effect of light of different wavelengths on the human body. This suggestion has been adopted by the Corporation.

The report of Callender's Hospital and Distress Fund, approved at the recent general meeting, states that members' subscriptions, £947 12s. 4d., are lower than last year by £32 13s., but the awards to hospitals, etc., £885 15s., have not been decreased. Hospital letters issued were 668, and letters for special nursing at home 28. Surgical appliances were supplied in 78 cases, compared with 122, the number of convalescent home letters issued was 38, and spectacles were supplied to 128 applicants. Grants amounting to £92 7s. 6d., against £83, were made to members in distressed circumstances. Donations amounting to £158 3s. 10d. were received.

PERSONAL.

MR. Thomas Alva Edison celebrated his 82nd birthday on Monday.

Mr. Owen Young, chairman of the General Electric Co., of New York, was on Monday, elected chairman of the Expert Committee on Reparations, now sitting in Paris.

Mr. V. W. Dale, business manager of the British Electrical Development Association, who has been suffering from pneumonia and empyema, following influenza, is now making very good progress, although it will be some time before he will be fit to return to his usual activities.

MR. Denis Ziani de Ferranti, youngest son of Dr. and Mrs. S. Z. de Ferranti, with his bride, Miss Elizabeth Esplin Thomson, photographed at the reception following their wedding at the Roman Catholic Church of All Saints, Hassop, on February 9th. The group includes Miss Yvonne de Ferranti and the Misses Yolande and Valeria de Ferranti, who acted as bridesmaids.

Mr. Harry Moss and Mr. A. Smith of Bradford, Mr. D. Green of Leeds and Mr. P. Hewitt of Sheffield, have been elected to represent the E.C.A. on the new North Midland Area Committee of the E.D.A. Mr. H. Rendall Baker, borough electrical engineer, Halifax, has been elected chairman.

Mr. R. Hoggard, manager of Lincoln Corporation Transport Department, who is leaving to take up a similar position at Chesterfield, has been presented by the employees with a silver tea and coffee service and a silver tray. From the city officials he received an electric lamp standard in oxidised silver.

The General Purposes Committee of the Bridlington Town Council on January 21st considered a recommendation by the Electricity Committee that the salary of the borough electrical engineer, Mr. A. J. Beckett, should be increased from £640 to £705 per annum. It was decided to defer the matter until the end of the financial year.

The Massachusetts Institute of Technology, Cambridge, Mass., has invited Prof. Dr. Ing. Reinhold Rudenberg, chief electrician of the Siemens-Schuckertwerke A.G., to deliver, at the Institute, before March 26th, 1929, a series of lectures on the latest progress in electrotechnics. Prof. Rudenberg has been an honorary professor at the Technical High School, Berlin, since 1926, and the degree of Dr. Ing. was conferred upon him by the Technical High School, Karlsruhe, in 1921.

The retirement is announced of Mr. R. Dumas, works manager at Rugby for the British Thomson-Houston Co., Ltd., a position he has filled since 1908. Mr. R. C. Clinker, chief of the engineering laboratory, has also relinquished his position, and is succeeded by Mr. H. W. Warren. Mr. Clinker joined the company in 1895 in London, and Mr. Warren joined the Rugby staff in 1911, and in 1913 went to Coventry and was responsible for the introduction of insulation manufacture, both at Rugby and Coventry.

At the Victoria Electrical Works, Huddersfield, of T. W. Broadbent, Ltd., on February 1, a presentation was made to Mr. Maurice Edward Broadbent, only son of the founder of the firm, the late Mr. T. W. Broadbent, on his coming-of-age. The workmen presented him with a suit case bearing his initials, the gift being handed over by Mr. Law Brook, the oldest employee. Mr. G. A. Broadbent, chairman of the company, presented each workman with a monetary gift, varying in amount according to length of service.

In connection with the retirement of Mr. W. A. Wilson at the end of last year, it is interesting to note that he joined the contract department of British Insulated Cables, Ltd., in April, 1901, as engineer. He supervised various contracts, including complete networks of h.t. cables in Amsterdam, and the laying and jointing of some 100 miles of 11 000 V feeders in connection with the electrification of the Underground Electric Railways. In 1905 he was transferred to the commercial side, being placed in charge of a new branch opened by the company in Birmingham; in 1906 he took over the management of the Scottish branch. He was appointed manager of the company's telephone instrument works at Liverpool in 1911, while in the following year he became commercial manager, involving the management of agencies and publicity. To these latter responsibilities were added, on his transfer to the general manager's office in London, in 1919, those of assistant to the general manager, duties which he continued up to the time of his retirement. Mr. Wilson's retirement and the death of Mr. James Taylor, the late chairman, in September, 1927, have of necessity caused various changes in the staff appointments. As so many of our subscribers are in personal touch with the chiefs of the various departments in British Insulated Cables, Ltd., we feel that it would be helpful to give a list of the new appointments. On the death of Mr. James Taylor, Mr. Dane Sinclair, director and general manager, became chairman of the company; Mr. G. H. Nisbett, chief engineer and director, was made managing director; Mr. B. Welbourn, contract manager, was appointed chief engineer; and Mr. N. K. Bunn, assistant contract manager, was appointed contract manager. On the retirement of Mr. Wilson, it was arranged that a committee should be appointed to take over his duties, the committee being constituted as follows: Mr. R. B. Paul (agency manager), Mr. A. J. Macphail (publicity manager), Mr. W. P. Ward, Mr. L. J. de Wynter, Mr. C. E. Newton, and Mr. E. A. Eaton (joint sales managers). Mr. C. E. Newton was, up to August, 1928, engineering representative at the London office. This appointment has now been taken over by Mr. N. H. Miller and Mr. E. A. Sayers. See page 207.

Obituary.

MR. FREDERICK BEARDMORE, aged 60 years. He was in business as an electrical contractor at Salford.

MR. JOSEPH GOBIN, aged 82 years. He was for many years associated with the old tramway company at Wigan, and was engineer prior to that undertaking being taken over by the Corporation.

MR. THOMAS C. STEPHENS, on February 2nd. He was superintendent at Weston for the Commercial Cable Co. He succeeded Mr. J. P. Gorton in this position in December, 1927, and was with the company for 40 years.

MR. A. H. ALLEN, on Wednesday, in his 57th year, from pneumonia following an attack of influenza. Mr. Allen, who had been a full member of the Institution of Electrical Engineers since 1913, and who was technical editor and a director of the "Electrical Review," which he joined in 1899, served his apprenticeship with Norman and Son, the Glasgow electrical engineers, and in 1889 became electrical assistant to the late Prof. A. Jamieson. After becoming the first Pender Gold Medallist in Electrical Engineering at the Glasgow Technical College, he joined Messrs. J. H. Holmes and Co. at Newcastle-on-Tyne, leaving them in 1894 to become lecturer and demonstrator on electrical design at the Central Technical College, London. Although a keen opponent of the Electricity Bill of 1926, he exerted every effort to assist the smooth working of the measure when it was placed on the Statute Book, and notable among his efforts in this direction was his work in the formation of the Overhead Lines Association in the face of formidable opposition. He took a keen interest in the work of the Electrical Trades Benevolent Institution, and had for some years been a member of the Council. To his journalistic acquaintances, as to others, his unfailing courtesy and dignity, and the kindliness behind a somewhat reserved and undemonstrative demeanour were notably evident qualities. Mr. Allen is survived by his widow and two daughters.

OVERSEAS TRADE.

January Electrical Exports Exceed Imports by Over £1 000 000.

THE exports of electrical machinery, apparatus and material from the United Kingdom during January of this year, amounted to £1 614 301 as against £1 546 691 during the same month of 1928, representing an increase of £67 610. Imports of similar goods for January, 1929, amounted to £598 095, as compared with £572 754 for January, 1928, the increase being £25 341. Comparing exports for the month with imports shows a favourable balance of exports of £1 016 206, or an increase of £42 259 on the position at the same time last year.

Exports which show improvement for the month of January, 1929, when compared with the same period last year include motors and generators, other than railway and tramway motors, increase £60 889; rubber insulated wires and cables, other than telephone and telegraph, increase, £20 293; electric glow lamps, increase, £10 335; and various electrical goods and apparatus, increase £94 448. Exports which show a decline include submarine cables, £31 464; railway and tramway motors, £16 492; telegraph and telephone instruments and apparatus, excluding wireless valves, £40 691; batteries and accumulators, including parts, £19 674.

On the import side, electrical machinery increased by £8 558 when compared with the corresponding month of last year, while rubber insulated wires and cables also showed an increase, namely £2 066. Other import items which show increases are telegraph and telephone instruments and apparatus, £60 681; electric carbons, £2 278; and batteries and accumulators, £6 960. Imports which show decreases for the month include electric glow lamps, £58 371; and commercial electrical instruments other than telegraphic and telephonic but including house service meters, £5 632.

We give below detailed figures for the month of January, 1929, contrasted with those for the same period of last year:—

	Month of January. 1928 £	1929 £
IMPORTS.		
Electrical Machinery	148 096	156 654
Electric Wires and Cables, Insulated—		
Rubber Insulated (not being Telegraph or Telephone Wires or Cables)	15 725	17 791
Insulation other than rubber (not being Telegraph or Telephone Wires or Cables)	46 865	58 660
Telegraph and Telephone Wires and Cables (not being Submarine Cables)	11 834	3 781
Submarine Telegraph and Telephone Cables	—	—
Telegraph and Telephone Instruments and Apparatus (except wireless valves)	53 354	114 035
Carbons, Electric	10 893	13 171

A petition signed by 118 shopkeepers in Prestatyn urban district has been presented to the U.D.C. protest ng against that body erecting shops and engaging in municipal trading. Members of the deputation which presented the petition said it was unfair that the Council should enter into competition with ratepayers as they had done in electric fittings.

LEGAL INTELLIGENCE.

India Rubber, Gutta Percha and Telegraph Works Co. in Patent Action Appeal.

IN the Court of Appeal, consisting of the Master of the Rolls and Lords Justices Lawrence and Russell, on February 1st. the India Rubber, Gutta Percha and Telegraph Works Co., Ltd., appealed from a judgment of Mr. Justice Eve in the Chancery Division, holding that they had infringed the letters patent of the plaintiffs, the Rose Street Foundry and Engineering Co., Ltd., of Inverness, for a welding machine.

The plaintiffs alleged that the defendants' (appellants) had caused to be altered a manually-operated electric resistance butt-welding machine so that it infringed their patent No. 190 734 of 1922 covering the automatic control of the welding operation.

The defendants pleaded that the plaintiffs' invention was insufficiently described in their specification, and alleged that it had been anticipated by prior publications, prior public user, and prior common general knowledge.

Mr. Justice Eve, however, held that the invention was sufficiently and accurately described in the plaintiffs' specification and drawings, and that the utility of the invention had been completely established. He further held that the defendants objections to the validity of the patent failed, and that they had been guilty of infringement.

He accordingly granted the plaintiffs the injunction claimed, an inquiry as to damages, the delivery up of the infringing machines, and the costs of the action. He also granted a certificate of validity. The defendants now appealed.

Mr. Whitehead, K.C., in support of the appeal, said the two issues on the appeal were as to the validity of the plaintiffs' patent and the question of infringement. He contended that the Judge had not come to a proper decision on the construction of the plaintiffs' patent, and finding that it was valid. He also submitted that the Judge was wrong in finding that there had been infringement, as the defendants' machine was enormously different from that of the plaintiffs.

On February 10th judgment was reserved.

IN PARLIAMENT.

New Scottish Bills—Replies to Questions of Electrical Interest.

THE Lord Chairman of Committees in the House of Lords and the Chairman of Ways and Means in the Commons have decided that the promoters of the West Highland Water Power, the Galloway Water Power and the Grampian Electric Supply schemes must proceed by Private Bill legislation and not by Provisional Order. It has accordingly been arranged that substituted Bills shall be deposited and the Bills first considered by the House of Lords.

The Postmaster-General does not propose to recommend a reduction of the cost of wireless licences from 10s. to 7s. 6d.

If no unforeseen difficulties arise the work of laying the submarine telephone cable between the Isle of Man and the mainland will be completed in July next.

The Minister of Transport states that he is informed that all the passenger rolling stock on the scheduled services between Glasgow and London on the L. and N.E. Railway is lighted by electricity, and that as regards the L.M. and S. Railway about 99 per cent. of the vehicles of express passenger trains between London and Scotland are at present electrically lighted. He has the whole matter under consideration.

Ducts and cables containing approximately 600 000 miles of telephone wire, were laid underground during 1928 at a cost of £4 280 000. About 40 000 miles of this represents diversion of overhead wire. Arrangements have been in operation for some time past for the exchange of information between the Post Office and other undertakers, including electricity supply companies, in regard to projected underground works, and every endeavour is made to secure co-ordination in this respect.

There has been a deficit on the telegraph service every year since the introduction of the sixpenny telegram in 1885. In the inland service there has been for years a continuous decline of traffic. Improvements of service are being effected by the introduction of machine telegraphy on a large scale, but the Postmaster-General fears that there is no prospect of making the service self-supporting so long as the present inland tariff (with a shilling minimum) remains in force, and any considerable increase of the tariff would tend further to accelerate the transfer of traffic to the telephone system.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, when available.

AYLESBURY CORPORATION.—Supply of materials for 12 months to the electricity department, including cable, overhead material, meters, poles, joint and pole boxes, cut-outs, switches, etc. Specification from Mr. W. A. Turnbull, Electricity Works, Exchange Street, Aylesbury.

LIVERPOOL CORPORATION.—Supply and erection of electrically-driven pumping plant, at Aubrey Street pumping station. Specification from the Water Engineer, 55, Dale Street, Liverpool; deposit £2 2s.

Lighting of Bandstands, &c.

RAMSGATE CORPORATION.—Supply of electric lamps, cable strip lighting, material for switchboard, etc., for use at bandstands, concert halls, etc. Specifications, etc., from Mr. R. J. Costerton, entertainments manager, West Cliff Concert Hall, Ramsgate.

ST. HELENS EDUCATION COMMITTEE.—Electric light installation at new Boys' Secondary School. Persons desirous of tendering must send names to Secretary, Education Offices, St. Helens.

CENTRAL ELECTRICITY BOARD, February 15th.—Supply and laying of 66 000 V cables in London area, in connection with South-East England Electricity Scheme. Specification (S.E.E.-L.C.1) and form of tender from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

LEEDS CORPORATION, February 15th.—One year's supply of stores to the electricity department, including castings (section C.), i.r. covered cables, mains boxes and fittings, jointing and insulating materials, fittings and sundries (section N.). Forms of tender, etc., from Mr. C. N. Hefford, manager, 1, Whitehall Road, Leeds. State section for which it is desired to tender.

EASTBOURNE CORPORATION, February 15th.—Electric light installation in 250 small houses. Specification, etc., from Mr. J. K. Brydges, borough electrical engineer.

ST. THOMAS'S CHURCH, GOOLE, February 16th.—Electric light installation in church, presbytery, schools and club. Specifications from the Rev. J. J. O'Shea.

BELFAST CORPORATION, February 18th.—Twelve months' supply of stores for the electricity department, including electrical accessories (form No. 8), lamps (No. 9), carbon brushes (No. 10), bitite strip, prepared tape and rubber tape for joints and joint box compound (No. 12), c. i. street box frames and covers (No. 14), copper cable connectors and solder (No. 18), electricity meters and instrument transformers (No. 19), m.d. indicators (No. 20), automatic time switches (No. 21), cut-outs (No. 22), transformers (No. 23), cables and joint boxes (No. 24), v.i.r. cables, wires and flexibles (No. 26), etc. Forms of tender, etc., from Mr. F. H. Whysall, city electrical engineer and manager, East Bridge Street, Belfast.

BETHNAL GREEN (LONDON) BOROUGH COUNCIL, February 18th.—Six or 12 months' supply of electric lamps, lanterns, etc. Specifications from the Borough Engineer.

CENTRAL ELECTRICITY BOARD, February 18th.—Supply and erection of 132 000 V overhead transmission lines, in connection with the North-West England and North Wales Electricity Scheme. Specification (No. N.W.E.-P.L.1) and form of tender from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, February 18th.—Supply and erection of 132 000 V overhead transmission lines, in connection with the Central England Electricity Scheme. Specification (No. C.E.-P.L.1) and form of tender from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2; deposit £2 2s.

HULL CORPORATION, February 18th.—Twelve months' supply of stores to the tramways department, including controller parts, trolley parts, car truck parts, cables, lamps, lighting fittings, armature repairing material, overhead line material, etc. Forms of tender, etc., from the General Manager, Albion Street, Hull.

LANCASTER CORPORATION, February 18th.—Supply of 400–600 Ah battery (at one hour rate) booster, switchgear, cable connections, etc., for Caton Road generating station. Specifications, etc., from Mr. G. C. Milnes, borough electrical engineer; deposit £2.

STOKE AND WOLSTANTON GUARDIANS, February 18th.—Electric lighting installation at Relief Offices, 18, Church Street, Tunstall. Specification from Mr. W. Pendleton, Union offices, Stoke-on-Trent.

TYNE IMPROVEMENT COMMISSION, February 18th.—One 1½-ton portal, electric, travelling, level luffing crane, for Riverside Quay, Albert Edward Dock, North Shields. Specification, etc., from the Secretary, Bewick Street, Newcastle-on-Tyne; deposit £1 1s.

WEST HAM EDUCATION COMMITTEE, February 18th.—Electric light installation in South Hallsville New School, Agate Street, Tidal Basin. Specifications, etc., from Mr. J. H. Jacques, 61, West Ham Lane, Stratford, London, E.15; deposit £1.

BIRKENHEAD CORPORATION, February 19th.—One year's supply of stores to tramway depots, including overhead line material, copper bonds, trolley wire, traction lamps, tapes, etc. Forms of tender, etc., from the General Manager, Corporation Tramways and Motors, Laird Street, Birkenhead.

MANCHESTER GUARDIANS, February 19th.—Renewal of a 98-cell electric storage battery at the Colony for Epileptics, Langho, near Blackburn. Particulars from Mr. E. Hargreaves, superintendent of works, Union Offices, All Saints, Manchester.

BRISTOL GUARDIANS, February 20th.—Supply of electric fittings for six months. Particulars from Mr. Thomas S. Lamb, clerk to the Guardians.

HARROGATE CORPORATION, February 20th.—Twelve months' supply of stores, including electric lamps, c.i. lamp pillars, etc. Forms of tender, etc., from the Borough Engineer.

HOVE CORPORATION, February 20th.—Supply of electric lamps, etc. Forms of tender, etc., from the Borough Surveyor.

METROPOLITAN ASYLUMS BOARD, February 20th.—Electric lighting installation at Southwark Casual Ward, Guildford Street, London, S.E.1. Specification, etc., from the Board's office, Victoria Embankment, E.C.4; deposit £1 1s.

DUMFRIES CORPORATION, February 21st.—Supply and erection of one 1 500 kW turbo-alternator and condensing plant. General conditions, specification and form of tender from Mr. W. S. Johnston, engineer and manager, Electricity Works, Leafield Road, Dumfries; deposit £1 1s.

Annual Supplies of Underground Cables.

BEDFORD CORPORATION, February 22nd.—Supply of e.h.t h.t., and l.t. underground cables (section 1) and incandescent electric lamps (section 2) during year ending March 31st, 1930. Only British manufacturers in the U.K. are invited to tender. Specifications, etc., from the Borough Electrical Engineer, Prebend Street, Bedford.

BELFAST EDUCATION COMMITTEE, February 22nd.—Electric light installation, at Malone Public Elementary School, Balmoral Avenue, Belfast. Specifications, etc., from the Education Architect, Victoria Street, Belfast; deposit £1 1s.

BELFAST EDUCATION COMMITTEE, February 22nd.—Installation of electric lighting and heating system, in Riddell Memorial Public Elementary School, Malvern Street, Belfast. Specifications, etc., for the Education Architect, Victoria Street, Belfast; deposit £1 1s.

CENTRAL ELECTRICITY BOARD, February 22nd.—Supply of 132 kV outdoor switchgear, for transforming stations in area of Central England Electricity Scheme. Specification from Sir R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2.

BAKEWELL GUARDIANS, February 23rd.—Three-valve wireless apparatus, with three loud speakers (for connection to a.c. mains), for Haddon District Hospital. Tenders to the Clerk, Hospital Committee, Union Offices, Bakewell.

ORSETT GUARDIANS, February 23rd.—Electrical wiring and fitting of new infirmary block and poor law buildings. Particulars from the clerk, Mr. Chas. Asplin, Bank Buildings, Grays.

TYNEMOUTH GUARDIANS, February 23rd. Electric light and heating installation in Children's Scattered Homes, at North Shields, Earsdon, and Monkseaton. Specification from the Clerk, Guardians' Hall, North Shields.

Digitized by Google

BROMLEY GUARDIANS, February 25th.—Installation of intercommunication telephone system (30 points) at the Farnborough Institution. Further particulars from Mr. P. J. D. Wiley, clerk to the Guardians, Bromley, Kent.

HASTINGS CORPORATION, February 25th.—Electrically-driven pumping plant, of British manufacture, for Kent Street pumping station. Specification, etc., from Mr. G. M. C. Taylor (J. Taylor and Sons), Caxton House, Westminster, S.W.1 ; deposit £5.

LONDON COUNTY COUNCIL, February 26th.—Provision and fixing of electric goods lift at Hammersmith Building Trade Schools, Lime Grove. Specification from the Chief Engineer, Old County Hall, Spring Gardens, S.W.1 ; deposit £1.

LINLITHGOW DISTRICT COMMITTEE, February 28th.—Erection of lamps and other electric lighting fittings in Winchburgh and Kirkliston special lighting districts. Specification, etc., from Mr. J. G. B. Henderson, district clerk, Linlithgow.

NEWTON ABBOT GUARDIANS, February 28th.—Electric lighting installation at the Institution. Forms of tender and specification from Messrs. Watson and Watson, 36, Torwood Street, Torquay ; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, March 2nd.—Supply and erection of 33 000 V overhead line—Luton to Aylesbury—in connection with the South East England Electricity Scheme Specification (No. S.E.E.-S.L.2) and form of tender from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, Charing Cross, London, W.C.2 ; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, March 2nd.—Supply and erection of 66 000 V and other transformers in the London area, in connection with the South-East England Electricity Scheme. Specification (No. S.E.E.-L.T.1) and form of tender from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2 ; deposit, £2 2s.

CENTRAL ELECTRICITY BOARD, March 4th.—Supply and erection of 132 000 V transformers in connection with the North-West England and North Wales Electricity Scheme. Specification (N.W.E.-P.T.1) from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2 ; deposit, £2 2s.

ERITH URBAN DISTRICT COUNCIL, March 4th.—Supply of h.t. and l.t. underground cables, joint boxes and other accessories during 12 months. Particulars and form of tender from the Electrical Engineer, Walnut Tree Road, Erith.

LEEDS CORPORATION, March 5th.—One year's supply of materials to the tramways and transport department, including electrical sundries, bitumen compound, electrodes, etc. Specification, etc., from Mr. R. L. Horsfield, general manager and engineer, 1, Swinegate, Leeds.

RACECOURSE BETTING CONTROL BOARD, March 5th.—Supply and erection of equipment for mechanical control of racecourse betting transactions in Great Britain. Specifications, etc., from Mr. J. R. Chambers, Secretary, 33, St. James's Street, London, S.W.1 ; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, March 6th.—Supply and erection of 66 000 V switchgear, for South-East England Electricity Scheme (London area), and supply and erection of 132 000 V transformers. Specification from Sir R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2.

LEEDS CORPORATION, March 9th.—Supply of single-phase (2 000 and 6 600 V), three-phase (6 600 V) and Scott-connected transformers, as required over a period of two years ; and 11 000 V, three-phase transformers (10 500 kVA), for early delivery. Specification from Mr. C. N. Hefford, Electricity Department, 1, Whitehall Road, Leeds ; deposit £1 1s.

SHEFFIELD CORPORATION, March 14th.—Buildings, civil engineering works and constructional steel work (specification B.M. 64) ; transformers (B.M. 66) ; pipework and valves (B.M. 69) ; e.h.t. three-phase switchgear (B.M. 71) ; battery locomotive and accessories (B.M. 74). Specifications (deposit £3 3s. for each) from Mr. S. E. Fedden, general manager and engineer, Electric Supply Department, Commercial Street, Sheffield.

Overseas.

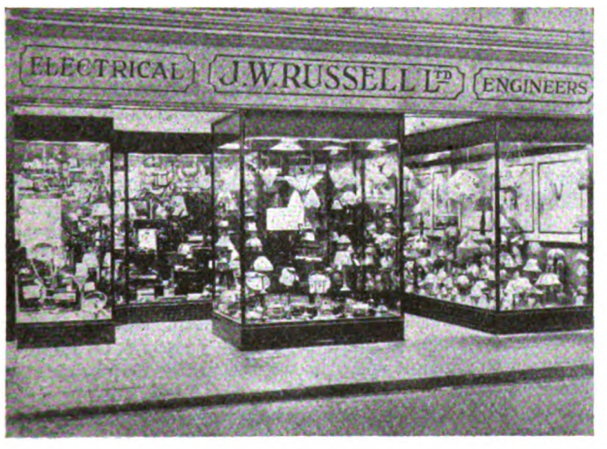
UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

INDIA STORE DEPARTMENT, February 15th.—Supply of 62 248 metallic filament lamps, for train lighting. Form of tender (5s.) from the Director-General, Belvedere Road, London, S.E.1.

INDIA STORE DEPARTMENT, February 15th.—Supply of hydro-electric plant, comprising four 12 000 kW water-wheel driven alternator sets, auxiliaries and spares (schedule 4). Forms of tender (5s.) from the Director-General, Belvedere Road, London, S.E.1.

IXELLES MUNICIPALITY, February 16th.—Supply of armoured cables. (Reference B.X. 5 100.)

NEW SOUTH WALES DEPARTMENT OF PUBLIC WORKS. Extension of date.—February 18th.—Supply and erection of



CONTRACTORS' SHOWROOMS.

THE accompanying pictures illustrate the new showrooms opened by J. W. Russell, Ltd., electrical engineers and contractors, of Watford. The frontage of the premises is 34 ft., the showrooms having a depth of 80 ft. The windows are laid out on the island scheme, giving a window glass frontage of 84 ft. The ceiling layout is on the panel principle, having flush plug and fitting hooks fixed at the panel crossing, and each switched independently, thus permitting any of the 200 fittings to be demonstrated separately if necessary. The floor layout is such that different sections are arranged as dining room, drawing room, etc. At the rear of the main showrooms are rooms fitted out as demonstration kitchen, bathroom, etc., showing geysers, immersion heaters, reflectors, cookers, etc., working under actual conditions. Above the main showrooms are the offices and large stock rooms, as well as workshops for the repair of all classes of electrical equipment.

hydro-electric generating plant for Burrinjuck development. (Reference 4 938.)

INDIAN STORES DEPARTMENT, February 19th.—Supply of Diesel engine, directly coupled to 115 kW, d.c. generator (Order No. N/9 322.) (Reference B.X. 5 097.)

NEW ZEALAND POSTS AND TELEGRAPHS, February 19th.—Supply of bronze wire and copper binding wire. (Reference A.X. 7 252.)

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, February 19th.—Supply of 120 000 galvanised steel spindles for insulators. (Reference B.X. 4 948.)

POSTMASTER - GENERAL'S DEPARTMENT, MELBOURNE, February 19th.—Dry cells and wet battery parts (schedule C. 404). (Reference B.X. 5 068.)

CAPE TOWN MUNICIPALITY, February 20th.—Pumping equipment for storm water, etc., for the electricity department (specification 445/28). (Reference A.X. 7 345.)

WHANGAREI (N.Z.) HARBOUR BOARD, February 28th.—Supply of one 15-ton electrically-operated level luffing gantry crane (contract No. 35). (Reference A.X. 7 263.)

JOHANNESBURG MUNICIPALITY, March 4th.—Supply of 6 600 V switchgear (Contract No. 126). (Reference B.X. 5 087.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 5th.—Supply of seven single-phase 5 500 kVA transformers, for Waitaki power scheme, section 4. (Reference B.X. 4 873.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, March 7th.—Supply of hydraulic accumulator, horizontal ram pump, electric motor, motor or belt driven air compressor, starter and control gear.

DUNEDIN, N.Z., CORPORATION, March 20th.—Supply of hand brake equipment, electrical equipment for magnetic brakes and bogie trucks, for tramcars.

CAPE TOWN MUNICIPALITY, March 21st.—Supply of 300 A fuses (specification 453/1928). (Reference B.X. 5080.)

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, March 26th.—Switchboard cords. (Reference B.X. 5 067.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, March 26th.—Supply of telephones and dials (schedule C. 401). (Reference B.X. 5 023.)

EGYPTIAN MINISTRY OF THE INTERIOR, March 27th.—Supply and installation of electric lighting system for the town of Fashn. (Reference B.X. 5 037.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, March 28th.—Supply of telephone switchboard cords. (Tender No. 148.) (Reference B.X. 5 048.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, April 2nd.—Supply of jumper rings and terminal strips (schedule C. 405). (Reference B.X. 5 066.)

VICTORIAN ELECTRICITY COMMISSION, April 8th.—Supply of 22 000 V transformers (specification No. 29/17). (Reference B.X. 5 101.)

VICTORIAN ELECTRICITY COMMISSION, April 8th.—Galvanised steel transmission line towers (specification 29/13). (Reference A.X. 7 401.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, April 9th.—Supply of induction voltage regulators, for Lake Coleridge scheme (section 215). (Reference B.X. 5 018.)

VICTORIAN ELECTRICITY COMMISSION, April 29th.—Supply of two or three steam turbo generator sets, with condensers, etc., for Yallourn power station extension (specification 29/7). (Reference B.X. 5 062.)

VICTORIAN ELECTRICITY COMMISSION, April 29th.—Supply of two swing hammer mills, with electric motors, for brown coal (specification 29/9). (Reference A.X. 7 434.)

STATE ELECTRICITY WORKS, MONTEVIDEO, July 8th.—Construction and equipment of 50 000 kW power station.

Tenders Accepted.

EGYPTIAN STATE RAILWAYS.—Bellis and Morcom, supply of two generating sets, £1 275.

ADMIRALTY.—Edison Swan Electric Co., Ltd., supply of vacuum and gas-filled lamps.

DUBLIN CORPORATION.—General Electric Co., Ltd., maintenance of electricity meters for one year, £700.

GRIMSBY CORPORATION.—Metropolitan-Vickers Electrical Co., Ltd., supply of extra high pressure switchgear, £3 550.

BOOTH STEAMSHIP CO., LTD.—Siemens Electric Lamps and Supplies, Ltd., 12 months' supply of Siemens electric lamps.

TORQUAY CORPORATION.—Johnson and Phillips, Ltd., overhead 11 000 V three-phase line from Ipplepen to Dartington.

GLASGOW CORPORATION.—Kennedy, Stark and Co., electric lighting, bell and fire-alarm installations at Mearnskirk Sanatorium, £1 571.

SALFORD CORPORATION.—N. V. Nederlandsche Kabelfabriek, Delft, Holland, supply of cable to British standard specification, £9 358.

GILLINGHAM (KENT) CORPORATION.—Callender's Cable and Construction Co., Ltd., cable for extension to Rainham, Wigmore and Hempstead, £7 807.

MANCHESTER CORPORATION.—Cargo Fleet Iron Co., Ltd., supply of tramway rails for sidings at Hyde Road depot; G. Hill and Co., renewal of electric lighting cables at Baguley Sanatorium.

MANCHESTER CORPORATION. Seddon and Sons, alterations to electric light installation at Queen Street Central Municipal School; C. Churchill and Co., Ltd., shaping machine and electric drill.

MANCHESTER CORPORATION.—Forest City Electric Co., Ltd., and Messrs. Thos. Bolton and Sons, Ltd., tramway rail bends; J. Needham and Sons, Ltd., cast iron finials for tramway poles.

Electrically-Driven Pumping Plant.

METROPOLITAN WATER BOARD.—Worthington-Simpson, Ltd., two sets of centrifugal pumps, one turbine-driven and one electrically-driven, for Kempton Park Works, £542. (Recommended.)

BRADFORD CORPORATION.—E. Green and Son, Ltd., erection of certain apparatus in connection with scheme for increasing the economiser surface of a boiler at the Valley Road power station.

STEPNEY (LONDON) BOROUGH COUNCIL.—Reason Manufacturing Co., Ltd., replacement of about 850 old-type demand indicators, at £2 7s. per instrument, allowing the Council 7s. for each old instrument.

ROTHERHAM CORPORATION.—Vickers-Armstrong, Ltd., supply of pumping plant required in connection with river and canal pumping scheme, £1 295 (including allowance of £200 for switchgear and £100 for contingencies).

TORQUAY CORPORATION.—Switchgear and Cowans, Ltd., vertical shrouded ironclad switchgear, at Vicary Mills substation, £81[illegible]; Johnson and Phillips, Ltd., erection of overhead 11 000 V three-phase line from Ipplepen to Dartington, £2 880 13s. 11d.

VICTORIAN ELECTRICITY COMMISSION.—John Thompson Water Tube Boilers, Ltd., 8 boilers, each of overload capacity of 85 000 lb. of steam per hour, 275 lb. working pressure, with superheaters, air pre-heaters, fans, pupework, etc., for Yallourn power station, £223 288.

MANCHESTER CORPORATION.—Ferranti, Ltd., Measurement Ltd., and Metropolitan-Vickers Electrical Co., Ltd., supply of meters; Waygood-Otis, Ltd., provision of electric lift at High School of Commerce; Sudlow and Co., electric light installation at Apollo School Centre.

LEEDS CORPORATION.—Supply of cables: W. T. Henley's Telegraph Works Co., Ltd., £4 752 14s.; Enfield Cable Works, Ltd., £3 008; Macintosh Cable Co., Ltd., £20 776 10s.; Hackbridge Cable Co., Ltd., £1 865; and Greenwich Cable Works, Ltd., £4 118 10s. 4d.; Thos. Bolton and Sons, Ltd., two miles trolley wire, 12 $\frac{7}{16}$d. per lb.

SALFORD CORPORATION.—A. E. Dean and Co., installation of X-ray apparatus at Tuberculosis Dispensary, Regent Road, Salford, £347; J. Price and Sons, electric light installation at Trafford Road Girls' School, £196; Connolly's (Blackley), Ltd., supply of 4 200 yards of 2 sq. in., e.h.t., concentric, paper insulated, lead covered cable, £1 436; Greenwich Cable Works, Ltd., supply of l.t., paper insulated, lead covered and armoured cable, £2 633. (All recommended.)

GLASGOW CORPORATION.—A. Robertson, electrical installation work in houses in Scotstoun area, £2 361; D. Henderson, electrical installation work in houses under Gairbraid Avenue re-housing scheme, £1 618; Ferranti, Ltd., supply of seven single-phase 50 kVA transformers, £409; and 12 kVA portable a.c. testing equipment, £168; Lancashire Dynamo and Motor Co., Ltd., 50 H.P. motor, £143; British Electrical and Manufacturing Co., supply of 50 000 yards of cable, £562.

SHEFFIELD CORPORATION.—Steel, Peech and Tozer, Ltd., 1 000 tons of tram rails, £10 2s. 6d. per ton. Twin movable connected points—Edgar Allen and Co., Ltd., six at £118 per pair; Messrs. Hadfields, Ltd., 12 pairs at £120 a pair, 3 pairs at £127 per pair; Edgar Allen and Co., Ltd., 3 pairs at £141 per pair, and three pairs at £143 per pair; Titan Trackwork Co., Ltd., 10 manganese steel crossings, £27 15s. each; copper bonds: Thos. Bolton and Sons, Ltd., 1 000 24 in. at £8 4s. 3d. per 100 and 1 000 34 in. at £10 6s. 10d. per 100; A. Frost and Co., Ltd., 100 56 in. at £15 per 100, 200 60 in. at £16; 50 144 in. at £34; 50 192 in. at £45, and 25 204 in. at £47 10s.

WORK IN PROSPECT.

BARNSLEY.—Technical college for the Borough Education Committee. Particulars from the architects, Briggs and Thornley.

BURTON-ON-TRENT.—Orthopædic Hospital wards, for Derbyshire County Council. Particulars from the architects, Martin and Martin and W. H. Ward, 106, Colmore Row, Birmingham.

BURNHAM (ESSEX).—Houses (18), for the Urban Council. Particulars from contractors, J. and F. Challis.

CARLISLE.—Technical school, two central schools, and library and museum extensions, for the City Council. Particulars from the City Surveyor.—Houses for the Town Council Particulars from the contractors, J. and R. Bell, Ltd. (159), John Laing and Son, Ltd. (108), and Border Engineering Contractors, Ltd., Whitehaven (32).

COULSDON AND PURLEY.—Houses (20), Sanderstead, for the Urban Council. Particulars from the surveyor, Mr. G. A. Ballard, 6, Brighton Road, Purley.

DURHAM.—Housing scheme (60), Cassop, for the Rural Council. Particulars from the Surveyor.

FARNBOROUGH (HANTS).—Housing scheme (20), for the Urban Council. Particulars from the architect, Mr. J. E. Hargreaves, Town Hall.

GRAYS.—Secondary school (350 places), for the Governors. Particulars from Mr. J. Stuart, county architect, Springfield Old Court, Chelmsford.

HARPENDEN.—School, Manland Common, for Herts Education Committee. Particulars from the Director of Education, Hertford.

ILFRACOMBE.—Housing scheme for the Urban Council. Particulars from the Surveyor.

LYMM.—Business premises for the Warrington Co-operative Society. Particulars from the C.W.S. Architect, 1, Balloon Street, Manchester.

OLDBURY.—Additional 28 houses for the Urban Council. Particulars from the Surveyor.

REPTON.—Bathrooms, etc., Etwall Isolation Hospital, for the Committee. Particulars from the architect, Mr. R. S. Litherland, 10, High Street, Burton-on-Trent.

RUGBY.—Houses (12), Clifton-on-Dunsmoore, for the Rural Council. Particulars from the surveyor, Mr. J. E. Weeks, Temple Street.

SALE.—Extensions to County High School for Girls, to cost £14 000, for Cheshire Education Committee. Particulars from the County Architect, Chester.

STOCKPORT.—Extensions, Central premises, for the Co-operative Society. Particulars from the general secretary, Mr. S. Lloyd.—Bowl-houses and shelters for the Town Council. Particulars from the borough surveyor, Mr. H. Hamer.

STOURPORT.—Practical subjects centre, etc., for Worcestershire Education Committee. Particulars from the Director of Education, Worcester.

SWADLINCOTE.—Housing scheme (80), for the Urban Council. Particulars from the architects, Baines, Provis and Cope, 22, Friar Lane, Leicester.

THORNE (DONCASTER).—Houses (36), Marshland Road, for Mr. W. Wilkinson.—Housing scheme (48), for the Rural Council. Particulars from the Surveyor.

WALSALL.—Houses (45), for the Town Council. Particulars from the contractors, T. Richards, Ltd., Chasetown.

"INTER NOS."

"Inter Nos," the journal of the Ex-British Westinghouse Association, self-described as a publication of variable frequency is full of the breezy good fellowship which is typical of this group of former members of the staff of the British Westinghouse Co. The latest issue of this literally "price-less" production worthily maintains the X.B.W. traditions, and provides reading matter which is interesting and amusing, even to those outside the charmed circle. Incidentally, "Inter Nos" gives the first intimation of the formation of a new electrical company, which will be known as the Assimilated Genmetenglishratusantipalinhouse, Ltd. This company, it is stated, will produce a lamp on an entirely new principle under the name of "Oscostungnanazda."

The next dinner and reunion of Ex-British Westinghouse men will be held at the Hotel Cecil, London, on March 8th, Mr. F. Massingberd Rogers presiding. Particulars and tickets (15s. each, including one year's subscription) may be had from the honorary treasurer, Mr. W. E. Warrilow, 40, Mildred Avenue, Watford.

TRADE PUBLICATIONS.

WE have received from KING'S PATENT AGENCY, LTD., of 146A, Queen Victoria Street, London, E.C.4, a pocket size diary for 1929.

Super tension cables are described in a new booklet sent to us by SIEMENS BROTHERS AND CO., LTD., Woolwich, London, S.E.18. Reference 155 A.

A new catalogue relative to standard ironclad switch and fusegear has been published by SIMPLEX CONDUITS, LTD., Garrison Lane, Birmingham.

Leaflet No. X.2020, dealing with e.h.t. standard oil switches, has been issued by J. G. STATTER AND CO., of Queen Anne's Chambers, Westminster, London, S.W.1.

The MULLARD SERVICE WIRELESS CO., LTD., Denmark Street, London, W.C.2, has published leaflet W.A.17, dealing with the P.M. gridleak and condenser holder.

The GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, London, W.C.2, has issued booklet F. 4910, concerning industrial and street lighting fittings and accessories.

The new "Exide" poster described below.

The BRITISH THOMSON-HOUSTON CO., LTD., has published three new booklets, L 459 dealing with industrial lighting, L 451 concerning floodlighting, and L 460 devoted to shop lighting.

New lists published by A. H. HUNT, LTD., H.A.H. Works, Tunstall Road, Croydon, include catalogue No. 60 and leaflet No. 138 B, dealing with moving coil measuring instruments.

The BRITISH THOMSON-HOUSTON CO., LTD., Rugby, has published list No. 6845 dealing with d.c. circuit breakers, tramcar pattern, type K/R, and list No. 5270 A* dealing with hand-operated three-phase auto-transformer starters, types AHT and AHQ.

The GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, London, W.C.2, has issued leaflet B.C. 4911, describing the Gecophone portable screen grid four receiver. Leaflets F.4857, F.4858 and F.4859, dealing with Gecofix lighting fittings, have also been published.

We have received from GEORGE NOBBS, LTD., of 89, Cleveland Road, London, N.1, a calender in colours printed on satin. The subject of the picture is a picnic party climbing a hill with a girl as the central figure. The title of the picture is "At the Top," and in these dull days the sunny scene is distinctly pleasing.

We have received from Metro-Vick Supplies, Ltd., of Trafford Park, Manchester, a copy of list No. 150/12. This describes the whole of the company's electrical domestic appliances and certain industrial equipment. The list, comprising some 90 odd pages, is profusely illustrated, and each page is arranged with full details as to technicalities and price.

The CHLORIDE ELECTRICAL STORAGE CO., LTD., of Clifton Junction, near Manchester, has just issued a very attractive coloured poster (20 in. by 30 in.) dealing with the well-known series of Exide DTG, DFG, DHG and DMG 2 V cells for comparatively slow rates of discharge. The poster contains a clear and attractive illustration of a popular type of Exide wireless cell, and prominently sets forth a number of notable improvements which have been effected in the design.

ELECTRICAL ENGINEERS' BALL.

The Electrical Engineers' Ball was given at the Hotel Cecil, London, on February 8th, about 750 invitations having been sent out. The first of these balls was held on February 15th, 1904, and this year's function was made an opportunity for celebrating the 25 years which have passed. Mr. A. M. Sillar, who has acted in the capacity of hon. secretary since the first ball, was, during the course of the evening, presented with a silver inkstand, suitably inscribed.

ELECTRICITY SUPPLY.

Additional Plant for Ashford—Electric Houses at Wakefield—Supply Wanted for Omagh—County of London Co.'s Scheme for Essex—Hackney Electricity Committee Disapproves J.E.A. Proposals—Plymouth Wiring Scheme.

ASHFORD (Kent) U.D.C. is to increase its generating plant, at a cost of £10 000.

Radcliffe-on-Trent P.C. seeks sanction for a loan of £500 for street lighting.

Carlisle Electricity Committee has authorised mains extensions at a cost of £3 175.

The Clyde Valley Electrical Power Company is to erect a sub-station near Ashfield Farm, Possil.

Cables are being laid in Forth Street, North Berwick, for the extension of the electricity supply system.

Newport (co. Fife) T.C. is anxious to obtain a supply of electricity, and has asked the Electricity Commissioners when a supply will be available.

Stretford U.D.C. has applied to the Electricity Commissioners for sanction to borrow £20 000 to meet prospective expenditure in respect of the provision of l.t. mains and services.

Wakefield Electricity Committee has authorised the Electrical Engineer to fit 50 houses on the Lupset estate with electrical appliances, on similar lines to the houses which have already been fitted on the estate.

Bristol Electricity Committee reports that it is necessary to replace e.h.t. switchgear at the Feeder Road station by larger and more up-to-date gear. The cost of the new works will be approximately £26 090, including £7 000 for building work.

London County Council has approved plans submitted by the County of London Electric Supply Co., the Kent Electric Power Co., and the West Kent Electric Co., Ltd., for laying a 33 000 V feeder cable and a control cable from Woolwich to Swanscombe.

The Town Clerk of Omagh has been instructed to communicate with certain towns where electrical plant has been installed and obtain details as to the working and cost of the undertakings. Local opinion is in favour of obtaining an electricity supply for the town.

The County of London Electric Supply Co. has informed Ongar R.D.C. that it has formulated a scheme for the supply of electricity throughout all parts of the county of Essex, not otherwise already supplied. The transmission system is to be mainly overhead.

The assessment authorities have proposed to increase the assessment of Hull Corporation's electricity department from just over £10 000 to £45 000. The Electricity Committee has confirmed the action of the City Treasurer in appealing against the assessment.

The Glasgow Lighting Inspector who recently attended a demonstration in London in connection with the Radiovisor automatic lighting unit, desires to make further experiments in his own laboratory in connection therewith. The Watch Committee recommends that he be authorised to expend a sum not exceeding £100 in connection with these experiments.

East Ham Electricity Committee has had under consideration the question of establishing an installation department in connection with the electricity undertaking and, having heard the report of the engineer and manager thereon, recommends that the matter be left in the hands of the chairman and the engineer and manager, who will prepare a further report.

Tonbridge U.D.C. has applied for a loan of £12 715, estimated expenditure to March, 1930, in connection with the alteration of the system of supply of electricity. The total applied for originally was £21 100, to be expended between 1929 and 1934, but the Commissioners intimated that they could only sanction the amount required for any one year.

Tavistock R.D.C. has been asked to consent to Messrs. W. G. Heath and Co.'s application for an Order to supply electricity in Tavistock rural district. Messrs. Heath and Co. already supply in Okehampton, and in the urban district of Tavistock and the parish of Yelverton. At a recent meeting of the R.D.C., a committee was appointed to consider the matter.

Canterbury Lighting Committee has offered to supply electricity to houses on the North Holmes site at a flat rate of 9d. per week, on the Housing Committee guaranteeing the weekly payments, but has declined to sell fittings to the tenants. The Council has given the guarantee, but has decided not to adopt the Electricity Commissioners' suggestion to provide the first lamps free of charge.

At a meeting of Kesteven Council last week a special committee, reporting on a suggested scheme for supplying Lincolnshire with electricity, recommended that of Mr. Borlase Matthews. The committee had pointed out that the areas around Grantham and Sleaford were being neglected, but on negotation, Mr. Matthews had agreed that those areas should be provided with electricity within five years. The report was adopted.

Gloucester Corporation has decided to apply for a loan of £90 345 5s. 5d. to cover past and prospective expenditure. The former includes extensions of buildings, £2 301 12s. 4d.; machinery, £12 756 12s. 1d.; mains, cables, and overhead lines, £43 891 7s. 11d.; electrical instruments, £160 5s.; public lamps, £1 717 9s. 1d.; sub-station buildings, £8 128 19s.; and sub-station equipment, £839. The prospective expenditure comprises £10 000 for rotary converters; mains and services, £10 000, and public lamps, £550.

Hackney (London) Electricity Committee recommends that the Central Electricity Board, the Electricity Commissioners, the London and Home Countries Joint Electricity Authority, and the Conference of Local Authorities owning Electricity undertakings in Greater London be informed that the B.C. does not approve of the proposals of the Joint Committee of the Joint Electricity Authority and the Conference of Local Authorities owning electricity undertakings for a combination of ownership and operation of local authority generating stations and main transmission lines by transferring them to the Joint Electricity Authority.

Arrangements have been made by Liverpool Power and Lighting Committee for the supply of energy for heavy and commercial cooking apparatus at ⅝d. per kWh, except between 4 p.m. and 6.30 p.m. from October 1st to March 31st. In this excepted period the lighting rate will be applicable. Tenants of Corporation houses are to be permitted to employ slot meters, with the option of a quarterly meter. The Electric Power and Lighting Committee proposes that £125 000 be voted from the funds of the electricity and tramway estates towards relief of rates. This represents £50 000 from the electricity undertaking, compared with £35 000 last year, whilst the tramways grant is £75 000 compared with £115 000.

Col. F. Gordon Tucker recently held a Ministry of Transport inquiry into an application by the North Somerset Electric Supply Co., Ltd., for compulsory wayleaves for overhead lines between Wells and Highbridge. The approximate length of the line is 12 miles, with 299 poles. The company has secured wayleaves from 88 per cent. of the owners of land for the erection of 276 poles, but the remaining owners have failed to make any satisfactory arrangement. Of the seven owners concerned only four attended the inquiry. It was suggested that an overhead line across a field would reduce its selling value, and an increase in the rent per pole was asked for.

Hastings Corporation is to lay cables in Baldslow Road, at a cost of £1 267, and to extend mains to the Guestling Hill area, at a cost of £1 045. The Electricity Committee will supply electricity to the pumping station of Battle U.D.C. at Starrs Green, and will lay cables for the purpose at a cost of £1 160.—The Committee has agreed to an application from Messrs. F. Strickland and Sons for a supply of electricity for power purposes at their works at Earl Street. It will be necessary to instal a three-phase transformer in the Earl Street sub-station, and to lay cable from the sub-station to Messrs. Strickland's premises, at a cost of £500.—The Committee seeks sanction to borrow a further £1 000 for transformers.

Mr. E. G. Okell, borough electrical engineer of Plymouth, and the chairman of the Electricity Committee have interviewed representatives of registered contractors with regard to the renewal of the agreement as to the prices to be charged for electrical installations under the Council's scheme, and they report that the contractors are prepared to renew the agreement on the price per point being increased from 16s. 6d. to 17s. 3d. for twelve months. The committee has decided that the quarterly payment for fittings by consumers shall be 3½d. per 5s. or fraction of 5s. of the cost of the installation. The Electricity Committee has asked a special sub-committee to report on (*a*) a scale of charges for sale of installations to consumers; and (*b*) a system for the hire-purchase of radiators.

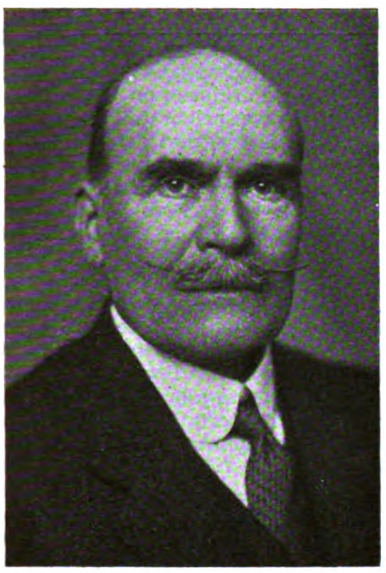
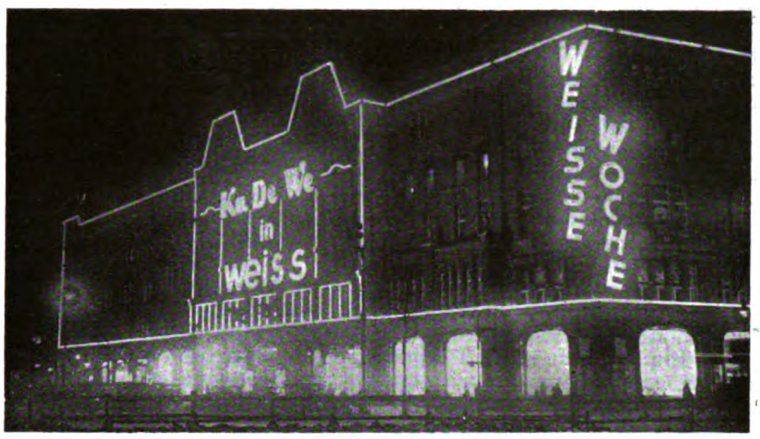
ELECTRICAL NEWS OF THE WEEK IN PICTURES.

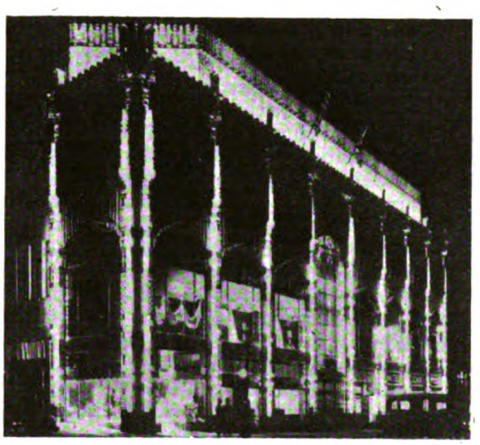


Mr. W. A. Wilson, who retired from British Insulated Cables, Ltd., at the end of last year. See page 200.



One of the features of the "White Sales" period in Berlin is the exterior illumination of the departmental stores, etc. These decorations are carried out in white light and a typical example is illustrated above.

An elaborate "street lighting" scheme which has been developed at Nice in connection with the Carnival. Many of the electrical decorations are particularly attractive and incorporate a number of new ideas.



A permanent outside illumination scheme which has just been installed at the McClatchey Building, Philadelphia.

Members of the Birmingham Branch of the Electrical Association for Women photographed on the occasion of their visit to the headquarters of the Shropshire, Worcestershire and Staffordshire Electric Power Co. In the centre is Mr. J. T. H. Legge, chief engineer and manager, and Lady Brooks, President of the Branch.

ELECTRIC TRACTION.

ILFORD Corporation has lodged an objection against the new assessment of the tramways on the draft valuation list, on the ground that it is excessive, being increased from £1 800 to £3 000.

Leamington and Warwick Corporations are opposed to the Leamington and Warwick Electrical Co.'s proposal to introduce trolley vehicles in and between Warwick and Leamington.

Rotherham electricity department has received an offer of £1 000 for the purchase by the Mexborough and Swinton Tramways Co. of the Rawmarsh power station; and the Committee recommends that the offer be accepted.

A "Daily Telegraph" correspondent describes an electro-steam motor coach which is being constructed at Indianapolis, U.S.A. The vehicle has six wheels, and seats 40 persons. The electro-steam generating plant has a capacity of about 150 H.P., and oil fuel is used.

At last week's meeting of Glasgow Corporation, it was stated that the tramways department now had on the road 200 new and reconstructed cars. On the routes on which the new cars were travelling a larger number of passengers were being carried, compared with last year. The Tramways Committee has decided to enclose the upper seck seats at the front and rear of 300 tramcars at a cost of £19 500.

At the recent annual meeting of the South Wales branch of the Institution of Mechanical Engineers, Mr. J. W. Burr (Swansea) read a paper on "The Electrification of a Small Railway." He said the problems that arose today in regard to this subject were more of a financial than a technical character. It had been found, in connection with suburban electrification, that an increased frequency of service attracted a larger number of passengers. He gave details of the recent electrification of the Mumbles Railway.

At a meeting of the Wolverhampton Engineering Club recently, a debate between Mr. C. O. Silvers (Wolverhampton) and Mr. A. C. Baker (Birmingham) took place on the question, "Are Trams Obsolete?" Mr. Silvers argued that the modern trolley vehicle was the most suitable for transport in modern towns, because of its comfort, speed and greater mobility, and safety. Mr. Baker said a tramcar was most suitable for carrying masses of people quickly in densely populated areas. The majority of those present favoured an affirmative answer to the question.

Additions and improvements to the rolling stock of the tramway and motor 'bus sections of Aberdeen Corporation tramway department, at an estimated cost of about £50 000, are recommended by the Tramways Committee. The Committee recommends the Council to purchase 12 of the latest type of tramway cars, fitted with cushioned cross seats in the lower saloon and also on the upper deck. The cars will have high-speed motors, and their estimated cost is £27 168. It is further recommended that four tramcars of a similar type should be constructed in the department's own workshops, and that the cars at present in use be modernised by fitting them with new trucks and high-speed motors.

LOCHABER TUNNELLING COMPLETED.

Progress of British Aluminium Company's Hydro-Electric Scheme.

MRS. Halcrow, accompanied by Mr. W. T. Halcrow, consulting engineer, of C. S. Meik and Buchanan (Ltd.), fired, on February 9th, the last shot opening up the fifteen mile tunnel which has been driven through the Ben Nevis range between Fort-William and the valve shaft at Loch Treig, in connection with the British Aluminium Co.'s hydro-electric scheme. Tunneling through the rock has now been completed, with the exception of the break through at Loch Treig, which will be the final operation when all other work is completed and the power house ready for commercial use. The main tunnel driving at Lochaber was commenced early in 1926. In addition to the tunnel proper there are twelve shafts, intake dams, conduits, pipe lines, power house, factory and tail race, as well as 23 miles of access railways. The cost runs into several million pounds. The works are designed for a total development of 120 000 H.P. The company is erecting a new town near the base of Ben Nevis. The main purpose of the scheme is the manufacturing of aluminium, and the factory is expected to employ several thousand workmen. The contract has been carried out by Balfour, Beatty and Co. (Ltd.).

THE SOCIAL SIDE.

ON February 7th, there was celebrated the twenty-first birthday of F. and A. Parkinson, Ltd., Guiseley. This business, which recently amalgamated with Crompton and Co., Ltd., was founded by Mr. Frank Parkinson on February 7th, 1908. The twenty-first birthday was celebrated by a coming-of-age party held at Horsforth, Leeds, and attended by 450 members of the staff of the Guiseley works and offices. The party was preceded by a complimentary dinner at the Queen's Hotel, Leeds, to the employees of over 10 years' service. The chair was taken by Mr. Frank Parkinson, supported by the Lord Mayor of Leeds (Alderman D. B. Foster), the Lady Mayoress, and Mr. Albert Parkinson. The toast of "The Company" was proposed by the Lord Mayor and responded to by Mr. Frank Parkinson; the toast of "The Ladies" was proposed by Mr. Albert Parkinson, and responded to by Miss Doris Dawson. At the conclusion of the dinner, the company present were conveyed to Horsforth to join the party. Elaborate arrangements were made for entertainment and dancing. Immediately preceding supper, members of the Works' Dramatic Society, locally famed as "The A.C.'s," presented a play entitled: "A Pantomime Rehearsal." The presentation of this was of exceptionally high order, and it is difficult to single out any particular character for compliment, since all were good. At midnight Mr. Frank Parkinson, in a speech of congratulation, presented Miss N. Senior (office staff) with a gold wristlet watch and shares to the value of £50 in Crompton, Parkinson, Ltd.; to Mr. Joseph Ackroyd, works foreman, a gold cigarette case and shares to the value of £50; and to Mr. Fred Dixon (works staff) a gold watch. These gifts were suitably inscribed in commemoration of exceptionally long service with the company.

The annual gathering of the committees engaged in social or welfare work at the Trafford Park works of the Metropolitan-Vickers Electrical Co., Ltd. took place in the M-V. Club Hall on February 4th. This was the twelfth gathering, and the committees represented, numbering twenty-five, were:—Angling Club, Allotments Association, Apprentice Council, Approved Society, Benevolent Fund (Works), Benevolent Fund (Staff), Foremen's Association, Girls' Club, Golf Association, Hockey Club, Long Service Association, M-V. Club, Dramatic Society, Male Voice Choir, Orchestra, Overseas Association, Production Staff Association, Rugby Union Football Club, Safety First Committee, Social and Debating Union, Sports Committee, Staff Committee, War Relief Committee, Women Works Committee and Works Committee.

The chair was taken by Mr. G. E. Bailey (director) supported in the vice-chair by Mr. A. McKinstry (director), and the chairman of the company, Sir Philip Nash was also present. The orchestra, the Male Voice Choir and the Dramatic Society provided items of entertainment, and an abstract from the report of each committee was read. Mr. G. E. Bailey, in a short speech, thanked the members of the committees for the lated the work they were doing. Sir Philip Nash congratuvoluntary members of the committees on the good work of the past year. Among those present were Mr. Ritchie and Mr. Maling from Australia, and Mr. Ohlson from South Africa. Mr. Ritchie, as President of the M-V. Australia Works Welfare Association, compared conditions in Australia with those in this country. Mr. McKinstry, as vice-chairman, also congratulated the committees on their activities.

BUSINESS ITEMS.

VAMPIRES, LTD., announce that they will be exhibiting at the "Daily Mail" Ideal Home Exhibition, Olympia, at Stand No. 40, Gallery, New Hall.

Our attention has been drawn to the change of title of WAGNER ELECTRIC SUPPLIES, LTD., to WOLF AND MORGAN, LTD., sole distributors for the Wagner Electric Corporation.

In connection with the British Industries Fair at Castle Bromwich, Birmingham Corporation has prepared for distribution among visitors "The City of Birmingham Handbook, 1928–1929."

The GENERAL ELECTRIC CO., LTD. has opened a new branch at Blackpool, in Birley Street. The branch of the company at Singapore has been moved to 12, Battery Road, instead of 5, Battery Road as hitherto.

On February 6th a serious fire caused considerable damage to the premises of PHILIPS LAMPS, LTD., at 27, Womanby Street, Cardiff. We are informed that arrangements have been made whereby business will not be interrupted.

COMPANY NEWS.

Increased Prices of Manufacturers' Shares—Supply Companies' Dividends—Fife Tramway Light and Power Co.'s Enhanced Profit—Improved Dividends of Companies in Underground Group—New Companies Registered.

A REACTION after the recent rise in General Electric shares has brought the price down to 67s. 6d., which is still a couple of pounds above the highest quotation of 1926, 1927 or 1928. British Insulated Cables are also making new records, another 3s. 9d. bringing the quotation up to 96s. 3d. Callender's and Henley's are each 1s. 3d. higher. Ever Readies have sagged a further 1s. 3d. to 24s. 3d. Easterns and Marconi's are respectively 5s. and 2s. 6d. down. Underground Electric Railways ordinary shares have given way 2s., to 25s. 6d. County of London Supply ordinary shares are 2s. better; Newcastle and District ordinary are lower to approximately the same extent.

LONDON AND SUBURBAN TRACTION CO., LTD.—Rev. for 1928 does not justify a div. on 5% cum. pref. shs.

STRICHEN ELECTRICITY SUPPLY CO., LTD.—Div. at rate of 6% for year ended Dec. 31, 1928, is recommended.

ELECTRIC SHOVEL COAL CORPORATION.—Qrtrly. div. of $1 p. sh. is payable on $4 cum. participatg. pfd. stk.

SIMM'S MOTOR UNITS, LTD.—Mtg. to consider proposal to increase cap. to £350 000 by creatg. 100 000 6% £1 cum. participatg. pref. shs. will take place to-day (Feb. 15) at Winchester House, London, E.C. The shs. will carry right to extra 1%, up to 9% for every 1% paid on ord. over 12%.

SINGAPORE TRACTION CO., LTD.—Net pfts. for year ended Sept. 30 £37 260, after provdg. for int. charges, and £2 367 bt. fwd. A div. of 5% proposed on the 7% pref. shs., appropriating £10 000 for mngrs., addg. £4 000 to redeptn. fund and £10 000 to renewals fund., writg. £3 000 off preliminary exes. and £87 off invstmts, and carryg. fwd. £2 539.

RUTHS STEAM STORAGE CO.—It is reported that this co. has just completed the formation and organisation of Ruths Steam Storage Inc., New York, authorised cap. $1 500 000, and of Ruths Steam Storage (Canada), with authorised cap. of $300 000, to operate Ruths patents in the United States and Canada respectively. The whole of the issued capital is owned by the parent company.

POWER SECURITIES CORPORATION, LTD.—Gross income for last year £123 159, compared with £111 796 for 1927. After makg. provisn. for taxatn., £19 482, agst. £9 772, and all exes., there is available £85 239, compared with £84 678. It is proposed to transfer £20 000, agst. £30 000, to res. and £10 000, agst. nil, to div. equalisatn. acct. Div. maintained at 7% less tax. Fwd. £14 869, compared with £15 630.

NORTH METROPOLITAN ELECTRIC POWER SUPPLY CO. Directors recommend payment of div. due on 6% pref. shs. and fin. div. on ord. shs. of 6%, makg., with intm. div. of 4% already paid, div. of 10% for year 1928, same as previous year. To res. £120 705, compared with £143 217, which includes £43 217 premium on shs. for previous year, leavg. £28 202 to carry fd., compared with £19 041 brt. in. Div. on ord. shs. will be payable March 5.

ST. JAMES' AND PALL MALL ELECTRIC LIGHT CO., LTD.—Net pft. for 1928, £103 852, plus blce. from 1927, £81 807. Intm. divs. paid in Aug., 1928, 8·4d. p. sh. (3½%) on £1 pref. shs., and 9d. p. sh. on £1 ord. shs., leavg. blce. £157 033. Directors propose div. of 8·4d. p. sh. (3½%) on £1 pref. shs. for second half-year, and blce. div. on £1 ord. shs. of 9·949d. p. sh., makg. standard div. or year of 1s. 6·949d. p. sh. To special res.—ord. shhldrs. benefit under sliding scale for years 1926, 1927 and 1928—£13 382; fwd. £112 377.

YORKSHIRE ELECTRIC POWER CO.—Net pft. for 1928, after paymt. of int. and deb. stk. disct. charges, £310 073, agst. £294 371 in 1927, plus £74 096, agst. £65 260, brt. in. Divs. recommended at rate of 6%, less tax, for 1928 (of which 3% was paid in Aug. 1928) on ord. cap. and at rate of 8%, less tax, for 1928 (of which 3% was paid in Aug., 1928) on shs. issued prior to 1928. To gen. res., £100 000; fwd. £78 233. Demand for electricity has again increased, notwithstandg. trade depressn., particularly that of coal industry.

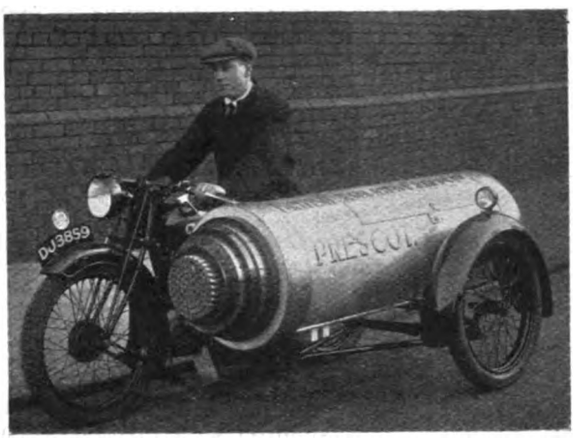
FIFE TRAMWAY LIGHT AND POWER CO., LTD.—Rep. for year 1928 shows that tradg. pfts. amtd. to £127 004, against £104 386. Of this sum there was reserved in the accts. of the undertakg. an aggregate amt. of £35 544, against £26 508, blce. being paid over to co. After paymt. of administratn. exes., taxatn.; etc., there remains, including £5 253 bt. fwd., £85 451, against £76 748. Int. charges £26 634, against £21 589, div. on pref. shs. £24 000, deb. stk. redemptn. acct. £4 968, against £4 719, reserves £8 000, against £5 187, leavg. £21 848. Proposed div. on ordinary shs. of 4%, less tax, carrying forward £5 848.

TYNESIDE TRAMWAYS AND TRAMROADS CO.—Exes. during half year ended Dec., 1928, exceeded receipts by £1 049, to which is added int. on mtges., loan, etc., less int. received on invesmts, etc., makg. total deficit for half-year £2 530. An amount of £2 500 has been transferred from gen. res. and, after bringing in blce. of £60 from previous half-year, there remains £30 to be carried fwd. Traffic receipts show decrease of £2 126, and for whole year there is a decrease of £3 181. A Bill has been deposited with Parliament with the object of

Digitized by Google

obtaining powers to abandon the whole or any part of the tramways, and to institute omnibus services.

ELECTRICAL AND INDUSTRIAL INVESTMENT CO., LTD.—Net pft. for 1928, £22 148, agst. £19 454. Divs., 6% on pref. shs., 7% on pfd. ord. shs. (both same as last year) and 6% on dfd. ord. shs. Fwd. £3 747, makg. undivided pfts. £17 939. A sum of £85 500, being blce. of £60 986 at credit of res. at Dec.



A NOVEL delivery combination recently designed by British Insulated Cables, Ltd., for express delivery of the smaller sizes of cables, wires and accessories. The sidecar, as will be observed, is made and finished in the form of a stepped down cable, with a hinged door at the top.

31, 1927, and £24 513 forming part of blce. of rev. acct. at same date, has been capitalised and distributed by way of bonus to dfd. ord. shhldrs. by issue of 1 710 000 fully paid dfd. ord. shs. of 1s. ea. Since close of year unissued 10 000 dfd. ord. shs. of 1s. ea. have been subscribed at par.

VERA CRUZ ELECTRIC LIGHT, POWER AND TRACTION, LTD.—Directors announce that by purchase of 223 632 fully paid £1 shs. out of 350 000 shs. of issued cap. American and Foreign Power Co., of New York, has obtained control of co. In due course managemt. will be transfrd. to New York and mtgs. of co. will shortly be held for purpose of makg. necessary alteratns. in articles of association. These meetgs. will be followed by resignatn. of present board. Directors have obtained from American and Foreign Power Co. an offer of 8s. per fully paid £1 sh. for all outstandg. shs. offered for sale by Feb. 20. Upwards of 46 000 shs. have already been offered for sale in accordance with offer.

TILLING AND BRITISH AUTOMOBILE TRACTION, LTD.—Accts. for 1928 show a total rev. £187 573, and net pfts. £167 206, after deductg. administratn. and gen. exes., income tax and deb. stk. int. Includg. blce. £21 456 brt. fwd., total of £188 662 is available for distributn. The sum of £10 000 is placed to res., and directors propose, in additn. to fixed div. of 8% on participatg. pref. shs., further div. of 2% (makg. 10% for year). Ord. shs. receive a fin. div. of 6%, makg. 10%. Co.'s name has been changed from British Automobile Traction Co., Ltd., to Tilling and British Automobile Traction, Ltd., and the authorised sh. cap. increased to £2 000 000. Fwd. £22 926. Total income, after provisn. for depreciatn., £187 573 agst. £99 110.

ATLAS LIGHT AND POWER CO., LTD.—An agreemt. providg. for sale of its holdings in electric supply and tramway undertakgs. in the Argentine for £8 500 000 has been entered into by the directors of the Atlas Light and Power Co. The purchasers are the American and Foreign Power Co., Inc., New York. Agreemt. provides that British mnfrs. will continue for at least ten years to be given pref. for bulk of orders for equipmt. for the operatg. co. transferred. Agreemt. will be submitted for shhldrs' approval at gen. mtg. to be called at an early date. The directors, in a circular, recommend shhldrs. to confirm sale, and point out that amt. to be realised can be reinvested over a wider field with advantage. Co. will retain its hldgs. outside the Argentine.

DUBLIN UNITED TRAMWAYS CO. (1896), LTD.—Total receipts on rev. acct. for 1928 amtd. to £574 621, and after provisn. for int. on bonds, debs. and deb. stk., deb. stk. disct. redemptn., wayleaves and paymt. to Howth Co., blce. was £138 826. Intm. divs. amtg. to £23 715 were paid on Aug. 17, 1928. It is recommended that div. at rate of 6% p.a., less tax, be paid on pref. stk. for half-year ending Dec. 31, 1928, and that a fin. div. at rate of 5% p.a., less tax (makg. 4% for year), be paid on the ord. stk. for same half-year; that £50 000 be set aside towards renewal of track, £7 000 towards renewal of overhead line standards and cables; and £15 000 for mtge. and deb. redemptn. fund. Divs. and sums set aside will absorb £125 040, leavg. £13 786 to carry fwd.

UNDERGROUND GROUP.—The following divs. are recommended for paymt. by the Underground Electric Railways Co., of London, Ltd., and its associated companies.—*Underground Electric Railways Co. of London, Ltd.:* Half year's int. to Dec. 31, 1928, on 6% 1st cum. income deb. stk., int. of 3%, subject to British tax, on 6% income bonds of 1948 for half year ended Dec. 31, 1928, makg. full rate for year; and fin. div. of 4% on ord. shs., makg., with intm. div. of 3% paid on Aug. 3, 1928, 7% for year, agst. 5%. Fwd. £262 504, agst. £169 762. *Metropolitan District Railway Co.:* Fin. div. for 1928 on ord stk. 2½%, makg. with intm. div. of 2½% paid on Aug. 3, 1928, 5% for year, agst. 4%. To res. £90 000; fwd. £44 768, agst. £38 161. *London Electric Railway Co.:* Fin. div. for 1928 on con. ord. stk., 2½%, makg. with intm. div. of 2½% paid on Aug. 3, 1928, 5% for year, agst. 4%. To res., £157 198; fwd. £177 152, agst. £158 101. *City and South London Railway Co.:* Fin. div. for 1928 on con. ord. stk., 2½%, makg. with intm. div. of 2½% paid on Aug. 3, 1928, div. for year of 5%, agst. 4%. To res., £25 000; fwd., £36 179, agst. £33 156. *Central London Railway Co.:* Fin. div. for 1928, on undivided ord. stk., 2½%, makg. with intm. div. of 2½% paid on Aug. 3, 1928, 5% for year, agst. 4%; fin. div. for 1928 on pfd. ord. stk., 2%, makg. with intm. div. of 2% paid on Aug. 3, 1928, 4% for year, agst. 4%; div. for year, on dfd. ord. stk. 6%, agst. 4%; to res., £40 000; fwd., £105 053, agst. £98 926. *Associated Equipment Co., Ltd.:* Fin. div. for 1928 on ord. shs., 4% tax free, makg., with intm. div. of 4%, tax free, paid on Aug. 3, 1928, 8%, tax free, for year, agst. 8%. Fwd. £201 261, agst. £178 978.

BAIRD TELEVISION DEVELOPMENT CO., LTD.—Directors' first report (to June 30, 1928) states that applicatn. of group of patents possessed by co. covers principles the applicatn. of which extends in many directns. Directors have, however, considered that of these varied applicatns. the one most interestg. and most likely to be productive of immediate results is that of televisn., and the energies of the co. have therefore been principally occupied since its formatn. in developing applicatn. of Mr. Baird's patents in this directn. Suitable premises havg. been secured at 133, Long Acre, London, W.C., the existing laboratory, with its equipmt., has been established there. During the period of about eighteen months which has elapsed since the statutory mtg. vast strides have been made in the developmt. of televisn. Great interest in the system has been evinced by radio mfrs. in various parts of world, and there is no doubt, so soon as broadcastg. facilities are granted, that televisors mfd. under licence from Baird Co. will form an immediate source of revenue. Application of co.'s patents in other directns. will be proceeded with at earliest opportunity. Co. has obtained further premises at Kingsbury, Middlesex, chiefly for purpose of enabling wireless transmissn and receptn. to take place between Long Acre and Kingsbury. Blce-sheet shows authorised and issued cap. to be £125 000. Cash at bankers and in hand is £61 572. Purchase price of patent rights, trade marks and other interests in Baird inventns. acquired on incorporatn. satisfied by issue of 400 000 dfd. ord. shs. of 1s., £20 000. Co. has certn. rights under contract entered into by Television, Ltd., in connectn. with exploration of various foreign and Colonial patents and patent applicatns., but value of such rights is not at present capable of ascertainmt.

Company Meetings.

WEST LONDON AND PROVINCIAL ELECTRIC AND GENERAL TRUST, LTD.—An extraordinary general meeting was held on January 30th to consider resolutions increasing the capital of the company to £390 000 by the creation of 18 000 new shares of £5 each and sub-dividing each of the 18 000 new shares into one pref. share of £4 and one ord. share of £1 and converting them into pref. and ord. stock. Mr. Harry Kahn, chairman of the company, presiding, stated that as soon as these resolutions become effective, it was intended forthwith to issue the new £5 shares at par, as of right, to the ordinary stockholders, in the proportion of one £5 share for every £10 ordinary stock held; and in cases where stockholders hold amounts of ordinary stock which are not a complete multiple of £10, stockholders would receive a payment in cash of 4s. for every odd

Digitized by Google

£1 of such stock which remained. From the capital reserve fund it was intended to appropriate £36 000, which sum would be utilised in crediting £2 of the £5 payable for each share, the balance of £3 being payable on application. The ordinary stockholders were hereby receiving a valuable bonus, as a present holder of £100 of ordinary stock would receive eventually £40 5 % cumulative preference stock and £10 ordinary stock for a total payment of £30. The resolutions were adopted.

HALL TELEPHONE ACCESSORIES (1928), LTD.—Major Oscar M. Guest, presiding at the first ordinary general meeting on Monday, said the company's telephone coin collectors, which were entirely made at their factory at Willesden, and for which they owned world-wide patent rights, were of what was called the prepayment multi-coin type, as opposed to the former system of single denomination post payment, where the money was inserted after the operator had obtained the number asked for. The collector, besides dealing with local calls, had been the means of giving the public facilities to obtain long distance calls, including international calls, from any call office and also telegraph facilities, as telegrams could be sent from a telephone cabin so equipped. Besides having obtained from the British Post Office a satisfactory contract for their collectors, their stamp machine hiring business had approximately doubled in size since the formation of the company. The directors had reasonable grounds for assuming that 1929 should compare favourably with the period now under review. The report and accounts were unanimously adopted, and a final dividend of 6%, making 10%, less tax, for the year, was declared. At an extraordinary general meeting resolutions were passed increasing the capital to £175 000.

SINGAPORE TRACTION CO., LTD.—Mr. L. W. Hawkins, presiding at the meeting last week, said that it was satisfactory that they had re-entered in a modest way the list of dividend-paying companies, their position in which had been lost last year in consequence of the boycott and the resultant reduction of profits. The number of vehicles in use had risen from 60 to 90, passengers carried from 23 000 000 to 32 500 000, gross traffic receipts from £89 000 to £140 000 and operating profit, as far as traction alone was concerned, from £22 000 to £49 000. During the first sixteen weeks of the current year, the car miles run, the number of passengers and the receipts each showed an increase of about 25%. The steady augmentation of their rolling stock was not accompanied by any appreciable diminution in the earnings per car mile, which was evidence that they had not reached saturation point and that their policy of development was fully warranted. The introduction of petrol motor-buses was an experiment, and they believed that, as auxiliaries to their fleet of trolley buses, they contained considerable potentialities. The report and accounts presented a state of affairs which the directors regarded as completely justifying the reconstruction of the old company and the conversion of its almost derelict and insolvent tramway undertaking to its present form.

LONDON POWER CO., LTD.—Mr. W. F. Fladgate, presiding at the meeting last Friday, said during 1928, they had for the first time been operating all the stations which they proposed to take over, and they had, in effect, by laying down their 22 000 V interconnecting mains, completed the first portion of their programme. They were, naturally, desirous that the sales of their commmodity, which was current, should increase as much as possible, but it was not their wish that the cash which they received should proportionately increase with their sales. In the past year they sold to the constituent companies some 593 000 000 kWh, and, in respect of that sale, they had received £1 641 000. In 1927 they sold some 506 000 000 kWh and received £1 680 000, the result being that while they had delivered some 87 000 000 kWh in excess of the delivery of the previous year, they had received some £40 000 less. The actual cash benefit to the companies in respect of the generation of electricity for 1928 as against the cost of generation for 1927 was, after adjusting the coal figure to a common basis, no less than £152 000. Cost of coal decreased from £596 000 to £471 000. Salaries of engineers and officers increased by £15 000, but wages at generating stations were reduced from £123 000 to £93 000, consequent on the shutting down of the inefficient stations. All displaced employees had been compensated. During the flooding of the Thames in the early part of 1928, one of their generating stations was shut down, but, luckily, their interconnecting mains had been completed, and they were able to supply the whole of the district from other stations. The chairman then referred to the evidence given by Mr. J. M. Kennedy in support of their scheme before a House of Commons Committee, in which he stated that in 1924 the average operating cost of the ten companies was 0·55d. per kWh generated, and that if the scheme were adopted the result would be that by 1927 these costs would be reduced by 40 per cent., and by 1929 they would be reduced by a further 10 per cent., making a reduction of 50 per cent. Mr. Kennedy's figure of 0·55d. per kWh generated must be reduced to 0·45d., as it was based on coal at 27s. 6d. per ton, the then prevailing figure, for which 20s. per ton, which was now about the average price, must be substituted. Adopting his suggestion that in 1929 the cost should be reduced by 50 per cent., the cost for that year should be 0·225d. In 1928 their operating costs were 0·278d., or within 0·053d. of Mr. Kennedy's figure, and he (the chairman) predicted that before they came to the end of 1929, they would arrive at 0·225d., and thus justify Mr. Kennedy's evidence. The Deptford West station would be, at any rate, to some extent, in commission before the end of the year, and they would at once proceed with the work at the Battersea station, which had been commenced and which would give them a further ultimate capacity of 400 000 kW. The report and accounts were adopted and the dividend was approved.

New Companies.

SIDNEY HALL, LTD.—Cap., £2 000. Electrical engineers, etc. Reg. office: 49, Queen Street, Blackpool.

BASIL MARSH, LTD.—Cap., £100. Manufacturers of and dealers in wireless apparatus, etc. Solicitor: J. A. Bosley, 2, Palace Place, Brighton.

LEWIS MOTORS (FALMOUTH), LTD.—Cap., £2 000. Motor, electrical, wireless and general engineers, etc. Solicitors: Coulter, Hancock and Thrall, Truro.

SOUTH ESSEX SUPPLY CO., LTD.—Cap., £500. Electrical, mechanical and general engineers, sign makers, etc. Reg. office: 30, London Road, Romford, Essex.

H. PETRIE AND SONS, LTD.—Cap., £1 000. To acquire business of electrical engineer, etc., now carried on by H. Petrie at 107, Hamlet Court Road, Westcliff-on-Sea, Essex.

ELECTRIC NEWS PANELS, LTD.—Cap., £20 000. Manufacturers of and dealers in signs, electrical and mechanical engineers, etc. Reg. office: 31/33, Bishopsgate, London, E.C.

Receiverships.

GREENWOOD (A. I.), LTD. B. Armitage, C.A., 99, Albion Street, Leeds, was appointed receiver on January 31st, 1929, under powers contained in debentures dated March 30th, 1926.

MARPLE AND FRISBY, LTD. F. S. Wilks, 31, Lombard Street, E.C.3, was appointed receiver on January 28th, 1929, under powers contained in a debenture dated June 3rd, 1927.

Private Meetings, etc.

[***Inclusion under this heading does not necessarily imply failure. Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.***]

EAVES, Reginald Ernest Allen, and CAMERON, Harold Douglas trading as THE EMPRESS RADIO AND ELECTRICAL CO., at Manor Works, Stonehouse, Plymouth, and as THE WESTMINSTER RADIO CO., at Plymouth, Bridgwater, Taunton and Newquay. A meeting of the creditors in this matter was held last week at the Great Western Hotel, Paddington, when the debtors' accountant stated that the liabilities amounted to £4 965, of which £2 423 was due to the trade, while there were partly secured creditors for £1 392, who held security valued at £1 200, leaving £192 to rank as unsecured. The balance of the liabilities was due to cash creditors. The assets totalled £1 437, from which had to be deducted £137 for preferential claims, leaving net assets of £1 300, or a deficiency of £3 666. The assets consisted of cash in hand £62; stock in trade estimated to produce £600, plant and machinery £100, fixtures and fittings £225, motor car and van £75, two sailing boats valued at £20, life policy £5, and book debts £350. The accountant said that the stock was a very difficult item to value. The cost price of it was £1 277. With regard to the plant and machinery that was very limited. A circular letter had been issued to the creditors stating that the debtors had consulted their relatives with regard to their position and if it were the wish of the unsecured creditors, sufficient cash would be forthcoming to pay the preferential claims in full, the costs of the deed of assignment and the unsecured creditors 6s. in the £. The business was started in July, 1922, with a capital of £50 and tools. The accounts prepared showed that for the year to March 10th, 1927, the sales were £14 227, and there was a net profit of £236. The next year the sales were £18 065, and there was a profit of £28. Mr. White added that in April, 1928, the firm suffered a severe blow through a fire which occurred. The result was that being under-insured, they did not receive sufficient compensation. Soon after that date the debtors opened branch shops. Replying to questions Mr. White stated that he understood that the debtors received about £2 700 from the insurance co. in respect of the fire. After a long discussion it was decided to accept the debtors' offer of 6s. in the £, and the creditors, after hearing Mr. Stoneman's explanation of his position in the Western Radio Co., a vote of sympathy was passed for him. It was also decided to confirm the deed of assignment already executed.

London Gazette, etc.

Companies Winding-up Voluntarily.

ATTAIX, LTD. By reason of its liabilities, January 31st K. M. Scott, A.C.A., 32, Finsbury Square, London, of Merrett Son and Street, Chartered Accountants, appointed as liquidator Meeting of creditor at the Institute of Chartered Accountants Moorgate Place, E.C.2, on Tuesday, February 19th, 11 a.m.

EPOCH ELECTRICAL SOCIETY, LTD. By reason of its liabilities, February 8th. C. Hughes, 24, Ironmonger Lane, London, E.C., chartered accountant, appointed as liquidator.

RADCLIFFE, Harold Howe Delmé, and HADDLETON, Frank, 51, Islington Row, Birmingham, trading as CITY ELECTRIC SERVICES, electrical engineers. Receiving order, February 4th, debtor's petition.

Notice of Intended Dividend.

WESTNUTT, Josiah (known as JOHN VICTOR WESTNUTT), High Street North, Dunstable, electrical engineer. Last day for receiving proofs, February 22nd. Trustee, A. J. Rogers, The Parade, Northampton, Official Receiver.

Bankruptcy Proceedings.

KAY (T. L.) AND CO., LTD., 6, Blake Street, York, wireless factors, etc. The creditors were called together, on February 11th, at the Royal Station Hotel, York. Mr. D. S. Mackay, the Official Receiver, reported that a compulsory winding-up order had been made against the company. The company was registered in June, 1926, and took over an existing business as from January 1st of that year. Last September, a resolution for voluntary liquidation was passed, and a statement of affairs was then prepared which showed liabilities of £4 031, against net assets of £988. The assets then consisted of cash in hand 16s. 1d.; stock at cost £1 277, expected to produce £458; fixtures, tools, etc., £83; motor car, £95; good book debts, £618; and bad and doubtful debts, £152, valued at £40. One creditor objected to the voluntary liquidation being continued and filed a petition upon which the winding-up order was made. The Official Receiver pointed out that the matter was somewhat involved, and certain items called for explanation. In December, 1927, the total assets were valued in the company's balance sheet at £9 100, whilst in the voluntary liquidation the assets were estimated at £1 294, and were subject to preferential claims of £305. A resolution was passed appointing Mr. R. Crampton, accountant, of York, as liquidator with a committee.

METAL AND CHEMICAL PRICES.

TUESDAY, February 12th.

		Price.	Inc.	Dec.
Copper—				
Best Selected ..	per ton	£82 0 0	1 5 0	—
Electro Wirebars	,,	£84 10 0	3 5 0	—
H.C. Wires, basis	per lb.	11⅝d.	1/16d.	—
Sheet	,,	11⅝d.	1/16d.	
Phosphor Bronze—				
Wire (Telephone) basis	per lb.	1s. 2⅛d.	1/16d.	—
Brass 60/40—				
Rod, basis ..	per lb.	8½d.	—	—
Sheet ,, ..	,,	10½d.	—	—
Wire ,, ..	,,	11d.	¼d.	—
Pig Iron—				
Cleveland Warrants	per ton	£3 8 6	—	—
Galvanised Steel Wire, basis 8.S.W.G. ..	,,	£14 15 0	—	—
Lead Pig—				
English	per ton	£24 15 0	1 0 0	—
Foreign or Colonial	,,	£23 5 6	17s. 6d.	—
Tin—				
Ingot	per ton	£224 12 6	1 7 6	—
Wire, basis ..	per lb.	2s. 11d.	—	—
Aluminium Ingots	per ton	£95 0 0	—	—
Spelter	,,	£26 2 6	—	7s. 6d.
Mercury	per bottle	£22 5 0	—	3s. 6d.

Sulphur—Flowers, Ton £12 0 0 *Sulphuric Acid*—
,, Roll ,, £10 15 0 (Pyrites, 168°) Ton £6 15 0
Copper Sulphate ,, £25 to £25 10 0 *Sodium Chlorate* per lb. 2¾d.
Boric Acid (Crystals),, £30 0 0 *Sodium Bichromate* ,, 3¼d.
Rubber—Para fine, 1s. 0½d.; plantation, 1st latex, 11d.

∴ The metal prices are supplied by British Insulated Cables, Ltd., and the rubber prices by W. T. Henley's Telegraph Works Co., Ltd.

LEAD MARKET REPORT.

The lead market last week was, according to James Forster and Co., of a firm tone, prices registering a daily advance. Conditions in America have also remained firm, the leading interests advancing their price on February 6th to 6·75 cents.

Closing prices on February 8th were £23 2s. 6d. for February and March, £23 1s. 3d. for April and May, showing a rise of 17s. 6d. to 11s. 3d. on the week according to position.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

303 926 British Thomson-Houston Co., Ltd., and J. G. Wellings. Switching devices for potential transformers. (17/10/27.)
303 933 H. Wade (N.V. Philips' Gloeilampenfabrieken). Devices for supplying direct voltage, and more particularly a grid bias to the grids of the valve or valves of a radio installation. (17/10/27.)
303 936 British Thomson-Houston Co., Ltd., H. W. H. Warren, and A. T. Ward. Insulating enamels, varnishes, or the like coatings. (22/10/27.)
303 951 R. T. Norton and E. Long. Electric switch fuses. (5/11/27.)
303 952 J. H. Runbaken. Electric battery testers. (5/11/27.)
303 954 Coventry Automatic Telephones, Ltd., and C. C. Puckette. Electric selective switches. (7/11/27.)
303 973 General Electric Co., Ltd., H. C. Turner, and A. Sherwin. Electrical protective or alarm arrangements. (24/11/27.)
303 976 J. A. Crabtree, Electric switches. (29/11/27.)
303 977 E. Morel. Magneto-electric machines. (29/11/27.)
303 984 H. Wade (Soc. Anon. Trefileries et Laminoirs du Havre, Anc. Etab. L. Weiller, Soc. Cooperative de Rugles, et la Canalisation Electrique Reunis). Electrolytic manufacture of metallic powders. (3/12/27.)
303 986 Graham Amplion, Ltd., and J. D. Dunthorne. Electromagnetic gramophone reproducers. (5/12/27.)
303 992 J. T. Irwin. Electrical instrument for indicating instantaneous pressures or currents. (9/12/27.)
303 996 Alloy Welding Processes, Ltd., and E. H. Jones. Arc welding electrodes. (13/12/27.)
282 750 Eisen u. Stahlwerk Horsch Akt.-Ges., and Dr. W. Heidenhain. Method and apparatus for hardening substances of iron, steel, and other ferromagnetic materials. (28/12/26.)
304 006 J. W. Coldman and Scruttons, Ltd. Construction of overhead electric travelling hoist. (24/12/27.)
288 232 F. Quast and A. F. V. Eichert (trading as Berko-Werke Quast and Co., (firm of)). Magnets or magnet systems for magneto-electric machines. (8/4/27.)
304 007 T. Yamanouchi. Anchoring connection or dead-end clamp for electric cables. (29/12/27.)
304 016 Evershed and Vignoles, Ltd., and C. Midworth. Dial reading measuring instruments. 6/1/28.)
283 856 Berliner Batterie-Fabrik Ges. Anode batteries. (17/1/27.)
304 031 J. Collier. Electrical conductors. (21/1/28.)
284 225 Egyesult Issolampa es Villamossagi Reszveny-Tarsasag. Process for the determination of voltage equivalents of electric currents at varying potentials. (24/1/27.)
304 035 British Thomson-Houston Co., Ltd., C. J. Morton, and L. M. T. Bell. Ignition devices for internal combustion engines. (25/1/28.)
284 635 Metropolitan-Vickers Electrical Co., Ltd. Lightning arresters. (1/2/27.)
285 039 Allgemeine Elektricitats-Ges. Excess consumption electricity meter with direct current motor. (9/2/27.)
285 496 International General Electric Co., Inc. Electric motors, suitable more particularly for electric meters. (18/2/27.)
289 395 Siemens-Schuckertwerke Akt.-Ges. Electric switches. (26/4/27.)
304 057 Metropolitan-Vickers Electrical Co., Ltd. (Westinghouse Electric and Manufacturing Co.). Electrical insulators. (17/2/28.)
304 058 P. Rosenkaimer. Protecting glasses and globes for electric lamps. (18/2/28.)
287 520 W. Schott. Electric liquid heaters. (23/3/27.)
287 524 British Thomson-Houston Co., Ltd. Electric signalling systems. (23/3/27.)
287 142 International General Electric Co., Inc. Automatic reclosing circuit breaker systems. (16/3/27.)
287 462 Marconi's Wireless Telegraph Co., Ltd. Apparatus for use in radio and other high frequency installations. (19/3/27.)
287 926 Akt.-Ges. Brown, Boveri et Cie. Protective means for single or multiphase rectifiers operating in parallel with other direct current machines or apparatus. (30/3/27.)
288 152 Siemens-Schuckertwerke Akt.-Ges. Shades for incandescent electric lamps. (1/4/27.)
288 186 British Thomson-Houston Co., Ltd. Electric measuring instruments. (2/4/27.)
288 329 Electro-Transmission. Electric motors. (8/4/27.)
289 057 F. Kruckenberg and C. Stedefeld. Current collectors for high-speed railways. (21/4/27.)
289 882 N.V. Philips' Gloeilampenfabrieken. Installations for rectifying alternating current. (6/5/27.)
290 587 Associated Telephone and Telegraph Co. Automatic train control systems. (6/10/26.)
290 588 Associated Telephone and Telegraph Co. Automatic train control systems. (6/10/26.)
294 565 G. Main. Vacuum or gas-filled incandescent electric lamps. (26/7/27.)
293 386 Landis and Gyr Soc. Anon. Electricity meters. (5/7/27.)
293 420 Siemens-Schuckertwerke Akt.-Ges. Laminated core body for electric machines and apparatus. (5/7/27.)
293 313 General Electric Co., Ltd. Manufacture of electric incandescent lamps, thermionic valves, and the like. (2/7/27.)
293 426 British Thomson-Houston Co., Ltd. Variable ratio transformers. (6/7/27.)
293 431 Associated Telephone and Telegraph Co. Automatic train control systems. (6/10/26.)
293 432 Associated Telephone and Telegraph Co. Automatic train control systems. (6/10/26.)
294 242 General Electric Co., Ltd. Manufacture of electric incandescent lamps. (21/7/27.)
297 052 Falk, Stadelmann and Co., Ltd. Filaments for electric incandescent lamps. (13/9/27.)
294 938 Siemens-Schuckertwerke Akt.-Ges. Transformers with oil-filled terminals. (1/8/27.)
298 647 Telefunken Ges. fur Drahtlose Telegraphie. High-frequency signalling. (14/10/27.)
277 937 C. Hellyar and Anglo-Sphinx Engineering Co., Ltd. Electric switches. (24/10/27.)
304 380 Dubilier Condenser Co. (1925), Ltd. Rectifiers for alternating current. (24/9/26.)
304 336 L. H. Peter and Westinghouse Brake and Saxby Signal Co., Ltd. Electric current rectifying apparatus. (20/6/27.)
283 538 Dr. W. Kunze. Measurement of the transmission time of electrical oscillations. (13/8/27.)
304 162 D. F. Campbell. Construction of roofs of electric furnaces and the like. (15/9/27.)
291 069 Scintilla Akt.-Ges. Electric starters for engines. (28/5/27.)
304 175 J. A. Crabtree. Manufacture of the dollys or operating levers of electric switches. (12/10/27.)
304 165 E. W. Braendle and R. H. Billingsley. Means for converting mechanical, acoustic, or the like impulses into electrical impulses. (12/10/27.)
304 167 British Thomson-Houston Co., Ltd., A. P. Young and J. Hutt. Arrangements for supplying current for the operation of thermionic valve systems. (15/10/27.)
304 177 Dowell and Hanmer, Ltd., and W. J. Daniel. Illuminated direction indicators and signals for motor vehicles and the like. (13/10/27.)
304 169 Automatic Telephone Manufacturing Co., Ltd., F. Kessler, C. R. Woodland and J. C. McCrindle. Mounting arrangements for automatic switches and the like. (15/10/27.)
304 342 English Electric Co., Ltd., and G. Zweigbergk. Flexible couplings for transmitting rotary motion, adapted for electric locomotive drives. (17/10/27.)
304 347 S. G. S. Dicker (N.V. Philips' Gloeilampenfabrieken). Magnet systems for converting electric oscillations into acoustic ones, or *vice versa*. (17/10/27.)
304 259 S. G. S. Dicker (N.V. Philips' Gloeilampenfabrieken). Electrical devices such as wireless receiving sets. (17/10/27.)
304 222 S. G. S. Dicker (N.V. Philips' Gloeilampenfabrieken). Thermionic valve circuits. (17/10/27.)
304 348 W. Meacher. Electric contact seam-welding machines. (18/10/27.)
304 265 A. Browne. Electrical induction voltage regulating systems. (18/10/27.)
304 351 A. J. Wilkins. Wireless aerials. (19/10/27.)
304 352 Standard Telephones and Cables, Ltd., G. Hurford and N. V. Kipping. Automatic dial switches. (19/10/27.)
304 353 Standard Telephones and Cables, Ltd., B. B. Grace, G. Newton and C. P. Smith. Circuit interrupting mechanisms for telephone systems. (19/10/27.)
304 354 Standard Telephones and Cables, Ltd. (Western Electric Co., Inc.). Electrodeposition of alloys. (19/10/27.)
279 455 Standard Telephones and Cables, Ltd. Telephone and like repeater circuits. (19/10/26.)
304 356 British Thomson-Houston Co., Ltd., and H. S. Petch. Protection of electric transformers. (19/10/27.)
304 357 British Thomson-Houston Co., Ltd., and H. S. Petch. Protective devices. (19/10/27.)
304 359 A. Reyrolle and Co., Ltd., and H. C. Atkins. Balanced electric protective arrangements. (19/10/27.)
304 367 Standard Telephones and Cables, Ltd., and J. Collard. Method of balancing electric cables. (20/10/27.)
304 369 W. S. Smith and N. W. McLachlan. Electric oscillation generators. (20/10/27.)
304 382 J. K. Im Thurn, G. Shearing and C. Matthews. Transmitting apparatus for wireless telegraphy. (24/10/27.)
279 845 Radiofrequenz Ges., and H. Eberhard. Devices for generating electrical oscillations by means of piezo-electrical crystals. (26/10/26.)
279 510 Deutsche Telephonwerke und Kabelindustrie A.G. Apparatus for electrically transmitting to a distance the indications of a mesauring instrument or the like. (23/10/26.)
304 386 A. F. Harmer and Drake and Gorham, Ltd. High-tension electric circuit controlling devices. (25/10/27.)
304 390 General Electric Co., Ltd., and E. L. Randall. System of illumination. (27/10/27.)
304 396 S. G. S. Dicker (N.V. Philips' Gloeilampenfabrieken). Coating metallic or non-metallic bodies with rhodium, iridium and ruthenium. (31/10/27.)
279 910 Akt.-Ges. Brown, Boveri et Cie. Metal vapour rectifiers. (1/11/26.)
304 399 Callender's Cable and Construction Co., Ltd., and L. G. Brazier. Laying of electric cables and apparatus therefor. (3/11/27.)
280 560 Dr. S. Loewe. Method for obtaining a perfect high vacuum. (11/11/26.)
281 265 Magneta Suisse Soc. Anon. Electrical signalling apparatus. (27/11/26.)
304 417 K. L. Wood and Eastern Telegraph Co., Ltd. Synchronised electric telegraph systems. (15/11/27.)
304 423 S. G. S. Dicker (N.V. Philips' Gloeilampenfabrieken). Electric discharge tubes. (23/11/27.)
304 430 Graham Amplion, Ltd., and P. K. Turner. Apparatus suitable for the reception of wireless telephony. (5/12/27.)

Applications for Patents.

1929.

January 1st.

25, 26 Associated Telephone and Telegraph Co. Train control systems.
84, 85 H. H. Berry. Electric fires.
383 F. J. Breslee and British Insulated Cables, Ltd. Coating wire, etc.
8, 9 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Arrangements for modulating frequency of electrical oscillations.
10, 12 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Electric discharge tubes.
80 Electramonic Co., Ltd., D. W. Sayers, and L. N. and S. J. Tyrrell. Synchronising gramophones and kinematographs.
42 Electro Dynamic Construction Co., Ltd. Application of variable induction generators.
102 Ferranti, Ltd., and S. Z. de Ferranti. Alternating current motors.
116 F. Krupp Grusonwerk A.G. Magnetic separation of materials. (5/1/28. Germany.)
106 Scintilla A.G. Coils for battery ignition apparatus. (9/8/28, Germany.)
118 Siemens-Schuckertwerke A.G. Regulation of potential of electrical machines. (23/2/28, Germany.)
41 J. A. Smith. Means for holding electric conductors, etc.

January 2nd.

197 J. L. Baird and Television, Ltd. Thermionic valve apparatus.
183 Electroacustic Ges. Apparatus for directional transmission of wave energy. (14/1/28, Germany.)
189 Enn-Werke Neu, and Neuberger, J. Neu and J. Neuberger. Electric hand lamps.
181 Etablissements E. Belin. Variable speed for wireless, etc., transmissions. (26/1/28, France.)
193 H. C. M. Ingeberg and A. Vesterlid. Insulation material.
165 International General Electric Co., Inc. Vacuum cleaners. (3/1/28, U.S.)
187 Keller Mechanical Engineering Corporation. Electric tracer control for lathes. (27/7/28, U.S.)
199 H. Kirschfeldt. Methods of producing electric power.
167 Maschinenfabrik Oerlikon. Electric switches. (25/1/28, Switzerland.)
191 N. V. Technisch Handels-Bureau Thabur. Electric heating elements. (2/1/28, Holland.)
178 K. Nishimoto. Storage battery. (16/1/28, Japan.)
150 W. Guy-Pell. Light controlling means.
182 J. Schurmann. Electric igniting devices.
168 Soc. des Etablissements Ducretet. Electronic tubes. (13/1/28, France.)

January 3rd.

254 W. S. Adams, British Thomson-Houston Co., Ltd., and J. G. Wellings. Electric switchgear.
276 R. P. A. Andersson. Incandescent lamps.
255 British Thomson-Houston Co., Ltd. Transmission of pictures. (23/1/28, U.S.)
232 N. R. Campbell. Photoelectric cells.
241 Electroacustic Ges. Apparatus for directional transm ssion and reception of wave energy. (4/9/28, Germany.)
271, 272, 273 Ferranti, Ltd., and A. W. G. Tucker. Transformers.
274 Ferranti, Ltd., A. W. G. Tucker. Alternating current load-transferring switches.
277 Furukawa Denki Kogyo Kabushiki Kaisha. Manufacture of battery plates. (17/1/28, Japan.)
232 General Electric Co., Ltd. Photoelectric cells.

Digitized by Google

240 G. Hager and A. Stuppöck. Electric switches. (3/1/28, Austria.)
221 W. Nicol. Electric lamp bulbs, etc.
218 F. H. Reeves and Revo Electric Co., Ltd. Electric lamp fittings.

January 4th.

399 Akt.-Ges. Brown, Boveri et Cie. Arrangement for commutation of continuous current. (28/1/28, Germany.)
375 Automatic Telephone Manufacturing Co., Ltd., and J. E. Ostline. Telephone systems.
370 C. W. Bloomfield. Lead covered conductors, etc.
330 A. P. C. Collier, Radiovisor Parent, Ltd., and E. F. Stephenson. Electric relays.
364 Edison Swan Electric Co., Ltd., G. A. Percival, and H. Swithinbank. Electric lamps.
391 Ferranti, Ltd. and A. Hall. Electromagnetic gramophone pick-up devices.
392 Ferranti, Ltd., and A. Hall. Radio receiving systems.
328 V. H. Gilbert and Radiovisor Parent, Ltd. Forming electrodes of selenium bridge.
371 A. A. Greenslade. Means for indicating and recording telephone calls.
362 International General Electric Co., Inc. Electric protective devices. (4/1/28, Germany.)
334 J. Y. Johnson (I.G. Farbenindustrie A.G.) Production of electrodes for secondary cells.
311 A. E. Jones. Electrical switch plates, etc.
329 Radiovisor Parent, Ltd. Wheatstone bridge cricuits.
395 F. Reid. Fire alarm systems.
358 F. A. Robinson. Distribution of electric current.
290 J. R. Sinclair. Electron discharge devices.
403 Telefunken Ges. fur Drahtlose Telegraphie. Picture, etc., telegraph apparatus. (8/2/28, Germany.)
404 Telefunken Ges fur Drahtlose Telegraphie. Radio communication systems (10/2/28, Germany.)

January 5th.

480 Burdick Corporation. Therapeutic lamps. (6/1/28, U.S.)
454 H. L. Curtis. Loud-speaking telephones.
491 Fabrique d'Appareils Electriques. Favarger Soc. Anon. Apparatus for electrical transmission of information. (6/1/28, U.S.)
433 A. Fotheringhame. Means of obtaining energy from a magnetic field.
443 General Electric Co., Ltd. Devices sensitive to radiant energy.
477 W. O. Heyne and Plessey Co., Ltd. Thermionic valve holders, etc.
501 R. MacDonald. Electrical reproducing devices.
458 Maschinenfabrik Oerlikon. Switch for transformers. (17/1/28, Switzerland.)
457 E. H. Newman and L. C. Rudkin. Wireless receiving apparatus.
489 P. S. O'Donnell and M. de Wolfe. Electrical indicators.
478 J. Robinson. Transmission of pictures.
410 J. Swinburne. Recording sounds.

January 7th.

624 A.C. Spark Plug Co. Preparation of flexible cable. (5/1/28, U.S.)
616 W. H. Apthorpe and Cambridge Instrument Co., Ltd. Vibrating electrical devices.
634 Automatic Telephone Manufacturing Co., Ltd., and W. A. Duff. Telephone systems.
502 F. Blake. Driving tyre for dynamos, etc.
543 K. Bratel. Means for operating electric luminous tubes.
537 British Thomson-Houston Co., Ltd., C. J. Morton, and T. H. Woodfield. Lighting and ignition apparatus for vehicles.
635 British Thomson-Houston Co., Ltd. Variable condensers. (7/1/28, U.S.)
554 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Transformers.
540 Electric Furnace Co., Ltd. Heating metals, etc.
608 Electrical Research Products, Inc. Electric regulators. (29/6/28, U.S.)
522 Electroflo Meters, Ltd., and G. E. Lloyd. Direct current measuring instruments.
615 Ferranti, Ltd., and G. L. Porter. Automatic voltage regulators.
558 W. Frianz. Incandescent lamps.
532 F. W. Golby (Red Spot Electric Co.). Electric fluid heaters.
535 International General Electric Co., Inc. Electric switching devices. (7/1/28, Germany.)
543 Patent-Treuhand Ges. fur Elektrische Gluhlampen and K. Wiegand. Means for operating electric luminous tubes.
557 Patent-Treuhand Ges. fur Elektrische Gluhlampen and K. Wiegand. Arrangement for treating liquid with ultra-violet rays.
517 H. A. Sims. Electrically actuated gongs, etc.

January 8th.

725 Bakelite, Ltd., and D. N. Davies. Earthed panels for wireless signalling.
674 British Thomson-Houston Co., Ltd., and L. J. Davies. Electron discharge devices.
716 C. E. Cornelius. Electric furnace. (9/1/28, Sweden.)
702 N. A. Davis and Metropolitan-Vickers Electrical Co., Ltd. Electric induction furnaces.
703 N. A. Davis and Metropolitan-Vickers Electrical Co., Ltd. Preparation of refractory linings, etc., for coreless induction furnaces.
733 T. C. Finnimore and Gramophone Co., Ltd., A. Whitaker, and J. White. Electromagnetic vibratory devices.
732 Gramophone Co., Ltd., and A. Whitaker. Apparatus for simultaneous reproduction of pictures and sounds.
734 Gramophone Co., Ltd., E. M. Payne, and A. Whitaker. Electromagnetic vibratory devices.
673 D. P. Long and Siemens Bros. and Co., Ltd. Automatic telephone systems.
709 D. C. Plyer and Rotax (Motor Accessories), Ltd. Voltage regulation of telephone systems, etc.
684 Siemens-Schuckertweke A.G. Producing thin insulating layers on wires. (16/1/28, Germany.)
690 Siemens-Schuckertwerke A.G. Producing thin insulating coatings on wires. (16/2/28, Germany.)
718 Soc. Anon des Etablissements Técalémit. Stoppers for accumulators. (9/1/28, France.)

January 9th.

801 A. Arcioni. Pressure regulation of a.c. lines. (9/1/28, Italy.)
844 C. E. G. Bailey and Gramophone Co., Ltd. Tuning devices for wireless receivers.
845 C. E. G. Bailey and Gramophone Co., Ltd. Heterodyne wireless receivers.
774 G. B. Bowell. Electric clocks.
810 British Thomson-Houston Co., Ltd., and C. J. Morton. Ignition devices. (6/1/28.)
775 R. O. Carter, E. K. Sandeman, and Standard Telephones and Cables, Ltd. Electric signalling system.
750 A. Dickinson. Means for preventing microphonic disturbances in wireless components.
784 J. Downs and Watts, Fincham and Co., Ltd. Electric hand lamps.
814 Ferguson, Pailin, Ltd., and G. Pailin. Electric switchgear.
815 Ferguson, Pailin, Ltd., and G. Pailin. Plug and socket connections.
789 General Electric Co., Ltd. Step-by-step mechanism.
811 International General Electric Co., Inc. Safety devices for power installations. (11/1/28, Germany.)
859 D. L. Lees, J. S. Murray, and P. K. Turner. Moving coil sound reproducers
850 Magneto Belge. Electric motors. (13/7/28, Belgium.)
831 Marconi's Wireless Telegraphs, Ltd. Picture telegraph apparatus. (9/1/28, U.S.)

January 10th.

865 H. C. Andrewartha and J. H. Needham. Electric switches, etc.
979 J. Bethenod. Electrically actuated musical instrument. (2/3/28, France.)
977 F. S. Clifford. Electric sound transmission.
961 E. Dunkel and Schall and Son, Ltd. Timing X-ray photographic exposures.
981 S. J. Eintracht and Universal and General Radio Co., Ltd. Converters for supplying radio apparatus from a.c. mains.
920 R. E. Henreich, Radiowerk E. Schrack, and E. Schrack. Loud speaking systems.
886 M. H. Goldstone. Inductance coils.
914 International General Electric Co., Inc. Electric switches. (10/1/28, Germany.)
867 G. Jones. Electric switches.
926 F. G. McDonald. Electric switch indicators for vehicles.
869, 870, 871, 872 W. G. Moore. Electrodes for obtaining therapeutic rays.
888 S. Moss. Wireless tuning devices.
877 C. Odolini. Electric ignition devices.
958 H. J. Round. Portable radio receivers, etc.

1 023 R. Holloway. Galvanic primary cells.
1 087 Imperial Chemical Industries, Ltd. Arc welding.
1 066 International General Electric Co., Inc. Manufacture of insulated enamelled wire. (11/1/28, Germany.)

COMING EVENTS.

Friday, February 15th.

Institution of Mechanical Engineers.—Storey's Gate, Westminster. Annual general meeting. Paper by Mr. H. J. Ward on "Refrigeration on Ship-board." 6 *p.m.*

Electrical Development Association.—Royal Society of Arts, John Street, Adelphi, London. Conference on "Organising for Increased Sales—Spring Cleaning Season, 1929." Speaker, Mr. H. W. Roberts. 7.30 *p.m.*

Saturday, February 16th.

Association of Mining Electrical Engineers (Western Sub-Branch).—60, Wind Street, Swansea. Paper on "Fault Localisation," by Mr. S. T. Richards.

Monday, February 18th-Friday, March 1st.

British Industries Fair.—London and Birmingham.

Monday, February 18th.

Institution of Electrical Engineers (Western Centre).—South Wales Institute of Engineers, Park Place, Cardiff. Paper by Messrs. Johnstone Wright and C. W. Marshall on "The Construction of the Grid Transmission System in Great Britain." 6 *p.m.*

Institution of Electrical Engineers.—Institution, Savoy Place, Victoria Embankment, London. Informal meeting. Discussion on "Modern High Power Rectifiers: Their Development and Use." (Opened by Mr. R. L. Morrison.) 7 *p.m.*

Institution of Electrical Engineers (Mersey and North Wales-Liverpool-Centre).—Arts Theatre, The University, Liverpool. Faraday lecture by Mr. Ll. B. Atkinson on "How Electricity Does Things." 7.30 *p.m.*

Tuesday, February 19th.

Illuminating Engineering Society.—Home Office Industrial Museum, Horseferry Road, Westminster. Special general meeting for the purpose of considering certain amendments in the Constitution, followed by a discussion on "Various Problems in Illuminating Engineering." 6.45 *p.m.*

Institution of Electrical Engineers (North-Western Centre).—Engineers' Club, 17, Albert Square, Manchester. Paper by Mr. W. Cruickshank, on "Voice-Frequency Telegraphs." 7 *p.m.*

School of Engineering and Navigation.—High Street, Poplar. Lecture V (course of five lectures) by Mr. H. Brazil, on "Electrical Sub-Stations." 7 *p.m.*

Wednesday, February 20th.

Electrical Contractors' Association (Sussex Branch).—Midland Bank Chambers, Brighton. Ordinary meeting.

Polytechnic School of Electrical Engineers.—307-9, Regent Street, London. Lecture IV (course of eight lectures), by Mr. E. S. Ritter, on "Picture Telegraphy." 5 *p.m.*

University of London.—Institution of Electrical Engineers, Savoy Place, Victoria Embankment, London. Lecture I (course of five lectures), by Mr. L. Emanueli, on "High Voltage Cables." 5.30 *p.m.*

Institution of Electrical Engineers (Sheffield Sub-Centre).—Royal Victoria Hotel. Address by the President, Lt.-Col. K. Edgcumbe. 7.30 *p.m.*

Thursday, February 21st.

Institution of Electrical Engineers (Irish Centre, Dublin).—Physical laboratory, Trinity College. Paper by Dr. K. Ott on "The Erection of the Mechanical and Electrical Part of the Shannon Scheme." 7.45 *p.m.*

Friday, February 22nd.

Physical Society.—Imperial College of Science, Imperial Institute Road, South Kensington. Papers by Mr. L. F. Stanley on "The Construction and Calibration of a Sensitive Form of Pirani Gauge for the measurement of High Vacua; Dr. C. H. Lees, F.R.S., on "The Free Periods of a Composite Elastic Column or Composite Stretched Wire" Messrs. A. Ferguson and J. A. Hakes on "A Capillary Tube Method for the Simultaneous Determination of Surface Tension and of Density"; and a demonstration of a standard electrostatic voltmeter and wattmeter, used for measurements of alternating currents at power frequencies at the National Physical Laboratory, by Dr. E. H. Rayner. 5 *p.m.*

University of London.—Institution of Electrical Engineers, Victoria Embankment, London. Lecture II (course of five lectures), by Mr. L. Emanueli, on "High Voltage Cables." 5.30 *p.m.*

Institution of Electrical Engineers (London Students' Section).—Institution, Savoy Place, Victoria Embankment, London. Paper by Mr. W. Ford on "Standardisation." 6.15 *p.m.*

Birmingham Electric Club.—Grand Hotel, Colmore Row, Birmingham. Paper by Mr. S. E. Britton on "Electricity in Agriculture." 7 *p.m.*

Institution of Electrical Engineers (North-Eastern Students' Section).—Paper by Mr. G. Waters on "The Progress of Electrical Installations on Ship-board." 7.15 *p.m.*

Saturday, February 23rd.

Association of Mining Electrical Engineers (South Wales Branch).—Cox's Café, Queen Street, Cardiff. Annual dinner. 6.30 *p.m.*

Association of Supervising Electrical Engineers.—Hotel Cecil, Strand, London. Annual dinner.

Exports and the B.I.F.

In spite of the fact that a large number of foreign buyers have already visited the British Industries Fair, there are many more who would not brave the rigours of an English February for all the trade fairs in existence. With full recognition of this fact we have made special arrangements whereby this issue of THE ELECTRICIAN, containing an extensive review of the electrical exhibits at the Fair, shall reach a large proportion of the absentees in the various Dominions and foreign countries, thus, so to speak, taking the Fair to those who are unable to visit it in person. So far as the Electrical Section is concerned the show this year is bigger and better than ever, and the new arrangement of the stands has greatly simplified the location of any particular exhibit. It was a mistake, we think, to decide once more to admit members of the general public to the Fair during certain hours, for at a time like this catering for the requirements of business visitors demands the unqualified attention of the exhibitors' staffs. The presence of large crowds of people on sightseeing bent may have some psychological effect on some of the overseas visitors, but it can hardly be said to facilitate the transaction of real business.

In view of the growing interest in the great possibilities inherent in the vigorous adoption of a policy of trading within the Empire one notes with interest the Canadian participation in this year's Fair in exhibits of storage batteries, electric washers and ironers, electric cookers and stoves, suction cleaners, etc. At the present time over 65% of our external trade is with foreign countries, the remaining 35% being with the British Empire, while the exports from this country to the British nations had declined from 49% of the whole of the exports in 1895 to 36% in 1923, the latest year of which complete figures are available. The per capita purchasing power of the populations of the British Dominions is very considerably greater than that of foreign countries, and as the populations increase this feature will become still more marked.

The export side of the British electrical industry is one of the comparatively few in this country which is exerting itself with success in making the most of export possibilities. Although, as we point out in a later note, our home trade is weak on the selling side, those responsible for the export side are increasingly aware of the need—so forcefully expressed by the PRINCE OF WALES on Monday—for up-to-date salesmanship. There is, as the Prince said, a very strong desire, not only in British communities overseas, but in foreign ones as well, to buy goods manufactured in Great Britain in preference to others if—but only if—those goods suit their requirements. Our facilities for meeting these requirements are unrivalled, for, as Sir PHILIP NASH has pointed out, our location for getting raw materials is unique, our labour is the most intelligent, and our financial system in size and integrity, is without equal in the world. Using these assets together with a greater measure of self-confidence and fuller co-operation, aided by careful organisation and hard work, we need have no fear for the future of British export trade.

Organising for Increased Sales.

DESPITE the deliberately intense provocation offered by Mr. H. W. ROBERTS, and the insistence of the chairman, Mr. F. W. PURSE, in reminding speakers that selling topics were in season, few of those who discussed "Organising for Increased Sales" at the E.D.A. Sales Conference last Friday seemed to be very concerned with selling. This apparent decline in interest in a subject which is of vital importance to the future progressive development of the electrical business is a tendency which has been noted before, but we cannot feel apologetic for dwelling again on a matter which means so much to the entire industry. Generally speaking, we have not yet begun to develop the home market, though a moment's thought shows that a flourishing home trade is a necessary corollary of big scale production for export. Curiously enough, our backwardness in salesmanship is not so much due to prevalence of the idea that electricity and electricity consuming apparatus are so good that people will demand them without encouragement from us, as a lack of vision regarding the possibilities, and the neglect to fix some sort of a goal to aim at. Too many of us are content to think of the cooker or other apparatus which has already sold itself, to bother about the greater number we might have sold, given efficient sales organisations, and about the still greater opportunities which lie ahead. The value of having a point upon which to march is so universally acknowledged that we cannot altogether agree with those who say that American sales methods will not work over here, when we hear from time to time of some con-

Digitized by Google

tractor who decided to turn over 1 000 irons or 200 washers in a given period, and actually sold the desired number. The methods necessary for successful selling in the two countries may be, and probably are, very different. In the U.S.A. the methods are at least commonly understood and employed, whereas we do not seem to have begun to formulate anything better than a string of negatives. We are frequently told, by those who should know, how not to sell electricity and electrical appliances to the British public, but constructive views are markedly rare. It has been suggested to us that the E.D.A. Sales Conferences in their present form offer little hope of training up the younger members of the industry in the way they should go. If this view is generally endorsed, as we fear it must be, the task of organising something more practical and more comprehensive should be undertaken without delay. Beyond suggesting that some useful hints might be obtained from the organisers of the E.L.M.A. Lighting Service Bureau courses on illumination, we do not propose at this stage to offer definite suggestions. But we do invite the free use of our correspondence columns for proposals designed to assist in establishing suitable machinery for the dissemination and demonstration of sound sales methods. Some of the weak points in our export salesmanship was touched on by the PRINCE OF WALES at the B.I.F. Banquet, and many of his remarks apply with equal point to the home market.

An Omnibus Association.

THE plea put forward by Mr. T. STRETTON at the E.W.F. dinner for the establishment of one electrical trade association which would co-ordinate the functions of existing organisations has been advanced again and again, but with the same dearth of results, or even expressions of opinion, either for or against the proposal. The fear of a few short-sighted association officials that the operation of such a scheme would deprive them of their jobs does not seem to provide sufficient cause for the apparently general disinclination to discuss the project in a constructive manner. There is at least a *prima facie* case for consideration. Why, then, is the subject taboo ?

A Gas Scandal.

USED as we are to reading of the asphyxiation of whole families by escaping gas, we are apt to dilute our sympathy with the victims with reflections that people who choose to live in such dangerous company have expected too much of Providence. But a recent incident at Eastbourne, in which a husband, wife and two girls died from gas poisoning, suggests that even those who have no gas supply may fail to wake almost any morning due to the nocturnal ramblings of this " Spirit of Coal " In the Eastbourne tragedy it appears the vicitims lived in a flat which had no gas installation, but yet were found in a room full of gas, which had apparently forced a way under the premises from a leakage in the main outside. If electricity could have caused such a terrible tragedy there would have been a great outcry coupled with demands for safeguarding the public against a repetition. In the Eastbourne case, however, nobody seems to have been particularly perturbed by such a danger.

Lord Birkenhead and Electricity Supply.

" DESPITE a well-organised Spanish manufacturing industry and active competition from other European manufacturers, American electrical equipment is considered standard. This situation is partly accounted for because of the extensive investments of American capital in Spanish factories and utilities." Statements similar to this quotation from an American journal so frequently come to light, and practical knowledge of the advantages which British industrialists have gained in the past from investments in partially-developed foreign countries is so definite, that LORD BIRKENHEAD'S acceptance of the chairmanship of the American-financed Greater London and Counties Trust is a move demanding careful attention. Suggestions that this financial penetration would deprive the British industry of orders have been very definitely controverted ; not only by Lord BIRKENHEAD, but also by Sir PHILIP DAWSON and Mr. F. MASSINGBERD ROGERS, both of whom are prominently associated with the scheme. The benevolent motives of the Utility Power and Light Corporation in financing the development of electricity supply in this country must therefore be accepted, as well as the statement that the Trust is under entirely British control, and will work entirely to the advantage of Britain. What we fail to see at the moment is how, under these circumstances, American capital can derive much advantage from investment in distribution enterprises in areas which for the most part have shown little attraction to investors with full knowledge of local possibilities ; enterprises which must, moreover, purchase supplies from the Central Electricity Board and be subject, as the constituent companies now are, to the forms of control which apply to other supply undertakings in this country.

Electric Vehicle Law.

BY deciding on appeal that petrol-electric vehicles are electrically propelled vehicles, and chargeable as such with the preferential licence duty, the House of Lords has settled a knotty point. While on the one hand it had been contended that as the original source of energy is the internal combustion engine, it is not an electrically propelled vehicle, their Lordships hold that argument to be unsound, on the ground that a vehicle does not cease to be an electrically-propelled vehicle by reason of the fact that the electricity which drives the wheels is generated by a petrol engine. This decision will probably have an important bearing on the immediate future of electric vehicle design.

The Commissioners' Report.

IN recent years the annual reports of the Electricity Commissioners have tended to come out later each year. Their seventh report, issued nine months after the end of the period to which it related, was just in time for Christmas reading. The eighth report, which has just been issued (H.M. Stationery Office: 3s. net) is nearly eleven months old. Although the extra work which has fallen upon the Commissioners is mainly, if not entirely, responsible for the widening time lag, the value of reports of this kind is greatly increased by topicality. To refer at this date to a " proposal " to establish a hydro-electric generating station at Maentwrog, and to state that one turbo-generator at Brimsdown " is practically ready for the initial run " is to expect of the reader a closer knowledge of the Einstein Theory than some of us possess. One is somewhat reconciled to the lateness of publication by the encouraging progress which the Commissioners record in various directions. The Returns bear evidence that there was a rapid recovery as regards output and operating results from the adverse effects of the coal stoppage, the total output of 9 927 850 630 kWh being 18·7% above the figure for 1926–27. The increased output, moreover, was obtained at the expense of the small advance of 5·4% in coal and coke consumption. Sales by authorised undertakers increased by about 19·6%, thus raising the average per capita consumption to 155 kWh. As there was installed in 1924 no less than 2 500 000 kW of industrial generating plant not included in the above returns, the real average consumption spread over the whole population is obviously much greater than the recorded figure. Viewing the statistics over several years, the production of electricity at the stations included within the scope of the Returns has practically doubled since 1920–21 ; there has been an all-round increase of about 54% in the amount of electricity produced per ton of fuel consumed, as compared with the technical practice in 1920-21 ; and the sales of electricity by authorised undertakers have increased by about 88% in five years. For a country which is supposed to be " lagging far behind " others, the results as disclosed by the Commissioners are, to say the least, encouraging.

BRITISH TRADE.

Conditions Required for Industrial Revival—Six Vital Points—Our Future Policy—Output and Unemployment—Telling the World of Our Ability—Enormous Market for British Electrical Goods.

By R. H. SCHOFIELD, A.M.I.E.E.

THE inherent wealth of this island is very great after a century of progress as the leaders of the world in industrial production, and no small part of that wealth is the capacity of our people born and trained into respect for law and order.

Mr. R. H. Schofield.

Our accumulated wealth was poured out during the War by the thousand million, and positive wealth is still pouring away, thus our apparent inability to sell enough of our productions to keep our people fully employed.

Our productive capacity as a nation, both as regards people and factories, is working on a very poor load factor, and this is probably the real weakness of our present national condition.

Our potential wealth was reduced by the wholesale slaughter of men who were naturally of our best, both physically and mentally. Abstract wealth has been reduced very materially by the lethargic outlook of the masses and by the lack of guidance in economic perspective manifest in limited output per man-hour, both by brain and manual workers.

In such a condition it is necessary to review our assets and resources and to consider the best use of them for our immediate prosperity and the consolidation of the future of the country.

There is a very well-worn statement that "British goods are best," and this will probably continue to serve its purpose until such time as we shall not need to reiterate such a slogan, as others will do it for us.

In every industry there is a serious weakness of hoping that things will improve instead of fighting to improve them by real effort.

Those at the head of each industry should lead it well or get out, and, in my opinion, the following is a list of what has to be done:—

(1) We must acquire sufficient knowledge of the requirements of humanity. We cannot expect ever to relax our inquiry as to what is, and what will be, wanted. We should be able to know human needs as well as anyone, and it is urgently desirable that our youth should learn to understand and speak the principal languages of the world. It is futile for an Englishman to travel on the Continent for the purpose of broadening his mind, or even enjoying a holiday, unless he can understand the language and the psychology of the people of the countries visited. It is still more useless to spend good business-time and money when the spoken word has to be interpreted before it is understood.

We shall have to get out of the habit of satisfaction with a design, a type or a method, and to this end we have to get into a state of mind which compels us to inquire all the time.

(2) We must acquire the skill and technique to design commodities for these requirements. This is a very important factor, and although it is well known and appreciated that our technical men have high abilities, it is doubtful whether our designers meet the users frequently enough, and it is also doubtful whether this section of the work is made sufficiently attractive from the point of view of remuneration and general reward for industry.

(3) We must employ, and pay well, the industrial workers who are willing to sell their output at prices according to result. It is difficult to enlarge upon this feature without becoming political, but it is an undoubted fact that in Great Britain the output per man-hour is less than in other countries. The cause of this frame of mind is, in a great measure, the fear of unemployment. Every leader of industry knows that his workers can and do produce a greater output on a full order book, and every workshop foreman knows that workers very naturally hold back the finishing of a job unless there is another one in sight, because the fear of unemployment is a very real and serious dread.

The New Propaganda.

(4) We must bring to the knowledge of humanity the fact that our excellent commodities are available. This means advertising in the broadest sense of the word. For some years past we have been telling the world the onerous conditions of our national life, and we have shown them in many ways that we are temporarily below par. The result of this world-wide depression of the opinion of Great Britain is that in general we are trying to cultivate trade by sentimentality rather than by value for money. It is necessary to look as if we want the orders, but not as if we need them. Let us begin early a new kind of propaganda showing our national ability and capacity rather than the continual exposure of our difficulties.

(5) We must cut out ruthlessly the costly non-productive portion of our overhead charges.

(6) We must study international and empire trade relationships from our own business angle, and not from the political party standpoint.

The outstanding bright spot of British export trade at the moment is in the electrical industry. This success is very largely due to the comparative newness and vigour of the people in the trade.

The world market for British electrical commodities is tremendous, and there is profitable trade to be done by those who will first take the trouble to find out what is wanted, design it skilfully, sell it with enthusiasm and deliver it punctually.

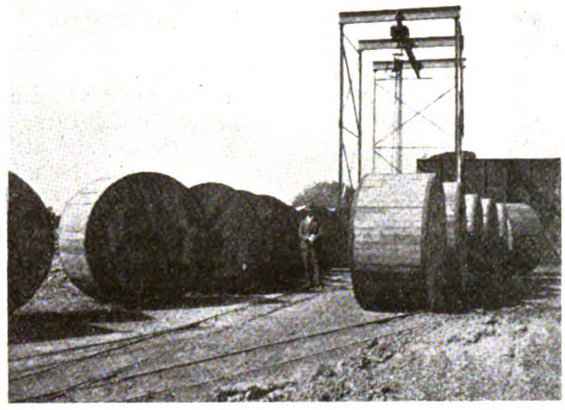
BRITISH EXPORTS PICTURED.

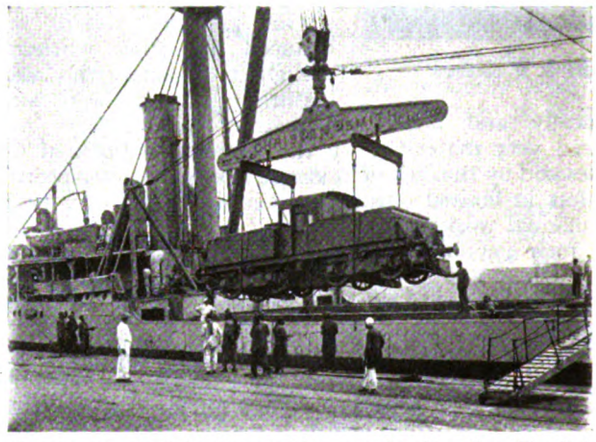
A 61-ton Parsons alternator stator unloading at Sydney, Australia, by floating crane.



Part of a big consignment of J. and P. cables, at Pretoria power station.

Unloading a 53-ton Parsons stator, for Witbank, at Lourenço Marques, Portuguese East Africa.

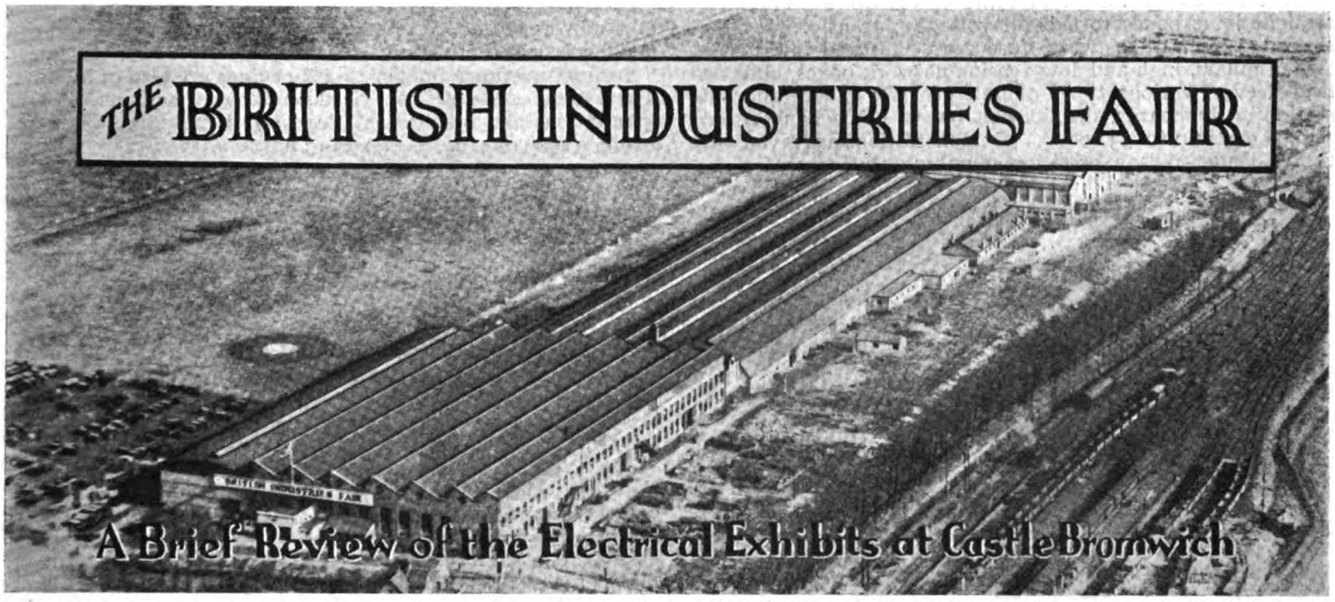
A 600-H.P. Metropolitan-Vickers electric locomotive on the Oeste de Mines Railway, Brazil, with some of the railway staff.



A 57-ton electric locomotive made by the English Electric Co., for the B.B. and C.I. Railway, unloading at the Alexandra Docks, Bombay.

Reminiscent of one of the "Old Masters" is this picture of a half condenser shell made by the Metropolitan-Vickers Electrical Co., being hauled to site at Bunnerong, Australia.

Digitized by Google

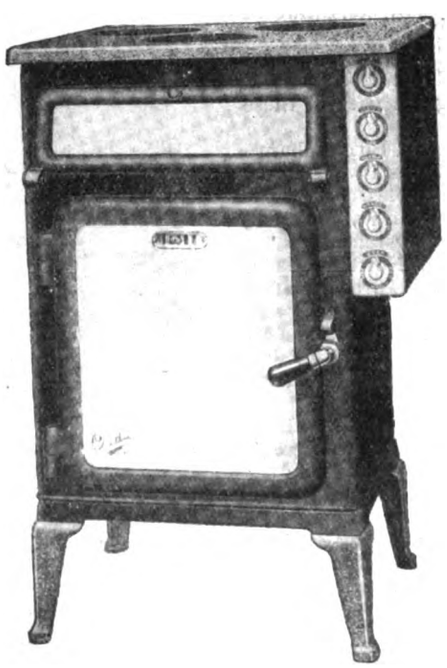


WE continue below our review of the exhibits of electrical interest at the Birmingham Section of the British Industries Fair. Our remarks last week were chiefly in relation to domestic equipment, and below will be found descriptions of some of the industrial interests.

THE WESTINGHOUSE BRAKE AND SAXBY SIGNAL CO., LTD. (82, York Road, King's Cross, London, N.1). The exhibits here include several complete battery charging sets; a 1 000 V rectifier set, suitable for power supply for transmitters; all types of radio units; a representative display of eliminators and chargers made by well-known manufacturers, which incorporate Westinghouse rectifiers, and a four-circuit charging set for garage and service station use, giving various outputs.

J. H. TUCKER AND CO., LTD. (King's Road, Tyseley). Prominence is given to the lines which have been introduced since the last Fair, including a new range of combined switches and sockets, some particulars of which have already appeared in the electrical Press. This new range has been specially designed to eliminate erection difficulties, especially in sunk boxes. The unit consists of a single base of porcelain with corner feet, with the switch and socket mounted thereon. The fixing of the whole unit in either iron or teak boxes is accomplished by two screws and does away with any form of mounting brackets. In the surface pattern of this range the unit is entirely enclosed in a bakelite case secured to the case with one single screw. Another feature is a complete range of three-pin sockets and plugs made to the B.S.S. No. 317, which was issued late last year. This range consists of the 2 A, 5 A, and 15 A sizes in surface, floor, and switchplate mounting types. In addition to giving prominence to these lines J. H. Tucker and Co. also have ranges of complete switchboards for country house lighting, knife switches and fuses up to 1 000 A. A novelty is provided in an endless belt system, which shows the extensive nature of "Tucker" products. Other exhibits are ranges of insulated products in telacite and bakelite, interlocked heavy duty switch-plugs, bakelite lamp holders (both of the ordinary and Home Office types) and similar lamp holders, incorporating a quick-make-and-quick-break switch action with push-bar method of operation. The miniature 5/15 A range of H.O. fuseboards, which made its first appearance at last year's Fair in teak cases, is shown for the first time in iron cases. Special wiring facilities have been incorporated in this new range, including detachable end plates for drilling. A new range of ironclad switches and switch-fuses with quick-make-and-quick-break action in double, triple, and four pole types is also to be seen, as well as single and double pole service cut-outs incorporating a fuse unit of new design.

PRITCHETT AND GOLD AND E.P.S., CO., LTD. (50, Grosvenor Gardens, Victoria, London, S.W.1). This exhibit is made up of batteries for central stations, house lighting, yachts, automatic telephone exchanges, train lighting, etc. The chief feature is the closed top cells. These have found favour with contractors and lighting set manufacturers, in view of the ease with which the lid may be removed to allow for internal inspection. There is no sealing to be cut away, as the cells are sealed by means of a rubber flange fitted to a wooden lid. These cells can be sent out fully charged complete with acid.



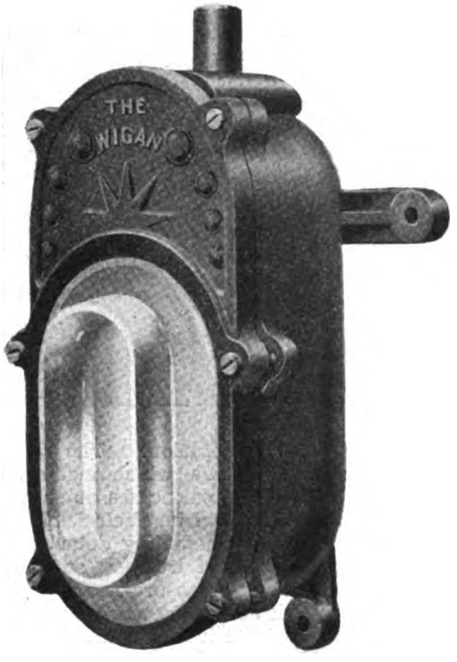
ONE of the electric cookers to be seen at Birmingham on the stand of Credenda Conduits, Ltd.

CREDENDA CONDUITS, LTD. (Oldbury, Birmingham). Here is shown a wide selection of apparatus sold under the name of "Creda." Foremost in interest are the new automatic electric hot water storage heaters. These are made in four sizes and are automatic in action. A full range of cookers is shown, together with kettles and other small domestic appliances. Another interesting section is that devoted to "Credalux" reflector lighting fittings.

CALLENDER'S CABLE AND CONSTRUCTION CO., LTD. (Hamilton House, Victoria Embankment, London, E.C.4). Here is shown a complete range of l.t., h.t., and super-tension cables, up to and including 66 000 V. The range covers paper, rubber and cambric insulated cables, lead sheathed, armoured, taped and braided; special cables for ship lighting and colliery work; patent rubber cab tyre sheathed cables, and "Ancalite" cables for railway signalling work, etc.; insulating tapes and compound, and jointing accessories; also Callender-Kay poles and accessories for overhead transmission. On this stand there are also found specimens of outdoor type dividing boxes up to and in-

Digitized by Google

cluding 66 000 V, indoor dividing boxes up to 11 000 V, straight joint boxes to suit all voltages; transformer pillars showing standard c.s.w. l.t. fuse gear, high and low tension switch pillars, high and low tension network boxes, chill cast lead sleeves, various types of unit gear for pillars and sub-station switchboards, distribution boxes, cable hangers, and sealing ends up to 33 000 V. Demonstrations are given with the Callender-Wilson precision plumbing apparatus, for electrical and mechanical plumbing for fiery mines or for ordinary outdoor use. Callender's also exhibit the "Kalibond" system of wiring.



One of the industrial equipments shown by Heyes and Co., Ltd.

The Gutta Percha Co. (Wharf Road, London, N.1). The exhibits here are divided, broadly, into two classes, the first, magnetic alloys, and the second, electrical resistance alloys. Within the first group are the patented alloys, "Mumetal" and "Rhometal." These, it is claimed, possess high magnetic permeabilities in feeble magnetic fields. A third magnetic alloy exhibited is "Radiometal." This has been primarily developed for use in the cores of audio-frequency transformers. It is characterised by high incremental permeability and, we are informed, enables designers to produce audio-frequency transformers which will give a uniform amplification over the musical scale. The second group of alloys (nickel-chromium resistance) are sold under the registered name "Pyromic," Pyromic No. 1 being characterised by its strength at high temperatures, and its long life at temperatures of the order of 1 100° C. Pyromic No. 2 is a binary alloy consisting of 80% nickel and 20% chromium. This, it is claimed, is the purest nickel-chromium alloy on the market; the whole of these alloys are, we are informed, prepared in high frequency induction furnaces. Examples illustrating the uses of these metals are also shown.

Earle, Bourne and Co., Ltd. (Heath Street, Birmingham). This firm manufactures rolled metals and tubes in brass and copper, the exhibit comprising various examples of work of interest to both general and electrical engineering, including tubes incorporated in domestic water heating systems.

Rd. Johnson, Clapham and Morris, Ltd. (Newton Heath, Manchester). The exhibits staged by this firm include examples of bar and tinned copper conductors in rod, strip, and wire, and in cotton covered and braided rod, strip, laminated strip, and instrument wires in all standard sizes and finishes designed to meet the general requirements of every department of electrical construction and service.

The Record Electrical Co., Ltd. (Broadheath, Altrincham). Here is exhibited a complete range of ammeters, voltmeters, insulation testers, cut-in and cut-out switches for accumulators, and automatic circuit breakers for power circuits. Amongst the instruments worthy of note are the change-coil ammeter which can be used for testing various loads over a wide range without the use of current transformers. The line of circuit breakers manufactured by this company has been redesigned and many outstanding features have been incorporated.

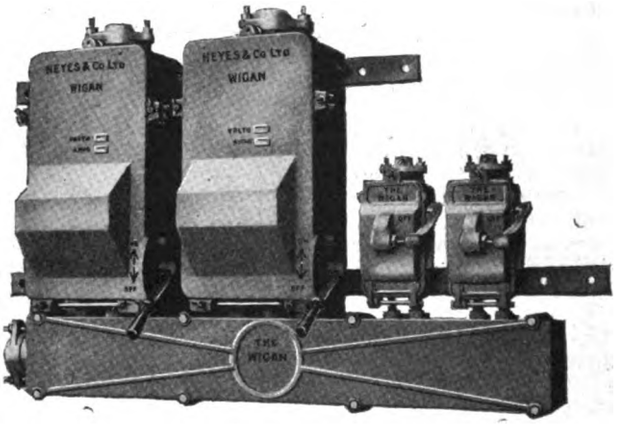
Blackstone and Co., Ltd. (Stamford). Outstanding exhibits of this firm include two-cylinder high speed engines of 1½ B.H.P. coupled to a dynamo, and new petrol-electric plants with outputs of 1 to 3½ kW suitable for supplying light and power for country houses, farms, estates, small workshops, shop lighting, etc. Other exhibits are "Spring Injection" heavy-fuel-oil engines, by means of which, so it is claimed, electricity can be produced at a cost of between ½d. and 1d. per unit, according to the size of the engine and the delivered price of fuel-oil. To small power users, the latest "Spring Injection" hopper-cooled engines are also of interest. These engines are self-contained small power units needing no foundations and operate on Diesel oil or paraffin. They are made in sizes of 5, 6½, 8, 10, and 13 B.H.P.

Burovox, Ltd. (Craven House, Kingsway, London, W.C.2). The exhibits shown by this firm comprise a wide range of inter-telephone systems for offices, factories, ships, the home, etc. Public address systems are also included.

Heyes and Co., Ltd. (Water-Heyes Electrical Works, Wigan). This company exhibits an extensive range of "Wigan" flameproof and industrial type specialities, including mine signalling equipment, lamp fittings, prismatic bulkhead fittings, telephones, flameproof and watertight air-break switchgear, bells, keys, pushes, and armour glands, etc. A modern type of luminous indicator for mines shaft signalling is shown in operation, together with suitable bells and keys.

Thor Lamps and Supplies, Ltd. (53–55, Tredegar Street, Cardiff) exhibit all their types of lamps, including standard colliers' lamps, both in the pillar and pillarless types. These latter are fitted with various forms of wellglass, including clear glass, opaque glass, tinted glass, and a special form of Holophane glass which is being developed. The cells fitted in the miners' lamps are of the non-spillable variety, filled with "Sollyte" jelly electrolyte, and they can be supplied with cases of flexible vulcanite, or of celluloid. There is also exhibited a charging stand of the usual type with special features, such as resistance cut-out, circuit breakers in place of fuses, and unbreakable trays. A patent magnet opener, which includes the provision of an automatic switch-on device, is also shown.

Ringsdorff Carbons (England), Ltd. (Colindale Avenue, Hendon, London, N.W.9). Carbon brushes for stationary motors and generators, rotary converters, turbo-generators, railway motors, and automobile starting motors and lighting generators are shown in all sizes, while carbon rings for steam turbines, carbon rods for electric welding, carbon plates and rods for electrolytic work, carbon contacts for circuit breakers, carbon discs for telephone equipment, etc., are also included. There is also an interesting exhibit consisting of a working model of various designs of brush holders demonstrating how one design permits the whole surface of the brush to be continuously in contact with the surface of the commutator, while other designs allow the brush to be in contact only at its edges.



Another exhibit to be seen on the stand of Heyes and Co., Ltd.

Dexine, Ltd. (Abbey Lane, Stratford, London, E.15). The stand of this firm includes various exhibits in rubber and ebonite. Among those of electrical interest may be mentioned wireless panels, insulating bushes and cylinders measuring 2 ft. long by 20 in. diameter, ⅛ in. thick. Among the claims made for these cylinders may be mentioned the following: specific gravity at 60° Fah., 1·2765; tensile strength per square inch at maximum load, 6765 lb.; electrical test: sheeting, ¼ in. stood 21 000 V twenty-five periods for six mins. without breaking down; insulation resistance: 3 000 megohms; water absorption after 48 hours very small i.e., 339 grm. weight before immersion, 339·23 grm. weight after immersion; insulation resistance after immersion, 3 000 megohms.

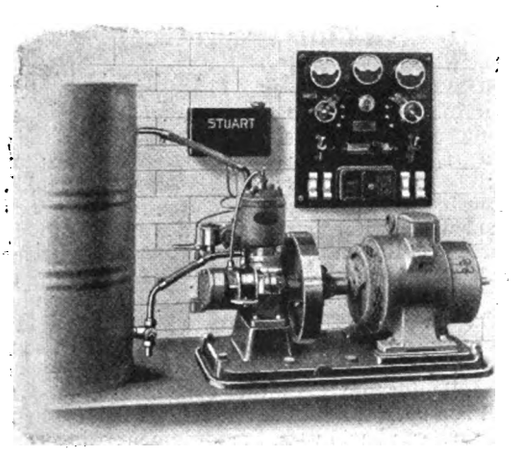
Digitized by Google

THE DIAMOND FIBRE CO., LTD. (75A, Queen Victoria Street, London, E.C.4), shows red, black and grey vulcanised fibre sheet, rods and tubes, machined parts, i.e., rings, washers, noiseless gears, bobbins, bushes, cleats, switch handles, etc., as used for various purposes in the electrical and mechanical industries.

DAVIES AND TIMMINS, LTD. (York Road, King's Cross, London, N.1). This exhibit includes metal thread screws, bolts, nuts, and terminals turned from the solid rod, examples of repetition work in all metals for electrical and general engineering.

BEATL SALES, LTD. (49, Wellington Street, London, W.C.2). On this stand is shown, in conjunction with the British Cyanides Co., Ltd., and The Beetle Products Co., Ltd., demonstration moulding plant, illustrating the production of finished mouldings from beetle moulding powders.

HOLDEN AND HUNT (Cox's Lane Works, Old Hill, Staffs). A representative range of electric resistance welding machines, including spot, butt, wire and chain welders, as well as an electric rivet heater and an electric heater for soldering irons are shown. All the machines are in operation, including a new and improved 12 kW spot welder and a 4 kW wire butt welder. A large size double-headed rivet heater incorporating several unique features is shown. The machine has an electrical capacity of 25 kW and is capable of heating 220 $\frac{3}{4}$ in. by 3 in. rivets per hour, the time for other sizes being in proportion. In addition to the No. 3 and No. 4 size spot welders, Messrs. Holden and Hunt exhibit their No. 2 size, which has an electrical capacity of 8 kW, and is capable of welding iron and mild steel up to $\frac{1}{8}$ in. added thickness on repetition work or $\frac{5}{16}$ in. added thickness occasionally. An example of a hand-operated butt welding machine, intended primarily for heavy jobbing work and capable of welding up to one square inch section, is another feature. This is rated at 30 kW, and is designed for undertaking a wide variety of work, with accuracy of alignment under the heavy "upsetting" pressure required. The machine is water cooled throughout, and the "upsetting" pressure is applied by means of a powerful eccentric cam, designed to give the pressure in a direct line with the required "upset" and to prevent any twisting or unbalanced force from acting on the slide. The



A ½ kW lighting set by Turner Stuart, Ltd.

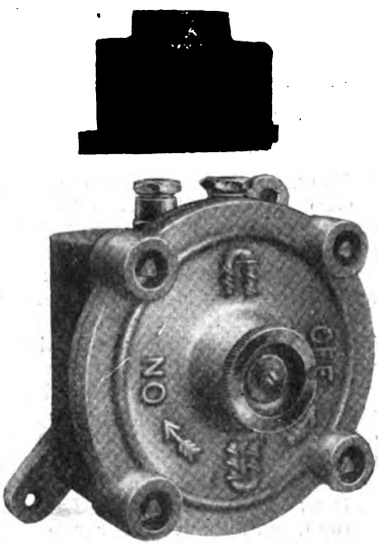
switch is foot-operated and the heating speed controlled by means of a three-way regulator. Besides the No. 2 size of wire welder an interesting bench type is on view. The machine has an aluminium body and as it weighs only 30 lb., it can easily be carried about. The electrical capacity is $\frac{1}{2}$ kW, and it will weld up to $\frac{1}{8}$ in. diameter steel, $\frac{1}{16}$ in. diameter brass, and $\frac{1}{32}$ in. diameter copper.

F. GILMAN (B.S.T.), LTD. (Skatoskalo Works, Regent Street, Smethwick). This firm, the sole manufacturers of "Skatoskalo" tools, exhibits various mechanical devices for carrying out every type of tube and surface scaling work. Standard machines of various types, including electrical and pneumatic tools, are also shown on this stand, the electrical tools being in operation.

THE MIDLAND FAN CO., LTD. (212, Acton Road, Birmingham), displays all kinds of spraying equipment for the application of paints, enamels, varnishes, lacquers and all types of cellulose enamels and polishes for wood or metal. The exhibit includes a working demonstration plant complete with air compressor, air receiving tank, exhaust fan, air filter, various types of spraying pistols, gravity feed and pressure feed paint containers, etc.

THE LIVERPOOL ELECTRIC CABLE CO., LTD. (Linacre Lane, Bootle). This firm, in conjunction with the London Electric Wire and Smiths, Ltd., exhibits paper insulated mains cables, of which a full range of samples of various types for the transmission of electric power up to and including 11 000 V working pressure, are shown, together with representative types of pure and V.I.R. insulated wires, cables, and flexible cords, and the well-known specialities of the company, "Lecite" V.I.R. insulated cables, and the patented 'Lecite" wiring system which, it is claimed, has been evolved in order to meet the demand for a system which will prove universal in its application.

HOLLINGS AND GUEST, LTD. (Thimble Mill Lane, Birmingham). This stand is mainly devoted to hydraulic machinery, the most interesting from an electrical point of view being a vertical four column press with steam heated platens specially designed for the manufacture of insulating materials for the electrical industry. This press is fitted with two hot plates, made of cast-iron, in which the steam heating coil is cast solid in the plate, making it practically impossible for a fracture to occur at any steam pressure which may be reached. The hot plates in this press are 15 in. square, machined on both faces, and polished on their working surfaces. The top hot plate is firmly fixed to the press head, and the bottom hot plate is attached to the press table. The cylinder of the press is of cast iron, bored and faced for the columns, machined to receive the ram, and fitted with hydraulic packing. The ram is of mild steel machined and polished on its working surface, and spigotted into the table. The four columns are of mild steel, machined all over, screwed and fitted with steel nuts. A number of electrically-driven pumps are also shown, together with examples of "Ellmar" insulating mouldings.



A 5 A flame-proof switch by the General Electric Co., Ltd.

GENT AND CO., LTD. (Faraday Works, Leicester). On this stand are displayed improved mining bells and relays, suitable for working in parallel on bare wire signalling, also improved tapper keys, mining pushes, heavy-duty power pushes, telephones, all incombustible and flame-proof. A new "Tangent" high and low liquid level alarm with diversion relay suitable for a.c. or d.c. circuits, is shown, together with motor syrens a.c. and d.c. in sizes ranging from 1/10th to 4 H.P., a new electric motor bell operated by a 1/10th H.P. motor, while an interesting display is made of "Pul-synetic" electric clocks.

SILVERTOWN LUBRICANTS, LTD. (Minoco Wharf, West Silvertown, London, E.16). This firm has a comprehensive display of electrical oils, such as cable impregnating oil, insulating oil for ironclad switchgear, cable inlet and outlet boxes, etc., transformer oils, switch oils, electrical condenser oils, insulating oils, radio valve cooling oils, etc.

THE BROMFORD TUBE CO., LTD., (Eddington, Birmingham), who are manufacturers of hot rolled weldless steel tubes of every description, exhibit boiler tubes, steam mains, superheater tubes and elements, cable and telephone ducts, coils and manipulated tubing, etc. This firm also exhibit seamless steel standards for electric lighting, and have recently introduced new types with fluted columns.

LACY-HULBERT AND CO., LTD. (Boreas Works, Beddington, Surrey). On this stand are displayed samples of high speed compressors especially designed for direct-coupling to electric motors, petrol engines and other high speed prime movers. These machines are also exhibited as fixed and portable sets direct coupled to d.c. motors. The range of these machines includes sizes from 2½ cu. ft. to 80 cu. ft. of free air per min. for any pressure up to 150 lb. per square inch. Other exhibits include combined electric-driven compressors mounted on air receivers, a portable electric air blast for cleaning electrical machinery and similar purposes, also larger sets for the same purpose as used in generating stations, workshops, mills and shipyards.

Digitized by Google

C. C. WAKEFIELD AND CO., LTD. (30/32, Cheapside, London, E.C.2), are exhibiting lubricants and cutting oils, together with lubricating appliances.

PETTERS, LTD. (Yeovil). As in the past, this firm has again made country house lighting plants an outstanding feature of their exhibit, the various sets including a 5 B.H.P. "S" type surface ignition oil engine direct coupled to a G.E.C. generator, a 1½ kW "Petter-Light" plant for use with storage batteries, and an "Alpha-Petter" switchboard fitted with a button for starting the engine similar to a car self-starter being shown. Another exhibit is the "Auto-Petter" lighting set which was described in our issue of December 28th last.

Welding Plant.

ALLEN-LIVERSIDGE, LTD. (Victoria Station House, London, S.W.1), exhibit a complete set of all types of welding equipment, including "Alda" electric arc welders, and "Pontelec" resistance welding machines, one for spot welding, one for butt, and one for seam.

GEO. BRAY AND CO., LTD. (Leeds). This firm is exhibiting a full range of the well-known "Chromalox" heating units and appliances, porcelain insulators and electrical refractories. With regard to the heating units these include automatic and non-automatic water heaters from 500 to 6 000 W.

FREDERICK SMITH AND CO. (Anaconda Works, Salford). The exhibits here include hard drawn H.C. copper trolley wire, hard drawn H.C. copper wire for all electrical purposes, soft copper wire and strip, hard copper strip, sectional copper strip, tinned soft copper wire and strip, bare hard drawn copper strand for transmission lines, copper plating wire, silicium bronze telephone wire, cadmium copper telephone wire, aluminium wire, and steel cored aluminium strand.

JOHN HARPER AND CO., LTD. (Albion Works, Willenhall, Staffs.), exhibit a full range of sand-blasted castings for electrical instruments, meters, radiators, switchgear, motors, resistances, etc. They also show heat-treated iron of special analysis to meet the need for magnet castings of high permeability, and since they are also licensees for the production of "No-mag" castings, interesting samples of these are also displayed.

BULL MOTORS, LTD. (Ipswich). An exhibit of particular interest is a special motor-driven high frequency alternator, typical of a number which have been supplied to the British Post Office and leading wireless telegraph companies. The alternator delivers a single-phase output of 2 kVA at 450 cycles. Another exhibit is a motor generator set consisting of a squirrel cage induction motor direct-coupled to a shunt wound generator. The set is shown in operation at full load and the generator supplies current at 500 V to a series wound motor direct-coupled to a tramway brake compressor. This series wound machine is of a type developed for this class of work and so constructed as to form one unit with the compressor.

CROSSLEY BROS., LTD. (Openshaw, Manchester). Here is shown a vertical 4-cylinder type heavy oil engine of new design coupled to a Crompton 72 kW, 440 V d.c. dynamo. The engine is totally enclosed, with all moving parts protected, and self-lubricated by oil supplies under a pressure system. Another new engine is a 2-cylinder horizontal type.

SPAULDINGS, LTD. (40, Gloucester Street, London, E.C.1). This firm exhibits a range of bakelite and fibre machined parts and bakelite mouldings.

Fuse Equipment.

THE CASTLE FUSE AND ENGINEERING CO., LTD. (Castle Works, 33, Chester Street, Liverpool). Among the many items to be seen here may be mentioned a 3-unit fuse equipment for 2-wire d.c. supply, made up of three standardised unit type boxes. The equipment consists of a switch box with sealing chambers for two sets of incoming mains at the bottom, metering equipment mounted on the top of the box, and inside, a 500 A d.p. change over switch on a 1 in. thick panel; two distribution boxes containing a number of "Triumph" power fuses in sizes from 60 to 350 A. These boxes are of gas tight construction, having lids with machined face and spring loaded hinges; they have removable panels on each side, so that any number of boxes may be coupled together side by side. The fuse assemblies are mounted on a new combined fuse bar and support bar, a simple form of interconnection is made between the bus bars in adjoining boxes. Other exhibits are balanced 3-wire and 2-wire service distribution boxes having four 60 A ways, switch and metering equipment, made up in a large and small standardised boxes, respectively; two new larger unit boxes with removable panels, for three-phase distribution or to house circuit breakers; a feeder pillar; fuse assemblies mounted on a new divided bus bar; ironclad fuse boards in double pole and triple pole types, in ratings from 15 to 100 A., and teak distribution boards in sizes from 5 to 30 A for lighting purposes.

THE GENERAL ELECTRIC CO., LTD. (Magnet House, Kingsway, London, W.C.2). On the industrial side the G.E.C. shows 8 and 30 kW electric furnaces, electric japanning ovens, electrical apparatus for the production of distilled water, electric water heaters, lighting fittings and supplies, Osram lamps and valves, bells and telephones, etc. The cable factories of the Pirelli-General Cable Works are represented by a large cable drum on which are mounted samples of the company's products. A large replica of an electro-magnet, made up of conduit and conduit accessories, is also shown. The Witton display includes an old Byng-Hawkins motor which has been in continuous use since 1898, and this forms the background of a display of eight new standard "Witton" motors, four of which are of the drip-proof squirrel cage type, while the remaining four are of the d.c. shunt wound protected type. The squirrel cage motors are intended for general industrial purposes, and comply with B.S.S. 168/1926. High torque starting characteristics are a feature of these motors, the sizes shown being 1, 7½, 12½ and 25 H.P., running at 1 400, 1 500, 1 000 and 750 r.p.m. at 400/440 V. respectively. Interesting features of the d.c. machines include the louvre covers over the commutator openings, and the impregnation of the windings so that the motors are capable of withstanding tropical conditions. The range of motors displayed is of 1, 5, 20 and 10 H.P., to run at speeds varying between 950 and 1 350 r.p.m. at 440 V. Some interesting examples of ironclad switchgear are shown, including dwarf circuit breakers for controlling small domestic appliances, cookers, testing and change circuits, etc.; counter e.m.f. starters for d.c. motors (push button or pilot switch control), and a 5 A flame-proof s.p. quick-make-and-break switch. A triple-pole 50 A quick-make-and-break switch with fuse known as the "D.B. Major" is also shown.

Lifting Magnets.

THE RAPID MAGNETTING MACHINE CO., LTD. (Magnet Works, Lombard Street, Birmingham). This year's exhibit includes a number of new equipments. Demonstrations are given with lifting magnets, separating machines, while the exhibits include a self-contained, portable motor blower; magnetic clutches; rotary separators, etc. Another exhibit is a high intensity electro-magnetic chute, interconnected and interlocked with switchgear in such a way that in the event of the current failing, not only does a collapsible bridge divert the iron adhering to the poles, but also the feed is automatically shut off, the switch is cut out, and a bell rings, giving the alarm. Such a chute is, we understand, being used in dealing with coal prior to being powdered for fuel, and is also used for extracting tramp iron from powders, granular material, semi-solids, liquids, etc. Another type of equipment recently developed is a special light electro-magnet for use in conjunction with pickle and acid vats, the equipment being used for the purpose of getting small pieces of iron or steel that have dropped from the hangers to the bottom of the vats.

DAVEY, PAXMAN AND CO., LTD. (Aldwych House, Aldwych, London, W.C.2). This exhibit includes various sizes of the "Paxman" all-steel, sectional boiler, an illustration of which is given on another page.

THE HACKBRIDGE ELECTRIC CONSTRUCTION CO., LTD. (Hersham, Walton-on-Thames)). Here are shown drawings and photographs of all types and sizes of transformers and sections of high voltage coils for voltages up to 132 kV. There is also a pole mounting type transformer complete with its associated switchgear, while transformers of the company's manufacture are to be seen operating under load, in the exhibition sub-station.

THE HEWITTIC ELECTRIC CO. (Walton-on-Thames, Surrey), shows a range of medical lamps for general and local treatment on direct and alternating current supplies; battery charging rectifiers, water sterilisers, and service lighting for photographic and cinema studio purposes. A 200 kV lighting and power mercury arc sub-station supplies the exhibition.

ACCLES AND POLLOCK, LTD. (Oldbury, Birmingham). Here are shown the possibilities of weldless steel tube drawing processes for general manufacturing purposes. Examples are

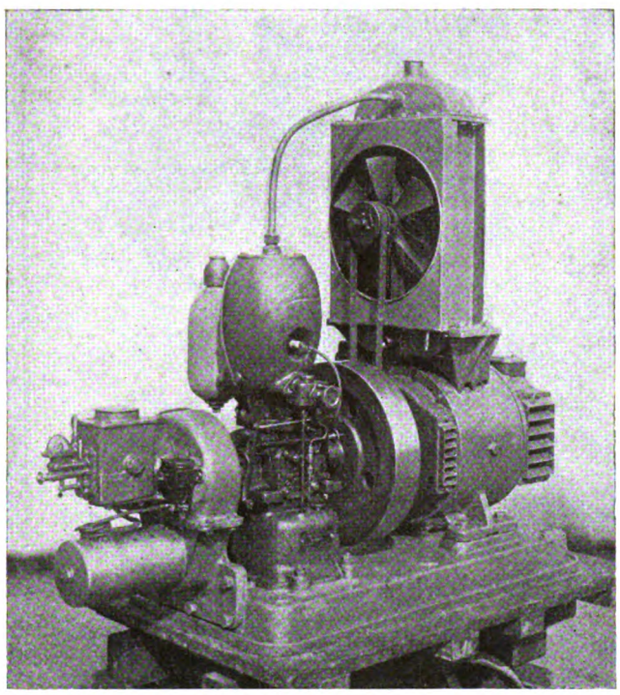
shown of special sections selected from over 700 different shapes.

REAVELL AND CO., LTD. (Ranelagh Works, Ipswich). Among a large variety of electrically driven compressors shown by this firm is a special sub-station set designed for cleaning electrical machinery and consisting of a small rotary compressor



The "Auto-Petter" lighting set exhibited by Petters, Ltd.

directly connected to an electric motor. The plant is in operation.

BIRKBYS, LTD. (Liversedge, Yorkshire) exhibit "Elo," a synthetic resin product, comprising mouldings, moulding powders, insulating varnish, and resin. This is claimed to be superior to ebonite, hard rubber, shellac compounds, bitumen, pitch, soft plastics, and many other products used for mouldings in numerous respects.

CLEAR HOOTERS, LTD. (79-81, Lombard Street, Birmingham). The chief exhibits of this firm are electric horns, syrens, and hooters. The accessories for these appliances are also shown.

BAKELITE, LTD. (68, Victoria Street, London, S.W.1). On this stand is exhibited a range of bakelite products of particular interest to the electrical world. These include moulding materials and examples of mouldings produced; bakelite sheet and bakelite silent gear material; bakelite impregnating varnish for insulation purposes.

W. AND T. AVERY, LTD. (Soho Foundry, Birmingham). On this stand is featured a wide range of industrial visible weighers, including those suitable for the electrical industry.

TANGYES, LTD. (Cornwall Works, Birmingham). The exhibits here include 144 B.H.P. heavy fuel oil engines, 19 H.P. fuel oil engines driving dynamos for lighting purposes, 6 H.P. fuel oil engines driving vertical treble ram pumps, "Tan-Gyro" centrifugal pumps of various sizes, six-stage turbine pumps, vertical treble ram pumps, vertical single ram pumps, horizontal duplex boiler feeders, and a collection of pulley blocks, lifting jacks, etc.

TURNER BROTHERS ASBESTOS CO., LTD. (Rochdale). This exhibit is devoted to asbestos products of special interest to the electrical and electro-chemical industries. Foremost among these are the ad ... well-known "Sindanyo" boards in their two forms: the insulating grade, designated "Ebony 'Sindanyo,'" and the arc-resisting grade, known as "Natural 'Sindanyo.'" The former of these is a non-hygroscopic electrical insulating board, possessing mechanical strength and other s ... properties. An interesting portion of this exhibit is a range of "Sindanyo" switchboards carrying typical gear, lent by electrical manufacturers.

CITY OF BIRMINGHAM ELECTRIC SUPPLY DEPT. (14, Dale Road, Birmingham). Here are seen demonstrations of soap manufacturing plant, consisting of electrically-driven mill, plodder, stamper, etc.; electric butt welding machines of 50 kVA capacity; electric spot welding machines of 10 kW capacity; 10 kW rivet heaters. Another exhibit is a range of electric furnaces of 23 kW, 11·9 kW, 7·9 kW and 4 kW capacity for hardening, tempering, enamelling, etc., while small electrically-driven portable tools, ultra-violet ray medical apparatus, and industrial lighting fittings and heating units are also shown.

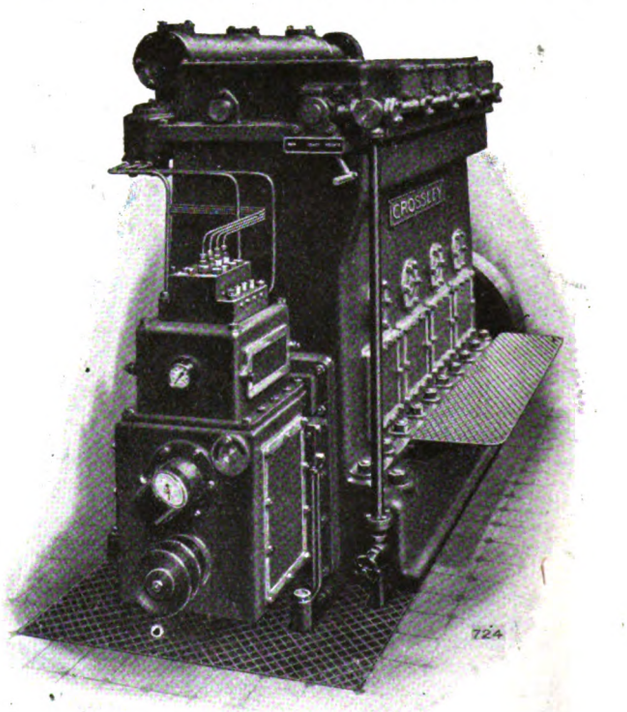
BROOK MOTORS, LTD. (Empress Works, Huddersfield). On this stand are seen a.c. motors in sizes from 1 H.P. to 50 H.P. of crane, pipe ventilated, totally enclosed and protected types. Interchangeable d.c. motors with the company's a.c. motors are shown, as are also special motors made for driving woodworking machinery, and motors built into woodworking machines to become part of the machine itself, whereby no belts or gears are required. Motors attached to pumps and fans are exhibited, as well as various types of switchgear and starters.

THE RAY ENGINEERING CO. (Waterdale Works, Southmead, Bristol). This exhibit, as last year, shows a complete range of "Ray" switchboards and switchgear. In addition, a new type of enclosed controller for electric lighting plants is shown. Resistance battery charging units, automatic cut-out switches, shunt regulators and instruments are included, together with a sample of the company's open type power switchboards.

W. AND C. PANTIN (147, Upper Thames Street, London, E.C.4). This exhibit includes an installation of overhead chain conveyors fitted at intervals with hangers and hooks on which various types of articles can be suspended.

THOMAS L. HALE (TIPTON), LTD. (Dudley Port, Tipton, Staffs). Here are shown examples of various castings as supplied to the electrical industry.

THE CROSTHWAITE ENGINEERING AND FURNACE CO., LTD. (York Street, Leeds) are showing improved type of patent mechanical stokers and self-cleaning furnaces which, it is claimed, give complete combustion of the fuel, elimination of smoke wthout the need for admitting excess air, and easy and simple working. The self-cleaning furnaces are designed for the economical burning of "slurry" and other waste fuels.



A vertical 4-cylinder type heavy oil engine of new design by Crossley Bros., Ltd.

MESSRS. BERTRAM THOMAS (Worsley Street, Hulme, Manchester) exhibit the "Tiltrack" method of keeping stores for spare parts. The virtues of which will be gathered from the illustration on another page.

THE CHLORIDE ELECTRICAL STORAGE CO., LTD. (Clifton Junction, near Manchester) shows, in addition to small capacity batteries, higher capacity batteries for inspection and types for marine wireless installations and lifeboat sets, together with others designed for emergency lighting and

Digitized by Google

gyro compass operation on board ships. "Exide-Ironclad" batteries for traction purposes are included, together with cut-away sections showing details of the exclusive slotted tube construction of these cells. This type of cell has been specially designed for use on locomotives, trucks, vehicles, and all forms of transport using battery power. Specimens of the "Lux" battery, specially designed for train lighting, together with special cells for miners' hand lamps and portable batteries, are also among the exhibits.

THE ELECTRICAL POWER ENGINEERING CO. (BIRMINGHAM), LTD. (Ward End, Birmingham). Here are shown, in addition to a standard range of d.c. motors from $\frac{1}{8}$ H.P. to 100 H.P., an epicyclic geared motor and motor-driven air compressor, polishing and buffing motors, electric dynamos, etc. A special feature this year is a new range of fractional horse-power interchangeable a.c. and d.c. motors specially designed for driving domestic machinery. The "Warwick" lighting plant is again exhibited and this year a special model cut completely in two is on show.

RANSOMES, SIMS AND JEFFERIES, LTD. (Orwell Works, Ipswich). Besides domestic exhibits this firm is showing squirrel cage motors, motor induction machines, drip proof shunt wound motors, and shunt wound machines.

THE STURTEVANT ENGINEERING CO., LTD. (147, Queen Victoria Street, London, E.C.4). Various electrically-driven vacuum cleaners for industrial purposes are shown here, including models for cinemas, theatres, etc. These are made in a variety of types and have been installed in many of the latest theatres in the country. The equipment permits of various points being installed in the building, a common plant creating the vacuum.

THE REVO ELECTRIC CO., LTD. (Britannia Works, Tividale, Tipton). The domestic exhibits of this firm were dealt with in our last issue and, in addition, street lighting fittings, inverted switch and fuse gear for industrial applications are other prominent exhibits.

THE BRITISH THOMSON-HOUSTON CO., LTD. (Rugby). A considerable number of the exhibits are in operation here, including electric motors and control gear for industrial use, and in addition to a.c. and d.c. motors of the more standard types in fractional H.P. and higher ratings, the British Thomson Houston Co. shows single-phase reversing motors of the repulsion-induction type; vertical spindle motors; "built in" motors for the direct drive of machine tool cutters; motor-generators; "Fabroil" silent pinions, etc. The single-phase repulsion-induction motors are designed to start up as repulsion motors, and when up to speed to run as induction motors, there being an external or primary winding on the rotor which gives a high starting torque, and an internal or squirrel cage winding, which allows only a very small speed variation from "no-load" to "full-load," no centrifugal mechanism brush-raising gear, etc., being required. Suitable equipments for the control of a.c. and d.c. reversing and non-reversing motors of various sizes are shown, while included in these exhibits is the new thermal type oil-immersed circuit breaker and a.c. motor starter, which has been designed primarily for the direct starting of squirrel cage motors taking up to 100 A starting current on voltages up to 660. One of the exhibits made for the first time is the new metal-clad vertical plugging switchgear, known as Class Z. It is claimed that this switchgear is suitable for service under the most adverse climatic and other conditions, and its introduction makes the metal-clad construction commercially applicable for small as well as large circuits. The busbars are completely shut off from other chambers, but they can conveniently be rendered accessible. An automatically-operated shutter closes the contact socket holes when the breaker is withdrawn, and guide holes are provided for accommodating locating spears carried by the oil circuit breaker. The contacts are of a special self-aligning type, and the current transformers are housed in the circuit breaker top casing. Contact is made with the circuit connections below, through the medium of spring pins carried on porcelain insulators in the bottom of the transformer tank.

A 132 kV transformer terminal by The Micanite and Insulators Co., Ltd.

A. REYROLLE AND CO., LTD. (Hebburn-on-Tyne), are showing examples of their unit-type distribution gear designed for currents of from 30 to 350 A at pressures up to 660 V, which can be assembled to include switches or fuses or combined switches and fuses as may be required. It lends itself to easy extension, and should one wall become full, an extension can be carried on along the next wall at right angles, a right angle coupler being inserted to make the necessary connection. If automatic features have to be provided for the protection either of the incoming feeders or of one or more of the outgoing circuits, standard oil-break switchgear can be built into the complete arrangement in conjunction with the unit gear. A busbar chamber runs throughout the assembled switchboard. Dividing boxes are provided, as required, for the incoming cables feeding the busbars, and for the outgoing cables to the distribution circuits, and ammeters and voltmeters can be fitted. Metal-clad 60 A and 100 A switch type fuse boxes are also shown. These are used for a variety of purposes, both in domestic and in industrial service. The draw-out principle has been embodied in the design by mounting the fuse on the lid, and so providing a combined switch and fuse. When the lid of the box is open, the fuse and its terminals are dead. Messrs. Reyrolle are also showing an electrically-heated immersion-type water boiler. The sample shown is of 18 kW capacity, and is capable of raising steam in approximately 10 to 15 minutes. The steam pressure is 80 lb. per sq. inch, and the boiler evaporates 40 lb. of water per hour. The heating elements are built up of three 6 kW units, and the required selection is made by means of a standard Reyrolle earthed plug. Three sockets are provided, so arranged that either 1, 2, or 3 units are in circuit, giving 6, 12, or 18 kW respectively.

KELVIN, BOTTOMLEY AND BAIRD, LTD. (18, Cambridge Street, Glasgow). The K.B.B. fugitometer shown is the result of prolonged research by the British Association for the woollen and worsted industries. Samples for test are placed in closed swatch boxes arranged symmetrically around a special form of carbon arc lamp of intense actinic power A humidifying chamber and fan motor built into the apparatu

Two of the stands at the Birmingham Section of the British Industries Fair; that on the left is a picture of the display by Messrs. George Ellison, while on the right is part of the exhibit of Metro-Vick Supplies, Ltd.

E

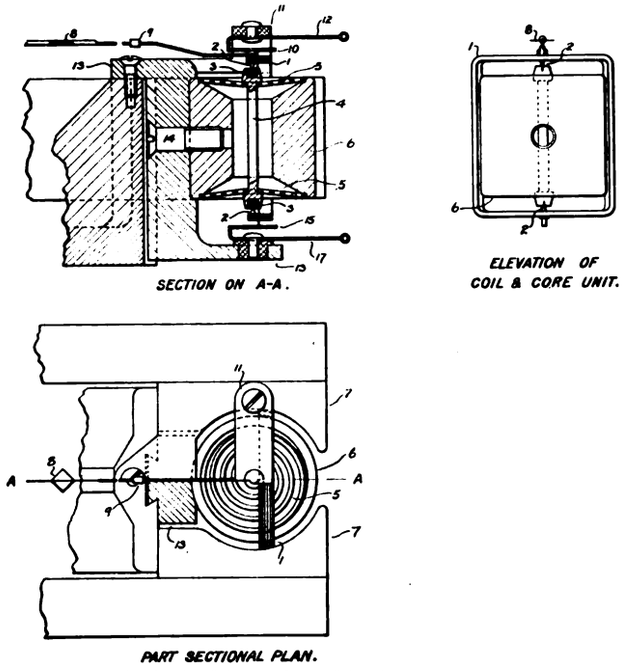
circulate a constant current of humidified air through the swatch boxes, and the latter are arranged for hinging down so that samples may be inspected during a test without disturbing or interrupting the humid air circulation. In addition to woollen, cotton and silk textiles, the fugitometer is also applicable for testing leathers, coloured papers, lithographic colours and printing inks, etc., and a simplified form



Diagrammatic sketch of the working of the "Resilia" movement in the instruments shown by the Foster Instrument Co., Ltd.

is made for testing the ageing of rubber, and rubberised fabrics, paints, varnishes, etc. The instrument can be operated off a.c. or d.c. supply mains, and is complete with double-pole main switch and cut outs. The fluorescence cabinets exhibited provide a new and rapid means of analysis for the analytical and industrial chemist, the physicist, biologist and inspection departments for examining materials in a beam of invisible ultra-violet radiation. The light source is a mercury vapour quartz lamp, the emission from which is filtered through a special glass screen so that invisible ultra-violet rays fall only upon the samples under test. By means of the characteristic fluorescences excited in the samples, defects and adulterations of all kinds are rendered visible to the eye. Other exhibits include shadowless operating lamps and quartz-mercury vapour lamps.

The Electric Furnace Co., Ltd. (17, Victoria Street, London, S.W.1) are exhibiting plant and photographs illustrating the various types of electric furnaces installed by them. The installations comprise furnaces of various types for melting and heat-treating all kinds of metals, their standard types of furnaces including the Héroult arc furnace for melting steel and nickel; the Ajax-Wyatt induction furnace for melting brass and nickel-silver; the Ajax-Northrup high frequency furnace for melting steel and non-ferrous alloys; resistance furnaces of the Efco, Efco-Doulton and Wild-Barfield types for heat treatment of steel and non-ferrous alloys, for core drying and enamelling; the Snead equipment for heat-treating tubes; furnaces for the manufacture of calcium carbide and ferro alloys; and amorphous and graphite electrode plants. Most of these furnaces are of such a large size that it is impossible to show them in operation in an exhibition, the working furnaces accordingly consist only of a small Ajax-Northrup high frequency furnace and an air heater. The body of a one ton Ajax-Northrup furnace is also shown, the furnace being identical with one now being erected in France. A metal liner, as used in the Efco process of formed linings, suitable for use in this furnace, is another feature. A number of electric furnace products are shown, which demonstrate the wide range of electric melting and heating. These include a fine exhibit by Doultons, Ltd., of pottery decorated in a 115 ft. double chamber Efco-Doulton kiln; samples of high speed steel made in an Ajax-Northrup furnace in Sheffield, and of small cobalt steel letters made in a similar furnace at Braintree; various articles made of "Silveroid" and other products of high frequency furnaces and samples of electrodes, ferro-alloys and various electrically treated materials.

Steatite and Porcelain Products, Ltd. (56, Victoria Street, London, S.W.1). This exhibit consists of four strings of standard insulators suspended from a tower erected by Braithwaite and Co. (Engineers), Ltd. The tower is one similar to that adopted by the Central Electricity Board. The special feature of the exhibit is to show that the insulator pins, though fixed by purely mechanical means, have an extremely high mechanical strength. The illustration of these facts takes the form of two full-size railway trucks, 19 ft. overall, weighing nearly 15 tons, hanging in the air on a single string of insulators. The carrying capacity of each insulator is 20 tons, thus offering a high margin of safety and security. The exhibitors point out that one of the difficulties of high tension transmission in the past has been the danger of interruption in the supply due to some failure on the line, caused perhaps by a heavy lightning stroke. The mechanically fixed spring ring insulator claims to protect the line from any such trouble, and is therefore of importance to power companies. A large works, with an area of over 5 acres, has been erected at Stourport in Worcestershire, for the production of these insulators, which have never previously been manufactured in the British Empire.

Ruston and Hornsby, Ltd. (Lincoln). The exhibits here include a back-acting trenching machine. This machine, which weighs about 14 tons, arrived, we understand, at Castle Bromwich sidings, dismounted unaided from the truck and proceeded under its own power to its position in the Fair buildings. The machine is a full circle half-cubic yard universal excavator, and is fitted with special equipment by which it can easily be converted for work as a shovel, dragline, excavator, back-acting trencher, skimmer scoop or a grabbing crane. Trenches can be dug to a depth of 10 feet. The machine is fitted with a petrol-paraffin engine and enables the excavating to be undertaken within a few minutes of starting. Where electric power is available the machine can be fitted for electric drive.

Davidson and Co, Ltd. (Belfast), are showing a complete range of "Sirocco" fans. Included in the range are fans for ventilation, dust removal, and for supplying high pressure blast to cupolas, furnaces, and forge fires. Those concerned with corrosive gases will be specially interested in the fan lined with ebonite, which protects the internal metal surfaces

The equipment with which demonstrations of plumbing are being given by Callender's Cable and Construction Co., Ltd.

from the action of such gases and consequently greatly increases the life of the fan. One of the practical and efficient methods of grit collection is exemplified by the Davidson patent flue dust collector, of which a working model is to be seen in operation. These collectors we understand, have been installed in over 100 power stations. A similar collector for dealing with industrial dust can also be seen at work. A fascinating exhibit on this firm's stand is the "Sirocco" aerostat, which is the source of much speculation on the part of the visitor as to how the rotating balls are maintained in position.

The Foster Instrument Co. (Letchworth). The exhibit here demonstrates how a special spring mounting for the moving system with moving coil measuring instruments, has eliminated one of the troubles due to damaged pivots

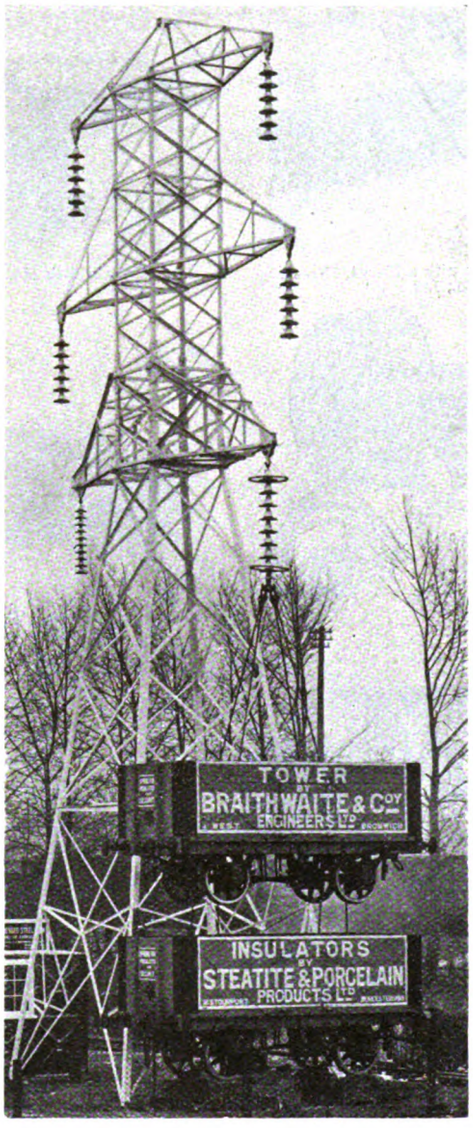
or jewels. While spring mounting in various forms is not novel, the particular way in which it has been developed in the construction known as the "Resilia" is specially interesting as it ensures that the pivot and jewel can never strike each other a blow under adverse conditions of service. In the illustration on page 226, this construction is indicated diagrammatically. A magnetic field is established between the pole pieces of the magnet 7 and the cylindrical iron core 6. The coil 1, carrying the current by means of which the measurement is made, swings in the space between 6 and 7, turning about an axis 4. The coil carries inturned pivots 2, having their bearings in the conical jewels 3. These jewels are mounted upon a staff 4, which itself is very light and which is held in position relatively to the core 6 by the light springs 5. Any jolt of the instrument, therefore, will move the whole system of coil, pivots, jewels and staff, and it is impossible for the pivots to strike a blow on the jewels. The current to be measured is led into the coil through the control spring 10, and the ligament 15; thereafter the circuit is carried by the frame 11 at the top and by the insulated arm 17 at the bottom. The zero is controlled by the arm 12. Attached rigidly to the coil is a light pointer 8. The coil 1 is mounted slightly eccentric to the axis 4 so that its weight balances the weight of the pointer 8, a final adjustment of balance being made by the position of the small sliding weight 9. This construction avoids the necessity of a counterweight tail and counterweight usually previously employed, and therefore enables the weight of the whole moving system be kept to a minimum, thus the controlling forces may be small and the pivot points very fine, and therefore the internal resistance of the instrument can be high without introducing objectionable mechanical delicacy or friction errors. The core 6 is held by the screw 14 to the rigid frame 13, which, in turn, is attached to the magnet and combines the whole moving system into a unit.

THE MICANITE AND INSULATOR CO., LTD. (Empire Works, Blackhorse Lane, London, E.17). Here is shown a comprehensive display of all classes of insulating materials, including mica, micanite, paxolin, bakelite, varnish-paper insulation, empire varnished cloths, tapes, silks, papers, leatheroid, etc, A feature of the exhibit is a complete range of indoor and outdoor condenser type terminals and bushings for transformer and switchgear, including a 132 kV terminal designed to meet the requirements of the Central Electricity Board.

GEORGE ELLISON (Perry Bar, Birmingham). There is

Digitized by Google

shown here a range of switchgear and accessories for the control of electrically-driven machinery for all industries, and switchgear for electricity supply sub-stations up to 11 000 V pressure. Ellison switchgear is also to be seen in the exhibition sub-station controlling the high-pressure supply from the Birmingham Corporation mains to the transformers and from the transformers to the various circuits of the Fair. On the stand, the exhibits include resistance starters and control panels for slip-ring induction motors; direct-on, star-delta and auto-transformer starters for squirrel-cage motors, automatic circuit breakers of various types; underground switchgear and cable couplings for mines; control equipment for cranes; and several examples of metal-clad distribution and main switchboards. A new design shown is an improved totally-enclosed circuit breaker for power circuits up to 660 V, having a higher than usual breaking capacity on short-circuits and accessory fittings which claim to simplify the work of installing and connecting up. A new type of switchboard consists of a group of small automatic circuit breakers mounted on a bus-bar enclosure to form a distribution point for branch circuits. This is an alternative to switch-fuse gear. The circuit breaker of the series for use at the coal face in mines is mounted on skids for portability. It is a welded steel cased unit, certified flame-proof, fitted with trailing cable plug connector and end coupling for the supply cable. The cable end coupling is a patented accessory which obviates the jointing of cables underground, as when the breaker is moved and another length of cable has to be laid, the new length of cable is readily connected up by bolting together the sealed end boxes, and connecting the cores by the links provided. Another exhibit of interest is a display of insulating material made in the company's factory for use in switchgear designs. This includes "Tufnol" in all kinds of shapes and a plastic compound, the material being a laminated synthetic resin material baked under pressure in moulds; it is claimed to be tough, and of high dielectric quality.



The spectacular exhibit of Steatite and Porcelain Products, Ltd., and Braithwaite and Co. (Engineers), Ltd.

NEGRETTI AND ZAMBRA (38, Holborn Viaduct, London, E.C.1). The exhibits here include indicating and recording pyrometers, thermo-couple type, for furnaces, stoves, annealing ovens, steam and flue gas temperatures, etc., suitable for temperatures up to 3 600° F.; mercury-in-steel dial and recording thermometers, distance type for temperatures of gas, liquids, etc., up to 1 000° F. Dial type draught and low reading pressure gauges, diaphragm type, for flues, ventilating ducts, forced draught, etc., sensitive to 1/100th of an inch water gauge; and electrical distance thermometers of the resistance pattern, multiple-point type, suitable for cold stores, refrigerating plants, etc.

THE STREETLY MANUFACTURING CO., LTD. (Ammunition Works, Aldrige Road, Streetly), is showing a variety of articles used in the electrical and other industries, moulded from bakelite and beetle powders. The exhibitors point out out that hitherto mouldings from synthetic resinous compounds have been largely limited to the darker shades, but the introduction of beetle powders has made possible their manufacture in all colours—plain or mottled.

CHESTERTON, JONES AND CO., LTD. (Alexandra Works, Walsall), display a comprehensive range of electric heating and cooking appliances, electric light fittings, and accessories. A range of "Davidson" reflector and bar-type fires is shown, the models varying from decorative designs to robust heaters suitable for the workshop. Another exhibit is a whistling kettle provided with a flat surface at the top so that a teapot or other utensil can be conveniently warmed while the kettle is being boiled. Other electrical apparatus is being shown, among which are plate warmers, table kettles, and a bath-water heater of the storage type with thermostatic control. The standard "Davidson" element is used in these tanks and this can be removed without the tank being emptied. These heaters are finished in white enamel. Tubular heaters for window and general warming are included in the exhibit as well as a variety of electric light fittings.

HADFIELDS, LTD. (East Hecla Works, Sheffield). The examples of heat-resisting steels exhibited demonstrate the wide variety of uses to which these special alloys have already been put industrially. They are remarkable for their strength at temperatures up to 900° C, and are adapted for work involving high temperatures, and those subjected to the oxidising effect of highly heated and sulphurous gases. For the retaining rings of the armatures of turbo-electric generators, a special material of high tenacity is called for. Further, it must be non-magnetic, otherwise there would be a diversion of the magnetic field through the rings, away from its proper path across the inter-polar space and through the windings. To this requirement must be added machinability. In the new "Resista H.Y." steel, Messrs. Hadfields claim to have provided a material which combines in itself each of these requirements. A specimen retaining ring, machined from this steel, is exhibited, while other specimens illustrate its tenacity and machinability, including turning, planing and shaping, drilling, slotting, and screw cutting. Under the tensile test, a yield point of 35 to 40 tons per square inch is obtained, the tenacity of the material being about 50 tons per square inch with an elongation of 30 to 35 %. At the same time, the material is non-magnetic, its specific magnetism not exceeding 0·1 % pure iron being reckoned as 100. While non-magnetic steels are no longer a novelty, in the past, such metal has been associated with extreme difficulty in machining.

W. CANNING AND CO., LTD. (133/137, Great Hampton Street Birmingham) are showing an extensive range of articles of special interest in regard to their equipment for electro-plating. There is also a range of low voltage electric-plating generators.

HAILWOOD AND ACKROYD, LTD. (Beacon Works, Morley, near Leeds). The chief exhibits on this stand are electric fittings of every description, including a number of novel designs in "Hailglass Ware" units for lighting large buildings, shops, etc. Bowls and ceiling fittings and galleries are also shown.

CABLE MAKERS' ASSOCIATION (Sardinia House, Sardinia Street, London, W.C.2). This exhibit, which is a joint exhibit prepared by the members of the Cable Makers' Association whose names are set out below, is intended to be generally representative of the various types of cables used in electric light and power installation. These include rubber insulated cables with various metallic and non-metallic protective covering, in single core, concentric and multicore types. Special system of wiring for houses, both in conduit and protected surface wiring systems, are shown. Types of telephone cables for underground work are also exhibited. Heavier cables for street mains, factories and power transmission in various types, insulated with paper and bitumen, armoured and unarmoured, are shown, while super tension cables for distribution at the highest pressures are also a feature of the exhibit. These types of cables are made by the members of the Cable Makers' Association, whose names

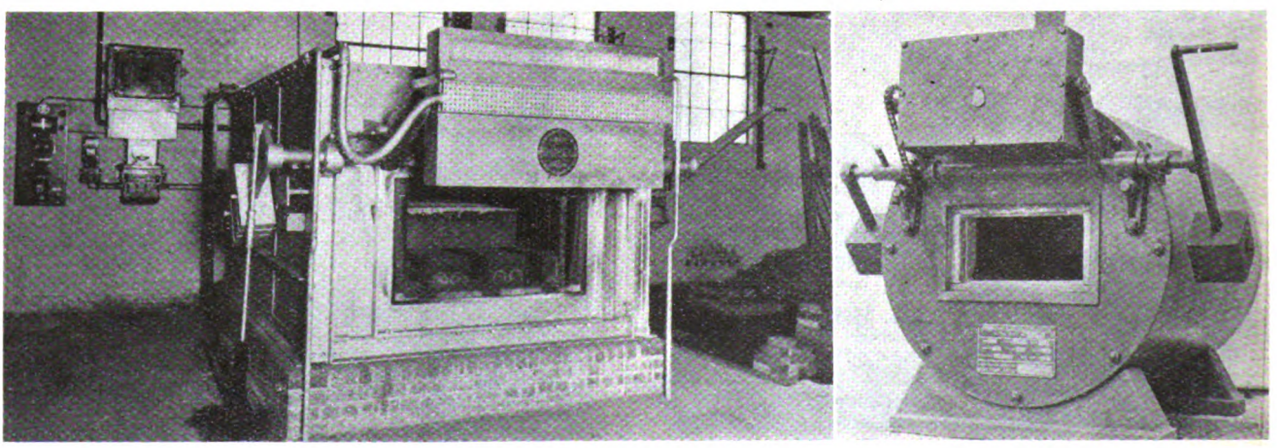
A modern type of bracket shown by Metro-Vick Supplies, Ltd., using "Gilbert Riley" glassware. Other Metro-Vick fittings are illustrated on page 245.

Berkeley and Young, Ltd. (Hay Mills, Birmingham). Here is shown a very comprehensive range of exhaust and ventilating fans. Every industrial type is shown with the exception of large blowers. Amongst the more recent productions exhibited is the "Ellipso" oscillating fan, which the makers claim to be the simplest control movement yet evolved. The elliptical traversing action of this fan is obtained by means of a single link which is connected to and rotates with a slow motion shaft. The link is anchored by a universal ball joint to a fulcrum fixed to the base. The reducing gear of 144 to 1 is contained in a simple gear box integral with the motor end cover and fitted with a clutch eliminating all chance of damage by anything fouling the guard. The reducing gears are exceptionally robust of hardened steel, polished and ground, worm wheels having straight cut teeth thereby reducing friction to a minimum. Amongst the several models of slow-speed ceiling fans exhibited, one of particular note is the model known as the "08" for direct current, which has a totally enclosed motor. This fan has been specially produced to comply with the exacting conditions of tropical service and Government requirements. The fan is automatically lubricated, costing little to run, it is of high volumetric efficiency, and combines the features of better-class fans together with low watt consumption and silent running. Another interesting exhibit is the "Ace" alternating current ceiling fan, the motor of which is of the enclosed induction type, fitted with ball bearings and so constructed to be grease tight; it is fitted with three and four 54 in. sweep blades, the watt consumption is 110 at 210 r.p.m., giving an air displacement of over 10 000 cu. ft. All "Bandy" fans are supplied in a standard finish of three coats enamel, white or black and gold lined, but any colour can be supplied. Speed regulators for use with the ceiling and exhaust fans both d.c. and a.c. are also exhibited. These are fitted with five to seven different speeds, and are supplied with or without fans. In addition to the range of fans Messrs. Berkeley and Young also manufacture the "Bandy" a.c. lift and crane motors, a model of which is displayed on their stand; other interesting exhibits are models of the "Giljay" battery charger, this having been designed for home charging of 6 and 12 V accumulators on d.c.

Birmingham Electric Furnaces, Ltd., (55, George Street Parade, Birmingham). One of the features of this exhibit is a full scale half section of a large "Birlec" furnace. The heating elements in this type of furnace consist of heavy section strip nickel chromium and an exceptionally long life is claimed for them. Photographs of some large installations are shown, including furnaces for annealing and general heat treatment of steel and non-ferrous metals (nickel, nickel silver, and other nickel alloys, brass copper, aluminium and its alloys, etc.), carburising, hardening, colour firing, etc. Two standard portable furnaces, out of a range extending from 8 to 40 kW are also included in this exhibit. A small machine designed to operate on single or two-phase, has a hearth 30 in. long by 16 in. wide, and is shown oil-hardening steel parts. A larger model C.P. 4 A having a maximum rating of 30 kW at 440 V, three-phase, has a hearth 36 in. long by 24 in. wide, and is shown carburising. The company's portable type of furnace consists of a welded steel cylinder lined with refractory and insulating material. The hearth however is flat, and is covered with nickel chromium plate. The heating elements, which consist of nickel chromium strip, are mounted in the roof, sides, and hearth, which together with the circular construction, give an even distribution of heat. "Sil-o-cel" insulation is employed, ranging from $4\frac{1}{2}$ in. to 9 in. thickness. The door is of the parallel motion type and is lined with refractory and insulation, the latter being covered with nickel chromium sheet; opening the door cuts off the current. Automatic temperature control is fitted to all models as standard, maintaining any desired temperature up to 1 000° C. Two of the exhibits are illustrated on this page.

The Wardle Engineering Co., Ltd. (Old Trafford, Manchester). This firm specialises in the design and manufacture of lighting equipment. The "one piece" reflectors shown incorporate an "easy wiring" cap and vibration proof porcelain lamp-holder and are worthy of special attention. The designs conform to the B.E.S.A. Specification and meet the Home Office recommendations. Bruce "one piece" copper lanterns, incorporating the dust-tight Holophane dome refractor with internal prisms, is another exhibit. Projectors for floodlighting, glass units for office, classroom, etc., "Prismat" bulkhead fittings, are also shown.



TWO of the exhibits of Birmingham Electric Furnaces, Ltd., showing on the left a box-type "Birlec" furnace arranged with mechanical charging for use in carburising work, and on the right a C.P. furnace for single or two-phase supply.

THE ALL-ELECTRIC "VICEROY OF INDIA."*

Some General and Preliminary Notes on the Biggest Electric Ship yet Constructed in this Country, and One of the Most Important Electrical Constructional Enterprises of the Year.

By A. C. HARDY, B.Sc., A.M.I.Mar.E. (Author of "Motor Shipping," "Merchant Ship Types," etc.)

On board the "Viceroy of India," February 19th.

WE are, in this sophisticated age, accustomed to having different ships or different machinery layouts hailed as marking eras in marine propulsion or epochs in engineering but even now it is not without interest to claim that an all-electric British ship is something out of the ordinary—particularly when that ship is capable of running at some 19 knots and has a total developed S.H.P. of about 17 000 H.P. Those who are intimately connected with the electrical industry, and particularly with the marine side of it, and those who are interested in marine propulsion, may possibly like to recall that it is only within the last year or so that marine electricity has been regarded, in this country, with anything approaching seriousness.

The First Official Run.

It seems fairly safe to suggest, therefore, that the "Viceroy of India," whose demonstration run has to-day been attended by a more representative and important collection of people who really matter in shipbuilding and marine engineering circles than has gathered together for some time, does definitely mark an era in British marine propulsion. It definitely marks the placing of marine electricity upon an established basis.

The P. and O. Company, who are in the main responsible for the construction of the "Viceroy of India," make no extravagant claims of fuel economy, but they do at least claim comfort for passengers. They have decided, moreover, that the best way to generate electricity to supply their two main propelling motors is by turbo-generators. Here, again, in conjunction with the builders, Messrs. Alex Stephen and Sons, of Linthouse, Glasgow, and the British Thomson-Houston Co. (represented by Mr. W. J. Belsey) they have achieved the considerable success of a neat, compact engine room, with a wonderfully complete, replete, and accessible main switchboard control at "top" platform level.

Excluding for the moment the boiler equipment, the beauty of the turbo-alternator, from the marine point of view, is its extreme compactness. The Diesel engine and the Diesel engine generating set are necessarily a spreading affair. The turbine generator crams maximum power within minimum space. Modern boiler practice, too, with high steam pressures and super-heat, permits of reducing the overall space taken per, say, 1 000 H.P. generated to within a very reasonable space. On the "Viceroy of India" the main propelling machinery consists of two separate turbo-alternators, each with its own condensing plant and auxiliaries supplying current to two slow speed synchronous motors, each coupled direct to a propeller shaft. The whole of the electrical equipment has been manufactured by the British Thomson-Houston Co. of Rugby.

The two turbo-alternator sets are rated 9 000 kW maximum at 2 690 r.p.m., 2 720 V, 3 phase. The maximum speed rating is 6 536 kW at 3 110 r.p.m., 3 150 V. These supply current to the two synchronous propulsion motors, each of 8 500 S.H.P. at 109 r.p.m., 3 150 V, 3 phase. These motors, which are smooth running and almost noiseless, give the ship a loaded speed of about 19 knots. It is stated unofficially that she can make over 17 knots with one turbo-alternator running, and that she can, if occasion demands, easily exceed 20 knots.

A special control cubicle is arranged on the upper platform on a level with the turbo-alternators. At the forward end are the isolators and the switch, each being triple-pole, and operated by handwheels. The isolators enable each alternator to be electrically connected to its respective propeller motor, or either of the alternators to be connected to both propeller motors. One likes, from a shipping point of view, to imagine the possibilities of bridge control for a ship of this type, but it would seem that the complication at this present stage of development would be too much. The control cubicle is very compact, and communication with the navigating bridge is by means of Siemens' electric engine room telegraphs.

Actually for each propeller there are three controlling levers. These are provided for operating contactors and speed setting of the turbine governors. There is a direction lever; a field and speed controlling lever; and a dead slow speed lever. These are all mechanically interlocked to ensure correct operation. Thus, the direction lever can only be moved if the manœuvring lever is at "stop." The field lever is in its first half of travel when it operates the field contactors in the correct sequence for starting the motor. For the remaining half travel, control is on the turbine governor, the speed setting of which it varies between one fifth and full speed. A micrometer adjustment is also provided in this lever, and this permits fine speed settings. Because the same lever is used for both purposes, all manœuvring must take place with the governor setting at one fifth speed. This lever is interlocked with the slow speed lever so that the latter cannot be used for reducing speed below one fifth, unless the field and speed controlling lever is in its slowest speed position. Correspondingly, the dead slow speed lever must be at its maximum speed position, before speed can be increased with the field and speed controlling lever.

The following is the sequence which must be observed to start the propelling motors: Place the "slow speed" levers in the open position. Place the direction levers "ahead" or "astern" as required. Move the "field" levers to notch No. 1 and lift the side latch, watching the speedometer until the two pointers are opposite each other. Further, move the, "field" lever to notch No. 3. The motor should immediately pull into synchronism. As soon as the motor synchronises lift the side latch and pass on to the "run" position, which is notch No. 4. The speed may then be adjusted as required. Actually the work is much simpler than the description appears and the ship handles very well indeed.

Auxiliary Power Requirements.

Auxiliary electricity for heating, lighting, ventilating and cooking, it is interesting to note, is taken from a batch of auxiliary generators, and for this purpose, also at upper platform level, there are four small turbo-generators, each developing 500 kW. In addition, for standby purposes, when the ship is more or less shut down during a longish spell in port, there are two Diesel-generator sets on tank top level. Each is a 165 kW unit driven by a 4-cylinder air-less injection Petter engine, operating at 275 r.p.m. In addition, in view of my recent comment on the "Celtic" disaster, it was interesting to note a 2-cylinder Petter airless injection Diesel coupled to an emergency generator in a special compartment on the boat deck—on which deck also comfortable quarters for the engineer officers are located.

The main turbo-alternators, of course, always rotate in the same direction and with both in operation, the speed and direction of either propeller may be varied irrespective of the other. When one turbo-alternator is used for driving both propulsion motors, both motors operate at the same speed. Note, however, that at this speed they may actually rotate in the same or in opposite directions of rotation.

Steam for the turbines is supplied at 350 lb. per square inch pressure and 700 deg. F., total temperature by six special Yarrow water tube boilers situated in two separate stoke-holds. Four boilers are placed in the aft stoke-hold, and are of sufficient capacity to enable the forward stoke-hold to be entirely closed down when the ship is steaming at 16½ knots. This, with the possibility of being able to use one turbo-alternator only, gives to the ship almost the flexibility of a Diesel-electric layout. All the auxiliary machinery for the boilers and turbo-alternators is electrically driven. The main switchboard, supplied by the B.T.H. Co., is at the aft end of the engine room and within view of the starting platform.

Such is a brief idea of the layout and arrangement of this, the first large example of a British electric liner. The "Viceroy of India" makes her maiden sailing from London on March 28th for Bombay and Karachi, and unquestionably her future performance will be watched with great interest by the shipping world. Seldom has such a galaxy of marine engineering talent been gathered for a short period on one single ship. This may, of course, be mere curiosity. On the other hand, it may be the forerunner of further developments in marine electricity.

* These notes have been specially compiled for us by Mr. Hardy as a resumé of his impressions after attending the trials of this important ship.—ED.

WATER POWER IN THE PUNJAB.

Possibility of Economic Development of 1 770 000 kW on Seven Rivers—Important Bearing of Schemes on Agriculture and other Industries.

By COLONEL AUBREY O'BRIEN, C.I.E., C.B.E.

ALREADY considerable progress has been made with the first instalment of hydro-electric power which can be produced to such a vast extent from the rivers of the Punjab. A small water plant has been established in the snow-fed valley of the Uhl, a tributary of the Beas, and with the 960 kW thus generated, a start has been made in the boring of a 9 ft.

The mountains above the River Uhl.

tunnel through the solid granite of a hill. Ultimately through this tunnel 2½ miles of waterway will be constructed, and the minimum supply of the Uhl will be dropped down 1 800 ft., and thus permit the development of 36 000 kW in the first instance. The Kangra Valley Railway, already opened for goods traffic, is primarily intended for the carriage of the heavy material for the power house and other works to be erected at Shanan, 100 miles from the present railhead of the broad gauge line.

Col. B. C. Battye, D.S.O., of the Royal Engineers, has been connected throughout with the hydro-electric schemes of the Punjab. At first, he was appointed to consider the possibilities of water power in connection with the Bhakra Dam Irrigation project. The Sutlej, just before it emerges from the Himalayas on to the plains, makes a very sharp bend, and the bend formed a good site for an impounding dam 400 ft. high. The suggestion was to make a short cut for the whole river through a tunnel under a hill 3 500 ft. high, and thereby to create water power. After elaborate calculations embodied in seven volumes, it was found possible to develop 80 000 kW without an impounding of water, with a possibility of increasing this to 240 000 kW if the lake was formed for irrigation purposes. However, a hitch arose in connection with the canal problems, and Major Aylward, D.S.O., M.C., was then

The headworks of the hydro-electric scheme at Shanan.

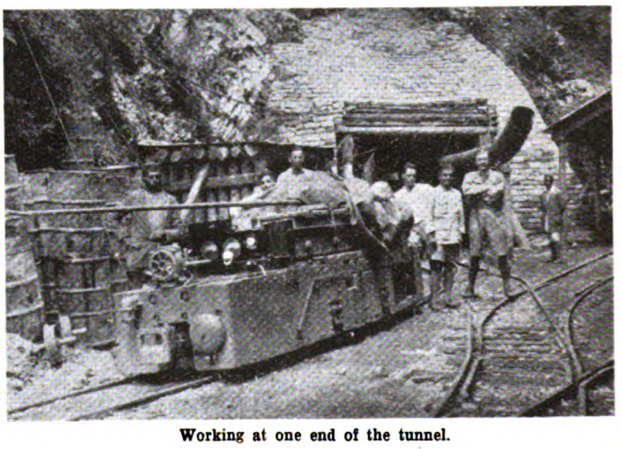
instructed to make a complete survey throughout that part of the Himalayas which touch the Punjab.

It was fortunate that the Bhakra scheme was not treated as a separate entity, for it was discovered that the resources of the Punjab were very large, and in particular, a site on the Uhl which is now being dealt with, was a better one than that on the Sutlej.

The power capable of economic development amounts to 1 770 000 kW on the seven rivers. The Indus and the Sutlej, which rise beyond the Great Himalayan range, have a much flatter slope than the others, and would give 210 000 and 80 000 kW respectively. Of the former the Swat tributary could supply a well placed 50 000 kW at the point where the irrigation canal emerges from the Malakand tunnel.

The Mid-Himalayan rivers, the Jhelum and the Chenab, will give 270 000 and 190 000 kW respectively, but the sites are mainly within the Indian States. Of the remainder, the Jumna which forms the boundary between the Punjab and the United Provinces is disappointing, with 50 000 kW, and the power of the Ravi with 190 000 kW lies mainly outside the Punjab proper.

The little Beas is, without doubt, the best river in the Punjab. With one exception all the sites are in British territory, and the gross yield is no less than 832 000 kW. The main river, fed by a large snowfield, tumbles down through alpine pastures and forests in gorges of remarkable depths and many waterfalls. The scenery of the Parbati and the Sainj tributaries is on a grander and even wilder scale than that of the Beas. The mountains rise steeply from the river beds, through narrow belts of cultivation and magnificent forests, to grassy alps and the regions of glaciers and eternal snow. The eastern line of the Mid-Himalayan range which forms the watershed rises in places to 21 000 ft. There are



Working at one end of the tunnel.

many other tributaries tearing down with a rapid slope, but for the present a start has been made on a programme which may one day reach prodigious proportions, at a site within the Mandi State on the snow-fed river, the Uhl.

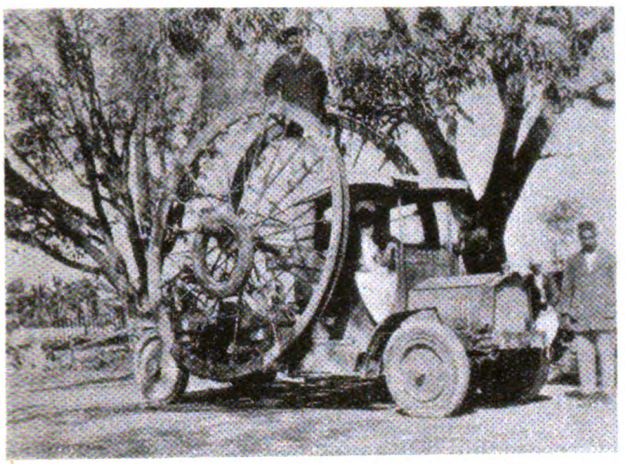
By an agreement with the Rajah of Mandi it has been arranged to divert the Uhl from the height of 6 000 ft. underneath a high mountain by a 9 ft. tunnel, 2½ miles long, through solid granite, and to drop it in the first instance 1 800 ft. to the neighbourhood of Shanan, near the existing cartroad from Kangra towards Mandi. This stage is already under construction. A small water-power installation has already been set up, and with its aid tunnelling has started from either end. By means of the Kangra Valley Railway, which is now complete, heavy material will be carried to the site, of which some will be taken over the hill by an electrically worked cable way. Thus, it is expected that by April 1930 the first instalment of 36 000 kW will be available for public use. The cost of this will be 422 lakhs of rupees, or £3 165 000.

The next stage will be to construct a dam 260 ft. high, and thus to impound a lake in the valley of the Uhl. By this means it will be possible to increase the available power to 70 600 kW. After this the water will be taken through 3 miles of duct and dropped down a second fall of 1 200 ft., by which the total will reach 118 000 kW. The cost of the later stages will be less than the initial, and it is expected that £7 500 000 will cover the total, including the whole of the transmission system and distribution down to Delhi, and

Digitized by Google

covering the whole of the Punjab between Wazirabad and Delhi. It is possible to use a third fall of 750 ft. and thus bring the total value of the Uhl to 145 000 kW, but the details of this have not yet been thoroughly worked out.

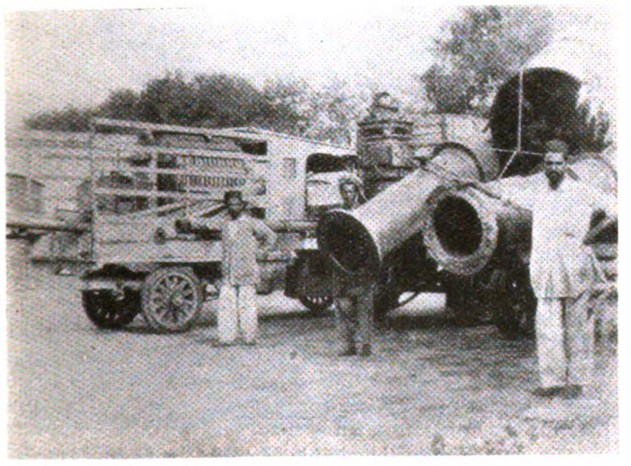
When this power is fully utilised, the Parbati and Sainj will be harnessed within the beautiful land of Kulu, to give 165 000 kW more, and finally the Beas itself will be taken in hand. The aim of the future is to have a system of electric



An awkward lorry load before completion of the railway.

power transmission line extending from India's capital at Delhi to Peshawar on the frontier. Negotiations have yet to be undertaken with the States within whose boundaries are several sites, but it is possible to create a continuous supply within British territory alone by the aid of a station on the canal fall near Rasul where the Lower Jhelum Canal takes off, by a site on the Haro river near Campbellpur, and by the use of the Swat canal near the Malakand. It has also to be noted that at present little use can be made of the latent power that exists at the numerous canal falls, because the channels do not run continuously. In the future it is hoped that all the best falls will be developed, and linked with the power from the Himalayas. In such a case when any one fall is not working, power will still be available from elsewhere, and the total additional supply from the canals will be substantial. It is hoped, of course, to obtain the whole 1 770 000 kW from the rivers in their upper reaches, but it is sufficient to say that something like a million kilowatts can be obtained for certain.

The Punjab problems, therefore, are not so much of adequate supply as of the creation of sufficient demand. For the purpose of calculation whether the scheme will pay, the engineers have only considered the needs of 20 towns of the Central Punjab for the first stage of the Uhl project, and those of 59 which, it is hoped, will use 118 000 kW in course of time. The majority of these towns are flourishing and have a knowledge of mechanics. They will of course make good use of the



Anothor awkward load handled by motor lorries.

power, which should be available at from ¾d. to ½d. per kWh. There will be a demand for existing and new factories, for light and fans, and for other urban needs. Speaking generally the towns can be relied upon to look after themselves.

The most important community in the Punjab, however, is that of the agriculturists, and since agriculture is by far the greatest industry for people dwelling on alluvial plains, the way in which electricity can be made subservient to agriculture requires most careful consideration. A Committee which discussed this subject in the Punjab, came to the conclusion that something like 80 000 kW might be used up in adding two and a half million acres to the irrigated area of the province at a cost which the cultivators could easily pay, especially if they devoted themselves to the more profitable crops.

The water for this purpose would be pumped electrically from tube wells, existing open wells with electrically-driven water lifts, and from open pumping stations drawing from canals, water-courses and seepage drains. In the latter connection electric pumping is likely to have most valuable action, for the vast increase of canals in the Punjab has had the result of creating various waterlogged areas. The lining of canals is expensive, and it is not always feasible to obtain the requisite outfalls for drainage; but once electric power is available, areas now lying waste and the sources of disease

The Uhl side of the tramway over the hill.

can be reclaimed, and additional water made available for irrigation elsewhere.

The yield from sugar cane in the Punjab averages 2 000 lb. of raw sugar per acre, as opposed to 8 000 in Java. It has been estimated that a considerable improvement might be obtained if, with the aid of the power available, and the gypsum that is abundant in the Salt Range ammonium sulphate can be manufactured at cheap rates. An increase of 20 per cent. more juice might also be extracted from the canes by means of more efficient crushers driven by electric power instead of by the aid of bullocks. However, the whole subject of the use of electricity on farms is so new to the Punjab that with the exception of the pumping, drainage, and fertiliser scheme referred to above, no definite plan has been thought out, and the future has been left to take care of itself. This is regrettable, because in other countries, from California to New Zealand, agriculturists have gained much from water power.

The problem is partly electrical, for it is a question of stepping down to small units on behalf of the villages without being involved into too great an expense. However, owing to the historical fact that villages are huddled together, because in the past they needed to do so for their own protection, the concentration of demand should be considerable.

EXPORT OPENINGS.

Some Market Points for Exporters of British Electrical Equipment—Meters for Spain—Conditions in the Argentine.

AN examination of the import and export statistics of many of the overseas markets reveals a number of promising openings for British electrical goods.

Corea is a market about which little definite information exists, but the present activity in connection with the making of railways, roads, harbour works and hydro-electric schemes, immediately suggests a variety of openings. The hydro-electric schemes entail the purchase of consumers' apparatus in addition to the generating plant, and in the irrigation schemes there is a fair demand for small electrically-driven pumps. Normally, much of this work will go to Japan, but there still remains a fair proportion for other suppliers and of which Great Britain could secure a larger share. Corea's total imports of machinery in 1927 were valued at 9 420 000 yen, of which 1 155 000 yen came from foreign countries. Though the market is not a large one at the moment it is to be remembered that the figures are for machinery only and not for materials. Furthermore, the above figures of foreign imports show direct imports only.

The Philippine Islands is another small but expanding electrical market, the recorded imports of electrical machinery, apparatus and appliances having risen from £335 620 in 1925 to £501 410 in 1927. British goods form too small a proportion of this total, and German suppliers are steadily advancing.

Recent reports show that there is only one Spanish manufacturer of electricity meters. Approximately 45% of the meters sold are of Swiss manufacture, most of the remainder coming from Germany.

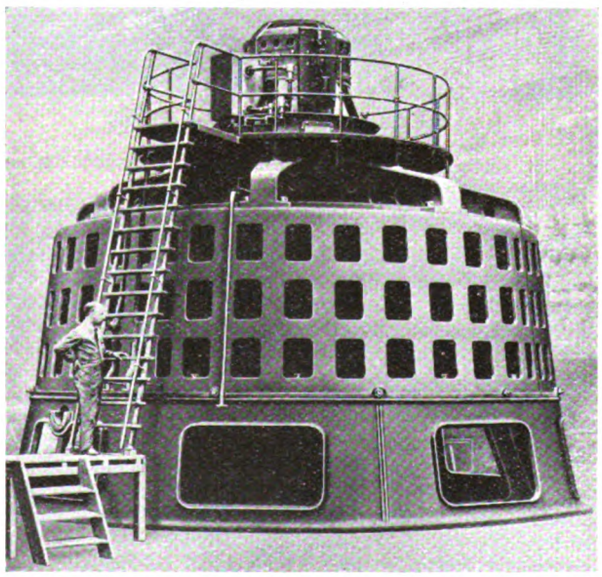
In his latest report to the Department of Overseas Trade on conditions in the Argentine Republic, Mr. H. O. Chalkley says British firms would be well advised to give special consideration to the reports of their Argentine connections on the changing situation and endeavour to frame a leading policy. American interests are particularly active, sometimes in association with German interests and at others in competition. The German electrical manufacturers have suffered from increased cost of production, and from the local prejudice that German plant and materials should be cheaper than others, so that their margin of profits has become small, and they are endeavouring to fix prices and sales conditions. Both they and the Americans, also the Italians, have plans for further local manufacture. Stronger competition from Italy, Holland, and even Denmark, is expected, and representatives of Swedish and Swiss finance and electrical industries have visited the Argentine to study conditions.

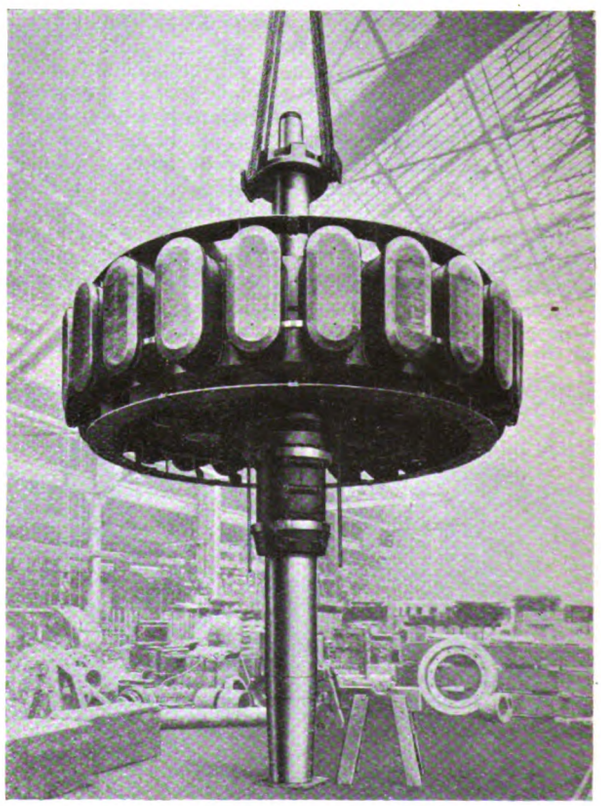
The sale of large generators, motors and transformers in any particular line is mostly in the hands of the nationality that controls the capital; for instance, the Germans and Italians, who own the largest power plants in and around Buenos Aires, naturally buy machines of German and Italian manufacture, and moreover impose their own standards for the installation of equipment to their lines. The railways are users of large generating machinery of British make. Any further electrification of the large British railways (and the Central Argentine company propose to convert from steam to electric traction their second suburban route) will make a big difference to British manufacturers of generators, transformers, h. and l.t. cables, switchboards, third rail, insulators, etc. The Germans and Americans so far usually outbid the British manufacturer on generating machinery in most of the smaller plants that are constructed throughout the country.

Latterly there has been an increase in the sale of British motors, but the competition in this line is very great.

There is a large and growing demand in the Argentine for insulated wires and cables of all kinds. The British manufacturers stand very high in the manufacture of cables for underground transmission, but the Germans seem to get the British specifications and undersell.

HYDRO-ELECTRIC PLANT FOR CHILE.





ONE interesting export field catered for by British electrical manufacturers lies in the supply of plant for hydro-electric schemes. On the left is seen one of three 13 330 kVA Metropolitan-Vickers vertical waterwheel alternators for the Maipo River power station of the Cia Hidro-Electrica Volcan, of Chile. Each machine is of 21 ft. 3 in. overall diameter, and weighs 128 tons. The rotor, seen to the right, is 21 ft. high and weighs, without the exciter, some 53 tons. The stator of each machine was built up in four sections, to facilitate transport, each section being shipped separately with its own part of the core assembled, and the winding in position, except for the coils bridging the joints.

TELEPHONES IN CHINA AND JAPAN

Possibilities for Supply of British Equipment—Progress of the Automatic System—Local Conditions and Tendencies Analysed.

By WALTER BUCHLER.

THERE are about 100 towns in China with sizeable telephone installations, and many more with smaller systems. Of these the Chinese Government operates 30 installations, and the rest are managed by companies or private concerns. The largest, most efficient and up-to-date telephone system is that owned by the Shanghai Mutual Telephone Co., of Shanghai, which has the monopoly of all telephones in the foreign concession, whilst the suburbs and Chinese native city telephones, as well as trunk lines, are under the control of the Chinese Government Telegraphs Administration.

The Shanghai Mutual Telephone Co., which is a British concern, has now 21 254 lines and 27 217 instruments in use.

Automatic telephones are gradually being installed in China's principal trade centres. An automatic switchboard was recently installed at the central exchange in Shanghai; Harbin, Dairen, and Tsinan already have automatics, and Tientsin is also installing one for its foreign concessions; another has been planned for Mukden, an important city in Manchuria, at an estimated cost of £180 000.

Some of the telephone systems run by the Chinese Government are inefficiently run, and require new apparatus. Besides telephones, China has a fairly extensive and efficient telegraph service, most of the equipment having been imported. With the growing popularity of the telephone and telegraph in China, there is no doubt that the next few years should see a steady increase in the demand for construction materials and apparatus.

Imports of telegraph and telephone materials during recent years were as follow:—

From:	1923.	1924.	1925.	1926.
Great Britain	£50 300	£59 300	£33 000	£22 000
Japan	39 500	23 000	46 700	42 000
Germany	18 000	40 800	29 000	136 000
U.S.A.	11 200	14 200	13 250	11 210
Sweden	13 700	46 100	20 600	14 900
France	66	7 700	12 100	14 300
Denmark	820	1 060	4 000	1 350
Netherlands	1 100	800	370	934
Norway	—	200	670	940
Belgium	1 700	670	1 460	25 600
Canada	23 200	430	1 000	1 400
Hong-Kong (port of transhipment)	15 540	7 115	7 950	7 630
Total (including others)	£186 000	£206 000	£182 000	£316 000

The total imports for 1927 were valued at £304 000.

There is also a considerable demand for insulated wire and cables, of which China imported in 1927 quantities to the value of £186 300 and £102 800 respectively. Japan and Germany supply the cheaper and lower grades of materials, those coming from Japan being inferior; Great Britain, America, and other Western countries obtain most of the orders for the better quality equipment. Larger towns (as Shanghai, Tientsin, Dairen, Harbin, Hong-Kong, Canton, Hankow, etc.) generally prefer the best quality materials to those of lower grade, though cheaper goods. In the interior, where it is more a question of finance than of efficient service, more consideration is given to price than to quality.

Saleable Equipment.

As regards the type of instruments suitable for this market, wall telephones are mostly used in the Chinese cities, extensions and other conveniences being available for an extra charge. Briefly, every description of telephone material and equipment is saleable in China. Tenders are often given out in Shanghai and elsewhere by the larger telephone companies, and it is necessary either to be on the spot oneself or to be represented by a foreign firm already established in China.

The present disturbed state of China should not deter those interested in this market from entering it, as Chinese "wars" seldom cause any great disruption of trade, which follows its usual course. In fact, in several cities in the interior the telephone system is run by the local Military Governor, as it constitutes a good source of revenue. The various military factions are often good customers for telephone materials and other electrical equipment required either for increasing their private revenue or for their "military" movements.

The Japanese telephone service was first opened in 1890 between Tokyo and Yokohama, and ten years later was extended to all the principal cities (Osaka, Kobe, Nagoya, Kyoto, etc.). Innovations are extremely popular among the Japanese, who quickly take to anything new, especially if introduced from abroad. The telephone soon became in great demand, though the service rendered was not very good; applications for telephone installations exceeded the number of instruments available, and the waiting list grew longer and longer; it is said now to number over 200 000. The fixed charge for having a telephone installed varies from 10s. to £1 according to place, but such an ordinary application takes 10 to 15 years to fulfil. One can, however, get an "urgent" telephone installed, but the cost of this is extraordinarily high; in Tokyo the charge is £120, in Osaka £110, in Yokohama, Nagoya, Kyoto, and Kobe £95, and £33 to £70 in other towns. These figures represent "reduced" charges, and this reduction took place only a few months ago, the cost before the reduction varying from £100 to £200.

The "Telephone Problem."

At present, there are in Japan approximately 600 000 telephone subscribers, whilst her population numbers 65 millions. The limited number of telephones made available by the Department of Communications in the principal cities of Japan has given rise to the telephone broker, whose business is a very profitable one in Japan.

The possession of a telephone is in Japan a fairly valuable asset. For every call one has to pay 3 sen (just under ¾d.), and there is the yearly charge of £4. Even with the present limited number of telephones in use, the Japanese Government derives a good profit from this source, its net revenue from the telephone being approximately £2 500 000 a year. If the system were improved, the service made more efficient, and the cost of a telephone made more reasonable and within the reach of the majority of the Japanese population, this revenue could be increased to many times this figure.

The majority of the telephones installed in Japan's cities are of local manufacture, and the Government is not anxious to import foreign makes. The home-made equipment is by no means perfect, and, though it serves the purpose, it is inferior to that made in the West.

Japan is, in many respects, the most progressive country in the Far East, though this is not so in the case of her telephone system and equipment. China, with her telephone organisation built up with foreign aid, and with imported equipment, has the more efficient system. There is, nevertheless, no doubt that Japan will, sooner or later, have to bring her telephone system to the same standard as in the West; her gradual industrial development, the anxiety of the Japanese to appear as up-to-date as possible, and the exigencies of trade and cost of living will make a moderate-priced telephone necessary in every office in Japan, if not in every home. Telephone equipment will have to be imported, unless Japanese manufactures improve greatly.

At present, the Japanese Government hesitates to make too many telephones available for fear of causing a reduction in price, which would also cause a depreciation of the telephones held by subscribers who have bought them at the "normal" price of £100 to £200. The question of financing the wholesale introduction of telephones is another difficulty facing the Department of Communications, a strict policy of retrenchment having been adopted by the Japanese Government.

Manufacturers of telephone equipment here should invite representatives of Japan's Telephone Bureau (selected by the Government) to study the telephone system in this country; a return visit of inspection of Japan's telephone system on the part of representatives from this country, with a mutual exchange of opinions and advice (the latter would be rather one-sided) would probably lead to the adoption on Japan's part of a more enlightened policy at home, and at the same time bring orders to this country for telephone equipment on a large scale as well as for one or two telephone experts to see to the organisation.

In South Manchuria, Japan has a better telephone service, with more modern equipment, than in Japan proper. The automatic telephone exchange, which was recently completed by an English company in Dairen is the largest of its kind in the Far East. Japan is extending her long distance telephones along the South Manchurian Railway.

A SOLUTION FOR TAPPING 132 kV LINES.

Investigation of Latest Practice Shows No Reason Why 5 000 kW Loads Should Not Be Tapped—Estimating Return on Capital Investment.

By WILLIAM T. TAYLOR, M.Inst., C.E., M.I.E.E.

IN the introductory note to a paper entitled "Electric Transmission of Power as Applied to Large Areas," which was presented by Mr. Archibald Page, at the Institution of Civil Engineers Engineering Conference, 1928, it was stated that ". . . . the cost of tapping the main lines (of the 132 kV grid) is still such that this will not be done for loads below 10 000 kW." In reply to this statement, Dr. S. Z. de Ferranti said: "Mr. Page reminds us that it is not worth while from a commercial point of view, and probably from a technical view, to tap the grid for less than 10 000 kW. . . . It is a very serious limitation."

An Investigation.

The writer has recently investigated the latest practice of 132 kV tapping, and herein gives briefly some idea of what is actually being done elsewhere for 132 kV sub-stations and lines exposed and operated under far worse climatic conditions than exist in this country; hence they should be relatively more robust and expensive and obviously require a greater load than 10 000 kW, assuming the above statement to be correct. It may be definitely stated that there is something wrong somewhere if a load of 10 000 kW is the *minimum* for a 132 kV tapping of a main line in a country like this, where practically all the materials, apparatus, and equipment are manufactured within a few miles or few hours' transport journey from the sites. Lines that traverse sun-scorched plains, continually battling excessive temperature ranges and high winds, where frozen fog often forms 2 ft. thick on towers and from 3 to 8 in. thick on the conductors, where continuity is just as important as any electric supply in this country, where the price of everything is either lower or no higher than the "grid" will offer, and where, from one electricity undertaking, over 25 000 farms are served, and, from another electricity undertaking some 300 cities and towns spread over 38 counties are served.

The tapping of a 132 000V line, or any line, depends on the amount of revenue that would be secured from the extension and installation as decided by the engineering, commercial, and operating items involved.

To arrive at that figure, or range of figures by close estimating, the engineer would compute the amount that would be required to be spent on the line (or lines) and station (or stations); he would also insert the operating expenses and figures, preferably giving a range of closest values for varying items; he would then deduct the return on the investment, this latter being the deciding factor as to what can be done when requiring to receive a reasonable return on the capital outlay.

First of all we desire to know the minimum kVA load, or the r.m.s. of average load in kW, to be tapped and paid for—the price per unit, etc., being understood. But this does not answer the whole problem. Four or more conditions are possible for any given length of extension and type of construction and design. That is to say: (*a*) when extending the line and completing the tapping entirely at cost of supply undertaking; (*b*) when doing so at part their cost, depending on the amount the consumer (or receiver) would pay; (*c*) when extending the line or part of the total installation only at supply undertaking's cost; and (*d*) when doing so at part their cost and part consumer's cost, depending on maximum amount consumer would pay. Also, the minimum kVA load for a given line voltage varies with the length of transmission extension.

Up to the present time, 100 kV to 200 kV lines are entirely used for the transmission of power between generating stations, and between generating stations and main terminal sub-stations at the larger and more important centres of distribution.

Ordinarily, such lines are not tapped to supply an industrial load unless, for (say) a 132 kV line, it is in the neighbourhood of 5 000 kW and is located in or close to rural territory. The question is rarely a matter of jeopardising the service "of the more important stations and towns" by having trouble in industrial sub-stations interfere with them—actually these should give no more trouble than the city sub-stations.

For a good and proper commercially-constructed 132 000 V line and system there is little or no reason why a 5 000 kW load should not be tapped. The writer has good reasons for saying practically every privately-operated 132 kV supply undertaking would willingly accept an extension of their 132 kV line for a load of 5 000 kW, *or less*; the 5 000 kW figure is but *one-half* of that load which has been referred to as the lowest possible for connection to the 132 kV national "grid" of this country. Independent of extension length, the minimum load depend on *a*, *b*, *c*, *d* given at end of article.

In some parts of the world engineers think this out in terms of population, saying they can afford to tap their main 132 kV lines for a city of not less than fifteen to twenty thousand people, but less than this when there is an extraordinary power load in connection therewith. The writer knows of one company operating 140 kV lines tapping for a population of 10 000 people. For this country and present conditions, it is doubtful whether *ten* times this figure will represent the maximum population for any 132 kV tapping.

As yet, such main transmission lines designed and operated at from 110 kV to 220 kV are not for individual consumers. Experience so far tells us that it is best to serve rural communities or consumers from some adjacent city or town supply, rather than to attempt to tap lines of this kind. The writer knows of at least one 120 000 V line tapping for 2 500 kW, also a 140 000 V line extension and sub-station built for, and supplying a *maximum* load of 5 000 kW; and the case of a 110 000 V line extended at part cost of power company and consumer for a load of 1 000 kW. Incidentally, going back 25 years, it may be noted that the writer has extended 66 000 V lines, and built and equipped sub-stations for loads less than 600 kW; and, past twenty years ago, the writer built and operated 60 000 V river *floating* sub-stations, each for a load less than 600 kW.

The materials, apparatus, and equipment for these 60 000 V floating sub-stations travelled nearly 8 000 miles by sea, nearly 2 000 miles by railway, then several days' transport journey by road beyond the nearest railway point.

Total costs for the construction of a 132 kV line extension are high and, it is necessary to secure a good amount of load in order to realise a reasonable return on the capital investment made.

Two Alternatives.

There are two alternatives, but they have somewhat interrelated solutions. As we consider best, we may base the proposition on the figures of kW load secured, or we may base it on the return received on the particular investment. We cannot go far wrong when we compute the amount of load that would have to be secured to earn a reasonable return on the amount of money invested. A reliable and simple method of estimating the return on the investment that may result from any extension and tap is given in the following forms:—*

METHOD FOR ASCERTAINING RETURN ON INVESTMENT FROM EXTENSION.

Municipality..... Town..... County.....

Return on Capital Expenditure		

The above computation should be made as complete and as accurate as possible for every tapping. The amount of revenue from the line extension under (A) is best given by the commercial department of the supply undertaking. The money required for line and station as estimated under (B) is then given, and the operating department provides the operating expenses under (C). The return on the investment is then figured so that we have *the* required factor; hence, there is no assumption of guess work. The nearest possibility for assumption is in the character of the load, which involves the relation existing between average and maximum rate at which power is necessary to meet the demand—costs rising as the load factor decreases.

Although the 132 kV "grid" for this country is essentially for the "dump" and "transfer" of power to and from cities and towns it is no less essential that definite rules be framed for prospective new business, that computation of probable earnings, and the amount of investment which can be afforded. This also should apply to cases where the necessary investment is greater than can be afforded by the supply undertaking (the Central Electricity Board, for this country), so that, in place of ignoring or putting aside new business, the proposed consumer or consumers obtain a tapping provided they make up the deficiency.

In computing figures based on the return received from investment, and on kW of load secured, the writer believes the following figure to be conservative for earning a reasonable return on the amount of money invested for an "average" 132 kV tapping, *when*:—

(*a*) Extending the line only at part consumer's cost .. .. 2 000 kW

(*b*) Extending the line, building transformer house and placing the switchgear and transformers, at part consumer's cost .. .. .. 3 500 kW

(*c*) Extending the line only at supply undertaking's cost .. .. 3 500 kW

(*d*) Extending the line, building transformer house and placing the switchgear and transformer, all at supply undertaking's costs .. .. 6 500 kW

It is felt that there is no necessity to discuss the relative economy of Government constructed, owned, and operated *versus* company constructed, owned and operated utilities; the differences in every respect are apparent to all.

BIRD GUARDS.

Some Advantages of Fibre Tubes—Extensive Use on 11 000 and 30 000 V Lines.

(By A CORRESPONDENT.)

PROBABLY the simplest method of avoiding trouble, due to birds perching on the metal cross arms of medium pressure overhead lines where pin type insulators are in use, is to cover the arm with an insulating sleeve which is non-hygroscopic and not liable to deterioration by exposure to the weather. Porcelain and many moulded insulations comply with these requirements; but there are other factors which narrow the field of choice.

The material chosen should be (1) low in cost, (2) not fragile, (3) capable of being machined, not only to ensure a snug fit round the arm and pins, but also so as to provide a self-fitting grip on the cross-arm without tieing or anchoring.

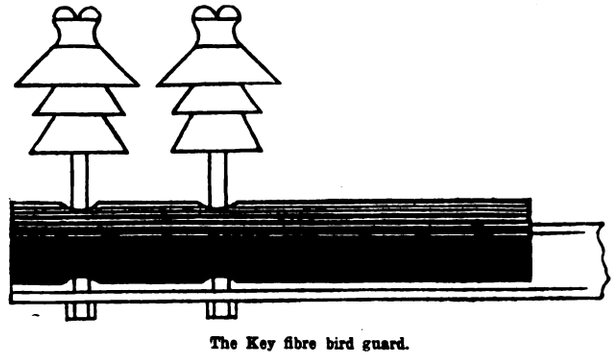
Porcelain, though reasonably inexpensive, is rather easily broken; it cannot be machined, and requires special methods of fixing and anchoring; this, of course, applies to most moulded insulations.

About eight years ago it occurred to a large power company in the North of England, who had for a long time been accustomed to use Key fibre conduit, supplied by the Key Engineering Co., Ltd., for underground cables, that these fibre tubes might very well be adapted for use on their lines where pin type insulators were used. A handsaw, brace and bit and a jack-knife can fashion quite a serviceable bird guard from one of these fibre tubes, and some were made as an experiment and put into commission.

From this beginning there has grown up an extensive demand for Key fibre bird guards, and to-day they are used on lines ranging principally from 11 000 to 33 000 V.

The illustration shows a very usual and simple form, used where single wooden poles with steel angle cross-arms are employed. The bird guard, with its accurately tooled slot, being of circular section, tends to close on and grip the cross-arm firmly. It is slipped on from the outer end and requires no tieing or anchoring.

In the supply of guards for even a comparatively short line, it is often necessary to have a dozen or so different shapes, and the manufacturers have literally hundreds of dimensioned prints to which they are working. This has quite an appreciable economic bearing, as it is obviously cheaper to cut out and shape a fibre tube than to make special mouldings. It also puts this little accessory in its proper place, as the bird guards can easily be made to suit the lay-out instead of designing the lay-out to suit the bird guards.



The Key fibre bird guard.

Many of the earlier transmission lines were erected without provision for bird guarding, and in order to rectify this, without interfering with the installation, short tubes, to cover the cross-arm up to the insulator only, have often been supplied. In this case the tubes cannot be slid on from one end, of course, but as there is a good deal of spring in the circular guard, it can be sprung over the angle iron from the front, the slot opening out sufficiently for the purpose.

One of the companies who contract for overhead transmission lines, when doing this, apply a blow lamp flame at the back of the tube opposite the slot. This temporarily softens the material slightly, but sufficiently to open out the slot, so as to pass the guard over the angle of the cross-arm without any effort. The material hardens again in a very short time, and the slot closes to make a grip.

GAS ALARM APPARATUS.

Device for Preventing Street Explosions—Automatic Operation of the "Ringrose" Gas Sentinel.

APART from the serious danger to life, street explosions of the kind which paralysed one of London's main thoroughfares just before Christmas result in enormous financial loss, not only in the cost of reinstating the roadways and pavements and other damaged property, but also through loss of trade due to the prolonged closure of the affected district.

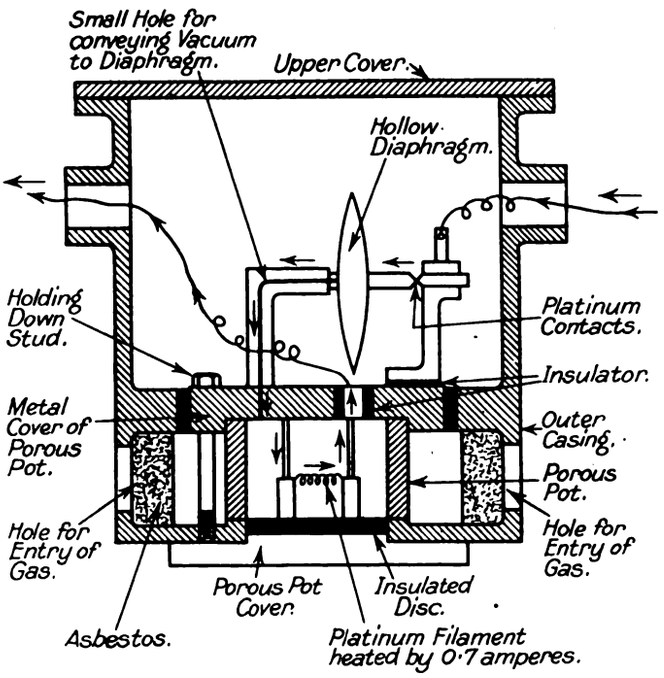
There is at present a distinct feeling of uneasiness at the prospect of further upheavals of this nature, and not without cause, for not only London, but many other cities, are literally honeycombed with networks of tunnels interconnected through manholes and shafts, all of which are potential pockets for the accumulation of explosive gases. Many of the gas mains are laid in areas subjected to the ever-increasing vibration of heavy traffic over roads which were never designed, and, having regard to the nature of the subsoil cannot be expected, to withstand it.

Natural cavities due to sinkage and silting must be added to the already enormous number of "pockets," and thus the danger of explosion from fractured gas mains grows daily. Punctures due to erosion are, of course, a further source of danger.

In spite of the gravity of the situation and the possibility of a repetition of the trouble at any moment, some of the authorities concerned have confessed themselves powerless to avert a future calamity.

Examination of the problem shows that there is only one sure way of preventing such explosions; and that is to detect the presence of gas before it assumes a dangerous concentration, and to arrange apparatus which, at the moment of detection, will simultaneously give visual warning at a control point and operate machinery for dispersing the gas. Fortunately a device of this kind is already an accomplished fact, and a demonstration of the apparatus to a representative of THE ELECTRICIAN furnished convincing proof of its efficiency.

The "Ringrose" gas sentinel, as it is called, is a modification of the "Ringrose" gas and fire-damp alarm and safety lamp made by W. R. Patents, Ltd., of Leeds, and it will be



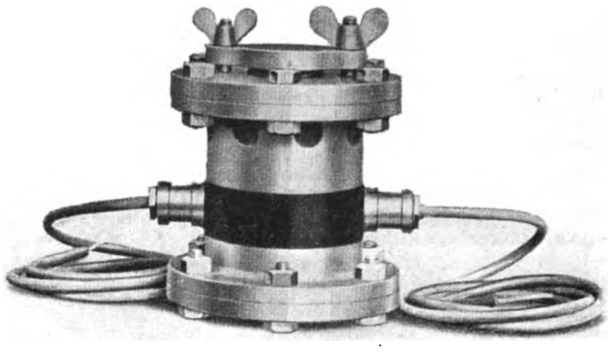
A diagrammatic sketch of the interior of the "Ringrose" gas sentinel.

recollected that this lamp, following approval by the Ministry of Mines, is providing extensive employment in collieries.

The device is very compact, as will be gathered from the illustration shown in the next column, and can be fitted inside any manhole, tunnel or inspection chamber.

Its functions may be briefly described as follows. It signals to any desired point or points when gas is present to a percentage of 1¼. It then automatically sets in motion an electric fan for dispersing the gas. When the gas has been reduced to below 1¼%, it signals "all clear," and resets itself ready for a further attack, without attention, so long as gas is present. Should any fault occur on its signalling circuit the appliance signals and assumes the "danger" position, a process which is automatically repeated. It is fool-proof and robust in construction, requires no attention beyond, say, five minutes every eighteen months or two years, and the cost of operation is approximately 5s. per annum.

The action and construction of the alarm may be followed in the diagram on this page. Enclosed in the apparatus is a



The "Ringrose" gas detecting equipment is fool-proof in its action and robust in construction.

porous pot, within which is a special filament heated electrically by an electricity supply such as is employed in telephone exchanges. Any gas present in the atmosphere percolates via gauze-covered holes through the porous pot, and is slowly burned by the heated wire. This creates a partial vacuum in the pot, and the vacuum so produced passes to the interior of a diaphragm and separates two platinum contacts, thus breaking the electric circuit. This breakage gives visual warning at the telephone exchange or other desired point, and at the same time sets in motion an electric fan for dispersing the gas.

E.P.E.A. (SCOTLAND DIVISION).

Annual Dinner Views on the Association and Conditions of Labour.

AT the annual dinner of the Electrical Power Engineers' Association (Scotland Division) at the Caledonian Hotel, Edinburgh, on February 9th, Mr. R. A. D. Macalister presided, and others present included Principal J. Cameron Smail (Heriot-Watt College); Major Herbert Bell (Glasgow Electricity Department); Mr. F. A. Fitzpayne (Edinburgh Tramways Department); and Mr. T. D. Martin, president of the Electrical Power Engineers' Association.

Principal SMAIL, proposing the toast of "The Electricity Supply Industry," said in these days, which were not altogether free from gloom and depression, it was very pleasant to be able to talk about something which was in a flourishing condition, and which it seemed in all probability would continue to flourish. It seemed to him that the electrical industry had behind it the great advantages of recent development and tremendous achievement. People seemed to be prepared to invest millions quite calmly in the new developments.

Major BELL, responding, said he had heard they were going to get electricity at ½d. per unit. Just at the moment he did not know how that was going to be done, but it was very interesting to know that the general price of electricity throughout the country was gradually coming down to a figure which it was believed would make it of use and available to all.

Mr. F. A. FITZPAYNE, proposing the toast of "The Association," said the reason for the formation of the Association was as strong to-day as it was then. It was to have an Association to protect their professional interests, and the E.P.E.A. had most efficiently performed that function.

Mr. P. D. MARTIN said if they compared the chaotic condition of salaries and conditions of labour in the early days with the present day it would be seen that the Association had fully justified its existence.

ORGANISING FOR INCREASED SALES.

Six Vital Points in Selling—Importance of Legislating for the Future—Overcoming the "Inferiority Complex"—Lamp Sales as Basis of Bigger Retail Turnovers—Preventing the Yearly Spring Cleaning.

ORGANISING for Increased Sales, with special reference to the "Spring Cleaning Season, 1929," was the subject of a paper read by Mr. H. W. Roberts at the E.D.A. Sales Conference held at the Royal Society of Arts, London, on February 15th, Mr. F. W. Purse in the chair.

Mr. ROBERTS dealt first with the general question of increasing sales under the following headings:—

(1) Salesmanship consists of:—(a) creating a selling atmosphere; (b) mastering your selling points; (c) method of approaching the customer.

(2) Organising for increased business is synonymous with looking ahead. Looking ahead does not mean next week or next month, but five, 10 or 15 years, and all our plans should be prepared so that expansion takes place in a normal manner.

(3) We must think on much broader lines, and prepare for really big business. Our turnover in merchandise to-day is very small in comparison with other industries, and we must learn to think in thousands where we have previously thought in hundreds.

(4) We must make up our minds how this business is going to be handled. The basis of all big business is the means of distribution to the general public. The obvious solution is through retail shops such as exist in other industries. When, therefore, deciding any policy we should ask ourselves: Will that help to bring about a large and stable retail section of our industry?"

(5) Two of the essential features of "organising for increased business" are: standardising and simplifying.

(6) Price-cutting as a means of "organising for increased business" should be avoided at all costs.

A good example of looking ahead was provided by the operations of the Central Electricity Board, which was definitely legislating for the future, and not just meeting the demand as it came along. There should be no hesitation about adopting this policy, as we had no excuse for lack of confidence. The consumption of electricity had doubled during the past seven years, and there was no reason why it should not be doubled again in the next three to four years, particularly in the south-eastern area of England.

Hand to mouth buying was very prevalent in our industry, which could only mean that there was a lack of confidence, whereas our industry, above all others, had the brightest of futures. This attitude was small thanks to those pioneers of thirty and forty years ago, who laid the foundations of future prosperity for the many young men and women now employed in the industry. It was the lack of thinking on broader lines that accounted for the inferiority complex which, according to one of our technical journals, existed in our industry.

Adequacy of Shops Questioned.

Mr. Roberts suggested that the E.D.A. local circles should devote one of their meetings to a survey of the retail shop representation in their area, and see whether, in their opinion, this was adequate to the public needs. A well known motor car manufacturer advertised that he had nearly 2 000 dealers associated with his service organisation, and every user of his cars knew where to go for immediate replacements or repairs. Speaking generally, did the public know where to go—without hesitation—to buy electrical apparatus or get advice on electrical matters? He was inclined to think not, as the electrical industry was very badly represented in the main shopping thoroughfares of the country.

It was frequently levelled against manufacturers that prices for apparatus made to B.E.S.A. specifications were too high, but this was purely a question of demand, and he was sure that if there were a general tendency always to adopt B.E.S.A. standards, the prices, as they had actually done in one or two cases, would much more nearly approach what had become regarded as standard prices for the accessories in question. At present all sections of the industry were hampered through varieties of stocks and patterns which should really be quite unnecessary.

The desirability of rendering electricity accounts monthly was stressed by Mr. Roberts. He thought it was a great mistake to couple a service like electricity with that of local rates, rent, and other such disagreeable charges that had to be met during the course of the year. By charging for electricity monthly one brought it within what was generally known as the "housekeeping money" atmosphere, rather than that of the quarterly bill.

Price-cutting was the royal road to bankruptcy. It showed lack of confidence in selling policy, quality of product and quality of work. There was much too great a tendency to depreciate values inside our own industry and amongst ourselves, instead of allowing the usual economic method of public demand to operate. Good value for money, coupled with good service, was the basis of public goodwill. Mr. Roberts feared we did not realise what good value we gave in certain of our commodities; it was instructive to consider what the public got for 2s. 3d. in a 60 W lamp and to compare the difference with the value obtained from a couple o cocktails, or 2s. 3d. worth of coal. Again, compare the price of electric fires with those of coal grates and gas fires, and it would be found that we were giving far better value. If we started selling goods with the idea that we were asking a high price, while not realising the value we were giving in comparison with other industries, we should never create in our own minds the confidence necessary to increase our business.

Fixing Desired Turnover.

In considering the question of increasing business it was essential to have a goal to aim at, and one should decide on the turnover that it was necessary to reach, then analyse it with a view to seeing how it could be achieved. The turnover and expected profit must, of course, bear a definite relation to the establishment charges to be incurred, and when speaking of a retail shop the first consideration should be to select a standard line in constant demand, such as lamps, and make up one's mind that the business in that particular line must, say, pay the rent of the shop. The advantage of lamp turnover was that it was quick, and quick turnover was the secret of profitable retail trading. Lamp selling, if studied carefully by the assistants, was an extremely good basis of building up salesmanship in all other lines of electrical apparatus.

The next step was to prepare a definite campaign, making up one's mind as to the turnover to be reached in various classes of apparatus, and then deciding as to how to get that business, namely, by canvassing, advertising in the Press or effective window displays. Having settled on a programme for say, three or six months ahead, it was essential to stick to it.

Another important point for consideration was the value of stock in relation to the expected turnover. It was, for instance, no good expecting to do a turnover of £250 per week with a stock valued at £100, as it was quite impossible to give good service, and the variety offered to the general public was too small. On the other hand, stocks should be very carefully selected and continually reviewed, to see that none of it was relegated to back shelves and forgotten. Standardising and simplifying should, of course, be the keynote of carrying stocks, as not only did it lead to buying in better quantities and at better prices, but it enabled a more careful watch to be kept, and made the task of the salesman much simpler.

As one of the greatest selling points in favour of electricity was its cleanliness, all shops, showrooms, etc., associated with the selling of electricity should be kept scrupulously clean and tidy.

Referring to the E.D.A. publicity plans in connection with Spring Cleaning, Mr. Roberts thought the campaign dealt too prominently with the suction cleaner, without referring to the numerous other possibilities of increasing business at that particular time of the year. Spring cleaning in the electrical age should be non-existent, but it would probably take another two or three generations to kill this horrible annual upheaval. There was, however, no better period during the whole year than the spring cleaning season for propaganda work by the electrical industry. We should not forget the old saying "Prevention is better than cure," and if we could educate the public up to the all-electric idea, then we should be preventing spring cleaning, instead of curing the evils of the other nine months of the year. The fact that during the early winter we were busily meeting demand should direct attention to another part of the year for creative work, and

Digitized by Google

there was no better time than when the householder was fed up with clearing dust and grime accumulated in the winter.

In conclusion, Mr. Roberts pointed out that this year extra vigour would be called for to counteract the upsetting tendencies of the coming General Election. The electrical industry, above all others, had the best chance of helping the nation back to its old prosperity, as we could ensure better homes, better working conditions and improved methods of production.

DISCUSSION.

Mr. BERNARD emphasised the necessity for confidence as the basis for any organisation for increased sales. Confidence must be the key-note of the whole selling policy. The salesman could not too often repeat that electricity and its appliances were the finest commodities in the world, and the more this was realised the faster we should get on. Confidence also came into the question of standardisation of apparatus, and the more we could get down to standardisation the greater must be the success achieved in the use of electricity. In the same way a great deal more should be made of relative cost of electricity and its apparatus in comparison with other forms of lighting and heating. On the question of rendering accounts monthly, it appeared that the gas companies found it satisfactory.

Mr. F. SELLEY said the foundation for any increased selling campaign was to get the price per unit on the proper basis, to start with. He did not agree with rendering accounts monthly, owing to the largely-increased costs for meter reading and clerical work. At present it took three weeks in each quarter to read the meters in his district, and assuming there was a staff of 100 at present to do this work on a quarterly basis, it would need a staff of 300 on a monthly basis. Standardisation was not such a simple thing as some people seemed to think, especially in connection with kettles, cookers, toasters, etc., as it was too often found that one householder would not have an article just because the lady next door had one. They wanted something different.

The trouble with electrical washing machines, especially in central London, was that there were no conveniences for drying. Simplicity was certainly necessary in regard to tariffs. Although he agreed that electrically-operated hot water systems would solve many household difficulties, it would be impossible to sell such apparatus with a charge of 2d. per unit.

Miss JONES remarked that as regards electrical washing machines, the poor people who really ought to have them could not afford them, whilst the richer people who could afford them would not bother with them and preferred to send their washing to the laundry.

Mr. E. A. JOYCE said that want of capital was preventing the increase of sales taking place in the electrical industry. What was wanted was a very much larger number of retail electrical shops in our large towns. At the present time there were remarkably few, although some enterprising electricity supply companies and municipalities had opened up excellent showrooms. As regards contractors, it seemed impossible to get them to use propaganda literature and printed matter, although it was supplied free by the manufacturers. Contractors very often, he said, were too busy filling in tender forms for public contracts and seemed to be too much concerned in getting on to a L.C.C. or similar list to give much attention to increasing the sales of apparatus.

Exploiting Wiring Possibilities.

Mr. P. M. SHEARS suggested that the most likely way of increasing the sales of apparatus in a spring-cleaning campaign was to tackle the large amount of new wiring work waiting to be done. He also suggested that a great deal of progress would be made if lamps could be obtained at 1s. each.

Mr. MOORE asked the author for an explanation of the expression "inferiority complex" which had been referred to in the paper.

Mr. B. C. HOLDING suggested that Mr. Roberts should be given a medal for his courage in reading a paper on salesmanship at a Sales Conference! It was, he continued, a real reflection on the trade in this country that so little domestic electrical apparatus was in use. It had recently been stated that in America only 37% of the homes using electricity for lighting were using suction cleaners, but the position was probably far worse in this country. If he might be permitted to criticise the E.D.A. Publicity, it would be for its tacit assumption that spring-cleaning is a necessary annual event, whereas the suitable and adequate use of electrical appliances should render, as the author said, this annual upheaval unnecessary. Electrical spring cleaning propaganda should have as its key-note some interpretation of the slogan "Make this Spring Clean your Last." It was obvious that the use of electrical appliances for domestic purposes was not yet sufficiently appreciated, and he was convinced that there was a big electrical field absolutely demanding to be cultivated. Mr. Roberts had shown the importance of the great selling principle of to-day: "make it easy for them to buy." Demonstration was the greatest of the things to make buying easy. As to washing machines and the difficulty of drying, there was on the market one machine which claimed to incorporate a centrifugal drier, which would seem to get over that difficulty.

In the selling of lamps nobody seemed to care much about the wattage of the lamp which a customer placed in an empty socket. Yet the wattage of each lamp sold was an important governing factor in the lighting load of some central station.

At the retail selling end we had a fair number of electrical shopkeepers who waited firmly entrenched behind heavy counters for the customer to come and demand electrical appliances. The real need was to turn these mere tenders of goods into sellers of the greatest and most valuable service known to civilisation.

Miss TICKELL (Leyton) mentioned that a firm of suction cleaner manufacturers had, in the name of the Leyton electricity undertaking, canvassed that district with its own canvassers, and had sold 250 suction cleaners in five months.

Lack of Sales Specialists.

Mr. PATMORE suggested that the industry was suffering from a lack of specialist staff on the sales side; otherwise it would not be necessary, as in the case of Leyton, for the manufacturers to send their own staffs to push the sale of apparatus from which the undertaking would secure a large revenue. Speaking of electric fires and tariffs, he mentioned the fact that a certain electricity supply company had just sent round a circular asking consumers to use their electric heaters as sparingly as possible between 10.30 a.m. and 4.30 p.m., as otherwise there might be a danger of shortage of supply. The trouble, said Mr. Patmore, was that this company was supplied in bulk, and under the present arrangements by which bulk supply was given, it was afraid to increase its maximum demand as the charge payable by the company was based on the average maximum demand over a certain period. He suggested that the Electricity Commissioners should be asked to revise this system in the interests of general development.

The CHAIRMAN, who incidentally mentioned that the campaign for the sale of suction cleaners in Leyton—where he lives—had resulted in considerable waste of effort, as the canvassers repeatedly called at his house in spite of being told that a suction cleaner was already in use, said that any campaign for increasing sales must be based upon the conditions and requirements of the particular district. He reminded Mr. Selley in connection with washers and drying, that steam laundries always dried indoors in drying cupboards, and there might be a possibility of increasing the load by providing electrically-heated drying cupboards. He anticipated a great development in connection with wiring on the rental system, and another direction in which he himself proposed to take action was to establish a maintenance department, which had proved so successful in the case of the gas companies.

Mr. H. W. ROBERTS, replying to the discussion, said he had no desire to criticise contractors or supply authorities. The whole object of the paper was to emphasise that the key-note of selling either electricity or appliances depended upon keeping in continuous contact with the public. Although he had expected Mr. Holding to explain the meaning of "inferiority complex," his own idea was that it indicated a looking down upon ourselves so far as value was concerned, in relation to other industries, and he felt it was time we held ourselves up a bit more.

As to the suggestion that lamps should be sold at 1s., he doubted whether this would be realised for a long time. The prices of lamps in this country compared favourably with those on the Continent, and although American lamps were cheaper, that was due to the fact that 95% of the consumers there were on one voltage.

Finally, Mr. Roberts mentioned that there was a large number of installations in this country fitted with current limiters. He regarded these devices as sales limiters, because it was impossible to sell even an iron to such consumers, and the sooner current limiters were abolished the better it would be for everybody.

ELECTRICAL WHOLESALERS' DINNER.

Sir Philip Nash Predicts Bright Future for British Electrical Trade—President Urges Closer Co-operation Between Wholesalers and Contractors.

ABOUT 300 members and guests of the Electrical Wholesalers' Federation were present at the annual dinner of that body, held on February 14th, at the Savoy Hotel, London, Mr. T. Stretton presiding.

Sir HAMAR GREENWOOD, proposing "Co-operation in Industry," referred to the merging of electrical companies, a proceeding which, he believed, was inevitable in all industries. He would like to see the British electrical industry develop throughout the Empire and throughout the world. Co-operation in industry was the hope of the human race. It meant continuity of employment, a reasonable standard of wages and a reasonable profit to the producer.

Sir PHILIP NASH, in reply, said that every generation in industry had its own particular problems. During this generation many methods had been tried with a view to promoting co-operation in industry, and the Turner-Melchett proposals were of great value in creating the right atmosphere for the prosecution of further steps in that direction; but the real place for the initiation of such co-operation was the floor of the workshop. The future of the electrical industry depended more than ever before on co-operation, and he was therefore glad to see that quality abundantly evident in the industry.

One of the directions in which big developments were to be looked for was in the application of electricity to the propulsion and general manipulation of ships. As a seafaring nation we had always taken the lead in marine matters, and he hoped that British electrical firms would help British shipbuilding to take the lead with electrically propelled ships.

Electrical manufacturers were co-operating with the wholesalers, as they were an essential link in the distribution of electrical products. So long as a wholesaler carried out his proper function of pushing sales and reducing the cost of a product to the consumer, he, as a manufacturer, was perfectly content to pay for those services.

British industry possessed many assets which were not always fully realised. Our location, from the point of view of getting raw materials, was unique, our labour was the most intelligent, we possessed a financial system which in point of of view of size, integrity and reputation, was unequalled in the world, and deep down in every Britisher was the accumulated knowledge and tradition of how to do business with other countries. And then we were the centre of the greatest Empire the world had ever seen. With these assets the only things necessary to restore our trade supremacy were confidence in ourselves, co-operation, organisation and hard work.

Mr. J. Y. FLETCHER proposed "The Electrical Wholesalers' Federation." He believed in co-operation in industry, as the days for individual negotiation were gone. He believed that the electrical manufacturing industry approved of the wholesaling policy, but wholesalers who did not sell goods bearing the brand of a manufacturer did not meet with his approval. He also thought that wholesalers in general should purchase material before they sold it.

Mr. THEODORE STRETTON, acknowledging the toast, said that Sir Hamar Greenwood, Sir Philip Nash and Mr. Fletcher had stressed the necessity for co-operation in the electrical industry. Never was it more important that there should be the widest and closest co-operation. During his term of office he had used every endeavour to get into closer touch with every other kindred association, and on the whole considerable progress had been made.

Perhaps their endeavours to get together with the contractors had not been quite as successful as could have been wished, and he appealed to them to get together. Both sections had exactly the same objects in view, and both desired that there should be a definite line of demarcation between the wholesaler and the retailer. Only by complete agreement as to that line of demarcation could there be proper control in the sale and installation of manufacturers' products. As there was no reason why there should not be the closest co-operation between the wholesaler and retailer he hoped they would put aside small grievances and get together.

Whilst on the subject of getting together, he again asked why it should not be possible to have, in the electrical industry, an association embracing all sections of that industry. The motor car industry had had for many years a society immensely strong in every way, and representing every section of the industry. It controlled that industry, and its word was law. The only thing outside its province was price maintenance, and that was controlled by an allied association.

He considered that one great electrical association with sections for every branch of the industry would be true co-operation and for the good of all. He was certain that this need not be a dream, as there were gentlemen at present controlling important trade associations who would probably be quite willing to bring such an organisation into being.

The E.W.F. had always endeavoured to play the game. They were out to give service to the manufacturer in the distribution of his goods to the retailer. The labourer being worthy of his hire, expected a living wage. The Federation would not accept for membership anyone who was not a genuine wholesaler, and the rules are stringent. It seemed to him, therefore, that they should be able to claim and obtain the assistance and co-operation of the manufacturer. They were, in spite of the loss of a few of their oldest and most respected members, the recognised organisation and mouthpiece of the wholesale electrical trades. He took the opportunity of saying publicly that from day to day the E.W.F. lived in the hope of the return to the fold of those they had, so to speak, temporarily lost.

The toast of the "Guests" was proposed by Mr. A. Albrecht, and replied to by Mr. A. Nichols Moore and Mr. L. B. Atkinson. Mr. G. P. Dennis proposed "Our President."

Some of the members of the Electrical Wholesalers' Federation and their guests at the annual dinner at the Savoy Hotel on February 14th. A report of the speeches is given above.

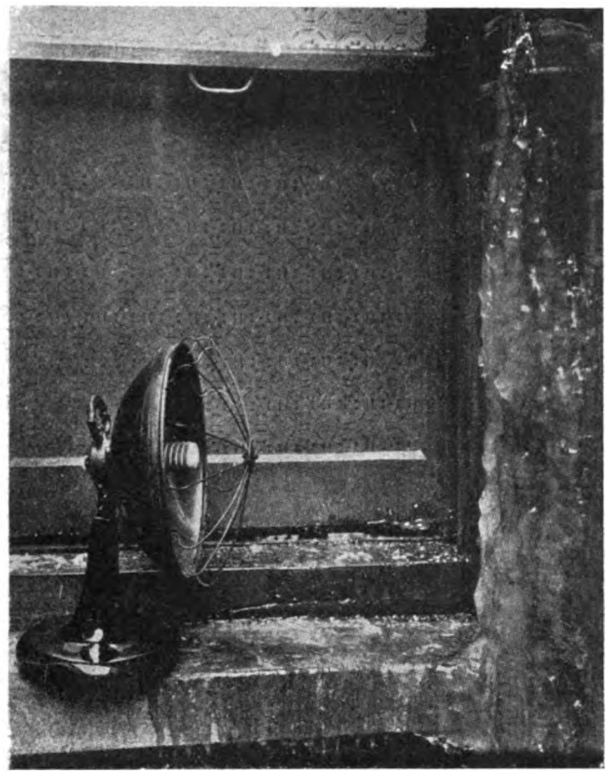
Thawing Out: Electricity to the Rescue.

[To the Editor.]

Sir,—It occurred to me that some of your readers may be interested to see the accompanying photograph showing how a frozen-up outside water pipe at my house in Hampstead was thawed by means of an electric bowl fire.



A seasonable use for the electric bowl fire.

I believe that Hampstead has recorded almost the lowest temperature in the country (—2° F.). But, fortunately, we have almost the cheapest electricity (½d. per kWh) !—I am, etc.,

D. J. Bolton.

Safety Factor of Concrete Poles.

[To the Editor.]

Sir,—I have read with interest Mr. W. T. Taylor's letter in your issue of February 8th, and can assure him that the officers responsible for framing the New Zealand Regulations are fully alive to the complicated nature of the problem of the design of reinforced concrete poles, and that the factor of safety of two was only arrived at after full investigation.

Owing to the high cost of material and labour the manufacture of these poles has not been carried out to any great extent, but two of the Power Boards have adopted this type of pole for practically the whole of their distribution work.

Steel is usually imported from England, cement is manufactured locally and costs over twice the English price, whilst labour is about 75% higher than the ruling rates for a similar class of work in England. In view of the fact that Ironbark can be obtained from Australia at reasonable prices it will be realised that it is only under special circumstances—such as low cost of crushed stone, efficient conditions of manufacture and cheap transport—where the reinforced concrete pole can compete commercially with Ironbark. The conditions in England are, of course, quite different.

A few years ago an investigation was carried out by Mr. H. R. Climie, M.I.E.E., of New Plymouth, New Zealand, who pointed out that the formulæ given in text books for the determination of the stresses in concrete poles, while approximately accurate for working loads, give quite fallacious results if applied to crippling loads. The results of this investigation are embodied in a paper which Mr. Climie read before the Electric Supply Authority Engineers' Association of New Zealand, in June, 1928. This paper deals in detail with the points raised in Mr. Taylor's letter, and I shall have pleasure in forwarding him a copy.—I am, etc.,

W. P. Gauvain.

London.
February 13th.

Sealing Medium for Insulators.

[To the Editor.]

Sir,—In his article on "Glass Insulators" in your issue of January 25th Mr. North condemns the use of Portland cement for fixing the pins into outdoor insulators and recommends plaster of Paris mixed with powdered glue as the most satisfactory sealing medium.

I have carried out some tests and find this sealing medium to be extremely weak mechanically, the pull required to dislodge a spindle from an 11 000 V insulator being only 460 lb. compared with 4 950 lb. when using Portland cement.

A further source of weakness is the extreme porosity of plaster of Paris, even when mixed with glue, and its tendency to disintegrate when moistened. An insulator with pin fixed as suggested was inverted and a little water poured into the inner pocket; within two minutes the top surface had powdered, and after one hour the disintegration had penetrated to a depth of ½ in.

Although insulators are not normally mounted in such a way as to collect water, a certain amount of moisture must inevitably come into contact with the plaster of Paris, which would eventually crumble away.

I shall be pleased if Mr. North will say what his experience has been with regard to the above two features of this sealing medium.—I am., etc,

P. M. W.

Waltham Cross, Herts.
February 18th.

"Glass Insulators."

[To the Editor.]

Sir,—Referring to the correspondence in connection with my article on "Glass Insulators," I am afraid that at least the earlier critics have looked at the question purely from an academic or test-house point of view, with entire disregard or lack of experience of Outdoor Transmission Equipment under service conditions.

No one appreciates more than the writer the very valuable contributions to the advancement of the art which the porcelain manufacturers have made during rceent years, but I am also compelled to take notice of the developments carried out by the glass works, and when my notice is brought to only a few of the characteristics indicated in my article, I am bound to plagiarise from a popular weekly, and feel that to change my opinion is but to say I am more wise to-day than yesterday.

If glazing is of so little, or no value, is it not remarkable that makers still include this expensive process in their manufacture—even for indoor service ?

When glazing is done simultaneously with firing of the main body, the danger of porosity becomes all the more likely, and I have known of cases where a faulty insulator has only been discovered by the accidental fracture by a workman during assembly, which has disclosed a porous porcelain under a perfectly glazed surface.

In regard to the temperature cycle test, the very fact that such insulators which undergo the test are not allowed to be put into service is surely the most convincing proof one may have of the high value of a test which can be applied to every insulator, because, conversely, one can only say that the insulators which are in service have never been tested, and even Mr. Goodlet, with his self-admitted obtuse views, would agree that, as is customary with all other electrical plant when possible, a test on the actual component part, or equipment, is better.

Personally, I think the application of the polarised light test opened up a new era for the possibilities of glass as a suitable, and, above all, reliable, insulating material, and the fact that over 4 000 000 extra high tension insulators have been supplied, by two firms alone, for service under the most extreme climatic conditions, combined with the fact that they are practically unheard of in this country, is sufficient to convince me of the justification for further interest in the subject at home.—I am, etc.,

Norman E. North.

London, W.C.2.

NEWS IN BRIEF.

Oldham and Assisted Wiring—Annual Dinner of the E.D.A.—Meetings of Electrical Women—Brookhirst Benevolent Fund—Telephones in Jamaica.

A GENERAL manager is required for Aberdeen Corporation tramways department.

Halifax T.C. recently held a meeting in committee to discuss the proposed purchase of a turbo-generator at a cost of £25 000.

Under the assisted wiring scheme inaugurated at Oldham nine months ago, applications for installations have now reached 1000.

The city architect of Sheffield and the fire brigade are to arrange for a fire alarm system to be installed at Lodge Moor Hospital, at an estimated cost of £263.

Hull Telephones Committee has decided to instal an additional 15 cord circuit and associated apparatus in the automatic exchange at Queen's Road, at a cost of £987.

The Brighton, Hove, and District Advisory Town Planning Committee discussed last week the proposal to erect 80 ft. steel towers across the Downs, under the national electricity scheme.

The Post Office is to have a new building erected in Queen Victoria Street, London, of sufficient capacity to house the trunk telephone exchange, the City and Central exchanges, and the toll exchange.

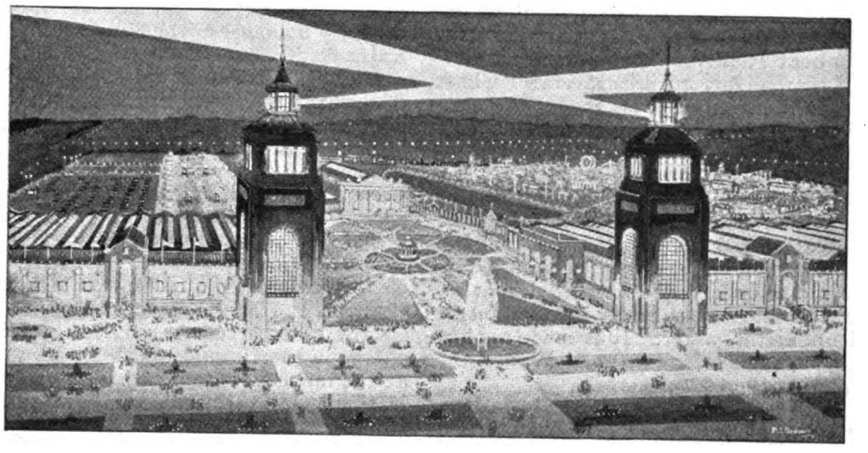
At a meeting of the Institution of Civil Engineers, on Tuesday, a paper by Mr. A. H. Barker on "The Electrical Heating and Ventilation of Bourne and Hollingsworth's Premises" was read. The Institution's students visited the Post Office (London) Railway on February 16th.

A village automatic telephone exchange was recently opened at Haynes, Bedfordshire. The exchange is the first of its kind in the country. Without an operator nearer than Bedford, seven miles away, the 12 subscribers at Haynes can make trunk calls day and night and a kiosk provides the same facilities for the public.

The annual dinner of the British Electrical Development Association, at which Sir John Gatti, president of the Association, will preside, will take place at the Piccadilly Hotel, London, on March 14th, at 7 p.m. for 7.30 p.m. Ladies are invited, and there will be dancing after 10·15 p.m. Tickets from the Association, 15, Savoy Street, London, W.C.2, at 21s. each, include wines during dinner.

The Italian National Research Council created by Signor Mussolini was formally inaugurated at the Campidoglio, Rome, on February 16th. Senatore Marconi, acknowledging his appointment as chairman of the Council, said that twelve committees—one each for agriculture, astronomy, biology, chemistry, physics, geophysics, geography, geology, engineering, mathematics, medicine and radio-telegraphy—had already begun work.

The annual report of telephone progress in the Birmingham district states that there are now 81 telephone exchanges in the area, including three hypothetical exchanges designed to facilitate the introduction of new automatic exchanges. The conversion of the Walsall, Bloxwich and Aldridge exchanges is expected to be completed in the next few months, and Dudley, Brierley Hill, Cradley Heath and Stourbridge will be converted during the present year. There are 68 333 telephone stations, an increase of 8·57%, and 56 061 677 local calls were originated in the district during the past year, an increase of 3 764 480.



AN artist's impression of the North-East Coast Exhibition which opens in May at Newcastle-upon-Tyne. The exhibition is being well supported by firms with electrical interests, and details of the special scheme of illumination which has been prepared for the buildings and grounds are given on page 250.

There are 46 students in electrical engineering at Blackpool Technical School.

Blackpool T.C. has applied for a loan of £8 000 for the hiring out of electric cookers, wash boilers, etc.

The British Cable and Telephone Co. has applied to the Jamaica Government for a concession to operate an island telephone service in parts of the island outside the area covered by the license of the Jamaica Telephone Co.

A mid-Gloucestershire branch of the Electrical Association for Women was inaugurated at Gloucester on February 13th. Mrs. H. S. Ellis presided, and the Mayor and Mayoress of Gloucester and Mr. F. H. Corsan, the city electrical engineer, were present.

An inaugural meeting of the Bristol branch of the Electrical Association for Women will be held on March 5th, at 3 p.m., at Rotary House, Colston Street, Bristol. Lady Augusta Inskip will preside, and the chief speakers will be Miss C. Haslett (Director E.A.W.), Miss M. Partridge and Mr. J. H. Inskip.

At the ninth annual meeting of the Brookhirst Benevolent Fund, Mr. W. W. Lea stated that during the past year 34 members had received sick benefit, and two had died. The total membership was 461, an increase of 37. The treasurer (Mr. C. H. Worth) stated that the assets of the fund were now £1 010 11s. 7d.

During the annual dinner of the Association of Veteran Wireless Operators of America in New York last week a tribute was telegraphed by the President to Senatore Marconi in Rome, referring to him as the greatest figure in the world of wireless, and expressing the warmest sentiments of brotherhood to him and to all comrades in "that great society that knows no boundaries."

Berkshire County Valuation Committee has obtained an opinion of Counsel that machinery and plant installed for the purpose of generating electric power or changing it to a kind suitable for the requirements of the occupier is rateable, while any machinery or plant installed for utilising the power after it has been generated or changed is part of the equipment of the premises, and is not rateable.

An "outlet" campign meeting was held on February 12th under the auspices of the Birmingham and Midland branch of the Electrical Association for Women. Mrs. L. A. Wilson, vice-president of the Association, said it was regrettable that the price of current varied so much, and it was for women to urge for such terms that they would be able to have all the economical and efficient articles at their elbows. A discussion followed.

A meeting of the Physical Society will take place to-day (February 22nd) at the Imperial College of Science, South Kensington, London, S.W.7. Papers will be read on "The Construction and Calibration of a Sensitive Form of Pirani Gauge for the Measurement of High Vacua," by L. F. Stanley; "The Free Periods of a Composite Elastic Column or Composite Stretched Wire," by Dr. Chas. H. Lees; and "A Capillary Tube Method for the Simultaneous Determination of Surface Tension and of Density," by Dr. Allan Ferguson and J. A. Hakes. A demonstration of a standard voltmeter and wattmeter for measurements of a.c. at power frequencies will be given by Dr. E. H. Rayner.

BUSINESS ITEMS.

MR. T. B. M. WHYTE, Glasgow Road, Blantyre, has added an electrical engineering branch to his business.

Mr. J. HAROLD JACKSON, electrical engineer, has recently opened premises at the corner of New Road, Winsford, Cheshire.

GRIFFIN, HARDING AND BRYANT, LTD., electrical engineers, of Swindon, have transferred their showroom from 66, Devizes Road to larger premises at 1, Park Lane.

The lifeboat searchlight of the London Electric Firm.

THE LONDON ELECTRIC FIRM, of Brighton Road, South Croydon, has supplied a searchlight for the Royal National Lifeboat Association, which forms part of the equipment of the recently launched super-motor lifeboat delivered to Cromer. The searchlight, an illustration of which is here given, is made in non-corrodible metal which, at the same time is very light. Perhaps one of the most important features is that the searchlight is entirely watertight. There is an inlet gland for the cable and another for the spindle of the lamp focus gear, it being possible for the user of the lamp to operate the former without removing the hand from the handle, consequently the searchlight could even be worked under the water. It is made for low voltage compressed filament bulbs taking up to 60 W, and the gasfilled variety is usually employed.

CORSON, GRINDLEY AND CO., LTD., electrical dealers, 1, Grange Road, West Kirby, Cheshire, have opened a new and up-to-date workshop, which will be managed by Mr. Thomas Brighouse, who was formerly with Messrs. Jordan and Godsell, ironmongers and electricians, West Kirby.

An electrical exhibition was opened at Ashford, Kent, on February 7th, under the auspices of the Ashford Electric Circle, in conjunction with the local branch of the Electrical Association for Women, members of which gave cooking demonstrations. The exhibition was officially opened by Mr. E. E. Hoadley.

A concession has been awarded to a concern in Pisa for the construction and working of an electric tram-line. Firms desirous of offering plant or materials likely to be required of British manufacture can obtain further particulars upon application to the Department of Overseas Trade. Reference No. A.X. 7 481.

DIXONIA, LTD., 4, Portsmouth Street, Kingsway, London, W.C.2, announces the purchase of the plant and goodwill (with the exception of the special and experimental engineering and tool making departments) of the FLUID PRESSURE PUMPS, LTD., Clifton Street Works, Clifton Street, Latimer Road, London, W.11.

Among the transformer orders received last month by JOHNSON AND PHILLIPS, LTD., Charlton, London, S.E.9, may be mentioned two 5 000 kVA, three-phase units for Woolwich Corporation; four 2 500 kVA three-phase units for the East Anglican Electric Supply Co., Ltd.; four 2 500 kVA, three-phase units for Ipswich Corporation; and two 1 800 kVA, single-phase units for the New South Wales Government Railways.

We are informed by the Department of Overseas Trade that two competitions in connection with power-driven agricultural machinery will be held in Switzerland in September, 1929 and 1930. The first competition will deal with the designs of machinery suitable for the exploitation of small holdings. The 1930 competition will involve the practical demonstration of machines. British firms interested may obtain further particulars on application to the Department, quoting Ref. No. A.X. 7 394.

Following on successful tests, the Conservative Central Office has placed a substantial order with the MARCONIPHONES CO., LTD., Tottenham Court Road, London, N., for public address equipments, on behalf of a number of the candidates at the forthcoming General Election. The apparatus consists of a special microphone, gramophone pick-up, valve amplifier and 200 V rotary transformer, supplied from from a 12 V car battery. The loud speaker is of a special type, having a rubber diaphragm which reproduces speech capable of reaching over half a mile. Although individual members have already used Marconiphones at several by-elections, the adoption of these outfits marks the commencement of a new official policy.

PERSONAL.

ALD. Major Hall-Thompson has been re-elected chairman of Belfast Electricity Committee.

Cape Town Electricity Committee has promoted Mr. J. S. Clinton to the position of charge engineer, with a minimum salary of £451.

Mr. J. W. Fawcett, electrical engineer to Holmfirth U.D.C., has accepted the position of resident engineer with the South-East Yorkshire Power Co.

Mr. Andrew Robertson, chairman of the Westinghouse Electric and Manufacturing Co., has been elected a director of the Radio Corporation of America.

Estate of the gross value of £12 262 with net personalty £12 031 was left by the late Mr. James Hay Jones, who was formerly manager of the Singapore cable depot of the Eastern Extension Telegraph Co.

Mr. R. A. Fearnley, manager of Keighley Corporation tramways, has been appointed to a similar position with Southend Corporation at a commencing salary of £750. He is a son of Mr. A. R. Fearnley, general manager of the Sheffield Corporation tramways.

Mr. Leslie H. Ham, who has since 1926 been the head charge engineer at the Bargoed power station, has accepted the appointment of combustion engineer at the new Government power station at Kalyan, Bombay, in connection with the electrification of the Indian State Railways.

Mr. E. P. Hart, assistant charge engineer in the Portsmouth electricity department, has been appointed junior engineer-in-charge in the Hammersmith (London) electricity department, at the inclusive salary provided by Grade 8a, Class F, of the National Joint Board's scale, at present £336 3s. 11d. per annum.

Sir Hugo Hirst, chairman and managing director of the General Electric Co., Ltd., accompanied by Lady Hirst and Sir Ernest Clark, formerly Assistant Under-Secretary for Ireland, and Lady Clark are passengers on the s.s. "Tamoroa," which is expected to arrive at Southampton from Australia early to-day (Friday). Sir Hugo Hirst and Sir Ernest Clark left England at the end of August as members of the Government Commission appointed to confer with the Commonwealth Government and the leaders of industry and commerce on the development of Australian resources and other matters which might tend to the promotion of trade between the two countries.

Obituary.

MR. C. W. SCHAEFER, electrician-in-chief of the Eastern Associated Telegraph Companies, at his home on Sunday morning.

MR. A. H. ALLEN. The funeral of the late Mr. A. H. Allen, technical editor and director of the "Electrical Review," whose death was announced in our last issue, took place on Monday at the Forest Hill New Cemetery, London. The family mourners were Miss Constance Allen (daughter), the Rev. A. Allen and Mr. Frank Broadbent. Mrs. Allen and other members of the family were prevented by illness from being present. Amongst others present were Mr. E. A. Gatehouse, Mr. A. H. Bridge, Mr. E. S. Middleton, Mr. H. Porter Cox, Mr Arthur Cox, Mr. P. J. Haskell, Mr. W. H. Wicken, Mr. W. A. Jones (E.P.E.A.), Mr. R. W. Hughman ("Electrical Times"), Mr. E. J. Wilcock, Mr. A. L. Johnson, Mr. B. G. Stewart, Mr. A. S. E. Ackerman, Mr. A. Brammer, Major T. Rich, Mr. J. H. C. Brooking and Mr. B. C. Holding (editor of THE ELECTRICIAN). A recent photograph of the late Mr. Allen appears on page 249.

MR. THOMAS HOLMES BLAKESLEY, on February 13th, aged 81 years. He made extensive research with respect to measuring alternating currents. Mr. Blakesley's publications on the subject began in THE ELECTRICIAN, and the first edition of his treatise, entitled "Papers on Alternating Currents of Electricity for the Use of Students and Engineers," appeared in 1885. At the time that he began this work Wilhelm Weber had produced an electro-dynamometer which Siemens had improved for measurements of direct current, and it was with an instrument of this kind and a primitive alternating-current dynamo that Blakesley demonstrated the principles of which he had given geometrical proofs. He separated the two coils of the instrument and sent alternating currents through each, to illustrate the measurement of power. Further, he showed that, by a combination of three such instruments, phase could be determined. He was for some years hon. secretary of the Physical Society.

BUSINESS OPENINGS.

Latest Particulars of Electrical Engineering and Wiring Installation Contracts for which Tenders are being Invited at Home and Abroad.

WE give below the latest particulars of contracts for which tenders are invited. The closing date is given, when available.

ALTRINCHAM DIVISION CONSERVATIVE ASSOCIATION.—Electric light installation in connection with alteration of premises at 23, George Street, Altrincham. Specification from Mr. G. Sisam, 12, Dunham Road, Altrincham.

POWELL DUFFRYN STEAM COAL CO., LTD.—Six months supply of electric cable and accessories. Forms of tender from Stores Manager, Ystrad Mynach, near Cardiff.

BEDFORD CORPORATION, February 22nd.—Supply of e.h.t. h.t. and l.t. underground cables (section 1) and incandescent electric lamps (section 2) during year ending March 31st, 1930. Only British manufacturers in the U.K. are invited to tender. Specifications, etc., from the Borough Electrical Engineer, Prebend Street, Bedford.

BELFAST EDUCATION COMMITTEE, February 22nd. Electric light installation, at Malone Public Elementary School, Balmoral Avenue, Belfast. Specifications, etc., from the Education Architect, Victoria Street, Belfast; deposit £1 1s.

BELFAST EDUCATION COMMITTEE, February 22nd.—Installation of electric lighting and heating system, in Riddell Memorial Public Elementary School, Malvern Street, Belfast. Specifications, etc., from the Education Architect, Victoria Street, Belfast; deposit £1 1s.

CENTRAL ELECTRICITY BOARD, February 22nd.—Supply of 132 kV outdoor switchgear, for transforming stations in area of Central England Electricity Scheme Specification from Sir R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2.

HAMMERSMITH (LONDON) BOROUGH COUNCIL, February 22nd.—Wiring work under wiring scheme. Specification from the Borough Electrical Engineer.

BAKEWELL GUARDIANS, February 23rd.—Three-valve wireless apparatus, with three loud speakers (for connection to a.c. mains), for Haddon District Hospital. Tenders to the Clerk, Hospital Committee, Union Offices, Bakewell.

DUMFRIES CORPORATION, February 25th.—Electrical work in nine blocks of houses. Particulars from the burgh surveyor, Mr. John Barker.

PLYMOUTH CORPORATION, February 25th.—Supply of lamp columns. Specification from the City Electrical Engineer, Prince Rock, Plymouth.

STIRLING CORPORATION, February 25th.—Electrical work in connection with Drip Road No. 3. housing scheme. Specifications, etc., from Mr. A. H. Goudie, borough engineer deposit £1.

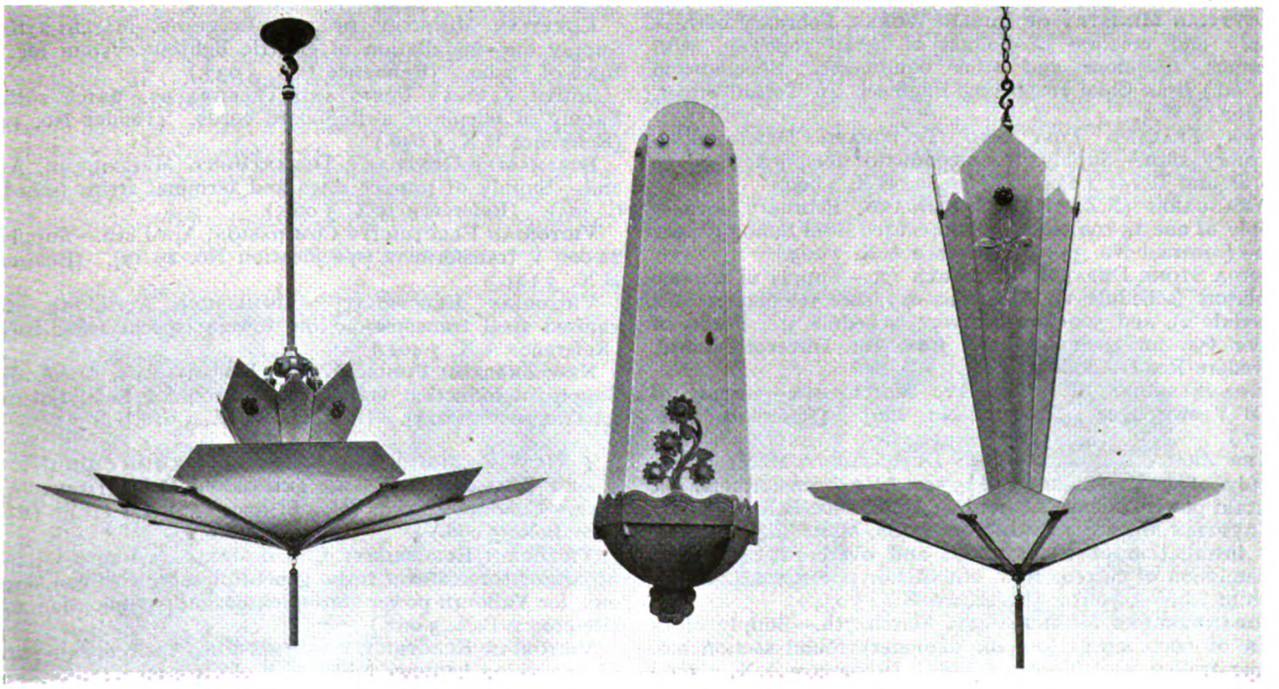
BELFAST CORPORATION, February 26th.—Twelve months supply of stores to the tramways department, including electrical accessories, insulation, carbon brushes, rail bonds, trolley head spares, trolley booms, guard and span wire, electrical equipment spares, etc. Forms of tender from the General Manager, Napier Street, Sandy Row, Belfast.

CONNAH'S QUAY URBAN DISTRICT COUNCIL, February 26th.—Installation work, in connection with free wiring scheme. Particulars from Mr. A. J. Leigh, consulting engineer, 167, The Albany, Old Hall Street, Liverpool; deposit £1 1s.

RHYL URBAN DISTRICT COUNCIL, February 26th.—Supply and laying of about 1 750 yards of 0·06 sq. in.; three-core, 11 000 V cable (C.M.A.), about 1 100 yards of 0·25 sq. in. four-core armoured cable (C.M.A.); and about 1 750 yards of telephone, etc., cable (C.M.A.); also supply and erection of e.h.t. switchgear, two 250 kVA static transformers and l.t. switchgear. Specifications from Mr. E. B. Wright, Electricity Works, Rhyl; deposit £1.

SUNDERLAND GUARDIANS, February 27th.—Automatic telephone system for the Poor Law institution, Hylton Road, Sunderland. Specifications can be seen on application to W. and T. R. Milburn, 19, Fawcett Street, Sunderland.

WATFORD CORPORATION, March 1st.—Wiring of lighting and heating points in dwelling houses, in connection with house wiring schemes. Particulars from the borough electrical engineer, Mr. A. W. Barham, Cardiff Road, Watford.



MORE EXHIBITS AT BIRMINGHAM.

THREE of the modern type of electric lighting fittings to be seen on the stand of Metro-Vick Supplies, Ltd. On the left is a pendant incorporating English sand blasted panels, illuminated by 12 lamps. The metal work is in dull gilt. The centre picture shows a bracket fitted with white opalescent glass for two double-ended tubular lamps, the metal work being green bronze. The right hand fitting is also of English-sand blasted glass for 12 lamps.

Digitized by Google

CAMBRIDGE CORPORATION, March 2nd.—Twelve months' supply of electric lamps (schedule 16), etc. Forms of tender, etc., from the Borough Engineer.

BROMLEY EDUCATION COMMITTEE, March 4th.—Electric lighting installation in Raglan Road Council School. Particulars from Mr. W. G. Trend, borough electrical engineer, West Street, Bromley.

DOVER HARBOUR BOARD., March 4th.—One year's supply of electrical sundries and cables. Particulars from the registrar, Mr. Rutley Mowll, Castle Street, Dover; deposit, 2s. 6d. for each schedule.

RACECOURSE BETTING CONTROL BOARD, March 5th.—Supply and erection of equipment for mechanical control of racecourse betting transactions in Great Britain. Specifications, etc., from Mr. J. R. Chambers, Secretary, 33, St. James's Street, London, S.W.1; deposit £2 2s.

CENTRAL ELECTRICITY BOARD, March 6th.—Supply and erection of 66 000 V switchgear, for South-East England Electricity Scheme (London area), and supply and erection of 132 000 V transformers. Specification from Sir J. R. Brooke, Secretary, Central Electricity Board, Trafalgar Buildings, 1, Charing Cross, London, W.C.2.

NORTH BRITISH ALUMINIUM CO., LTD., March 12th.—Supply and installation of all material required for electric power and lighting distribution system, at the company's works, near Fort William, Inverness-shire. Specification, etc., from the Company's Offices, Adelaide House, King William Street, London, E.C.4.

PADDINGTON (LONDON) GUARDIANS, March 20th.—Six months' supply of electricians' sundries, etc. Forms of tender from the Clerk, 313-319, Harrow Road, W.9. Stamped, addressed envelope to be sent.

EDINBURGH CORPORATION, March 25th.—Supply of materials to the electricity department for 12 months, including cables, conduits, fuses and fuse boards, electrical material, electricity meters, meter boards, etc. Specification from the Engineer and Manager, Dewar Place, Edinburgh.

Overseas.

UNLESS otherwise stated, particulars of overseas contracts are to be had from the Department of Overseas Trade (Room 52), 35, Old Queen Street, Westminster, London, S.W.1. *Note.—An asterisk denotes that local representation is, in practice, essential.*

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, February 26th.—Supply of induction coils and registers, for telephone work (schedule C. 394). (Reference B.X. 5 031.)

EGYPTIAN MINISTRY OF PUBLIC WORKS, February 28th.—Supply and erection at Sollum of aerial ropeway, with dynamos, telephone and other equipment. Specification (10s. 6d.) from Chief Inspecting Engineer, 41, Tothill Street, London, S.W.1.

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, February 28th.—Supply of six-conductor telephone cordage (No. P. and T. 151/1 234). (Reference B.X. 4 990.)

WHANGAREI (N.Z.) HARBOUR BOARD, February 28th.—Supply of one 15-ton electrically-operated level luffing gantry crane (contract No. 35). (Reference A.X. 7 263.)

INDIA STORE DEPARTMENT, March 1st.—Supply of 200 000 insulators (schedule 1), 49 drums dry core telephone cable (schedule 2), and 500 tons g.i. wire (schedule 3). Forms of tender (5s. for each schedule) from the Director-General, Belvedere Road, London, S.E.1.

JOHANNESBURG MUNICIPALITY, March 4th.—Supply of 6 600 V switchgear (Contract No. 126). (Reference B.X. 5 087.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 5th.—Supply of seven single-phase 5 500 kVA transformers, for Waitaki power scheme, section 4. (Reference B.X. 4 873.)

EGYPTIAN MINISTRY OF THE INTERIOR, March 6th.—Supply and installation of underground and overhead cables, for transmission of current from Mit Chamr power works to the town of Kom el Nour. (Reference B.X. 5 074.)

JOHANNESBURG MUNICIPALITY, March 7th.—Supply of 15 miles of 0000 s.w.g. (0·4 in. diameter) round section h.d. copper trolley wire (Contract 128). (Reference A.X. 7 506.)

SOUTH AFRICAN RAILWAYS AND HARBOURS, March 7th.—Supply of hydraulic accumulator, horizontal ram pump, electric motor, motor or belt driven air compressor, starter and control gear.

YUGO-SLAV MINISTRY OF COMMUNICATIONS, March 10th.—Supply of various materials, including electric welding apparatus, machine tools, Diesel engine with electric generator and switchboard, two electric motors (25 and 20 H.P.), various electric generators and other electrical materials, for the River Shipping Board; telegraph and telephone materials, for the Construction Department; electric lighting sets for passenger coaches, for the Machinery Department, etc. (Reference C.X. 2 982.*)

POSTMASTER-GENERAL'S DEPARTMENT, Melbourne, March 12th.—Supply of telephone relays (schedule C. 408). (Reference B.X. 5078.)

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, March 12th.—Supply of switchboard cords (P. and T. 151/1 247). (Reference B.X. 5 017.)

CAPE TOWN MUNICIPALITY, March 15th.—Supply of metal-clad switchgear (specification 449/28). (Reference B.X. 5 004.)

CHILEAN MINISTRY OF MARINE, March 15th (extension of date).—Two electric travelling cranes, for Port of Valdivia. (Reference A.X. 7 353.)

VICTORIA ELECTRICITY COMMISSION, March 18th.—Supply of 1 300 strings of suspension insulators, 600 strings of tensioning insulators, 1 300 conductor suspension clamps, 350 conductor tensioning clamps, 50 semi-anchor clamps for "V" strings of insulators, 200 semi-anchor clamps for single strings of insulators, 475 earth wire suspension clamps and 125 earth wire tensioning clamps. (Reference B.X. 4 997.)

LOURENCO MARQUES PORT AND RAILWAYS BOARD, March 19th.—Supply of three-phase, Diesel-driven 50 kVA generating set, and electrically-driven water pumping set. (Reference B.X. 5 050.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 19th.—Supply of 110 000 V transformer, for Mangahao electric power scheme (section 204). (Reference B.X. 4 952.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, March 19th.—Supply of 11 000 V switchgear, for Mangahao power development (section 203). (Reference B.X. 4 953.)

DUNEDIN, N.Z., CORPORATION, March 20th.—Supply of hand brake equipment, electrical equipment for magnetic brakes and bogie trucks, for tramcars.

CAPE TOWN MUNICIPALITY, March 21st.—Supply of 300 A fuses (specification 453/1928). (Reference B.X. 5 080.)

JOHANNESBURG MUNICIPALITY, March 21st.—Supply of 65 500 porcelain insulators (contract No. 135). (Reference B.X. 5 114.)

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT March 26th.—Switchboard cords. (Reference B.X. 5 067.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, March 26th.—Supply of telephones and dials (schedule C. 401). (Reference B.X. 5 023.)

EGYPTIAN MINISTRY OF THE INTERIOR, March 27th.—Supply and installation of electric lighting system for the town of Fashn. (Reference B.X. 5 037.)

SOUTH AFRICAN POSTS AND TELEGRAPHS, March 28th.—Supply of telephone switchboard cords. (Tender No. 148). (Reference B.X. 5 048.)

POSTMASTER-GENERAL'S DEPARTMENT, MELBOURNE, April 2nd.—Supply of jumper rings and terminal strips (schedule C. 405). (Reference B.X. 5 066.)

VICTORIAN ELECTRICITY COMMISSION, April 8th.—Supply of 22 000 V transformers (specification No. 29/17). (Reference B.X. 5 101.)

VICTORIAN ELECTRICITY COMMISSION, April 8th.—Galvanised steel transmission line towers (specification 29/13). (Reference A.X. 7 401.)

NEW ZEALAND PUBLIC WORKS DEPARTMENT, April 9th.—Supply of induction voltage regulators, for Lake Coleridge scheme (section 215). (Reference B.X. 5 018.)

New Zealand Government Requirements.

NEW ZEALAND POST AND TELEGRAPH DEPARTMENT, April 15th.—Conductor cords (No. P. and T., 151/1 319). (Reference B.X. 5 098.)

VICTORIAN ELECTRICITY COMMISSION, April 29th.—Supply of two or three steam turbo generator sets, with condensers, etc., for Yallourn power station extension (specification 29/7). (Reference B.X. 5 062.)

VICTORIAN ELECTRICITY COMMISSION, April 29th.—Supply of two swing hammer mills, with electric motors, for brown coal (specification 29/9). (Reference A.X. 7 434.)

TANGANYIKA GOVERNMENT, June 1st.—Concession for utilisation of Pangani River Falls for the development of electric power. Copies of the draft concession may be obtained from the Crown Agents for the Colonies, 4, Millbank, London, S.W.1.

STATE ELECTRICITY WORKS, MONTEVIDEO, July 8th.—Construction and equipment of 50 000 kW power station.

Digitized by Google

FEED WATER TESTING.

Description of Interesting Apparatus for Use by Power Stations.

WE give below a description of an interesting appliance which has been developed to meet the stringent requirements of modern marine and power station work. The increasing use of water-tube boilers and the tendency towards high steam pressures have made the question of the purity of the feed water a most vital one. The high rates of evaporation now general have accentuated the dangers resulting from the deposit of salt and other solids, and these dangers are naturally increased with higher pressures. In such circumstances, it is essential to have a means provided for keeping the condition of the feed water under continuous observation, if the lives of the operating engineers, and the successful and economical working of the plant, are to be adequately safeguarded. The means taken must possess certain essentials, such as continuous operation, reliability, simplicity and ability to withstand ordinary engine room use.

The Simplex patent electric salinometer by W. Crockatt and Sons, Ltd., 62-64, Darnley Street, Glasgow (based on the electrical conductivity of the solution being tested) answers these requirements, and has been in successful operation for some years in both marine and land installations, having been fitted in the British, Italian, Argentine, Chilean and Dutch Navies and in power stations all over the world. It is known that the resistance offered to the passage of an electric current through fluid of definite concentration, varies with the temperature of the fluid, and if an accurate reading of the concentration is to be obtained, a means of overcoming this variation is necessary. This is automatically done by the instrument itself, so that the reading as given on the scale is correct over any specified range of temperature, thus obviating any manipulation by the engineer or any reference to compensation charts. The instrument consists essentially of an electrode cell, a temperature compensation device, and an indication instrument.

The first photograph shown below illustrates the type of instrument supplied for use in naval work, and is known as the self-contained salinometer. The electrode cell, temperature compensator and indicator are all incorporated in a single unit. The water to be tested is led to the inlet in the left side of the compensator pocket, passes through this pocket and through the electrode cell and is returned either to the suction side of the pump or to a drain tank. The only other connection required is a lead from the lighting mains.

The indicator gives a clear reading on the dial in grains of salt per gallon, and the temperature compensation is arranged to suit the individual requirements. Should the impur ty content at any time exceed a certain pre-determined amount, the indicator is automatically cut out of circuit, and a red warning lamp lights behind the circular window in the top left hand corner of the case. When required, a warning bell or horn is fitted in addition to the warning lamp, both coming into operation simultaneously. When the water becomes pure again, the warning devices automatically cut out, and the indicator resumes reading. The instrument requires no handling or attention of any kind.

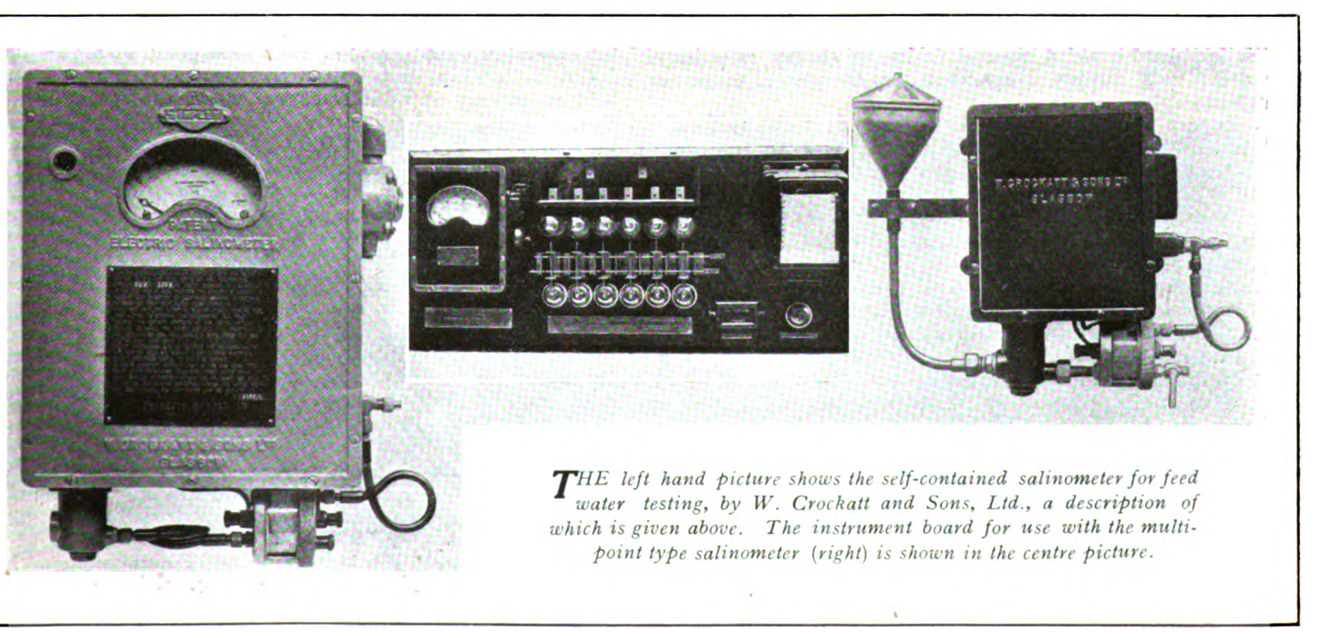
Another type of electric salinometer produced by the same firm is known as the multi-point type. This type is illustrated in the second and third photographs and is used where a considerable number of points are to be kept under observation. The essential elements are the same, but there is only one indicator and the electrode cell and temperature compensation device are placed in a separate case, known as the compensator box. These compensator boxes are placed in the vicinity of the points to be tested (condensers, feed pumps, etc.) and the water is led through the electrode cell as before, electric cable connections are made to the instrument board, on which are mounted the indicator, warning lamps and interlocked switches to correspond to each compensator box, relays, warning bell, master switch, etc. The only other connection to be made is a lead from the lighting mains to the instrument board. All the wiring terminals are arranged in a panel behind the board.

The normal electrical circuit is through the electrode cells and the warning lamps, and in the event of a sudden influx of impurity, the lamps light up brightly and the warning bell or horn comes into operation simultaneously. When the water clears again, the bell ceases ringing. When the engineer wishes to take periodic readings of the actual impurity content at any point, he sets the switch locking lever and switches in that point to the indicator. The locking gear is so arranged that only one point at a time can be switched in to the indicator, the others remaining in circuit through their warning lamps. The switch corresponding to the point which has been read must be replaced in its original position before the locking lever can be moved to allow another switch to be operated.

In the instrument board illustrated, a recording apparatus is supplied, in addition to the indicator, so that if the indicator gives a reading for any point, that point can be then switched in to the recorder and a record kept, over several hours, of the amount of impurity leaking into the feed water.

SOUTH AFRICAN STUDENTS VISIT WORKS.

A party of students from the University of Capetown visited the Stafford works of the English Electric Co., Ltd., on February 12th. The students, who were under the care of Prof. A. E. Snape and Mr. G. Stewart, travelled from Euston in a special saloon, accompanied by a member of the company's export department. The tour of the works was carried out in accordance with a pre-arranged programme, and an expert was present in each department to explain the various processes and special features of design; further informal addresses on technical subjects were given later in the Guest House. Before their return to London the party was entertained to dinner, and in speeches made by two of their number expression was given to the fact that the English Electric Co. had no reason to fear comparison with the electrical works they had seen in Germany.



THE left hand picture shows the self-contained salinometer for feed water testing, by W. Crockatt and Sons, Ltd., a description of which is given above. The instrument board for use with the multi-point type salinometer (right) is shown in the centre picture.

ELECTRICITY SUPPLY.

Loans for Extensions at Tilbury—The Clyde Valley Co.'s Charges—Walsall Electric Street Lighting—Kent Electric Power Co.'s Expansion—Carlisle's New Generator—Reductions of Rateable Value Charges—Pontefract Inquiry.

GLASGOW Electricity Committee has authorised mains extensions at a cost of £14 000.

The Yorkshire Electric Power Co. is to lay cables for the supply of electricity to the urban district of Gainsborough.

Aldershot T.C. has applied to the Commissioners for sanction to alter the system from d.c. to a.c. in the whole of the Council's area.

THE stand of the General Electric Co., Ltd., in the Electrical Section of the British Industries Fair, at Birmingham. The industrial exhibits are dealt with on page 219.

Warrington Electricity Committee has requested the Electrical Engineer to report on the supply of electricity to the parishes of Warburton, Agden and High Legh.

Doncaster T.C. has reduced the annual charge to Bentley-with-Arksey U.D.C. for street lighting by electricity with 122–120 W lamps from £6 10s. per lamp to £5 10s.

Lincoln Electricity Committee is to lay a new feeder cable from St. Swithin's power station to St. Giles. The cost, including alterations and other expenses, will be £3 613.

Bolsover Colliery Co. has made application to Nottingham County Council for permission to lay short lengths of electricity cables under the main road in the village of Edwinstowe.

Electricity has been provided for the village of Harrold by the Rushden and District Electricity Supply Co., by means of overhead cables, and the supply was inaugurated recently.

Buglawton U.D.C. has decided to join Congleton T.C. in an application for a Special Order to supply electricity. Congleton will supply Buglawton at the price ruling at Congleton.

Southport T.C. is applying for a loan of £1 000 for mains and equipment for the supply of electricity to the parish of Scarisbrick.

Tilbury U.D.C. has applied for loans of £600 for kiosk switchgear, £2 024 for mains in the North ward, £976 for h.t. cable in the South ward, and £2 500 for installations for a further 200 houses.

Marlborough T.C. has applied to the Electricity Commissioners for consent to extensions of the College generating station, and the installation of an additional 100 kW generating set, at an estimated cost of £6 000.

Representatives of the Consumers' Council, which has been formed to further the interests of electricity consumers in the area served by the Clyde Valley Electrical Power Co., are to meet the company and discuss alleged anomalies in the charges made for supplies to various sized houses and in different housing schemes.

Rotherham Electricity Committee has decided that from the end of the March meter readings the standing charges to consumers under the rateable value system be based on 13% of the new assessments, with a minimum assessment of £15 as at present, and that the matter be further considered at the expiration of three months.

Walsall Corporation has decided to improve the lighting of the central portion of the borough by approximately 60 750W electric lamps, at a cost for all-night lamps of £13 17s. 6d., per lamp per annum, and for half-night lamps £10 13s. 9d. per lamp per annum (plus £1 per lamp per annum where standards are provided by the Electric Supply Department).

Representatives of Sittingbourne U.D.C. and Milton Regis U.D.C. and R.D.C. met representatives of the Kent Electric Power Co. recently, relative to a supply of electricity for the district. The secretary of the company stated that the supply would be available next autumn. It was agreed that the councils should be supplied with a plan showing how the rural district would be served.

Moray County Council has decided to oppose the extension of the Grampian Co's electricity scheme to the county. The Council has resolved to endeavour to secure the support of Elgin Town Council in petitioning the Secretary of State for Scotland against the scheme, and to press for a guarantee that should they become distributors themselves there should be no competition on the part of the company.

The North-West England and North Wales Electricity Scheme provides for the installation of a 15 000 kW turbo-alternator in the first instance at Carlisle Corporation's Willow Holme station. The Electricity Commissioners consequently declined to authorise the installation of a 7 500 kW set. The Central Electricity Board has offered to pay the annual charges on the difference in the cost of a 7 500 and a 15 000 kW set (estimated at £43 000), and the Corporation has decided to accept the Board's proposals. The cost of the extensions is estimated at £129 000.

Barking U.D.C. has considered a letter from the Ratepayers' Association with respect to the provision of additional lighting facilities in the principal streets of the district, and has directed the Electrical Engineer to report on the question. —The Electricity Committee has considered the question of the revision of the scale of charges for the supply of electricity on domestic rate, arising from the increase of rateable value of property throughout the district, and recommends that the charge on domestic rate be amended from 15 per cent. on rateable value plus 1d. per kWh to 10 % on rateable value, plus 1d. per kWh.

An inquiry on behalf of the Electricity Commissioners was held recently into the application of the Chesham Electric Light and Power Co., for permission to extend its overhead mains from Northchurch to Little Gaddesden. There were objections by local residents to overhead lines crossing their grounds. Mr. Swann, for the company, put forward alternative suggestions. Mr. A. H. Randall, deputy clerk of the Berkhampsted R.D.C., said his Council raised no objection provided the company placed cables underground at Little Gaddesden. The inspector (Mr. Erskine) said he would meet the objectors, to see if some compromise could be agreed upon.

Col. T. C. Ekin, on behalf of the Electricity Commissioners, held an inquiry at Pontefract last week into the application by the local Chamber of Commerce and the T.C. for a reduction of the Yorkshire (West Riding) Electric Tramways Co.'s maximum charges for electricity. For the company, it was stated that they had not yet benefited from the reduced cost of coal. Negotiations were in hand for a new agreement with the Power Company and any exhaustive examination of the figures might prejudicially affect the Tramways Co. Consequently, the petitioners had agreed to the reduction of the maximum charge from 9d. to 7d. The inspector said the Order would be amended accordingly.

Birkenhead Corporation has received from the Ministry of Transport consent to the placing by the Corporation of overhead lines in the parish of Thornton Hough for the transmission of electrical energy at pressures of 11 000 V and 240 V for the purposes of the Wirral and Neston Electricity Special Order, 1925.—The Electricity Committee seeks sanction to borrow £5 000 for the equipment of sub-stations on consumers' premises and £1 360 in connection with extension of h.t. mains and installation of an additional switchgear cubicle at the Singleton Avenue sub-station.—The Commissioners have sanctioned a loan of £16 468, for the provision of the 33 000 V main transmission line between the Birkenhead and Wallasey generating stations.

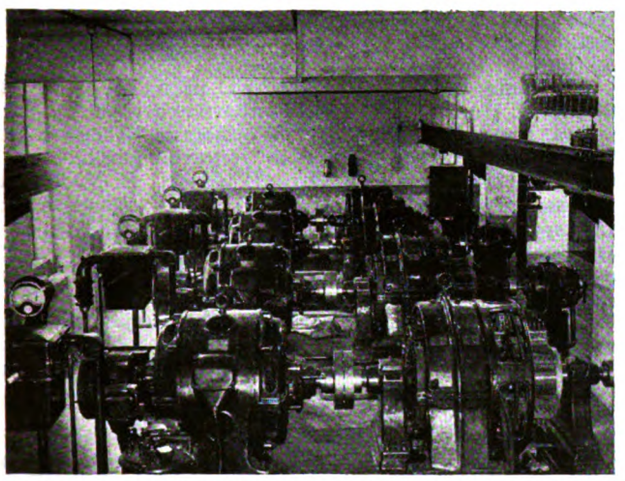
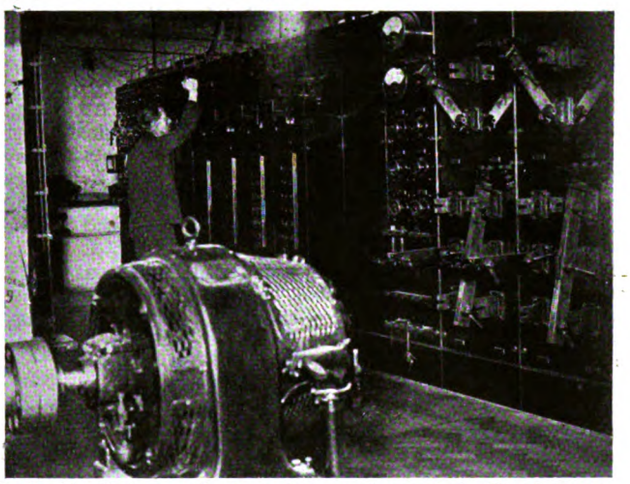
ELECTRICAL NEWS OF THE WEEK IN PICTURES.

Mr. A. H. Allen, whose funeral took place on Monday, at the Forest Hill New Cemetery, London. The names of electrical friends who were present are given on page 244.

The Shropshire, Worcestershire and Staffordshire Electric Power Co. has embarked on a comprehensive series of electrical exhibitions, designed primarily to promote the general use of electricity in rural areas. The first of these was held last week at Bridgnorth, and a section of the exhibit is shown above.





To those whose knowledge of automatic telephone exchanges is limited to their use, the two pictures above of the Wood Street, London, exchange, now nearing completion, are likely to yield something of a surprise. Though it is not generally realised, the equipment installed in such an exchange is considerable, and, as evidence of this, the left-hand picture shows the plant installed for battery charging, with the switchboard for controlling such plant on the right.

Fifty years ago, Werner von Siemens showed at the Berlin Trade Exposition what is believed to be the first electric "train." The "carriages" were pulled by a comparatively small vehicle over a railroad, and, as may be seen from this illustration, at least eighteen persons could be carried.

A NEW READING LAMP.

A NEW adjustable type reading lamp has been introduced by Falk, Stadelmann and Co., Ltd., 83/93, Farringdon Road, London, E.C.1. The lamp has a carefully proportioned green-cased opal parabolic reflector which focusses the filament of

The new reading lamp which has been introduced by Falk, Stadelmann and Co., Ltd.

a gasfilled lamp, thereby tending to add to the primary candle power developed. The prevailing style of reading lamp, with a channel reflector, is claimed by the makers of this new lamp to be ineffective when used with a gasfilled lamp, in that the thin arc of light given by the incandescent filament is in the wrong position to obtain full service. The new lamp is made with three adjustments, securing maximum flexibility, so that at whatever angle the rays may be projected, they are screened from direct contact with the eye. This flexibility is given by adjustment at the juncture of the base and the arm, at the saddle sustaining the shade carrier, and at the swivel immediately above the saddle.

The lamp is supplied complete with green-cased opal shade, 3 yards of flexible cord, pushbar lamp-holder and bayonet lamp-holder connector; it is obtainable in polished brass, or oxidised copper.

LORD BIRKENHEAD.

Relation of Cost of Energy to Industrial Prosperity.

LORD Birkenhead has announced his acceptance of the chairmanship of the Greater London and Counties Trust, the subsidiaries of which include a number of British electricity supply companies. In his statement accepting the position, Lord Birkenhead said: For some time I have been giving my attention to the possibilities of the development and use of electricity in England, and in consequence I have become aware of the beneficial effect which a cheap and abundant supply will have upon increased productivity, employment and wage-earning capacity.

The organisation with which I have decided to associate myself is British, although associated with the Clarke interests in the United States. Its board of directors is, and will remain, British, and it is not tied to any manufacturing organisation. It is not interested in any respect in the purchase of American or other foreign materials or machinery, and its purchases will result in the employment of British material and labour, and its entire staff is, and will remain, British.

So far as finance is concerned, this has been found up to the present almost entirely through the Clarke interests in America, but the broad policy of the trust is to obtain money in the cheapest market, and it is within its province to obtain funds in Great Britain if it is possible to do so at a cheaper rate than elsewhere. The question as to the desirability of the use of American capital in England has been traversed by Parliamentary Committees, which have approved of the principle, and those competent to judge have invariably expressed the opinion that the use of such funds in the manner indicated is in the best national interests.

N.E. COAST EXHIBITION.

Details of Illumination Scheme for Buildings and Grounds for the May Show.

A FULL scheme of illumination for the buildings and also the grounds of the North-East Coast Exhibition has been prepared by the consulting engineers, Messrs. Mountain, Wood and MacLean, Newcastle-upon-Tyne. The outside lighting includes the use of the decorative pillars for the Main Avenue and Grand Court. In addition, there will be a scheme of floodlighting the whole of the walls of the Palace of Engineering, the Palace of Industries and the Towers. There will also be an illuminated fountain in the Main Avenue, arranged for a very ingenious colour changing scheme.

Through the kindness of Sir Charles A. Parsons two searchlights are being loaned to the exhibition authorities, and these will be installed on the top of the Towers, their powerful lights showing over a considerable distance. For the general illumination of the buildings and outside lighting, something like 10 000 lamps will be required apart from the large number in the amusement park. The lamps in the grounds and pillars will be of variegated colour, and the floodlighting is arranged to give a variation in colour on the columns of the buildings. A large coloured illustration showing some of the lighting effects will shortly be exhibited in one of the windows of the Newcastle-upon-Tyne Electric Supply Co. An artist's impression of what the exhibition will look like is given on page 243.

JOHN BENN HOSTEL.

Names of Winners of Electrical Prizes.

WE give below names of the winners of those prizes which were offered by electrical firms in connection with the John Benn Hostel Ballot. It will be remembered that competitors were asked to place a dozen favourite sports and pastimes in the most popular order.

The names of winners of electrical prizes are:—Mr. Otho Bromfield, Huntly, N.B.—three-valve wireless set, by JOSEPH LUCAS, LTD.; Mrs. Partons, "Westbourne," Chantry Road, Moseley, Birmingham—"Servac" electric cleaner, by the WHOLESALE FITTINGS CO., LTD.; Mrs. K. E. Wright, 255, Marshalls Cross Road, St. Helens, Lancs.—"Amplion" cone loud speaker, by GRAHAM AMPLION, LTD.; Mr. Wm. Leach, 41, Stenhills Crescent, Runcorn—"Threesome" receiving set, by the EDISON SWAN ELECTRIC CO., LTD.; Mr. W. J. Smith, 45, Worple Avenue, Isleworth, Middlesex—standard lamp, by FALK, STADELMANN AND CO., LTD.; Mrs. Respindo Lovewell, 50, Chantry Road, Moseley, Birmingham, and Mr. W. Davies, 68, Parkhill Road, Hampstead, N.W.3—each a "Gecophone" loud speaker, by the GENERAL ELECTRIC CO., LTD.; Mr. Audrey Wastie, Long Handborough, Oxford, and Mr. W. Fendith, Gas Works, Hemel Hempstead—each an "Xcel" toaster and kettle, by the AUTOMATIC TELEPHONE MANUFACTURING CO., LTD.; Mr. J. A. Gibson, 4, Hawthorns Terrace, Newcastle-on-Tyne—"A. E. G." heating pad and bottle, by the A. E. G. ELECTRIC CO., LTD.; Mr. R. J. Sivers, 27, Lower Teddington Road, Hampton Wick—"Ever-Ready" searchlight, etc., by the EVER-READY CO. (GREAT BRITAIN), LTD.; Mr. Wm. Lawrence, 172, Mill Lane, Sutton, St. Helens—electric bowl fitting, by the NICO LIGHT CO., LTD.; Mrs. D. Burton, Xela, Church Lane, Oxted, Surrey, Mr. R. E. Phillips, Janark Cottage, Thames Ditton, Surrey—each an "Xcel" electric iron, by SIEMENS ELECTRIC LAMPS AND SUPPLIES, LTD.

A complete list of prize winners was published in the "Daily Telegraph" on Wednesday.

COIL WINDING.

With the knowledge of the fact that the firm of H. CLARKE AND CO. (MANCHESTER) LTD., of Old Trafford, Manchester, has already for years been winding and making the well-known "Atlas" plug-in coils for the radio industry, it is not difficult to see why this concern has recently added to its accomplishments, windings for the electrical and other trades. The works are replete with modern machinery for winding coils on the cotton interwoven principle; also no-volt and overload release coils. Shunt coils, series resistances, chokes, medical coils, ignition coils, coils for bells and magnetos and wireless transformers are also wound. At present they are well situated for giving quick delivery of any windings in which the home and export trades may be interested.

COMPANY NEWS.

Clarke, Chapman and Co.'s Increased Dividend—London Supply Companies' Reports—Greater London and Counties Trust—Proposed Transfer of Aluminium Corporation's Hydro-Electric Works—New Companies.

THE reaction in General Electric shares has continued, and the price has dropped a further five shillings to 62s. 6d. W. T. Henley's and Johnson and Phillips' ordinary are each half-a-crown down, at £6 and 38s. 9d. respectively. Ever Readies have regained the 1s. 3d. lost last week, and Thomson-Houstons have improved 6d. to 23s. 6d.; but English Electric preference at 9s. 4½d. show a fall of 7½d. British Electric Traction issues and Metropolitan Tramways 5% debentures have moved up. Buying of County of London Electric ordinary has caused a rise of 4s. 6d. in these shares; and Charing Cross and London shares also show some improvement.

BERLIN ELECTRICITY SUPPLY CO.—An issuing syndicate in New York last week offered for subscription a £3 000 000 loan in 6½% sinkg. fund debentures for this co. The price of issue was 93½.

LONDON ELECTRIC SUPPLY CORPORATION, LTD.—Fin. div. for 1928 of 3% (or 3s. p. sh.) on 6% £5 pref. shs., makg., with intm. div. paid on Sept. 1, 6% for year, less tax. Fin. div. for 1928 of 5% (or 1s. p. sh.) on £1 ord. shs., makg., with intm. div. paid Sept. 1, 9% for year, less tax.

MERSEY RAILWAY CO.—Receipts for 1928, £227 780, expenditure £144 428. Addg. miscellaneous receipts, £9 899, and deducting miscellaneous charges £10 135, leaves net rev. £83 116, to wh. is added £2 961 blce. from last acct. Int. on deb. stks. £55 057, to gen. res., £2 000, div. on 3% perpetual pref. stk., £19 472, leavg. blce. £9 548. Div. of ½% recommended on con. ord. stk., fwd. £2 487.

FERDINAND SCHUCKHARDT TELEPHONE AND TELEGRAPH WORKS, BERLIN.—It is announced in the Berlin papers that the Ludwig Blattner group, of London, has acquired control of the Ferdinand Schuckhardt Works, with the object of bringing the shs. into a new Anglo-German co., the object of which is to exploit Dr. Stille's patents for "the fixatn. and reproductn. of acoustic happenings on steel material."

NORTH METROPOLITAN ELECTRIC POWER SUPPLY CO.—Net rev. for 1928, £374 621, plus £19 042 brt. in. After deductg. mtge, deb. stk. and other int., £37 506, and placing to res. fund for 5% mtges. £2 000, to redemptn. fund for 5½% deb. stk, £8 750, and to gen. res. £120 705, blce. was £224 702. Divs. proposed on 6% cum. pref. shs. for year and 10% on ord. shs. for year (of which 4% has already been paid), will absorb £196 500. Fwd £28 202.

J. G. WHITE AND CO., LTD.—It is announced that the control of J. G. White and Co., Ltd., has been transferred to J. G. White and Co., Inc., of New York, the latter co. having acquired more than 95% of the sh. cap. J. G. White and Co., Ltd., was registered in 1900, and has carried out many large constructional engineering contracts at home and abroad, including the laying of a large part of the London County Council's electric conduit system of tramways.

WESTMINSTER ELECTRIC SUPPLY CORPORATION, LTD.—Rpt. for 1928 states that blce. brt. fwd. from last acct. was £35 551, makg., with blce. from net. rev. acct., £193 205. Int. divs. to June 30, 1928, absorbed £54 354, leavg. £138 851, out of wh. div. on 4½% pref. shs. to Dec. 31, 1928, required £12 375. Directors recommend payment to ord. shhldrs. of 13·12d. p. sh., makg., with intm. div. of 8d. p. sh., standard div. of 1/19·12d. p. sh. To special res. fund (ord. shhldrs., proportn. of consumers' benefit for 1926, 1927 and 1928), £28 609. Fwd. £29 022.

GREATER LONDON AND COUNTIES TRUST.—The Utilities Power and Light Corporation (U.S.A.) announces that it has acquired, through the Greater London and Counties Trust, the entire capital stocks of the (1) Bedfordshire, Cambridgeshire and Huntingdonshire Electricity Co.; (2) Cookham and District Electric Corporation; (3) East Anglian Electric Supply Co.; (4) Edmundson's Electricity Corporation; (5) Oxford Electric Co.; (6) Wessex Electricity Co., and (7) Western Electricity Supply Co., besides substantial interests in other British power companies. It is also announced that Lord Birkenhead has notified his acceptance of the chairmanship of the Greater London and Counties Trust.

AEONIC RADIO, LTD.—Statutory rept. states that total number of shs. allotted is 1 800 000. Of these 1 150 000 have been subscribed for at par, and blce. 650 000 allotted as fully paid. Total cash received in respect of shs. issued wholly in cash £114 733. Receipts and paymts to Jan. 31, 1929: receipts from shs., £114 733; amts. received in respect of shs. not allotted, £36 491; total, £151 224. Paymts., to vendors in respect of purchase of business and assets of J. L. Gottlieb and Co. and Aeonic Wireless Co., £15 000; to vendors in respect of stk.-in-trade, £25 000; prelim. exs., £15 000; issuing house fee, £3 000; brokerage, £279; underwritg. commissn., £5 750; on account of bldgs. and extens., £5 037; applicatns. repaid in respect of shs. not allotted, £36 491; transfer to tradg. acct., £14 680; blce. at bank, £30 986; total, £151 224. Prelim. exes. total £24 029.

YORKSHIRE (WEST RIDING) ELECTRIC TRAMWAYS CO., LTD.—Operatn. for 1928 resulted in net income, again includg. whole of pft. earned by West Riding Automobile Co. (less £473 carried fwd.) £28 133. Dividend of 6% p.a., less tax, on 6% pref. shs. absorbs £11 102, reinstatemt. of roadway after abandonmt. of tramways (Castleford sectn.) £4 876, and provisn. for expired cap. outlay (depreciatn.) £11 144, leavg. to be carried fwd. £1 010. Bad trade in area served by co. has operated adversely during year, and receipts from tramway passengers show decrease of £9 000, compared with 1927. Fare reductns which were made in Oct., 1927, have also largely contributed to this result, but directors were, and are still, of opinion that such fare reductns. were inevitable. Profit from co's. investmt. in West Riding Automobile Co. is much less owing to tax on petrol imposed on May 1st, 1928.

NORTH WALES POWER CO., LTD.—The co. has provisionally agreed to purchase the Aluminium Corporation's hydro-electric plant at Dolgarrog, at a total price of £500 000, made up of £350 000 in cash and the surrender of £150 000 of "C" debs. in the Aluminium Corporation held by the North Wales Power Co. A mtg. of the power co. will be held to-day (Feb. 22) to consider a resolutn. to reduce cap. from £1 000 000 to £808 059 by reducg. nom. value of each of the issued ord. shs. from £1 to 10s. It is also proposed that the 8% "B" debs. be purchased or redeemed, that all arrears of the 8% fixed cum. pref. div. on the pref. shs. shall be cancelled, that the pref. shs. be subdivided into two shs. of 10s. each, that resultg. shs. be converted into ord. shs. of the same denominatn, and that the authorised cap. shall then be increased to £1 000 000 in 2 000 000 shs. of 10s. each. A mtg. of the hldrs. of the 1st debs. of the Aluminium Corporation, Ltd., will be held on March 11 to consider a resolutn. sanctiong. the sale of the Corporation's hydro-electric undertakg. to the North Wales Power Co., Ltd., on the above-mentioned terms. The circular accompanyg. the notice conveng. the Corporation's mtg. states, *inter alia*, that the extensive developmt. of the power co.'s hydro-electric works at Maentwrog has placed that co. in such a positn. that in the near future it may not need to take further supplies of electrical energy from the Aluminium Corporation. This would deprive the Corporation of the profitable outlet for the sale of the main portn. of its electrical energy.

Company Meetings.

WEMYSS AND DISTRICT TRAMWAYS CO., LTD.—At a recent meeting in Edinburgh, the shareholders unanimously approved the Provisional Order promoted for the ensuing session of Parliament to restrict the alleged unfair omnibus competition along the tramway route.

SIMMS MOTOR UNITS, LTD.—At an extraordinary general meeting last Friday, the shareholders approved unanimously resolutions to increase the capital to £350 000 by the creation of 100 000 £1 preference shares. The entire issue is offered to the ordinary shareholders by way of rights.

BRITISH RADIO GRAMOPHONE CO., LTD.—Sir Ernest E. S. Bell, presiding at the statutory meeting on Monday, said the results obtained up to the present were very satisfactory. They had been fortunate in taking over the Peto Scott Co., Ltd., and the New Times Sales Co. as going concerns. The Peto Scott Co.'s sales during the two months following the issue had been 70% above those for the corresponding period a year ago. Mr. W. Scott Worthington, managing director, said the company already had a wide range of radio receivers, radio gramophones and electrical reproducing gramophones, varying from £10 to 165 guineas, and they had in production a new model radiogramophone operating off electric mains, that would sell at a popular price. They had been approached by a concern which proposed to float a company to open shops around London and handle the whole of the British Radio Gramophone Co.'s products.

UNIVERSAL GRAMOPHONE AND RADIO CO., LTD.—The statutory meeting of this company was held recently, Sir Louis A. Newton presiding. The company was established for the exploitation of the Racon Exponential Gramophone horn, the Murkham electrical pick up and the manufacture of gramophone and radio instruments generally. Regarding the Racon horn, Sir Louis explained that this horn, of which between four and five millions have been sold in the United States, was the only alternative to a horn constructed of wood. Exponential loud speakers for home use are being manufactured in quantity, and orders have already been booked. With regard to the Murkham pick-up, this is exclusive to the company, and negotiations are in progress with a continental company for the supply, over a period of years, of a large number of these pick-ups at a price which will give a satisfactory return to this company.

Ever Ready Trust's Good Prospects.

EVER READY TRUST AND FINANCE CO., LTD.—The statutory meeting was held on February 14th, Mr. Magnus Goodfellow presiding. The chairman said, while averse to any form of prophecy, he would like to give the shareholders such information as he properly could at that early stage in the company's history. In addressing the shareholders of the Ever Ready Co. on January 31st he was able to tell them that the Ever Ready Trust and Finance Co. had assisted the Ever Ready Co. financially in the acquisition of an interest in Lissen, Ltd., and he then expressed his opinion, which he had pleasure in confirming, that this acquisition should have far-reaching and beneficial effects both for the Ever Ready Co. and Lissen, Ltd. As the company was interested in the transaction, they might also anticipate benefits. Their company had acquired a substantial holding in the Ever Ready Co., and from this holding benefits had already been received. In several other directions they had acquired interests which should assist them in earning profits. Although the company was formed only three months ago, it had, in the board's opinion, already laid the foundations of a prosperous year.

TILLING AND BRITISH AUTOMOBILE TRACTION, LTD.—Mr. S. E. Garcke, presiding at the meeting on February 14th, said, in regard to the profit disclosed in the figures placed before the shareholders, it had to be borne in mind that the new capital was not yet fully productive, and in respect of many of the additional investments taken over in the spring a full year's dividend had not yet been received. In connection with the scheme whereby they acquired, from Thomas Tilling, Ltd., and from the British Electric Traction Co., Ltd., and others, further substantial holdings in omnibus undertakings, it was arranged to invite those companies to nominate additional directors to represent them on the board. Messrs. J. F. Heaton and R. M. Tilling, directors of Thomas Tilling, Ltd., and Mr. R. J. Howley, a director of the British Electric Traction Co., Ltd., had been appointed directors.

ALDERSHOT GAS, WATER AND DISTRICT LIGHTING CO., LTD.—At the annual meeting on January 30th, the chairman, Mr. R. W. Edwards, stated that the electricity department showed an increase in sales in "B" area during 1928 of 18·1%, as compared with 19·6% in 1927. The financial results of the Hindhead undertaking, absorbed by this company on December 20th, 1928, were not yet complete, but a full statement of the assets and liabilities would appear in the 1929 accounts. Three additional Special Orders had been deposited, and a public inquiry was held by the Electricity Commissioners on January 15th, 16th and 17th, the results of which was not yet available. The price of electricity for lighting purposes had been reduced since Michaelmas, 1927, by four-fifths of a penny per kWh, which included 3d. per kWh, operative from the last quarter day's meter readings and for all other purposes from midsummer, 1927, one and three-eighths pence per kWh, which included one-eighth of a penny per kWh operative also from the readings of the meters for Christmas last. It was hoped to make further reductions from midsummer, and again such reductions would be applicable to added areas.

ÆONIC RADIO, LTD.—Ald. Sir William Kay, presiding at the statutory meeting on February 14th, said the net profit up to February 7th was over £35 000. That profit dated from November 1st last, but it was not until the middle of December that they had the benefit of the new capital. Their increased factory space would be available in a few days, and they expected to have it in full working order by March 1st. The directors saw that even this increased space would not be

Digitized by Google

sufficient to cope with the flow of orders, and further contracts were entered into with Messrs. J. Jarvis and Sons, Ltd., to again double the space available, making four times its original size, and this would, he hoped, be completed by May 1st. When this work was completed they would be able to employ from 1 500 to 2 000 hands at the Cromer Street service depot and the works at Horley. The company's product was of entirely British manufacture, and up to now had no components or accessories other than British. The directors were considering the advisability of manufacturing their own valves. They had already been approached by some of the leading old-established radio firms who were anxious to merge their interests with those of the company.

FIFE TRAMWAY, LIGHT AND POWER CO., LTD.—Mr. William Low presiding at the recent annual general meeting, said on the power and light ng side of the business, which had contributed approximately 65% of the total trading profit, the improved results were attributable to the steps which had been taken to develop the outlying districts of the area of supply, and to popularise the use of electricity by domestic consumers. Additional sections of the tramway tracks in the Dunfermline and Falkirk districts had been reconstructed and doubled, and, except for a short closing length between Halbeath and Crossgates, which would be proceeded with in due course, the main Dunfermline-Cowdenbeath route and the whole of the Falkirk tramway route had now, at considerable expenditure, been completely relaid in the most modern form of construction. The gross receipts of all the properties for 1928 totalled £421 648, an improvement of £80 000, and a record in the company's history. The net trading profit of £127 004 represented an improvement of £22 619 over the previous year. The directors' report and accounts were adopted, the dividend on the preference shares was confirmed, and the dividend on the ordinary shares at the rate of 4% per annum, less tax, was approved.

New Companies.

DOREE, LTD.—Cap., £800. Manufacturers of and dealers in lighting shades, lighting specialists, etc. Reg. office: 91, Minories, London, E.1.

ORMOND BRASSFOUNDRY, LTD.—Cap., £800. Brassfounders, manufacturers of and dealers in electric light fittings, etc. A director: W. Horton, 50, Claremont Road, Handsworth, Birmingham.

IBBOTSON BROTHERS (ROTHERHAM), LTD.—Cap., £500. To acquire business of electrical and general dealer now carried on by F. Ibbotson at East Dene Garage, Doncaster Road, Rotherham, as "Ibbotson Brothers."

M.E.D.A.S., LTD.—Cap., £3 150. To acquire business of electrical, radio, lighting and heating engineers carried on by A. C. L. Oovell and D. J. Quenzer, at 185, Hammersmith Road, W., as the Modern Electrical Development and Supply Co.

WINTONES, LTD.—Cap., £100. Manufacturers, buyers and retailers of sound-producing instruments, wireless receiving sets and apparatus, and electrical goods, electrical and wireless engineers, etc. Reg. office: 67, Westcliff Park Drive, Westcliff-on-Sea.

CHELMSFORD RADIO, LTD.—Cap., £1 350. To acquire business of dealers in wireless apparatus and electrical goods carried on by H. J. Hawkes and D. C. Clark at 76, Duke Street, Chelmsford, as Chelmsford Radio Co. Reg. office: 76, Duke Street, Chelmsford, Essex.

MOVING COLOUR SIGNS, LTD.—Cap., £500. To acquire an invention for improvements in or relating to advertising apparatus, to carry on business of manufacturers and sellers of advertising signs, moving and otherwise, etc. Reg. office: 12, Spring Street, Paddington, London, W.2.

CRYPTOCODE MACHINE SYNDICATE, LTD.—Cap., £10 000. Manufacturers of and dealers in automatic, electrical, mechanical or other apparatus, machines, implements or other means used in connection with codes, codification, other secret forms of communucation or similar processes, etc. Solicitor: S. Sebbs, 7/8, Great Winchester Street, London, E.C.

LEAD MARKET REPORT.

The market opened last week with a firm tone, and, according to James Forster and Co., up to £23 6s. 3d. was paid for February and £23 5s. for forward. On Wednesday a setback occurred of 8s. 9d. per ton, but the following day the market firmed up again, February advancing 2s. 6d. and May 5s. per ton from the bottom prices of the week. The backwardation ruling at the end of last week has been replaced by a contango of 2s. 6d. per ton. Firm conditions prevail in the U.S.A., where the leading interests advanced their price on February 11th by 6·85 cents per lb.

Closing prices on February 15th were £22 18s. 9d. for February, £23 for March, and £23 1s. 3d. for April and May, 3s. 9d. lower or unchanged on the week.

YORKSHIRE POWER CO.

Orders for New Areas—The Mid-East England Scheme.

THE 37th ordinary general meeting of the Yorkshire Electric Power Co. was held in Leeds, on Tuesday, February 19th, with Mr. Arthur G. Lupton in the chair.

The chairman said: The number of units sold in 1928 have increased by about 8% to a total which constitutes a record. The demand for bulk supplies continues to grow. Orders are being asked for with powers to supply in parts of the counties of Derby, Lincoln, Nottingham, and in the East Riding of Yorkshire, which will increase the use of the company's mains and the services the company can render to the areas concerned. These districts adjoin the company's existing area of supply, and if the powers are granted the present mains of the company can at once be readily extended to supply the new areas.

These areas are mainly of an agricultural character, and it is our view that rapid developments can best be obtained by entrusting them to a supplying authority which is already established, rather than by forming a new organisation.

There must always be unavoidable delay if a new company has to be formed, and our own experience shows how long a period is required for the obtaining of sufficient capital for such a purpose.

Throughout the year extensions of mains, both high and low pressure, have been going forward, to meet growing demands and to improve the facilities of supply.

We have heard that there is a tendency for industry to migrate to the South of England, but I think that if those who are proposing to establish new works will consider the many advantages of the West Riding they will be less disposed to establish factories in places where coal and electricity are dearer and where the facilities of rail, road, and river for transport are so much less than they are in our highly developed area.

The Central Electricity Board have just issued their "Mid-East England Electricity Scheme," which provides that the three stations of the company shall be "selected stations," and that of the five "base stations" two will be our stations at Ferrybridge and Thornhill. It is too early yet to say more than this, but there is no doubt that the work of the company in past years in extending supply over the wide area entrusted to them by Parliament has materially assisted to simplify the problem of supply in the area with which the Board has to deal.

The company's future development will be made in the knowledge of the Board's requirements under the scheme, and with every desire to assist the Board in developing the supply of electricity in the area in the most rapid and efficient manner.

Private Meetings, etc.

[*Inclusion under this heading does not necessarily imply failure, Many private meetings are called merely for the purpose of the debtor consulting his creditors as to his position when he may not be insolvent.*]

ATTAIX, LTD., wholesale electrical and wireless dealers, late 106, High Street, Southampton. In pursuance of the provisions of the Companies (Consolidation) Act, a meeting of the creditors was held on February 19th, when the liquidator, Mr. K. M. Scott, of Merrett, Son and Street, C.A., 32, Finsbury Square, E.C., submitted a statement of affairs showing net assets estimated to realise £7 400, and were subject to £7 347 to meet the claims of the debenture holders (the bank), totalling £7 415. There are no assets available for the unsecured creditors, whose claims aggregate £2 335. The company was registered in 1925 with a capital of £1 000, subsequently increased to £2 000, later to £7 000, and finally to £8 000. During the year to April, 1928, the sales were £9 600, with a gross profit of £1 390, but after allowing for all the expenses there was a net loss of something like £3 000. He estimated that during the eight months to December 31st last the sales were £7 000, but there was a loss of £3 000, attributed to the depreciation of the stock of wireless goods. The company had traded almost exclusively as wholesalers, and it had carried a large stock, much of which had become old-fashioned.

NEW ERA SUN-RAY CLINICS, LTD., Leicester.—The statutory meeting of the creditors in this voluntary liquidation was held on February 14th at the offices of Harry L. Price and Co., I.A., 47, Mosley Street, Manchester. Mr. Arthur T. Eaves reported that the liabilities were £260, but were likely to be increased as claims were being received in respect of treatment not given or only partly completed. In addition, there were fully secured creditors for £176 in respect of plant and machinery supplied on the hire purchase system. For the purposes of the statement, the plant and machinery was valued at the amount of the balance outstanding. The landlord had distrained for rent amounting to £30, and he was shown as fully secured for that amount. There were no assets, and the deficiency as regarded the creditors was £260. The company was only registered on November 15th last. The nominal capital was £600, and shares to the value of £300 were issued for cash. The present position was attributed largely to an article in a certain newspaper.

The creditors decided to confirm the voluntary liquidation of the company, with Mr. Eaves as liquidator.

London Gazette, etc.

Companies Winding-up Voluntarily.

MALDON ELECTRIC WORKS, LTD.—By special resolution January 22nd, confirmed February 8th, A. F. Lovell appointed as liquidator.

MARPOLE AND FRISBY. LTD. By reason of its liabilities, February 8th. F. S. Wilks, F.C.A., 31, Lombard Street, E.C., London, appointed as liquidator. Meeting of creditors in the offices of Gray, Stainforth and Co., chartered accountants, 31, Lombard Street, London, E.C.3, on Monday, February 25th, at 11 a.m.

Bankruptcy Information.

STEIN, Samuel, and STEIN, Benjamin, trading as S. STEIN AND SON, electricians, 36, Warwick Street, Glasgow, Estates sequestrated February 9th, by the Court of Session.

Notice of Dividend.

HARTIGAN, James Aloysius, and HARTIGAN, George Joseph Dominick, trading as LONDON FAN AND MOTOR CO., 81, Charlotte Street, Tottenham Court Road, London, W.1, electrical engineers. First and final dividend, 3s. 9½d. per £, payable February 20th, Poppleton, Appleby and Hawkins, 4, Charterhouse Square, London, E.C.1.

Notice of Intended Dividend.

PACIFICO, Alexander Pacy, PACIFICO, Jack Pacy, and FEITELSON, Raphael, trading as THE COMTON WIRELESS MANUFACTURING CO., 26-28, Bartholomew Square, Old Street, E.C.1. Last day for receiving proofs, February 26th. Trustee, W. A. J. Osborne, Balfour House, Finsbury Pavement, London, E.C.2.

Order Made on Application for Discharge.

HODGE, William Percy, 92, Cannon Street, London, E.C., wireless salesman. Discharge suspended for two years, until November 30th, 1930.

Bankruptcy Proceedings.

KAY (T. L.) AND CO., LTD., 6, Blake Street, York. The winding up order herein was made in November last on a creditor's petition, and according to the statement of affairs as at the 14th January, 1929, there are ranking liabilities of £4 867, against assets, subject to cost of liquidation, amounting to £892, leaving a deficiency of £3 975. The issued capital amounts to £1 902, so that there is a total deficiency, as regards contributories, of £5 877. The company was incorporated on April 24th, 1926, with a nominal share capital of £3 000 divided into 1 000 preference shares of £1 each; 1 950 ordinary shares of £1 each; and 1 000 employees' shares of 1s. each. It appears that 1 902 ordinary shares of £1 each have been issued for cash. The company acquired the assets of T. L. Kay and Co., at the price of £2 122, and took over the liabilities as at January 1st, 1926, amounting to £402. There was no sale and purchase agreement in writing. The purchase price was paid by issuing fully paid up shares to the members of the firm of T. L. Kay and Co., but it would appear that shares to the value of £1 802 only were issued, yet in the minute book the allotment of shares and the assets of T. L. Kay and Co. are expressed as being carried out by payments of cash in each case. According to the balance sheets prepared as at December 31st, 1926, and December 31st, 1927, it would appear that a profit of £450 was earned for the year ending December 31st, 1926, and for the year ending December 31st, 1927, a loss of £722 was sustained. In September of last year a private meeting of creditors was held at the office of Mr. Hugh G. Gardiner, when a statement of affairs was submitted which showed liabilities of £4 031, against assets of £989, a deficiency of £3 042. At this meeting Mr. Hugh Gardiner, accountant, of 1a, Low Ousegate, York, was appointed liquidator of the company. It would appear that the business of the company has been carried on at a very considerable loss since the date of the balance sheet prepared on December 31st, 1927, and the company has been in difficulties for some time. The gross profit earned from the formation of the company to date of voluntary liquidation amounted to £1 301.

IRWIN, Muriel, trading as the K. AND I. COMPANY, 35, Robertson Street, Glasgow, wholesale wireless apparatus dealers. At her public examination, at Glasgow Sheriff Court, this bankrupt stated that she was the sole partner in the business, but took nothing to do with it, and had only lent her name to her brother to carry on. She understood that he could not use his own name until he was discharged from the last time he was in the Bankruptcy Court. Her brother had previously carried on business under the name of Keith and Irwin, but had been unsuccessful, and had become insolvent. He had asked her permission to use her name, and she had given it. She had also assigned to him her interest in her uncle's estate, so that it could be used for the purpose of keeping the business going. She did not actually give him any money, and drew nothing whatever out of the business. The income from her interest in her uncle's estate amounted on an average to £14 per annum.

Charles Irwin, who was examined as a third party, confirmed the statements made by his sister. He stated that he signed a trust-deed in respect of his former business, under which he paid 3s. in the £ to his creditors. When he commenced the business of the K. and I. Company, which was registered in his sister's name, he borrowed £75 from friends; and the stock of Keith and Irwin was bought by Mr. John Trotter and loaned to him. He attributed his insolvency to the fact that he started with too little capital, which proved insufficient to carry stock to meet his turnover. Examined on behalf of a creditor, he stated that he understood he had no interest in his late father's estate, although he had never seen a copy of the will. A year ago he was in financial difficulties, but he carried on. He further admitted that he had received from a firm called the Rapid Company certain goods on sale or return. The goods had been sold, but not paid for. Irwin also admitted that summonses calling for return of the goods had been received on behalf of his sister, but he had taken no notice of their contents.

What it really comes to is, you fraudently represented to the general public that they were dealing with you, while it was not your business, but your sister's?

I would not say it was done fraudulently, but I admit that it looked like it. I did not do it in a fraudulent manner knowingly.

It was stated that the last balance-sheet of the K. and I. Co. showed a deficiency of £580.

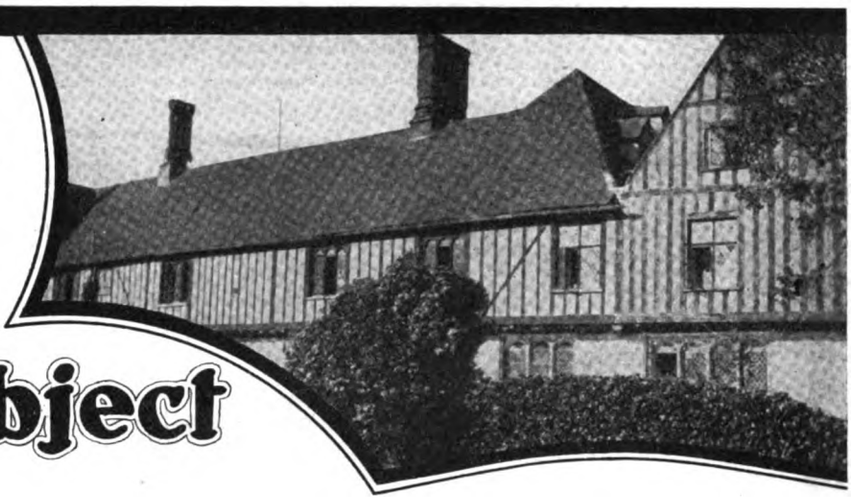
New Light on an Old Subject



Amid the modern craving for novelty: for things of a mere moment, it is a relief to turn to the beautifying of those things which age has mellowed and tradition endeared. The HELSBY TWIN WIRING SYSTEM brings the very latest self-contained Electric System into the home—no matter where it be nor what its size. In the modernizing of old surroundings it is a bright and cheerful way of perpetuating a very pleasant memory.

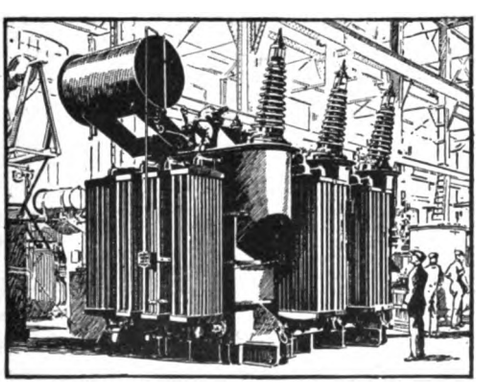
BRITISH INSULATED CABLES LTD

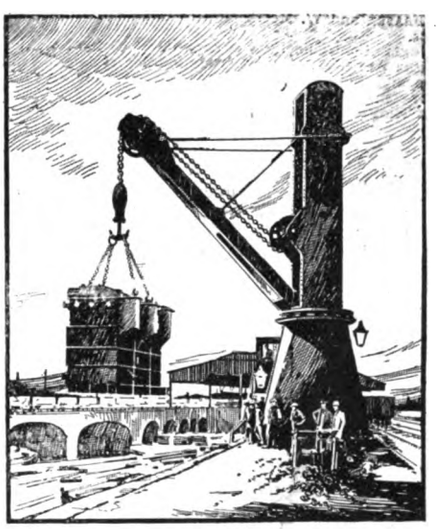
HELSBY NEAR WARRINGTON

Berry Transformers

for test pressures up to 300,000 volts are now being shipped abroad in weights of the order of 60 tons.

The factory at Hayes is adapted for building all sizes and types of transformers.





The British Electric Transformer Co. Ltd. Hayes, Middlesex, England.

PATENT RECORD.

The following information is prepared from the Illustrated Official Journal (Patents) by permission of the Controller of H.M. Stationery Office. Printed copies of full Patent Specifications, when accepted, may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at 1s. each.

Specifications Accepted.

304 432 G. E. Taylor and Electrical Furnace Co., Ltd. High-frequency coils for electric induction furnaces. (1/12/27.)
304 448 General Electric Co., Ltd., H. C. Turner and A. Sherwin. Electric switches. (30/12/27.)
304 458 Birmingham Electric Furnaces, Ltd., and A. G. Lobley. Annealing and other furnaces, muffles, and the like. (11/1/28.)
304 469 F. Casardi and R. Sarti. Receiving apparatus employed in wireless telegraphy and telephony. (19/1/28.)
283 902 Metropolitan-Vickers Electrical Co., Ltd. Electrical power systems for ship propulsion and other purposes. (19/1/27.)
283 973 Telephon-Apparat-Fabrik E. Zweitusch and Co., Ges. Telephone systems. (22/1/27.)
304 474 H. H. Berry. Electric fires or radiators. (23/1/28.)
304 483 Walker, Hunter and Co., Ltd., and J. Walker. Electrically heated ovens. (28/1/28.)
304 487 C. French. Electromagnetic apparatus for use in the reception or reproduction of sound. (31/1/28.)
304 493 E. S. Ali-Cohen. Electric cables. (13/2/28.)
288 965 Soc. des Etablissements Industriels de E. C. et de A. Grammont. Ionic valve with two anodes and two grids. (16/4/27.)
287 087 British Thomson-Houston Co., Ltd. Electric vacuum tubes. (14/3/27.)
304 511 Electrical Improvements, Ltd., and L. C. Grant. Sound reproducing horn. (15/3/28.)
288 142 Electrical Research Products, Inc. Method of and apparatus for switching reproducers from one device to another. (1/4/27.)
290 597 Soc. Anon. Hewittic and M. Demontvignier. Means for operating mercury switches. (16/5/27.)
288 289 Siemens-Schuckertwerke. A.G. Short circuit proof safety fuse cartridge with an overload lag. (9/4/27.)
288 326 Metropolitan-Vickers Electrical Co., Ltd. Electric circuit breakers. (6/4/27.)
290 281 H. Guillou. Radio-electric insulating supports. (12/5/27.)
292 139 Siemens-Schuckertwerke A.G. Electric furnaces for annealing metals. (15/6/27.)
290 297 Akt.-Ges. Brown, Boveri et Cie. Mercury vapour rectifiers. (13/5/27.
292 462 De Forest Phonofilms, Ltd. Picture projection and sound reproduction apparatus. (18/6/27.)
291 107 International General Electric Co., Inc. Transformers. (27/5/27.)
291 401 Pathe Cinema, Anciens Etablissements Pathe Freres. Incandescent electric lamps for projection apparatus. (1/6/27.)

Applications for Patents.

January 11th.

1 070 A. Joffe. Electric valves. (14/1/28, Germany.)
1 071 A. Joffe. Influencing electric currents by light rays. (14/1/28, Germany.)
1 078 J. Lucas, Ltd., and O. Lucas. Vehicle electric lamps.
1 059 Siemens-Schuckertwerke A.G. Vacuum vessels with contact devices. (12/1/28, Germany.)
1 027 C. C. B. Webb. Electric clocks, etc.
1 022 F. H. Wingrave. Luminous electric signs.

January 12th.

1 200 Benjamin Electric, Ltd., and G. Campbell. Mounts for thermionic valves etc. (31/5/28.)
1 163 British Electric Pari-Mutuel, Ltd. Totalisators, etc.
1 195 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Means for measuring electric power.
1 151 C. W. Fraser and W. McGeoch and Co., Ltd. Globe fittings for electric lamps.
1 177 H. F. Joel. Controlling flow of current.
1 158 C. Lorenz Akt.-Ges. Electric train lighting systems. (26/1/28. Germany.)
1 178 S. Prob and Sunderland Forge and Egineering Co., Ltd. Electric motor controllers, etc.
1 183 British Thomson-Houston Co., Ltd. Rotors for dynamos. (13/1/28, U.S.),

January 14th.

1 283 A. Bennett. Electrical equipment for vehicles.
1 326 E. A. Beer. Wireless aerials.
1 337 O. O. F. Bergmann. Indicators for electric llghting systems.
1 316, 1 317 Brandes, Ltd. Electromagnetic sound reproducer. (12/6/28, U.S.)
1 318 Brandes, Ltd. (Brandes Laboratories, Inc.). Electromagnetic sound reproducer.
1 266 British Thomson-Houston Co., Ltd. Elastic fluid generators. (13/1/28, U.S.)
1 211 W. Brooke. Control of electric motors.
1 342 S. G. S. Dicker (N. V. Philips' Gloeilampenfabrieken). Electrical speed regulating apparatus.
1 208 H. M. Dudgeon and T. C. E. Rowland. Braking gear of electric vehicles.
1 293 C. J. Feeny (C. R. Goss). Electrical inductances.
1 252 General Electric Co., Ltd., and C. W. Stopford. Resistance elements.
1 335 C. F. Johnston. Contact breakers.
1 325 H. Leben, A. Reyrolle and Co., Ltd., and E. W. M. Scott. Electric protective systems.
1 294 D. von Mihaly. Amplifier for photo-electric currents.
1 311 W. Otto. High frequency apparatus. (14/1/28, Germany.)
1 262 Siemens and Halske A.G. Circuit diagram for supervision of power distributing installations. (14/1/28, Germany.)
1 305 Soc. Anon. des Ateliers Heuze, Malevez et Simon Reunis. Circuit breaking device. (14/2/28, Belgium.)
1 268 Soc. Anon. R. Ardigo Brevetti, I.G.S. Protective systems for underground cables. (14/1/28, Italy.)
1 683 Soc. des Etab. Ducretet. Wireless apparatus. (17/1/28, France.)
1 351 Soc. d' Etudes et de Construction d' Appareils de Telemecanique. Transmission adapted to be thrown into gear electromagnetically. (14/1/28, France.)
1 215 W. H. Tait. Device for improving mechanical properties of electro-deposited metals.
1 267 H. E. Warren. Electric clock systems. (24/1/28, U.S.)
1 336 A. West, A. West and Co., Ltd. Electrical connections.
1 337 A. West and Co., Ltd. Indicators for electric lighting systems.

January 15th.

1 467 Bergolz Bros. and Co. and F. and I. Bergolz. Receptacles for desk telephones.
1 416 British Thomson-Houston Co., Ltd., H. S. Clifford and E. D. Regis. Electrical contacts.
1 366 G. H. Nkep and Switchgear and Cowans, Ltd. Electric switchgear.
1 432 A. E. O'Dell (Deutsche Telephonwerke und Kabelindustrie A. G.). Remote control indicators. (24/10/27.)
1 389 W. Pansegrau and Ultra Heilstrahlen-Apparate A.G. Lighting device for arc lamps.
1 373 A. Reyrolle and Co., Ltd. and E. W. M. Scott. Electric protective arrangements.
1 422 F. A. Robinson. Light sensitive cells.
1 423 A. A. Thornton (J. R. A. Willey). Anti-microphonic valve holders.
1 424 A. West, A. West and Co., Ltd. Thermal switches, etc.
1 465 Western Electric Co., Ltd. (Electrical Research Products, Inc.) Sound recording.
1 385 G. P. Woodbine. Supporting shades on electric lamp holders.
1 369 A. C. Wynne. Electric couplings.

January 16th.

1 597 Automatic Telephone Manufacturing Co., Ltd., and M. O. Williams. Generation of pulsating electric current.
1 518 Benton and Stone, Ltd. and C. E. Milner. Electrical heating device for cooling water systems of engines.
1 557 British Thomson-Houston Co., Ltd. Continuous windings for electrical apparatus. (21/1/28, Italy.)
1 480 H. E. Dance. Apparatus for graphically illustrating variation in product of two sinusoidal alternating magnitudes of equal frequency.
1 571 H. C. Harrison and St. Helens Cable and Rubber Co., Ltd. Electric cables.
1 517 Highfield Electrical Co., Ltd. and F. W. Highfield. Protective means for electric motors.
1 575 A. Imhof, Trub, Tauber and Co. Device for feeding l.t. apparatus, etc. (10/8/27, Switzerland.)
1 540 C. Lorenz A.G. Synchronous transmission of movements. (17/1/28, Germany.
1 515 Metropolitan-Vickers Electrical Co., Ltd. Electric control devices. (16/1/28, U.S.)
1 549 J. R. Quain. Electric switches.
1 509 L. A. Ramsden. Electric illuminating apparatus.
1 570 Siemens-Schuckertwerke A.G. Safety device for earthed distributing systems. (3/3/28, Germany.)

COMING EVENTS.

Friday, February 22nd-Friday, March 1st.

British Industries Fair.—London and Birmingham.

Saturday, February 23rd.

Association of Mining Electrical Engineers (South Wales Branch).—Cox's Café, Queen Street, Cardiff. Annual dinner. 6.30 *p.m.*

Association of Supervising Electrical Engineers.—Hotel Cecil, Strand, London. Annual dinner.

Monday, February 25th.

Electrical Contractors' Association. (Ealing Sub-Branch).—Ordinary meeting.

Institution of Electrical Engineers (North-Eastern Centres).—Armstrong College, Newcastle-on-Tyne. Paper by Mr. R. W. Gregory on "Electric Supply to the Rural Districts of England." 7 *p.m.*

Sheffield Illumination Society.—Lecture Hall, Fargate. Lecture on America. By Mr. J. F. Colquhoun. 8 *p.m.*

Tuesday, February 26th.

Electrical Contractors' Association (Birmingham Branch).—Ordinary meeting.

Electrical Contractors' Association (Chesterfield Sub-Branch).—Ordinary meeting. Falcon Café.

University of London.—Institution of Electrical Engineers, Victoria Embankment, London. Lecture III (Course of five lectures on "High Voltage Cables" by Mr. L. Emanueli. 5.30 *p.m.*

Institution of Electrical Engineers (East Midland Sub-Centre).—College, Loughborough. Paper by Mr. J. H. R. Nixon on "Motor Converters." 6.45 *p.m.*

Institution of Electrical Engineers (North Midland Centre).—Hotel Metropole, King Street, Leeds. Paper by Mr. R. A. Chattock on "The Modern Use of Pulverised Fuel in Power Stations." 7 *p.m.*

Institution of Electrical Engineers (North Western Students' Secton.)—Engineers' Club, 17, Albert Square, Manchester. Paper by Mr. T. A. Long on "The Loading of Transformers on a Thermal Basis, with Special Reference to Temperature Indicators." 7.15 *p.m.*

Electrical Power Engineers' Association.—Junior Institution of Engineers, 39, Victoria Street, London. "Survey of Modern Steam Power Plant Practice: Station Efficiency." By F. Nicholls. 7.15 *p.m.*

Paisley Association of Electrical Engineers.—Town Hall, Paisley. Lecture and Visit: "Paisley Abbey." 7.30 *p.m.*

Tuesday, February 26th-Friday, March 8th.

Ideal Home Exhibition.—Olympia.

Wednesday, February 27th.

Batti-Wallah's Society.—Hotel Cecil, Strand, London. Luncheon. 12.30 for 1 *p.m.*

Electrical Contractors' Association (Belfast Branch).—5, Bedford Street. Ordinary meeting. 3.30 p.m.

Electrical Contractors' Association (Croydon Sub-Branch).—Ordinary meeting.

Polytechnic.—School of Electrical Engineering, 307-9, Regent Street, London. Lecture IV (Course of eight lectures) by Mr. E. S. Ritter on "Picture Telegraphy." 5 *p.m.*

Institution of Electrical Engineers (South Midland Centre).—Midland Institute, Birmingham. Joint meeting with the Midland Centres of the Institutions of Civil and Mechanical Engineers. 7 *p.m.*

Thursday, February 28th.

Institution of Electrical Engineers.—Institution, Savoy Place, Victoria Embankment, London. Faraday lecture by Mr. Ll. B. Atkinson on "How Electricity Does Things." 6 p.m.

Institute of Patentees.—Caxton Hall, Westminster. Lecture by Prof. A. M. Low on "The Future." 8 *p.m.*

Friday, March 1st.

Batti-Wallah's Society.—Hotel Cecil, Strand, London. Annual Dinner and Dance.

University of London.—Institution of Electrical Engineers, Victoria Embankment, London. Lecture IV. (Course of five lectures) by Mr. L. Emanueli on "High Voltage Cables." 5.30 *p.m.*

Institute of Transport (Manchester, Liverpool and District Section).—Midland Hotel, Manchester. Annual Dinner. 6.30 *p.m.*

Finsbury Technical College Old Students' Association.—Trocadero Restaurant, Piccadilly, London. Annual dinner. 6.30 for 7 *p.m.*

Joint Delegation of the Local (Yorkshire) Associations of the Institutions of Civil, Mechanical, Electrical, Municipal and County, Locomotive and Structural Engineers.—Great Northern Hotel, Leeds. Fourth Joint Delegation Dinner. 6.30 for 7 *p.m.*

Institution of Electrical Engineers (Meter and Instrument Section Meeting).—Paper by Mr. W. Lawson on "The Rotor Bearings of Electricity Meters." 7 *p.m.*

Saturday, March 2nd.

Royal Institution of Great Britain.—21, Albemarle Street, London. Lecture by Sir Ernest Rutherford on "Molecular Motions in Rarefied Gases." 3 *p.m.*

Current Topics.

The British Industries Fair.

If the notion that overseas buyers are more prominent during the first week of the British Industries Fair than in the second week has any foundation, the attendance of foreign visitors at the Electrical Section at Birmingham this year must have been very small. Although, at the time of writing, there are several days to go before the Fair closes its doors, we gather that but little export business has been secured. If we say that we are not surprised, and that we have repeatedly urged that February is a most unsuitable time for an exhibition of this kind, our vigorous support of the Fair—as it is, and not as it should be—will serve to acquit us of any unfriendly intention towards a show which may not only equal, but outshine the older and better patronised Continental trade fairs. In any case, criticisms have been specially invited by the Fair Management Committee, and it is to be hoped that exhibitors and others having views on the future conduct of the Fair will lose no time in making them known, so that prompt action may be taken in directions where changes are indicated. The all-important question of the date of the Fair, is, we imagine, not solely in the hands of the Birmingham authorities, but even if it is not, a strong demand from Birmingham for a later date could hardly be ignored by the Department of Overseas Trade, in London. The points for and against a February Fair are well known, and have been repeatedly set forth in these columns, but we may remind the February-ites that the case for a later Fair is overwhelmingly proved by the differences between the size of the steamship passenger lists in February and those in May or June.

Assuming that this big obstacle is satisfactorily disposed of, future Fairs should be made much more readily accessible to visitors. The stranger, visiting the Birmingham Fair for the first time, must needs be very keen and observant if he is to reach his goal. He cannot book straight through to the Fair by rail from London. He must, on arrival at Birmingham, take another ticket for the privilege of travelling the remaining few miles to Castle Bromwich in slow, crowded and under-heated trains. On arrival at the Fair, he must give up the portion of his invitation ticket containing the railway and 'bus time tables, and, as the invitation only holds good for one day, he must either pay 2s. 6d. for each subsequent admission, or by some devious way obtain a further supply of tickets. And when he gets inside, he finds the place thronged with members of the public on sight-seeing bent, who impede progress and divert the attention of stand staffs from legitimate nquirers.

Export Trade and Luncheons.

The most important criticism, however, is more fundamental than any of the foregoing points, important as they are. It is that—so far as the Electrical Section is concerned—the original purpose of the Fair has been lost sight of. Elaborate arrangements are made for the reception and entertainment of the numerous associations connected with the electrical industry, and electrical luncheons are held, at which platitudinous remarks about the progress of electricity are offered to people who have heard it all before. There is no mention made of overseas trade, and, worse still, there are no such organised efforts of pedestrianism and mastication arranged for the benefit of those hardy visitors who have braved the rigours of an English February in their anxiety to come and give us their orders. No doubt the electrical exhibitors are delighted to see members of the I.M.E.A. and other associations, but such visitors at an export exhibition are but poor substitutes for the foreign buyers, especially as they are all easily reached in the ordinary way by the normal sales organisations, without necessitating the expense of a fortnight's exhibition. If British electrical manufacturers wanted to attract members of British electrical associations, they could obviously do it much more easily with an electrical exhibition occupying the whole of a conveniently-placed building, instead of a corner of one that is most inconveniently situated. If the Fair is to grow on the electrical side, these domestic visits and pow-wows must be relegated to the background, and some definite and vigorous attempt made, not only to get the overseas buyers to come to the Fair, but to make them welcome when they are here.

General Election and Trade.

No business man needs to be told that General Elections are a severe hindrance to trade, but many do not seem to realise that the ill effects of this political upheaval can frequently be tempered by suitable advance planning. Mr. H. W. Roberts, in his E.D.A. Sales Conference paper, made timely allusion to the need for the adoption of extra vigorous sales methods to counteract the upsetting tendencies of the coming Election, and we hope that his reminder will not pass unheeded. Meanwhile we gather that some members of the I.M.E.A. are somewhat anxious to learn whether their Annual Convention, arranged to be held

Digitized by Google

during the week commencing June 3rd, will clash with the Election. It is impossible at this stage to say whether it will or will not, but the uncertainty is most unsettling to the many bodies which, like the I.M.E.A., must book up accommodation and make plans for important business conferences several months ahead. If we are not careful to prevent it at the outset, this uncertainty regarding the date of the polls may be seized upon in various directions as an excellent excuse for holding up business which would normally be placed at that time. Even if "business as usual" during June is regarded as a hopeless ideal, a little extra effort during the intervening three months should go far towards restoring the normal trade balance.

Electrical Salesmanship.

For some considerable time past we have shown dissatisfaction not only with the lack of salesmanship in the electrical industry, particularly on the domestic side, but also with the machinery now available for inculcating a vigorous selling policy amongst the younger members of the industry. Realising that expressions of dissatisfaction alone are of little constructive value, we have published special articles on various phases of selling activity, and all primarily designed to make it easy for people to buy. As a further step in the development of this policy, arrangements have been made for a series of articles dealing in a practical way with the problems of electrical selling. All of these articles will be written by men with successful experience of selling, and there will be none of the stunt methods which have done such disservice to the business of selling in the past few years. The series opens in this issue with a strong plea for the initiation of a vigorous attack on the home electrical market, which we hope will not pass unregarded. We have the goods, and we have a wonderful field. It is ours for the selling.

Spring Cleaning Whitehall.

It may be a pose that impels the most expensive constitution in the history of the world to display to those who pass along Whitehall on the 'bus-tops after dusk so much obsolete lighting equipment. Lamps of initially low wattage, which have many times outlived their reputed life of a thousand hours, in conjunction with the old-fashioned opal shades which no self-respecting business establishment would harbour, "shine" pitifully upon the passer-by as if to invite his commendation of such obvious economy in the expenditure of public funds. The amount of money we pay for the pleasure of providing congenial work for the denizens of Whitehall is so great that an additional expense of a few hundreds of pounds would meet with little opposition, and might, like virtue, provide its own reward in the form of increased efficiency, and certainly improved health in the Civil Service. Put more selfishly, it would furnish a nice little order for some ambitious electrical firm. In addition to lighting, some of our super-salesmen might also provide equipment for removing accumulated dust from the pigeon-holed documents which may not be removed for dusting, and for general cleaning, and thus give to our Government offices at least an appearance of efficiency.

Ideal Homes—Real or Imaginary?

The 1929 Ideal Home Exhibition which opened at Olympia, London, on Tuesday, again includes a number of electrical labour-saving devices, and other domestic equipments of electrical interest. The electrical stands, which are referred to elsewhere in this issue, are more attractive than ever, but it is regrettable that once again the specimens of "ideal" homes, erected in one section of the exhibition, are still without those electrical facilities which are so essential in the really ideal home. The houses to be seen in the village of "Welcome-in," are for the most part lighted by electricity—and that somewhat crudely—but it seems obvious that electricity was only employed more as a matter of convenience to the exhibitors than for any other purpose. Most of these houses contain both gas and coal fires. It is true that one house has been fitted with an electric fire, but those concerned must be rather ashamed of their revolutionary conduct, as the fact is not mentioned in the catalogue. In the description of the same house, however, reference is made to the presence of gas fires. Year by year, with monotonous regularity we find ourselves making the same sort of criticism of this feature. Certain obstacles which existed some years ago are still trotted out to excuse electrical backwardness in a section of the exhibition which attracts many thousands of the general public, but no attempt is made to do anything. Experience with the W.O.B. Campaign clearly showed how easy it is to secure the co-operation of builders, furnishers and other traders in the equipment of model electric houses, and we suggest that time spent in conferences to discuss how the E.D.A. can help in extending the use of electricity would be more profitably occupied in erecting at least one electrically-equipped house at the Ideal Home Exhibition. It is realised that the E.D.A. has to cover a wide field on a ludicrously small financial backing from the industry, but the opportunities at Olympia are so great and the cost so relatively small that E.D.A. might have kept the electrical flag flying on this occasion. A large and rapidly increasing proportion of the public has convinced itself that homes without electrical service are hardly habitable. It goes to Olympia to see the last word in home design and equipment, and finds as examples, homes in which electricity is only conspicuous by its absence. They must wonder what is wrong. So do we.

Country House Fires.

As the unfortunate series of railway disasters which have occurred in this country during the past few months is regarded in some quarters as a cyclical sequence, possibly the same theory may be fitted to the causation of country house fires. Though we say it with bated breath, expecting a sudden change in the luck, we have noticed of late a considerable improvement in the imaginative power of the daily Press in its efforts to fix the responsibility for the many outbreaks which have been reported. The "fusing of an electric wire" theory seems to have been abandoned, but whether this is due to certain educative electrical propaganda efforts, or to realisation of the monotony of frequent repetition of the above-quoted phrase, we are unable to offer an opinion. Whatever the reason for the changed position, we are glad to see growing, if belated, recognition of the fact that fires have other causes.

All-Electric Offices.

The applications of electricity in the service of mankind are nowhere better appreciated than in the chemical industry. Many have been the speeches by chemical leaders, which have paid tribute to the electrical engineer, and many are the products which the chemist is able to produce by electrical means. As if to look to its own comfort, Imperial Chemical Industries, Ltd., has now built for itself an "all-electric" house of the most modern type, introducing into its appointments all those electrical devices which commercial experience has shown to be indispensable to real comfort. The lighting of the building is by "artificial daylight" throughout, while the stairways, halls, etc., are lighted through special "laylights." The board rooms are illuminated by electro-mechanical devices, which, used in conjunction with dimmers, cause the ceiling laylights to supply illumination of almost any required candle-power. We understand that natural lighting is dispensed with in the corridors, special ceiling panel lighting being used in its place. "Artificial sunlight" windows are provided, while the main doors on the Millbank front are opened and closed by means of push-buttons actuating a series of small motors. The building may be said to approach the ideal in so far as office accommodation is concerned, and shows that British architects are at last beginning to realise that the electrical engineer has designed, and is still designing, equipment which will lend additional beauty, convenience and comfort to whatever structure may be inspired by the set-square and mallet.

ELECTRICITY COMMISSIONERS' REPORT.

Organisation of National Schemes to Occupy Five Years—Production of Electricity at Stations Included in Returns Doubled since 1920-22.

SOME of the salient features of the eighth annual report of the Electricity Commissioners were dealt with in our issue of February 22nd. We give below an abstract of the report, which is published by H.M. Stationery Office (3s. net).

In their prefatory remarks, the Commissioners point out that, in preparing the regional schemes, they have envisaged in each case that a period of some five years will be required for the construction of the main transmission system by the Central Board, for the complete or partial standardisation of frequency where a change-over is involved, and for the bringing of the scheme into full operation. While economies will be brought about in particular areas as the work of construction proceeds and progresses, it is evident that the benefits of the far-sighted basis of development laid down by the Act of 1926 can only accrue by stages. The full advantages cannot be expected to mature over the country as a whole for a number of years to come, even when allowance is made for the utmost expedition in construction, in the completion of all necessary arrangements, and for the concurrent carrying out of schemes in different regions.

It is necessary to emphasise this aspect of the matter and also the fact that the new schemes are not specifically concerned with supplies to private consumers, in view of misunderstandings which appear to have been prevalent that the Act of 1926 would result in the early provision of supplies by the Central Board to potential consumers in areas where electricity has not hitherto been available.

With regard to electricity supply in rural areas, the report points out that during the eight years which have elapsed since the reorganisation of supply was commenced on the basis of the Act of 1919, it has become increasingly evident that the centralisation of generation will require to be supplemented by improvement in, and co-ordination of, distribution if the opportunities for expansion presenting themselves to the supply industry are to be utilised to the fullest advantage. In comparisons which are made with other countries, there is often a failure to recognise that rural electrification in Great Britain must be governed by British conditions. A table of distribution of population in Great Britain shows that the rural areas comprise as much as 92% of the total area, but only contain 22% of the population, with an average density less than one-quarter of that of the country as a whole and less than one-fortieth of that of the urban areas.

It is apparent that the provision of an electrical service for small communities and individual farms and other premises located in wide areas having a low average density of population represents a substantially novel phase of electrical development in Great Britain, with problems differing in many respects from those normally associated with the development of undertakings in urban areas. Generally speaking, the potential load is much sparser in character, the distances concerned are much greater, the conditions of living are somewhat different, and the remuneration and spending capacity of the rural population are on a lower scale than obtains in urban centres.

Rural Supplements to Urban Loads.

The results already attained by a number of undertakers who are operating outwardly from urban centres go to show that a considerable measure of rural electrification is economically possible in cases where the rural load can be developed as a supplement to an urban load. Further experience is necessary, however, before it can be determined whether, and to what extent, the electrification of a wide rural area *per se* can be successfully accomplished without dependence upon an urban load as a nucleus.

Apart from the Central Electricity Board, the number of authorised undertakers in Great Britain holding powers to supply electricity at March 31st, 1928, was 643. Inclusive of the Central Electricity Board, and allowing for the cases of two companies with undertakings in England and also in Scotland, the number of separate undertakers at March 31st, 1928, was 642, a net addition of 19 to the number holding supply powers at the end of the preceding year.

In a previous report, approximate particulars were given of the extent and population of authorised areas of supply in England and Wales as at March 31st, 1924. A more detailed analysis extending to Great Britain as a whole, with special reference to the position in the rural portions of the country, was commenced during the past year in connection with the investigations of the Conference convened by the Commissioners to consider the question of electricity supply in rural areas.

This analysis has been compiled in a form which shows in respect of every local government district in the country its area and population, the name of the authorised undertakers (if any) and the Order or Act authorising them to supply electricity. When completed, it will also embody a record showing whether a supply of electricity has been established or not yet commenced in the various districts. A table is given showing that the authorised distribution areas embraced over 92% of the cities and boroughs, 86% of the urban districts, and 58% of the parishes in the rural districts in England and Wales; and about 68% of the cities and burghs and 29% of the civil parishes (exclusive of burghs) in Scotland. The figures show that the authorised distribution areas in Great Britain at March 31st, 1928, covered about 89% of the urban areas containing upwards of 97% of the urban population; and nearly 42% of the rural areas containing upwards of 67% of the rural population.

Areas with Better Prospects Occupied.

The Commissioners state that it is clear that in the process of seeking statutory powers to supply electricity, the stage has been reached at which the majority of the areas possessing the higher average densities of population, and thus presenting the better prospects of development on a remunerative basis, have already become occupied. The unoccupied areas in which no supply of electricity has yet been authorised consist mainly of the more sparsely populated rural portions of the country amounting to 45% of the total area, but containing only 5% of the total population, with the low average density of fifty-six persons per square mile.

The rural areas for which powers were granted since 1920 account for upwards of 82% of the area and about 69% of the population of the rural distribution areas existing at March 31st, 1928. The figures also reveal the increasing sparseness of the rural areas for which supply powers have been sought in recent years, the average density of population in the rural areas of supply authorised prior to 1920 being of the order of 332 persons per square mile, as compared with 156 persons per square mile in the case of the rural areas of supply authorised subsequently.
